THE new pieces to be produced at the little Charing Cross include a semi-historic play, written by Mr. H. Hermann and entitled *Jeanne Dubarry*. Miss Lynd will act the heroine. There is also to be produced a new comic opera by Mr. Robert Reece: the music by Mr. Frederick Clay.

TO-NIGHT is the evening fixed for the production of the *Merchant of Venice* at the Prince of Wales's.

Weak Woman is the name of Mr. Byron's new comic drama, which we announced, a while ago, as in preparation at the Strand.

THE Mirror Theatre—as the Holborn Theatre is henceforth to be called—will open this day week, under Mr. Horace Wigan's management, and the main piece to be presented is the *Hidden Hand*—an adaptation by Mr. Tom Taylor of *L'Aieule*—and a drama, which, as many playgoers remember, was immensely successful at the Olympic Theatre some ten years ago, when Miss Kate Terry drew the town to see her in an important part. But there are several good parts in the piece. The Mirror company includes Miss Rose Leclercq, Miss Louisa Moore, Miss Kate Phillips, and Mrs. Fairfax, and Mr. J. B. Howard, Mr. David Fisher, Mr. F. Dewar, and Mr. F. W. Irish.

A SERIES of morning performances of *Hamlet* are announced at the Lyceum. They will take place on the five Saturdays of May. Wisdom has been shown in another announcement which accompanies this one—that there will be no evening performances on the days appointed for the morning representations. In view of the continued and unexampled popularity of Mr. Irving's *Hamlet*, the production of *A New Way to Pay Old Debts* is hardly to be looked for, during the present season.

MDME. FARGUEIL has gone to Brussels, to play Rose Michel at the Théâtre du Parc.

A MEETING was held at Mr. Graves's, in Pall Mall, on Monday, of those interested in the erection of a Shakspeare memorial theatre at Stratford-upon-Avon, and there is shortly to be a performance of *As You Like It* for the benefit of the fund; Miss Helen Faucit (Mrs. Theodore Martin) having volunteered her services as Rosalind.

M. HENRI DE BORNIER's admirable drama, *La Fille de Roland*, has just been produced at the Théâtre Français at Nice.

MDME. NATHALIE, after many years of excellent service, is going to retire from the Comédie Française.

VICTOR SÉJOUR's *Cromwell* is now ready for production at the Châtelet.

L'Affaire Coverley—a drama in five acts and seven tableaux, by MM. Crisafulli and Adrien Barbusse—has been brought out at the Ambigu Comique. This is a version of the Tichborne case.

THE *Vie Parisienne* has been reproduced at the Variétés, with Mdle. Julia Georges in the part that was to have been played by Mdle. Celine Montaland.

WEDNESDAY was appointed for the first representation of *Un Drame sous Philippe II.* at the Odéon.

THE theatrical event of the past week in Paris has been the reproduction, at the Théâtre Français, of Alexandre Dumas' *Mademoiselle de Belle Isle*. Mdle. Sarah Bernhardt played in it there some eighteen months ago, but it was now revived again for the continuation of the *débuts* of Mdme. Emilie Broisat, which up to this time have been successful. Nor is her performance in *Mademoiselle de Belle Isle* by any accounted a failure. M. Vitu, while holding her style to be somewhat too monotonous and moderate for so long and arduous a part, in which variety and great effects are above all things wanted, does justice to the intelligence and feeling which she brought to her work. The critic of the *Temps*, who has the rare wisdom of enthusiasm, is more entirely favourable to her. He might almost be praising Mdle. Bernhardt herself—there is so much of *bonne volonté* in his commendation. The elder Dumas, with admirable instinct for the needs of the theatre, has contrasted in *Mademoiselle de Belle Isle* two loves: the one light and fickle and thoughtless—that of Richelieu and Mdme. de Prie; and the other passionate and exalted—that of D'Aubigny and Mdle. de Belle Isle. And it is probably the highest praise of Mdme. Emilie Broisat, to say that she has confirmed and emphasized a difference which Dumas intended to make plain. Her creation is, by all accounts, one of admirable simplicity. "Elle a dit les premières scènes avec beaucoup de grace et de dignité. Elle a eu dans les dernières d'adorables mouvements de passion et des emportements de douleur qui ont ému toute la salle. Sa voix est une musique délicieuse, et les notes tendres en ont un charme pénétrant." Mdme. de Prie is played by Mdle. Croizette, and the Duc de Richelieu by Delaunay, who does not appear to have succeeded in giving to the part any historic character. His Richelieu is a man of our day, with the grace and the lightness of Delaunay himself. They say, however, that had Delaunay attempted a semi-historic portrait he would only have been unsuccessfully forcing his talent, and that he has done wisely in keeping well within his recognised means.

We learn from the Annual Report of the General Director of the Royal Theatres at Berlin, that at the latter there were 815 representations, of which 101 were of the so-called classical order, and of these fifty-five were of Shaksperian plays, while only sixteen were of Goethe's, and fourteen of Schiller's.

MUSIC.

PHILHARMONIC SOCIETY.

THE announcement of the performance for the first time in London of the most generally popular on the Continent of all Raff's symphonies, the work the name of which at least is most familiar to musicians here, naturally attracted a somewhat representative audience to the second concert of the Philharmonic Society at St. James's Hall last Monday. Among those present might be seen most of the leading members of the profession in London, and the close attention with which the very long work was followed throughout bore testimony to the curiosity generally felt concerning it. As last week's ACADEMY contained an account of the "Im Walde" symphony, it is needless to enter into many details on the subject here. I will only say that the opinions expressed both as to its great beauty and as to the diffuseness of its first and last movements were fully confirmed by hearing it, and I will pass on to speak of the performance itself. This, I regret to say, was (for reasons for which the conductor was only partially responsible), as a whole, far from satisfactory. Many of our readers will remember that the Philharmonic Society labours under the great disadvantage of being unable to obtain the services of any of the members of the opera orchestras either of Covent Garden or Drury Lane. As these two establishments number among their players a

large majority of the best available instrumentalists in London, it is no easy matter to get together a third band which shall be worthy of the reputation of so old and so honoured an institution as the Philharmonic; and, to tell the truth, though Mr. Cusins has under his bâton many excellent solo players in the various departments (such, for instance, as Messrs. Straus, W. Pettit, Svendsen, Clinton and Wendland), the *ensemble* is not all that could be desired. For this, of course, neither conductor nor directors are responsible; they are simply obliged to take the best men they can get, and if most of the best are already engaged elsewhere, the fault is not theirs. But in the case of such a work as Raff's "Im Walde" there is a further difficulty—that of insufficient rehearsals. The general custom is to have only one full rehearsal previous to a concert. I understand that in the present case an additional one was secured for the sake of this symphony; but, knowing the score intimately, I have no hesitation in saying that the finest orchestra in Europe could not give an adequate performance of it with only two rehearsals. Probably the only place where a really finished presentation of it could be secured would be at the Crystal Palace; because there Mr. Manns enjoys the advantage, which cannot be over-estimated, of being able, if necessary, to rehearse every day for a week, or even longer, till the necessary light and shade is obtained; and it was in this respect that the Philharmonic performance fell so far short of the requirements of the work. As regards the mere notes, there was little fault to find; for our orchestral players are for the most part excellent sight-readers, and make nothing of mere technical difficulties; the failure was in the balance of parts. This was especially noticeable in the opening movement, in which some of the more important melodies were so overpowered by the accompaniments that they were all but inaudible, and must have quite escaped the notice of those who did not know the work. For this, however, as already mentioned, the conductor is not to blame. But there was another blemish in the performance for which he must be held responsible. With the exception of the *largo*, each of the four movements was taken perceptibly slower than the time indicated in the score. In the case of the "Dance of Dryads" the difference was very considerable, being (as timed by the second-hand of a watch), exactly twenty beats in the minute slower than Raff has marked it; and from a light and fairy-like scherzo the movement was almost metamorphosed into a waltz. The first and last movements, too, suffered from the same cause, though in a less degree. With all its shortcomings, nevertheless, the performance excited great enthusiasm in the audience, each movement being heartily applauded; and the thanks of musicians are due to Mr. Cusins for bringing to a first hearing here one of the most important and representative works of the modern German school. Its success will doubtless lead to its performance elsewhere.

The other orchestral performances of the evening were Beethoven's eighth symphony, and Spohr's overture to *Jessonda*, both of which works are too well known to require notice. It is certainly an error of judgment to perform two symphonies at the same concert, especially when (as in the present instance) the first has lasted fifty minutes. Neither players nor hearers are in a condition to do justice to the music under such circumstances. The shorter the programme, within of course reasonable limits, the more chance there is of its being both well rendered and thoroughly enjoyed.

The solo instrumentalist at this concert was Mdle. Marie Krebs, who played Schumann's concerto with her usual finish and brilliancy, though the work appeared to suit her somewhat less than others that she has brought forward. The accompaniment by the orchestra was deficient in finish, and this may possibly have rendered Mdle. Krebs less at her ease than she would

otherwise have been. Mdle. Johanna Levier, who is deservedly making her way with the public, was heard for the first time at these concerts in the air "Ja, ich fühl's" from Spohr's *Faust*, and in songs by Rubinstein and E. Hecht.

For the next concert an interesting novelty is promised in Rubinstein's violin concerto, to be played by Herr Wilhelmj. EBENEZER PROUT.

THE last Saturday Concert at the Crystal Palace contained as the special feature of the programme Brahms's most interesting and enjoyable Serenade, Op. 16, for small orchestra. This work was produced last year at the Philharmonic concerts, and noticed then in some detail in these columns (see ACADEMY, July 4, 1874). It need only therefore be said that it gains much by a second hearing, especially with such an admirably finished performance as that given under Mr. Manns. Mr. J. F. Barnett's orchestral fantasia "The Lay of the Last Minstrel," written for last year's Liverpool Festival, was produced for the first time at these concerts. The pleasing scherzo "The Elfin Page," a movement strongly reminiscent of Mendelssohn, was encored. The overtures at this concert were those to *Jessonda* and *Zanetta*. Herr Pauer, a pianist who is always heard with pleasure, gave an excellent and most artistic rendering of Weber's "Concertstück," a work which, strange to say, had not been heard at the Saturday Concerts since 1869. The vocalists were Miss Edith Wynne and Mr. Edward Lloyd. To-day's programme includes the Pastoral Symphony, Schumann's overture to *Manfred*, a new *allegro* and *scherzo* by Sir Julius Benedict, and Paganini's violin concerto, played by Herr Wilhelmj.

DR. HANS VON BÜLOW gave his farewell recital previous to his departure for America at St. James's Hall on Wednesday afternoon. Besides Liszt's transcription of Bach's Prelude and Fugue in B minor, and short pieces by Raff, Brahms, and Rheinberger, the programme included Schumann's great Fantasia in C, Op. 17, and Beethoven's wonderful "33 Variations on a Waltz by Diabelli," which the Doctor performed at his first recital this season, on October 31 last. All lovers of music will heartily join us in wishing the Doctor not only a successful visit to America, but a speedy return to this country.

ON Wednesday last, in the Chapter House of St. Paul's Cathedral, the presentation to Sir John Goss of the "Goss Testimonial" took place. The testimonial has taken the form of an Exhibition for Chorister Boys in the Royal Academy of Music, and the deed relating thereto was presented, in the absence of the Rev. Sir F. A. Gore Ouseley, who was expected, by Mr. John Hullah.

FOUR recitals of chamber music are announced to be given at 50 Norfolk Square, Hyde Park, on Tuesday afternoons, April 20, May 4 and 19, and June 1, by Messrs. Sainton, L. Ries, Zerbini, and Lasserre, with Mdme. Jenny Viard-Louis as pianist. The programmes are very interesting, and include among other things piano quintets by Raff, Brahms, Schumann, and Rubinstein, and two of Raff's sonatas for piano and violin. Instead of the customary vocal music, the instrumental pieces will be divided by readings, to be given by Miss Emily Faithfull.

MDME. PLEYEL, whose death we announced last week, has left by her will the sum of 10,000 francs to the Belgian Association of Musical Artists. She has also ordered that the proceeds of the sale of her jewellery should be invested for the benefit of necessitous musicians.

THE eldest daughter of Cherubini, Mdme. veuve Turcas, has just died at Paris, at the age of seventy-nine.

THE Wagner Concert at Berlin—at which the selections from the *Götterdämmerung*, recently per-

formed with such success at Vienna, are to be given—is definitively fixed for the 24th instant.

BEETHOVEN's great string quartett in C sharp minor has lately been arranged for orchestra, and performed in this shape at Nice. Surely this is the *reductio ad absurdum* of orchestral arrangement!

A NEW Conservatorium for music has just been opened at Riga.

WE are informed on good authority that the directors of the Mozart Institution ("Mozarteum") of Salzburg are about to publish a complete and uniform edition of the great composer's works, including all which exist at present only in manuscript. The edition is to be uniform with those of Beethoven and Mendelssohn. When it is remembered that the total number of Mozart's works exceeds 600, many of them of large dimensions, the directors may well be complimented upon the boldness of their enterprise, which it is to be hoped may meet with the support it deserves.

M. ALPHONSE ROYER, formerly director of the Opera at Paris, has lately died, at the age of seventy-two. He was joint author with M. G. Vaez of the libretti of several well-known operas, among which may be named *Lucia di Lammermoor*, *La Favorita*, *Don Pasquale*, and *Otello*, and from 1853 to 1856 was director of the Odéon.

It is reported that Gounod has entered into an agreement with the management of the Grand Opera at Paris, by which he is to complete for them an opera in four acts for the season of 1875-1876.

THE Hungarian papers announce that Franz Liszt has been nominated by the Austrian Emperor to the presidency of the Academy of Music about to be established at Pesth. From Vienna we learn that Verdi will undertake in person the direction of his Grand Mass at the meeting of the Musical Society on June 17, when the *cantatrices*, Mesdames Holtz and Waldmann, will take part in the representation. These ladies are also engaged, it is said, to sing in his opera *Aida*, which is about the same time to be brought out under his direction at the Vienna Court-Opera House.

SATURDAY, APRIL 24, 1875.

No. 155, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

A Transcript of the Registers of the Company of Stationers of London; 1554-1640 A.D. Vol. I. Text. Detailed Cash Abstracts onward to August 2, 1596. Edited by Edward Arber, Assoc. King's Coll. London, F.S.A., Editor of "The First Printed English New Testament," the "English Reprints," and "The First Three English Books on America." Privately printed. (London: January 1, 1875.)

THIS new and larger venture of Mr. Arber recalls those of Rushworth and Prynne, and other men of unquestionable original faculty—intellectual and scholarly—who gave themselves up to the merest drudgery of literary work, and sent forth great folio and thick quarto in endless succession, with no possible hope of either fame or gain, and in the perfect knowledge that they were only opening out quarries whence later writers should fetch their materials, and by dint of polishing and setting rear monuments inscribed with their own names. Sooth to say, Mr. Arber's original faculty shows itself somewhat annoyingly in stupendously magniloquent paragraphs of "Introduction," and in oddly obtrusive self-assertion concerning the inestimableness of his undertaking—the former not to be repeated, it is humbly to be hoped; the latter advantageously left to others to discover and appraise—the more so that well-nigh thirty years ago Mr. J. Payne Collier preceded the Transcript in his valuable as laborious *Extracts from the Registers of the Stationers' Company* (2 vols. 8vo, 1848-9). But regarding the Transcript broadly, it is scarcely possible to exaggerate the self-denial, the sheer transcribing toil and editorial pains (in the fine old sense) given to this work and to which Mr. Arber is committed for years to come: e.g. a rough approximative estimate yields a total of well-nigh 200,000 entries of names of persons, books, things, &c., &c., bearing directly or more remotely on our literature up to 1640. This being so, it may be well in the outset to state that the present writer is able to testify from an express personal examination of the Register, so far as it is represented by vol. i. of the printed text, that it is thoroughly trustworthy. Having occasion to visit Stationers' Court, I was courteously permitted by the officials to make a prolonged collation of some fifty-seven test entries covering the entire period; and the very gratifying result was that the "escapes" (as the elder printers phrased it) proved to be of a kind that need simply to be notified or gathered up

in the closing list of inevitable errata. They are such as these—(a) The printed text seems to claim to reproduce the entries line for line and word for word; but it is not so, as two brief ones will exemplify, i.e. as taken from the MS.:—

"Mr. Tottle

Recevyd of Mr. Tottle for his lycense for pryntinge of the Tragically history of the | *Romeus and Julieta wth sonettes*, iiij^d [July 22, 1562-July 22, | 1563: p. 203.]

William Coplande

Recevyd of William Coplande for his | lycense for pryntinge of a ballet intituled *Lettell Robyn Red breaste*. iiij^d. | [Ibid. p. 205.]

Comparing these with Mr. Arber's Transcript, "Master" is twice extended for "Mr." and "with" for "w" and "sonettes" without the usual mark for a double "n," and our upright strokes denote the ends of lines, which differ from the printed ones. It might be well for the editor to let these departures be known, inasmuch as he asks us to understand that his Transcript might throughout take the place of the original if by any catastrophe the venerable original were destroyed. At least once, a word is mistaken by a failure to observe that the Scribe had corrected what was at first a T by giving it an addition in order to change it into a C. Mr. Arber gives us thus the impossible word "Tarsetors," for the actual word in the well-known tractate of Thomas Harman against "Cursetors," or cursers, or profane swearers (cf. p. 334). Mr. Arber also invariably prints the divine names of God and the Saviour with capitals, whereas the rule is a small g in God in the MS.—an apparently small thing, but not without its significance in the history of religious opinion and sentiment and the mode of expressing reverence. It is the more necessary to note these things, as there is a further violation of the editor's announced rule, viz. (b), while professing to give page for page of the MS., i.e. a printed page for a page of the Register, there is on the one hand waste of space, and on the other a somewhat confusing, not to say perplexing, filling up of blank pages. Waste of space is surely the least that can be said of such pages as these: pp. 63, 64, 65, and 68:—

"Anno domini 1557.

These parcelles folowyng | Dothe belonge to the halle | of the mesterye of the | companye of | stationers | as foloweth

The hall |

[Seven entries omitted]

In the greates parler |

[Four entries omitted]

[Four entries omitted]

In the Counsell parler |

[Ten entries omitted]

In the Chappell |

[Five entries omitted]

In the buttrye |

[Nine entries omitted]

In the kettchen |

[Four entries omitted]

[This page is entirely blank in the Original]"

These are four goodly quarto pages devoted to really *nil*; and thus is it with provoking frequency; and it must be permitted us to protest against any repetition of this sort of thing. The filling up of the blank pages is capricious; and there is confusion, inasmuch

as while the reader is busied over entries belonging to 1562, or other year, lo! he is interrupted with some irrelevant document of a century later. True, Mr. Arber may plead that (in a sense) these medley-documents are a free gift in addition. One might demur, seeing that the pages would better have been given to the actual Register itself; and at any rate the white elephant was none the less a bewilderment and a nuisance that it was a gift. His documents and elucidatory and illustrative notes Mr. Arber had better have assigned to the close of the work.

One class of entries from the Register requires an explanation in the editor's behalf—for he has simply done the thing without indicating its utility. The student is startled with very long lists in all the glories of Clarendon type and other ingenious contrivances, of Apprentices and their being made free of the Company. Thus (at p. 35) we read "*Item Recevyd of John huns-worthe the laste Daye of aprell [1556] in Reconpence of his brakefaste at his makynge fre ij^d iiij^d;*" and so identically the same wording in identical entries by the hundred. Surely a page of examples might have sufficed, leaving all this class of extraneous matters (extraneous to literature) to that history of the Stationers' Company, as a company, for which we have been kept waiting too long. Nevertheless, it is due to Mr. Arber's faithful reproduction of these manifold records of apprentices—in the bulk of them mere Smiths, Browns, Robinsons and Joneses—to remember that no one knows how the (at present) most unknown apprentice-names may clear up a difficulty of long standing. Thus it is within our knowledge that certain commonplace names in these lists are being utilised to give the key to certain hitherto baffling initials of secretly-printed books and tractates and broadsides, especially in the Mar-prolate series. Apprentice-names turn up in single books, even single slight pamphlets. So that at first blush, while apparently superfluous, the Transcript lists of bare names may prove of real value, though they need not have been encumbered with the same formulas.

Turning now to the Transcript proper, i.e., in its purely literary character, the more the Entries are studied the profounder will be the gratitude to Mr. Arber, and still more perhaps the double-wonder, that the Stationers' Company itself has so long kept treasures that are merely in their custody for the nation unprinted, and now that the work is being done by a private individual, that the well-known wealthy members of the Company should be conspicuous by their absence from Mr. Arber's meagre subscription-lists.

The Transcript as a record of our early literature begins on page 149 (=193),* and is headed "Ffor takynge of fynes for Copes as foloweth," and the first date is July 28, 1560. The date of 1554 put into the title-page refers to a solitary entry, which as it is curious may be here given:—

"Also yt ys agreed for an offence Doune by master wallye | for conselyng of the pryntynge of a

* The pages of the Register are at top: of the volume at bottom.

breafe Cronacle contrary to our ordenances before he Ded presente the Cope to the wardyns and his fyne to be payde within xiiij Dayes after this order taken. xx."

It is much to be deplored that the Registers should be missing until 1560.

One department of our poetical literature hitherto uncertain and vague—our ballads—receives no common additions for its students. In the present volume alone we have taken the trouble (if trouble it may be called) of numbering the entries relative to "balletts," and they amount to 556. Many of these entries will go far to determine the dates of not a few of the Roxburghe and Pepysian and other collections that just now are chaotic and very imperfectly and inadequately registered by the bibliographical authorities. It is most interesting to find "Robin Redbreast" and other national favourites to be so ancient. Professor Childs, of America, must rejoice as one that cometh on "great spoil," as he cons the rich pages of Mr. Arber's Transcript. My own experience on the recovery of so-called unique books makes me indulge the Pleasures of Hope that the entries of this work may lead to the recovery of "balletts" supposed to be lost, and of earlier versions. They suggest all manner of elucidations of our dramatic literature and manners—painting "bokes."

Another important service rendered by this Transcript is the approximative dating of erewhile undated books, and the partial lifting of the erewhile anonymous. At least 120 entries accomplish this in vol. i. For example, one is gladdened to hap on Churchyard's *Davy Dycar's Dreame*: "Recevyd of master Loble for his lycense for the pryntinge of DAVY DYCARS Dreame with the Reste the xxvj Daye of septembre [1560] v^d ob.;" and so with the semi-miracle play of *Queen Esther* and the vivid *Enterlude*: "Recevyd of William Pekerynge for his lycense for pryntinge of a playe of quene Hester, vj^d," and "Recevyd of William Coplande for his lycense for pryntinge of an interlude intituled Jack Juggeler and mistress Boundgrace, iiij^d" [1562]. Similarly with a Reformation tractate that has long been sought for in vain: "Recevyd of Rowlande hall for his lycense for pryntinge of the *Confession of the faythe in Skotlande*, iiij^d." Scarcely less interesting is this piquant entry of a contemporary assault on William Elderton: "Recevyd of John Alde for his lycense for pryntinge of an *admonition to Elderton to leave the Toyes by hym begonne*, iiij^d" [July 1561], the reference being to his "ballet" intituled "Elderton's Jestes with his mery Toyes," entered as "recevyd" in the same month earlier, as again in July 1562 we read: "Recevyde of Edmonde hallay for his lycense for pryntinge of a ballett intituled Elderton's parratt answered, &c., iiij^d." As intimated, another very valuable class of entries is the title-pages whereon the author's name appears. As a rule, it is the publisher or payer of the "fyne" whose name is recorded; but repeatedly the author's occurs, and not unseldom when it does not appear in the books themselves. A few examples must be acceptable: "Recevyd of Rowlande hall for his lycense for pryntinge of a boke intituled the crede and the tenne commandementes with other comfortable medytacyons

and prayers with a defence of the Doctryne of Godes Electe and predistination by John Bradforthe" [July 1562]: "Recevyd of Rycharde haryson for his lycense for pryntinge of a boke intituled the *Dyccionary* of master Thomas Elyott and master Cowper, viij;" [Ibid]: "... "the boke of wysedome by Peter Tye" [1562-3]. ... "a boke intituled the *sermonde in the wall*, there vnto annexed the common places of Patryk Hamylton" [Ibid]: ... "a boke intituled a poosye in forme of visyon agaynst wytche Crafts and Sosyre in myter by John Hall" [Ibid]. ... "a godly Learned sermon made this last lente at Wynsore by master Thomas Cole" [1563-4]. ... "an epygrame of y^e Death of Cuthberte Skotte some tyme besshoppe of Chester by Roger Shaklocke and Replied agaynste by Thomas Drant" [1565-6]. ... "a Sarmon which was preached at Edenbrough in auguste laste paste anno 1565 by master Nokes"—this "master Nokes" being the redoubtable John Knox, though here and elsewhere Mr. Arber seems to have been gravelled with the uncouth orthography.

Thus one according to the speciality of his chosen research and liking might go on. No one who really cares to know authoritatively our national literature can afford to dispense with this Transcript. The next volume will probably be an advance on the first, and each be richer than its precursor; while the promised fifth volume wherein Mr. Arber proposes to record from the actual books themselves our entire literature from the commencement onward to 1640 (at least), calls for the thanks of us all. We commend this work right heartily to practical recognition, that is, subscription, and regard it as a sorrow and a scandal that the laborious, patient, most accurate, and most deserving editor should have been called on to send out his proposals broadcast, and still to be unable to report the completion of the very limited number of names asked. I venture to appeal to my fellow-subscribers that they will each make it a matter of conscience to secure one new subscriber, and so relieve Mr. Arber of all anxiety about the pecuniary expenditure in which he is involved. The book intrinsically is well worth the money-cost, and extrinsically is a noble specimen of English printing and production.

ALEXANDER B. GROSART.

Life of the Right Honourable Francis Blackburne, late Lord Chancellor of Ireland, sometime also Master of the Rolls, Lord Chief Justice of the Queen's Bench, and Lord Justice of Appeal. Chiefly in connexion with his Public and Political Career. By his Son, Edward Blackburne, one of Her Majesty's Counsel in Ireland. (London: Macmillan & Co., 1875.)

THE object of Mr. Blackburne in preparing this biography for the public has not been, apparently, to make an entertaining book so much as to erect a monument worthy of his father's reputation. By a process, accordingly, of severe abstraction, he has brought together within a comparatively narrow compass the whole public life of this eminent man, stripped even of the professional details with which narratives of

this description are usually embellished; and making no appeal to any other tribunal than that of reason and justice. The result, of course, is a rather cold and colourless narrative, which the reader will search in vain for anything dramatic or picturesque. But at the same time as a simple and dignified record of great services during a period of supreme public interest, it will occupy a good rank among legal biographies.

The exact position which Blackburne is supposed to hold among Irish lawyers and judges it is for professional critics to determine. But to judge only from the evidence adduced in this volume, there could hardly be a higher one. As Master of the Rolls he was suddenly called upon to deal with an accumulation of equity business of a novel and perplexing character; yet though his experience had been confined to the common law, he acquitted himself with so much ability that Lord Justice Turner thought "the weight of his judgments could not be too highly spoken of." As Chief Justice of the Queen's Bench he presided at the trial of Smith O'Brien for high treason in 1848; and of his charge on this occasion Lord Brougham and Lord Campbell spoke in terms of the warmest admiration. As Lord Chancellor of Ireland, during the short-lived Ministry of Lord Derby in 1850, he so highly distinguished himself, that when the new Administration was being formed a leading article in the *Times*, expressing, we are told, the opinion of the new Government, declared it "most desirable that the great legal offices of the Lord Chancellor and the Lord Chancellor of Ireland should if possible remain undisturbed in the hands of their present possessors, whose services and ability as the first legal officers of the crown it is impossible to overrate, and would be most difficult to replace." With such testimonies to the excellence of the Judge we certainly would have wished to know something more of the man. Nor, in the absence of any reason to the contrary, can we think that Mr. Blackburne has acted wisely in excluding from his book all those interesting details in which most legal careers are particularly fertile, and of which none can be absolutely barren. It is possible, of course, that neither Blackburne himself nor any of his contemporaries had preserved any anecdotes of his early life, either as advocate or judge. Yet the Irish bar, if conventional tradition can be trusted, is not likely to have been wanting in incident; while Blackburne himself, we are told, was of a sociable and genial disposition. However, we must take the book as we find it; and though we may regret that to all this bread there should be hardly a pennyworth of sack, yet that is better than a deluge of small beer without any bread at all, which is not unfrequently the fare set before us under the title of biography.

The Blackburne family claim to be descendants from the Anglo-Irish settlement of the reign of Richard II. Blackburne's direct ancestry, however, does not extend further back than the reign of Queen Anne, when one John Blackburne was in the occupation of property at Footstown, in the county of Neath. His son acquired the fee simple of it, and his great-grandson was the

Judge's father. The future Lord Chancellor was born at Footstown in November, 1782, and when ten years of age was sent to school in his native county. Some years after, the family being compelled to quit their patrimonial residence by the disturbed condition of the country, young Blackburne exchanged for the better into a school at Dublin kept by the Rev. Mr. White, said to have been an excellent scholar and a skilful teacher. In the year 1798 he entered Trinity College, such being the alarm and perplexity which everywhere prevailed, that only two young men besides himself matriculated at the same time. His University career was a brilliant one, and as soon as it was concluded he began to keep his terms at Lincoln's Inn. He was called to the Bar in 1805, and so rapid was his professional advancement that in four years' time he paid off all the encumbrances on the estate which he inherited from his father, and was able to marry without imprudence. His wife was a Miss Martly, with whom he enjoyed what he calls unspeakable happiness for a period of fifty-eight years. We need not follow in any detail Blackburne's fortunes at the Bar. His abilities were speedily recognised, and although he received no official promotion till comparatively late in life, he was employed on important special services, and his name was well known beyond the legal circles of Ireland before he had reached middle life.

In politics he was a moderate Conservative, for though the name was not then in existence, Blackburne was exactly what it afterwards came to represent. Lord Grey, on his accession to power in November, 1830, in pursuance of his design to impart as mixed a character as possible to the Government he was forming, offered the Irish Attorney-Generalship to Pennefather, an avowed Tory, and on his refusal of it made the same offer to Blackburne, by whom it was immediately accepted. During his tenure of office he conducted with eminent success the prosecution of O'Connell under the Catholic Associations Act; and though it so fell out that O'Connell was never called up for judgment, the prestige of the agitator had received a fatal shock, of which he never forgave the author. In 1834 Blackburne retired with Lord Melbourne, but saw no reason why he should not resume office some months afterwards with Sir Robert Peel. He resigned again with his new chief in 1835, and from this time he became permanently connected with the Conservatives. In Sir Robert Peel's second administration he became successively Attorney-General, Master of the Rolls, and Lord Chief Justice of the Queen's Bench. In 1852 Lord Derby made him Irish Lord Chancellor. In 1856 Lord Palmerston made him Lord Justice of Appeal. Ten years afterwards he was again Lord Chancellor for nine months, and in the month of September 1867 he died.

We have no space to examine in detail the leading professional events of Blackburne's life; and it is the less necessary as there seems to have been very little controversy about them. But his somewhat chequered connexions with political parties seem to call for some few observations.

A lawyer who is promoted in turn by both the great parties in the State: who after a long and lucrative practice at the bar becomes Master of the Rolls, Chief Justice of the Queen's Bench, and twice Lord Chancellor, ought not, one would think, to have much to complain of in his friends. Yet Blackburne, if he did not exactly pass his life "in the predicament" of dissatisfaction, seems to have considered himself ill-treated by all his patrons at various turns of his career. He was very angry with Lord Melbourne for not making him a judge after 1835. He thought himself ill-used by Sir Robert Peel when made Attorney-General in 1841, and was brought to his grave by the treatment he experienced from the government of Lord Derby in 1867. Now, no doubt, Blackburne had a claim on Lord Melbourne over and above the mere professional claim created by his having been the Whig Attorney-General. To oblige him in a difficulty, Blackburne had waived his own promotion in favour of Crampton, the Solicitor. But in the meantime he had at a moment when party feeling ran very high, and when every unit was of consequence, taken office and resigned it with Sir Robert Peel. It was neither high-minded nor patriotic conduct in Lord Melbourne to allow the subsequent defection to cancel the previous obligation, or to deprive the Judicial Bench of Ireland of the man most fitted to adorn it. But Ministers of State have so many and such various claims upon them, that a worse excuse than Blackburne gave Melbourne must often seem sufficient to perfectly honourable men for absolving themselves from troublesome engagements. In this case, indeed, it is the opinion of Mr. Blackburne's son that Lord Melbourne was only prevented from doing justice to his father by the influence of O'Connell. Again, in 1841, Sir Robert Peel gave umbrage to Blackburne by stipulating that Pennefather, though only Solicitor-General, should have the first claim to promotion. The Attorney-General, we are told, did not grudge Pennefather his precedence; but he was indignant at its being made the subject of stipulation. No difficulty would have been made when the time came. But this kind of fastidiousness seems almost out of place in public affairs. At all events, though delicacy of feeling is always most commendable and desirable either in a Prime Minister or anybody else, we have scarcely any right to insist upon it to this extent. And when we consider how many lifelong estrangements and permanent political disasters have been the result of tacit understandings and presumed intentions, we shall think twice before we blame Sir Robert for stating his terms in black and white. Of the affair of 1867, if any secret history remains to be written, there may, of course, be some justification in reserve for the tone in which our author speaks of it. But judging only from what all the world knows, we cannot say we think there is. Blackburne had already refused the Chancellorship eight years before (1858) on the plea of age. In 1866 it was again pressed on him by Lord Derby, "if only for a short time," for the avowed purpose of extricating

himself from a difficulty. And in 1867, when he tendered his resignation, Lord Derby first of all declined, and afterwards accepted it. The original difficulty was said at the time to have been due to some professional jealousy between Mr. Brewster and Mr. Whiteside; and we are to infer that when this was appeased, intrigues were immediately set on foot to eject Blackburne from his place that it might be conferred on the gentleman for whom it was originally designed. This may or may not have been the case. But we do not see how Lord Derby can be involved in the transaction. When, in consequence of some private representations which were made to him, Blackburne first tendered his resignation, Lord Derby refused to accept it, not without some consciousness, to judge from the present narrative, of the feelings by which it was dictated. And it was not till he was informed that Blackburne's ill health was a bar to that ready communication which it was necessary always to keep open between the Castle and the Chancellor, that he recalled his refusal, and informed Blackburne that he was willing to accept his resignation. His son describes this change of mind as being due to "a plot" and "a cabal," which eagerly took advantage of Blackburne's temporary illness to push forward its own designs. It is a pity, we think, that the story has been revived. No real injury was done to Blackburne if the whole of it is true: while great injustice is done to the memory of Lord Derby if a tithe of it is false. We cannot blame a son for resenting what he even erroneously believes to have been a slight upon his father. But we think the judge's whole career proves that he was unduly sensitive, while there is some reason to suppose that his son may have inherited the weakness.

T. E. KEBBEL.

The First Voyage Round the World. By Magellan. Edited by Lord Stanley of Alderley. (Hakluyt Society.)

To an editor his subject is what his mount is to the horseman; and Lord Stanley, who has already done good work for the Hakluyt Society, was never better mounted than in undertaking this edition of *The First Voyage Round the World*. To no one more fittingly could be applied the "robur et aes triplex" of Horace, than to that bull-faced, bull-eyed, bull-headed, bull-necked man who first conceived this bold enterprise, and whose portrait we have here before us. Magellan was a Portuguese, for, although our form of his name is taken from the Spanish, Magalhaens belonged to that heroic series of pioneers in maritime exploration to whom, directly or indirectly, we owe the discovery, within one century, of one half of the globe that we inhabit, Australia included.

In 1505, when little more than twenty, Magellan went to Quiloa with Francisco de Almeida, the first Viceroy of the Indies, and in 1509 he was at the discovery of Malacca by Diogo Lopez de Sequeira. Two years later one of his cousins, Francisco Serrão, went to Ternate, married a woman of that island, and settled there, and thence communicated to Magellan the great commercial

advantages which might be secured by foreigners from intercourse with his adopted country. When Magellan left Portugal this acquaintance with the geography of the Moluccas made him an acceptable visitor to Charles V. He arrived in Seville on October 20, 1517, accompanied by two other malcontents, Ruy Faleiro, a learned cosmographer, and Christovam de Haro, a wealthy merchant, who already possessed immense commercial relations with India. The papal bull of Alexander VI. had fixed a line drawn from pole to pole a hundred leagues west from the Azores as the boundary between the claims of Spain and Portugal, but from the difficulty of measuring longitudes this was practically inconclusive. By the Convention of 1494 the line was removed to 370 leagues west of the Azores; but this did not improve matters, for though Portugal gained thereby in South America, Spain gained largely in the East. Magellan gave it as his opinion that the Moluccas, which formed the very garden of those spices the commerce of which was so eagerly coveted, lay within the Spanish boundary, and undertook to take a fleet thither by the south of the American continent. Mainly through the friendship of Juan de Ovando, the principal factor of the Contratacion or Chamber of Commerce, the arrangement was made with the Emperor for that great expedition which was afterwards to hold so distinguished a position in the history of nautical discovery.

Lord Stanley has brought together into his volume six contemporary accounts of the voyage. The first was written by a Genoese pilot of the fleet. The second by a Portuguese, and preserved by Ramusio. The third by Antonio Pigafetta, of Vicenza. The fourth is a letter of Maximilianus Transylvanus, a secretary of the Emperor Charles V.; and the fifth a log-book of a pilot named Francisco Albo, or Alvaro. The sixth is from Gaspar Correa's *Leendas da India*.

The fleet consisted of five ships and two hundred and sixty-five persons, each ship being accompanied by a Portuguese pilot. They sailed from San Lucar de Barrameda on September 21, 1519, but as the reader will have to travel with them all round the world within the space of a few minutes, it is obvious that a few points of interest only can be touched upon, and specially such as are suggested by this new edition. Great in the world's history as this voyage was destined to be, it was a most unhappy one. National jealousy doubtless lay at the bottom of it, for Spanish captains could ill brook the stern control of a commander such as Magellan, and he a Portuguese. Even so early as when off the coast of Africa a revolt was initiated by one of the Spanish captains named Juan de Cartagena, which was only repressed for the time by Magellan's firmness. They reached Rio de Janeiro on December 13, and Magellan named it Porto de Santa Lucia. Thence they came to the Rio de la Plata, where at first they supposed they had found a channel to the Pacific, but giving up this hope they proceeded south, and on March 31, 1520, entered Port St. Julian.

There are two interesting facts connected with the account of Brazil in this book

which call for special notice. One is that the country is called "Verzin," a name which is in fact the origin of the word Brazil. For centuries the name Verzin had been given to the red dye-woods imported into Italy from India, and when the valuable dye of the *ibirapitanga* was brought into Europe from the country which Cabral in 1500 had called Vera Cruz, afterwards Santa Cruz, the latter became changed into Brazil, which by transposing the "r," and interchanging the initials "b" and "v" and the liquids "l" and "n," we find to be the same as "Verzin." The other notable fact is that we here find on the coast of Brazil, at a distance of three thousand miles from the West Indies, three words used by the natives on the coast which are essentially Haitian; viz., "hammock," "canoe," and "cacique," all of them words mentioned in the accounts of Columbus' first and second voyages to St. Domingo.

It was in Port St. Julian that the first Patagonian made his appearance—a man of such size that when he started back with sudden surprise at seeing his face in a looking-glass, he overturned four Spaniards who were behind him. The story of the treachery resorted to to capture some specimens of this gigantic but friendly race is most revolting. Two young Patagonians having had their hands filled with presents, bright iron rings were offered them; but as they could not take them in their hands, it was proposed to put them on their legs, and thus unsuspectingly they were chained and captured.

Magellan remained five months in Port St. Julian, during which time he was able by his firmness to quell a formidable mutiny. It was on October 21, 1520, that he entered the famous strait which bears his name, and thirty-seven days after, on November 27, emerged therefrom into the Pacific; and that inflexible man, whom neither danger could deter nor death intimidate, is said to have shed tears of gratitude as he beheld this realisation of his hopes. Of his five ships three only now remained, one having been wrecked and another returned to Spain. They made immediately for the warm latitudes, and on February 13 crossed the line. On March 6 they reached some beautiful islands, where Magellan would gladly have stayed but for the pilfering habits of the people. He consequently named the islands the *Ladrones* (the Thieves). On March 10 he reached a group of islands which he named the Archipelago de San Lazaro, subsequently called the Philippines. It was here, in the little island of Matan, near Zebu, that the great captain was to meet his death without having yet reached those Moluccas which had been the focus of the voyage. Having converted the King of Zebu to Christianity, he imperiously demanded of the King of Matan that he should submit to the Christian King of Zebu, on pain of having his town ransacked and burned. The gallant chief refused, and Magellan, declining the aid of the King of Zebu, who would have led the attack with 1,000 Indians, landed on the island with only forty-eight men. The battle lasted the greater part of the day, but at length the ammunition began to fail, and Magellan

ordered a retreat, he himself bravely confronting the Indians, and looking back from time to time to see if the men had reached the boats. He received a wound in his right leg and another in his right arm, which prevented him from drawing his sword more than half way. The islanders seeing this attacked him boldly and speedily dispatched him. Thus fell this great navigator, second only to Columbus in the history of nautical exploration. Midway in the execution of a feat such as the world had never witnessed, the very hardihood which had rendered that achievement possible had now, by degenerating into presumption, deprived him of the glory of its fulfilment.

About 115 men only now survived of the armada, on which account they burned the *Concepcion*, the oldest of the three vessels. On leaving Zebu they steered west for Palawan, between Borneo and the Philippines, which island with its abundance of pigs, goats, fowls, and vegetables, proved their salvation, for they were so reduced by hunger that they had several times thought of abandoning the ships and settling on some land in order to live. It is amusing to read how, in the island of Palawan, our navigators were taken in by that remarkable and beautiful freak of nature, the *Phyllium pulchrifolium*, or walking-leaf, an insect whose stalk-like head and leaf-like wings are expressly designed to produce such deception. "In this island," says Pigafetta—

"are found certain trees, the leaves of which when they fall are animated and walk. They are like the leaves of the mulberry-tree, but not so long; they have the leaf-stalk short and pointed, and near the leaf-stalk they have on each side two feet. If they are touched they escape, but if crushed, they do not give out blood. I kept one for nine days in a box. When I opened it, the leaf went round the box. I believe they live upon air."

It was on Wednesday, November 6, 1521, that they descried the long-sought-for Moluccan islands, the discovery of which by a western route had been the object of this most wearisome voyage. Here they laid in a stock of spices and provisions, but on preparing to sail, on Wednesday, December 18, it was found that the *Trinidad* had sprung a leak. It was therefore resolved that the *Victoria*, which was now commanded by a Spaniard named Juan Sebastian del Cano, should sail forthwith to Europe by the Cape of Good Hope, and that the *Trinidad*, after repairing, should sail eastward for Panama. The *Victoria* had in her forty-seven Europeans and thirteen Indians. The *Trinidad* fifty-three Europeans.

It has been seen that among the documents brought together in this volume is the Log-book of Francisco Alvo. Lord Stanley is mistaken in supposing that this document was unknown to Admiral Burney, for the latter particularly commends it, and with justice, as being the only one in which the observations for latitude are connected with dates. Lord Stanley has, however, noticed an interesting fact which escaped the observation of Admiral Burney. From Alvo's log he shows that on March 18, 1522, the homeward-bound fleet discovered the northernmost of those two remotely outlying islands in the Southern Indian Ocean, St.

Paul and Amsterdam, the first discovery of which has hitherto been attributed to the Dutch navigator, Vlaming, in 1696. The observation is a discovery in itself which will live in the history of geography to the credit of Lord Stanley. It is worthy of note that the Dutch charts have always been in the habit of calling the northern island Amsterdam, and the southern St. Paul, while on English charts the converse nomenclature has prevailed till quite recent times.

Much as the homeward-bound navigators stood in dread of falling in with the Portuguese, they were compelled by starvation to put in at Santiago, in the Cape Verde Islands, and, reporting themselves as come from America, procured some rice; but as one of the sailors imprudently offered spice in payment for what he wanted, the remnant of this extraordinary expedition narrowly escaped even at this late period from a ruinous disaster. The Portuguese prepared to attack the ship, but Del Cano fortunately perceived the movement, weighed anchor, and left the island. He arrived at San Lucar on September 6, 1522, with only eighteen survivors of the fleet which had left the same port on September 20, 1519. He received from the Emperor a life pension of 500 ducats, with a patent of nobility. The coat of arms granted him bore branches of the clove, cinnamon, and nutmeg trees, with a globe for a crest, and the motto "*Primus circumdedit me.*"

How often in this world has one heroic spirit conceived or achieved some glorious enterprise, and yet in the end *tulit alter honores*! Columbus discovered the Western World, and yet that world bears the name of Vespucci. Bartholomew Dias was the first European who rounded the Cape of Good Hope, and yet his name is forgotten; while Vasco da Gama, who ten years later followed in his wake, has received all the glory. In the present instance, however, there is no injustice to be complained of, for it was not the breath of man, but the hand of the Almighty, that interposed between the conception and the fulfilment by one individual person of perhaps the greatest achievement that the world has ever witnessed.

R. H. MAJOR.

Fruit between the Leaves. By Andrew Wynter, M.D., M.R.C.P., Author of "*Curiosities of Civilisation,*" &c. In Two Volumes. (London: Chapman & Hall, 1875.)

THERE is unquestionably a good deal of fruit of a more or less wholesome kind to be found among the leaves of Dr. Wynter's last volumes. The author has been scrupulously careful not to try the digestion of his readers by offering them heavy food; and perhaps the worst that can be said of his fare is that it is not very satisfying, and occasionally betrays a crudity of flavour. In fact, a good deal of the fruit is out of place in the storehouse formed by these volumes, as it is not of "a keeping sort."

But who can criticise severely a writer who obeys so perfectly the Horatian maxim in mingling entertainment with instruction, and knows how to turn to profitable uses

the contents of a Dust-heap or the Eccentricities of a Cat? We can but regret that his eager efforts to amuse the public have left him too little time to examine the facts which his industry has collected, and that the carelessness engendered by rapid writing is constantly observable. Here, for instance, is an anecdote, quoted partly from Southey, which needs a good deal of revision:—

"The late Duke of Northumberland took great pride in his King James spaniels, which were solely in his possession. He appeared to be very fond of them, and certainly prized them very highly; but we may appreciate the true value of his liking by the conclusion of the anecdote. He never travelled without two of his favourites in the carriage. When at Worksop he used to feed his eagles with the pups. . . ."

Who can "the late Duke of Northumberland" be? Certainly not his Grace who died in 1867, nor, we suspect, any member of his family. The allusion to Worksop, which never belonged to the Percies, suggests that the nobleman referred to was the Duke of Newcastle, and the dogs he prized so much the celebrated Clumber spaniels. Again, Dr. Wynter tells us (quoting wrongly from Sir B. Burke) that

"among the lineal descendants of Edward (*sic*) of Woodstock, Earl of Kent, sixth son of Edward I., King of England, entitled to quarter the royal arms, occur a butcher and a toll-gatherer: the first, a Mr. Joseph Smart, of Hales Owen; the latter, a Mr. George Wilmot, keeper of the turnpike-gate at Cooper's Bank, near Dudley."

We have very grave doubts whether there is much truth in these oft-repeated statements. Granted that in the veins of the butcher and toll-collector there may have been an infinitesimal drop of the blood of the Plantagenets, that alone would not suffice to give them a right to quarter the royal arms. A quartering involves representation as well as descent, and it must therefore first be proved that Messrs. Smart and Wilmot derived their right through an heiress, or a succession of heiresses, from the Fair Maid of Kent. And, next, we should like to know whether these gentlemen were themselves entitled to arms wherewith to quarter the royal insignia. Nowadays it is hard to find any one who does not "write himself *armigero*," and no doubt if he wished to add the royal bearings to the arms already supplied to him by the Family Herald, he would as lief take those borne by her present gracious Majesty as by the Plantagenets or the Tudors, from whom, through some devious course, he claims descent.

But perhaps it is scarcely fair to make Dr. Wynter responsible for the mistakes of those — and they are legion — from whom he copies. We gladly admit that he shows to far better advantage when writing upon subjects more or less closely connected with his own profession. There are, for example, a couple of papers upon village or cottage hospitals which are worthy of attentive perusal. Those who dwell in the country know how much the poor suffer in their sicknesses through the absence of those comforts which mitigate pain, and the care which promotes speedy recovery. "Imagine," says Dr. Wynter, "a poor wretch with a fractured leg, or some accident involving the nervous system, shut up

in the single sleeping-room of his cottage with noisy children, subject to the barbarous, because untutored, nursing of his wife." The only alternative open to him is to be taken to the nearest town hospital, often from fifteen to twenty miles distant, in a rough cart, with the probable result that the injury to the limb becomes aggravated, and the patient's life incurs the additional risk that is involved in removal from country air to the atmosphere of a large town and a crowded ward. The village hospital system, as set on foot by Mr. Napper at Cranley, meets the difficulties of the labourer's case at every point. A cottage, clean and well-ventilated, is the hospital, and the staff consists of one trained nurse and a general servant. The patient can look through the latticed window on the little garden, breathe the pure air, listen to the homely talk around him, and absolutely feel himself at home and among friends. The doctor regards him as "a man," not as "a case," the clergyman feels for him and speaks to him in ways the chaplain cannot, and his neighbours cheer him with the gossip of the country-side. No wonder the sufferer mends apace, and does credit to the doctor's skill, no longer rusty from disuse. The system, moreover, has the merit of economy. Dr. Wynter goes very carefully into the question of expense, and we gather from his figures that the maintenance of a village hospital containing six beds may be estimated at about 120*l.* per annum. Experience has proved that the patients themselves are among the most willing contributors to the funds, squires and sick-clubs of course subscribe, and even farmers are disposed in such a cause to relax the tight hold which they usually keep upon their purse-strings. Dr. Wynter thinks that there ought to be a cottage hospital in every village ten miles distant from a town or county hospital: but this is impossible. There are very few districts in England where the villages are so populous as to require, or so wealthy as to be able to support, each one of them a separate institution. And again, where is the medical attendant to come from? It is absurd to suppose that country surgeons, already an ill-paid race, will willingly reduce the areas of their practice, and invite competition, in a rare spirit of self-sacrifice.

Of greater interest to dwellers in towns is Dr. Wynter's article entitled "*Preventive Medicine.*" Under this head he includes all sorts of sanitary measures, such as compulsory vaccination, the ventilation of sewers, an unstinted supply of pure water, and the due supervision of food. Government promises to attend to these matters, but is not likely to do much to the purpose unless supported by public opinion. Dr. Wynter will, therefore, be doing good service if he employs his ready pen in directing attention to these subjects, and insisting upon their supreme importance. This useful work is one which he seems both by knowledge and inclination eminently fitted to undertake, and in the prosecution of which he would have our best support.

CHARLES J. ROBINSON.

Scandinavian History. By Elise C. Otté.
(London: Macmillan & Co., 1875.)

It has been remarked that for the science of history to progress in a healthy and vigorous way, it is absolutely necessary that it should breathe an atmosphere of political and intellectual liberty. If this be true, one would certainly expect the three Scandinavian nations, with their high civilisation and unfettered public life, to be peculiarly rich in great historians. It may be cynically answered that the political liberty is there, but that the intellectual freedom is sadly lacking. Without definitely allowing so much, and yet pausing a moment to regret the lack of a broader and more courageous spirit of speculative thought, we would merely admit that the literature, from one cause or another, is not rich in historical works of the first rank. There is plenty of *Historie-grandskinning*, little *Historie-skrivning*; much heaping up of valuable material, little intelligent use of such hoards of data. There has risen no Saxo Grammaticus in modern times, no Snorro Sturluson, but there have been many laborious and indefatigable workers whose researches will be invaluable to the historian of the future. There is a painful tendency to triviality in the public attitude towards the study of the past life of the fatherland; a habit of judging the reigns of kings as matters of amusement, sentiment, or somewhat thin-blooded patriotism, and this has rendered the work of really serious historians a thankless task. But early in the present century men like Suhm and Langebek set themselves to collect materials for a more complete study than had yet been made of the annals of the three countries; such books as Estrup's learned and exhaustive *Absalon som Helt, Statsmand og Biskop* (1826), laid each a stone to the foundation of the great building, still unfortunately unbuilt. In fact Scandinavia stands no way behind the great European states in complete and scientific studies of various small epochs; it would be difficult to point to works in any language more penetrative and thorough than C. Paludan-Müller's *De første Konger af den Oldenborgske Slægt* (The First Kings of the House of Oldenburg), or Allen's *De tre Nordiske Rigers Historie, 1497-1536* (History of Scandinavia from 1497-1536), where the eloquence of the authors has rendered the interest enthralling, and yet where accuracy has never been allowed to make way for sham poetic sentiment or flippant devotion to the fatherland. But notwithstanding these excellent contributions, notwithstanding all that Geijer has done for Sweden, and P. A. Munch for Norway, it remains a fact that no thorough history of the three countries exists in the language of either of them. It was not to be expected that Miss Otté's volume should supply so great a deficiency, nor does it attempt to do so. In point of fact it is mainly founded on the somewhat antiquated German manual that a very eminent English writer has lately deigned to make the foundation of his own remarks on early Norwegian history; but Miss Otté has also availed herself, unlike her great contemporary, of authorities in the various original tongues. Her book suffers from a kind of

laboured simplicity of style, as though from the first the authoress had been weighed down by the necessity of writing for young people. This was, undoubtedly, forced upon her by the exigencies of the volume, which appears to form part of some educational series; but it is greatly to be regretted, since the readers likely to be attracted by such a book are scarcely children, and it would have had more permanent, as well as present value, if the authoress had been able to work up her materials into some such form as Mr. Ralston has adopted in his fascinating *Lectures on Early Russian History*, a parallel to which in Scandinavian history would have been widely welcomed. We must, however, thank the authoress for what she has given us, and acknowledge that she moves as gracefully and easily as possible in her educational fetters.

It is evident that these pages were written before last August, else Miss Otté would certainly not have repeated the old exploded error about the geographical distribution of the Lapps and Finns in prehistoric times. At the Archaeological Congress at Stockholm last autumn Worsaae completely and finally dismissed the old theory that, as Miss Otté puts it, the earliest inhabitants of Scandinavia were driven by the Gothic newcomers from the southern and Baltic shores far north, "where we still find their descendants under the names of Finns and Lapps." According to this notion, from the very earliest times, Scandinavia was peopled from the south-east and across the Sound. Now, however, it has been distinctly proved, by the absence of any traces of their presence in the south of Norway and Sweden, that the ancestors of the present Lapps can never have lived much south of their present latitude. Since this is the case, it is necessary to believe that the original influx of the Lapps took place over the extreme north of the Gulf of Tornea; and that, accordingly, there was a time when the central and southern districts of Scandinavia were a kind of uninhabited vacuum, unreached by the Lapps from the North, and waiting for the inroad of Teutons from the South. The statement of this very important discovery was one of the salient features of the Stockholm Congress, and it is a most interesting instance of the light which can be thrown upon history by the intelligent study of archaeology.

In spite, however, of one or two somewhat antiquated views, such as that just mentioned, Miss Otté's book deserves the warmest welcome as positively the first which can enable the English student to follow with any precision the curious fluctuations of Scandinavian influence in Europe generally. Two or three times the power of the three kingdoms has suddenly and mysteriously become augmented, and has taken the government of the North of Europe into its own hands, subsiding again in an equally rapid way. The first time that Scandinavia appears as a master-spirit in history is as late as the eleventh century, when the inroad of Olaf and Sweyn upon England resulted in complete conquest, and the annexation of our island to the Danish possessions. Knut the Great added the rest of Scandinavia to his dominions, and died master of six king-

doms, as it was said, the six being England, Denmark, Sweden, Norway, Scotland, and Cumberland; at the same time princes of Northern descent ruled Russia and Normandy. The influence of Scandinavia, therefore, was at this time paramount in Northern Europe; and had the Norsemen not possessed an extraordinary tendency to fuse themselves into the races that they conquered, so that in Russia they became Slavonic, and in England English, they might have preserved a kind of imperial sway over the young and struggling Teutonic nations. Fortunately they could not do this, and their actual dominion gradually shrank back to its geographical boundaries.

For two centuries the external influence of the three Scandinavian nations, weakened by internecine struggles, gradually disappeared. The growth of the German Empire, the rising importance of England and France, kept them in check and served to enforce attention to home affairs. Their principal relations to the rest of Europe consisted in wars and intrigues with the Hanseatic League, which possessed in Lübeck and in Wisby in Gothland two powerful points of attack for the Swedish and Danish coasts of the Baltic. It was partly with the view of overawing this ambitious foe, but more to stop the sanguinary internal wars, that the three kingdoms were united in 1397, by the celebrated Calmar Union, under Margaret, the Great Queen—a union that with many breaks lasted till the unwilling crown of Sweden slipped finally from the fingers of the Oldenburg kings, about the same time as they lost their last hold in Great Britain by pawning the Orkneys and Shetlands to James III. of Scotland for 58,000 florins. Hitherto it had always been Denmark that had led the van; but when the Swedes made Gustavus Vasa their king, a new element at once entered into European politics. Under the Vasas Sweden rose to an importance no less extraordinary than that earlier supremacy of Denmark under the sons of Sweyn. Everyone knows how rapidly the conquests of these wonderful men spread till they culminated during the Thirty Years' War, where we see Denmark again attempting, but in vain, to lead as in earlier times. It was Christian IV. of Denmark who became first chief of the Protestant League, but in five years the far greater light of Gustavus Adolphus outshone his. Till his death at Lützen the Swedish king was the foremost figure of the age, and Europe saw the remarkable phenomenon of two countries of insignificant geographical importance holding the first position among its states, Sweden and the United Provinces. Under the successors of Gustavus Adolphus Sweden steadily gained territory, clasping the whole of the Baltic in its possession, and robbing Poland, Germany, and Denmark. This culminated, of course, in Charles XII.; Sweden collapsed like a broken bubble, and since that time it has never again come prominently forward in European affairs. The result of these conquests and losses was yet on the whole beneficial to its autonomy, as they gave to it its natural, while taking away its accidental possessions, and it has ever since held the whole of the eastern side

of the peninsula, previously shared with Denmark.

Whether Scandinavia can ever hope to regain the dominant position that it has twice, at least, held in the world's politics, may well be doubted. The immense power of Germany has crippled it; the momentous advances of the Russian Empire fill it with alarm and threaten its very existence. At the present moment Copenhagen subsists as if delicately balanced between two weights; it owes its independence to the mutual forbearance of two great powers too jealous of the supremacy of each other to allow the key of the Baltic to be in a rival's hands. Denmark has ceased to belong to the influential states of Europe, and it is hardly conceivable that it will ever recover its importance. Sweden and Norway, on the other hand, as far as bulk is concerned, remain as imposing as ever, and it is in their capacity for an immensely increased population that their hope in the future consists. At this moment they are powerless. Stockholm lies almost as much at the mercy of Russia as Copenhagen at that of Germany. There is one contingency that opens up to Scandinavia a single chance of recovering its power in Europe. If Germany and Russia should exhaust and dismember each other in a succession of indecisive wars, the North—firmly allied with England or with France, and with Christiania, not Stockholm, for its capital—might regain for a moment under some brilliant military genius the importance that it enjoyed under Charles XII.

When we have said that Miss Otté's volume is neither extravagantly long nor short, and that it is illustrated by good though not exhaustive maps, we have nothing more to do than to recommend it cordially to all who are interested in the three Scandinavian kingdoms. EDMUND W. GOSSE.

Portraits Contemporains. Par Théophile Gautier. (Paris: Charpentier et Cie.)

THE veritable *feuilletoniste's* functions have no parallel, and are, indeed, scarcely comprehensible in England. Those Monday essays that occupy once a week the lowest storey of Parisian prints—that relieve us from the rank flavour of worldly novel, and the insipid picturesqueness of unreal travels—may touch upon all subjects, invade all spheres, discuss all questions that are not too intimately connected with the political chaos of the hour. They may roam from an archaeological treatise to the description of a dancer's novel *entrechat*, or an actress's latest acquisition in diamonds. They may be bits of biography, artistic, dramatic, or literary criticism, or a mosaic of all; strings of anecdotes, historic surveys, satires on morals and manners. If there is no new book, there is always a new fashion, a new folly or scandal. If the theatrical programmes are barren, the inventive faculties of the *coiffeur* are fertile. The *feuilletoniste's* province is the universe, with only Versailles subtracted; and not a few modern critics have explored it from end to end without finding its immensity oppressive. MM. Jules Janin, Edmond About, and E. Deschanel are hardy travellers in this sphere. Théophile Gautier belonged to a somewhat slower and

soberer school—that of Sainte-Beuve and M. Pontmartin; though he, too, was frequently compelled to make excursions beyond his library. With all his fanciful cynicism, his ridicule of the critic's "niche dans le bas du journal, où je veille tapi," the poet who was guilty of "Mademoiselle de Maupin" had a high sense of the dignity of letters. He confined himself as closely as he could to the legitimate domain of the critic, disdaining Janin's discursive egotism, Sarcey's pseudo-theological essays, and Deschanel's amusing gossip. We shall find in his *Lundis* no sketches of notorious courtesans, millionaires, dentists, or Asiatic potentates—no puerile essays on the "choses du jour;" his sympathies were narrow, but they were pure. He had read and dreamed and thought enough to be independent of *café* gossip and evening newspapers in the selection of subjects. Indeed, though his conception and execution were remarkably rapid, his peculiar temperament rendered him one of the slowest and clumsiest analysts it was possible to find of a "burning question" or *actualité*. He was born with the blindness of a bigot in art. On July 28, 1830, while the furious faubourg was tearing up pavements and anathematising the *Ordonnances*, Gautier was tranquilly surveying in the Palais Royal the pink covers of his first volume of poems, published in the morning "with," he remarks laughingly, "that *apropos* and keen scent of political commotions which are among my chief characteristics."

The classification of the innumerable portraits and criticisms he produced in this careless, haphazard fashion has been entrusted to friendly and experienced hands. Willing as he professed himself to be that with his body the outcome of his mind should perish on one pyre, Gautier nevertheless left precise instructions as to how his scattered articles were to be collected, where they were to be found, and in what order they were to be published. M. Maurice Dreyfous, his literary executor, has scrupulously followed these instructions. Articles, we are told by the editor, have been extracted from nearly every literary journal of worth, and from not a few absolutely worthless that have appeared in Paris during the last forty years. Gautier's pen was ready and generous. The models of graceful humour and rich, faultless French—models which are more studied and imitated every day—were as often as not thrown off in a lavish fit of *camaraderie* on the corner of a *café* table or compositor's case to fill the columns of an obscure Quartier Latin venture. The *Portraits Contemporains* are the gallery of literary, artistic, and dramatic celebrities he thus gradually assembled. Three-quarters of them bear names little known to the majority of English readers—such as Philoxène Boyer, Albert Glatigny, Denecourt, Provost the actor, &c.; for Gautier knew everybody—the penniless vagabonds of art as well as art's prosperous autocrats—the men whose reputation extended no farther than the Café de Madrid as well as those whose names had a meaning for the Antipodes. But the study which occupies the greater part of the volume is one of universal interest. It is a portrait—perhaps the most graphic

that has yet been penned—of Honoré de Balzac. Gautier became intimate with Balzac in 1835, and with brief interruptions the intimacy lasted until the novelist's death. His last letter—one line: "Je ne puis ni lire ni écrire"—was written to Gautier. All that the *Portraits Contemporains* contain on the subject of Balzac's character and private life is therefore authoritative. And what is told surpasses most men's knowledge, for, in comparison with the numberless analyses of his works, Balzac's biography and personality have been strangely neglected by historian and essayist. Yet, to judge from the glimpses Gautier gives of him at home, at his desk, or roaming from end to end of Paris studying and dreaming, the creator of the *Comédie Humaine* was one of the most curious characters of his comedy. For his comedy was himself, Gautier asserts. Balzac's avatars were a hundredfold as numerous as those of Vishnou.

"His observation, his physiological perspicacity, his literary genius do not suffice to explain the infinite variety of the two or three thousand types that play a more or less important part in the *Comédie Humaine*. He did not copy them, he lived them ideally, wore their garments, contracted their habits, adopted their surroundings, was themselves as long as it was necessary. Thus were created those personages unerringly maintained, supremely logical, never contradicting nor forgetting themselves, endowed with real life, who, to use one of the author's expressions, rival the civil registers themselves."

Gautier's theory was supported by many circumstances that came to his knowledge. Balzac would leave his home suddenly, retire to a distant quarter of the city or a far province, and dressed, talking like the characters he was studying, would live the life he intended to depict. In a week he was transformed from a Boulevard idler to the Auvergnat old curiosity merchant. He had the manias and hallucinations of his characters. At one time he would form a secret alliance, like the "Treize" with Gautier, Sandeau, Louis Bellanger, and others, and arrange mystic signals by which to correspond with his intimate friends. At another, he would insist that he knew the spot where all Toussaint Louverture's treasures were buried, and organise an expedition to recover them. Then a few days later he would propose to found a company, after the fashion of his financial heroes. And each of these schemes, while the idea lasted, was followed, thought of feverishly, with a hasty energy that made him resent the shortest word of counsel or admonition as an insult. He proposed to Gautier one night to write a drama together—a drama which was to produce four hundred thousand francs. And ere dawn the next morning he had sent for his *collaborateur* to begin the work at once. Gautier objected that it was desirable to have a subject before beginning—which remark was met with an angry "Oh, if you want to know the subject beforehand, we shall never have finished."

There is a monotony of praise—of *marcy*, perhaps—in all Gautier's criticisms. There is scarcely a hard word, scarcely a bitter epithet in all the volume; and when we see that it contains articles on Henri Monnier, Ingres, Paul de Kock and Brizeux, the Breton poet, we cannot but consider the

leniency a little forced, a little systematic. Of Henri Monnier, the caricaturist and realistic historian of petty bourgeois life, the creator of the one French proverbial type of the century—Joseph Prudhomme, Gautier finds nothing more sour to set amidst a multitude of sweetnesses than “it is not comedy—it is stenography.” And for Ingres and Delaroche he is even more tender. The Gautier “romantique à tous crins” who fought in the front of battle on the first night of *Hernani*, seems anxious to make amends for all the bitter things said in those days against the “Greek line,” the “poncifs” and the Ecole de Rome. One would be scarcely astonished to read after the eulogy of Lamartine an apology of Boileau Despréaux. Gautier could, however, defend his *parti pris* of gentleness with some verve and vigour. In an article on Neo-Criticism, published more than ten years ago, we find the following lines—which should be placed on the title-page of Gautier’s *Lundis* :—

“Until quite recently a few ingenuous and simple-minded writers imagined they were criticising books, pieces and pictures, while they pointed out the beauties and excused the faults inherent in our poor humanity. They were wrong. A man convicted of having produced an intellectual work must be stoned like a mad dog and reproved like a galley slave. Criticism is not what we imagined it—a tenth muse guiding and counselling her nine sisters, just indicating the weak spot, after she has finished praising, with a light stroke of the thumb nail: no, true criticism was born yesterday, and has conferred upon itself the priesthood of *enguelement*, the apostolate of invective. Carnival time was well chosen for the apparition. Loungeurs collected around the tumbrel where with flaming cheeks and furious eyes she recites hoarsely with waving arms the litanies of her new catechism. She knows that if she simply spoke, nobody would listen; so she shrieks.”

Gautier warbles, the notes are exquisitely modulated, the voice is sweet and cultivated, but it is with a feeling of half-confessed fatigue that one comes to the end of the long hymn of praise. The last portraits are of dramatic artists—and here the brush is fuller of rose-water than ever. Female beauty was a subject that Gautier delighted to dwell upon; and when he portrays Dorval, Grisi, Rachel, Mdle. Mars, he becomes positively impassioned. The editor states that not one portrait of a musician was to be found in all the vast gallery. It was Gautier who defined music as “le bruit qui coûte le plus d’argent.”

EVELYN JERROLD.

CURRENT THEOLOGY.

Colet's Lectures on 1 Corinthians. Now first published, with a Translation, Introduction, and Notes. By J. H. Lupton, M.A., Sur-master of St. Paul's School. (George Bell & Sons.) Mr. Lupton deserves so much thanks for his publication of Colet's extant works—which, we are told, will be completed by one more instalment, consisting chiefly of fragments—that it is ungracious to criticise his editorial comments. In the most important part of an editor's duty, fidelity to his author's text, he seems to have left no room for criticism. Yet, with all his loyalty to his founder's person and sympathy with his character, he seems to misunderstand his historical position. The Bible is not “often said to be an unknown book” in Colet's time to such an extent that we should be surprised to find “that

this is an exposition of Scripture”—at least it is not said by people of sufficient education for the present work to be likely to reach them. The really significant point in such lectures being delivered at the end of the fifteenth century is, not that a priest lecturing *ad clerum* should have taken a canonical book for his subject, but that in his exposition of it the lecturer has allowed the apostle to speak for himself, and heartily inculcated what appeared to him to be his teaching, whether it agreed with traditional Christian theory and practice or not. Colet outran popular morality by following St. Paul in the subject of litigation, and we thank Mr. Lupton for telling us how fully he practised what he preached. He also, in deference to St. Paul's supposed spirit, stopped short of his own intellectual tendencies, and here again we are glad to be told that, in the studies prescribed for his school, he showed himself a Christian first, and a Humanist very decidedly afterwards. On the subject of marriage Colet's views are no doubt peculiar, but Mr. Lupton seems entirely to fail to appreciate their real peculiarity. It would scarcely call for remark if he had simply assumed that 1 Cor. vii. proposes virginity as a “counsel of perfection,” instead of accepting the popular Protestant gloss, that the mention of “the present distress” in v. 26 limits the application of the whole passage to an age of persecution. What is really remarkable is, that Colet's rigour goes far beyond anything that can be ascribed to St. Paul—or indeed to any Catholic writer, except, perhaps, St. Jerome. His excursus on precepts, counsels and indulgences is the most scholastic part of his work, perhaps because he partly realised that it was the least orthodox. He appears to think it “ridiculous and damnable” for anybody to marry, except for the second of the three reasons specified in the modern English Prayer-Book: he sublimely sets the first aside, as obsolete since the Incarnation; and, less admirably, ignores the third altogether. Mr. Lupton's remarks on Colet's Platonism are the best part of his introduction; it seems worth inquiring whether the one unpleasant feature in his character is to be traced to a bit of Platonism held by the wrong end.

Six Lectures on the Text of the New Testament. By F. H. Scrivener, M.A., LL.D. (Deighton, Bell, & Co.; G. Bell & Sons.) Mr. Scrivener's lectures are probably the best of the rather numerous attempts that have lately been made to popularise the leading principles of New Testament textual criticism. He states very clearly the conditions of the problem: of course it is not to be expected that he should always be convincing in the specimens he offers of its solution.

Sermons and Essays on the Apostolic Age. By A. P. Stanley, D.D. Third Edition, revised. (Parker.) The new edition of Dean Stanley's *Sermons and Essays* will serve to remind the present generation of what they may almost have missed knowing—that the author's reputation does not rest exclusively either on the “pictorial theology” by which he gained his popularity, or on the party leadership—always generous, sometimes courageous, if seldom far-sighted—for which he has used it. This book, though written nearly thirty years ago, and reprinted with few alterations, is by no means superseded: it is a clear, common-sense statement of what can and what cannot be known about the ecclesiastical history of the first century, and offers a plausible working hypothesis for bringing the known facts into relation with each other.

Sermons (Second Series). By the Rev. Stopford Brooke, M.A. (Henry S. King & Co.) There are two elements of very unequal value in Mr. Stopford Brooke's sermons. His sentimental optimistic theology has even less intellectual coherence than the systems of his predecessors, Robertson and Maurice; nor is the style in which he inculcates it the better for such protests against pulpit conventionality as consist in calling things

“odd” and “curious,” or in interlarding a discourse with long extracts from Goethe and Wordsworth. But in the knowledge, not of God's decrees or man's destiny, but of man as he is—in moral insight into human nature in its good and evil—few preachers of this generation can compare with him. Contrast the first and the second halves of the sermon on “Faithfulness;” the true and touching analysis of the affections in man for man becomes unsubstantial, and ceases to find an echo in the heart's experience, when it is attempted to reason from it to man's relation with the unseen world. All figures traced on a cone are held to be essentially beautiful; if, as some mystics suggested, the finite universe be conceived as a cone, Mr. Brooke may be trusted to develop from it, in the truest and most delicate lines, the orbits in which our souls revolve. But a cone is only stable when set on its base; it is indeed barely possible to skilful fingers to make it stand on its apex: and humanitarian theists are like people who, when they fail to balance it there, tell us that the only way to make it secure is to set it on the circle described by the backward prolongation of the generating line.

MR. STRANGE'S *Legends of the Old Testament traced to their apparent primitive Sources* (Trübner) is a crude, pretentious work, compiled from very various sources without any attempt at discrimination. Thus Higgins, Faber, and Lempriere figure as authorities for Greek mythology, and the names of Dupuis, Bryant, and Inman alternate with those of Colebrooke, Max Müller, and Goldstücker. Mr. Strange holds the theory of the Aryan origin of the early Hebrew stories in an exaggerated form. His book can only mislead.

Characteristics from the Writings of J. H. Newman, D.D. By W. S. Lilly. (H. S. King & Co.) Mr. Lilly has endeavoured to present his readers with a general view of Dr. Newman's final state of mind as set forth in his writings, and Dr. Newman authorises him to say that he has succeeded in this. It is to be regretted that this programme has led to a little comparative neglect of the purely Anglican writings which represent the author's earlier manner, which, like Raphael's, has an independent separate charm of its own even for those who regard the second manner as an unequivocal advance. One individual omission might be supplied in a new edition—the account of the actual state of religious thought in England, drawn up to serve as an introduction to the French translation of the *Apologia*, and published from Dr. Newman's MS. in the *Month*. The collection is arranged under four heads—Personal, Philosophical, Historical, Religious: in the last there are three sections, Protestantism, Anglicanism, Catholicism, which is as long as both the others.

Church Memorials. By W. Roberts. (Rivingtons.) This is a very curious book: it was written five-and-twenty years ago; nearly ninety years ago the author got a prize for an essay on Refinement. He wrote a book on Wills that ran through three editions, and was an authority on the unreformed law; he wrote a Life of Hannah More, which also came to several editions; he edited the *British Review* for several years, and wrote two or three articles for every number. Lastly, he wrote a biographical Church history of the first six centuries from the standpoint of common-sense scriptural Anglicanism, which it has been thought worth while to publish now. It is not ill-written, and shows an outside gentlemanly acquaintance with the Fathers of something the same order as the acquaintance with the classics which was sometimes cultivated in the author's youth.

EDITOR.

Six lectures by Professor Frankland on “How to teach Chemistry,” originally delivered to science teachers, will shortly be published by Messrs. Churchill from notes taken and edited, with Dr. Frankland's sanction, by Mr. George Chaloner, F.C.S.

NOTES AND NEWS.

MRS. SYDNEY DOBELL writes to us that she would feel greatly obliged to all those friends who possess letters, of any length or importance, from her husband, if they would send them to her address, Tocknells House, Painswick, near Stroud, Gloucestershire. In all instances these letters would be copied and returned to their owners, and it need hardly be said that only those portions would be used for publication which are of general interest, and do not touch on private affairs.

MESSRS. SAMPSON, LOW, AND CO. have in the press a translation of a work on Photography, giving a history of the art, and a description of the various mechanical processes which are based upon it. The original is from the pen of M. Gaston Tissandier, who so nearly lost his life in the late perilous balloon ascent which proved fatal to his companions, Messrs. Sivel and Croce-Spinelli.

MESSRS. T. AND T. CLARK, of Edinburgh, have in preparation a *Chronological and Geographical Introduction to the Life of Jesus Christ*, by Oh. Ed. Caspari, with the author's latest additions and corrections. The work is translated and edited by Mr. Maurice J. Evans, B.A.

UNDER the modest title of *Beiträge zur Pali-Grammatik*, Dr. Ernst Kuhn has just published a valuable treatise on Pali Grammar (Berlin: Dümmler, 1875). It is very much on the same plan as F. Muller's *Beiträge zur Kenntniss der Pali-Sprache* published in 1869, but its superiority in depth and extent to the latter work affords a pretty accurate measure of the advance made in Pali scholarship in the last six years. Dr. Kuhn's work is done with the accuracy and thoroughness characteristic of German Oriental scholarship.

MESSRS. RIVINGTON have in preparation, under the care of Mr. H. W. Eve, of Wellington College, a selection from Sainte Beuve's *Causeries du Lundi*, the text in French, with notes for use in schools.

THE first portion of Mr. J. F. Bright's *History of England* is half way through the press, and may be expected in about two months' time.

THE Rev. P. Bowden Smith, of Rugby School, has also in hand for the same firm an edition of La Fontaine's *Fables*, with notes; and M. Vecqueray, of Rugby School, a German Accidence.

THE centenary of the birth of Leyden, the early friend of Scott, and himself a distinguished poet and Oriental scholar, falls on September 8 next, and the "Border Counties Association" are to celebrate the event by holding a festive meeting at Hawick on that date. Messrs. J. and J. H. Rutherford, Kelso, will publish a new illustrated centenary edition of the poet's works. The illustrations will include a portrait of Leyden which has never hitherto been published.

A PAMPHLET by M^{me}. Jules Michelet, which will cause a great sensation, is to appear immediately, with the title of *La Tombe de Michelet*. It will be in the recollection of our readers that after the death of the illustrious writer, his son-in-law demanded that the funeral should take place at Hyères, while M^{me}. Michelet, in accordance with her husband's well-known wish, desired that Paris should be the place of burial. M^{me}. Michelet immediately brought an action against M. Dumesnil for the right of transporting the remains to Paris, and the memoir addressed by her to the judges in the suit is now published as a *brochure*. It contains not only an eloquent vindication of the widow's rights, and curious particulars of the relations between Michelet and M. Dumesnil, but also a statement of Michelet's ideas on Death and Immortality, together with unpublished fragments of the highest interest. On its title-page it bears these striking words of Michelet:—"J'ai toujours donné aux morts, trop oubliés, l'assistance dont j'aurai peut-être un jour moi-même besoin."

MESSRS. MICHEL LÉVY will publish early in May the second volume of Michelet's *History of the Nineteenth Century*. It is largely concerned with this country, against which, as is well known, Michelet entertained those prejudices which were prevalent among the majority of Frenchmen reared under the First Empire.

MR. HALLIWELL, approving of the forthcoming pamphlet, "*Shakespeare's Plays: a Chapter of Stage History. An Essay on the Shakesperian Drama*," by A. H. Paget, has presented 600 copies of it to the New Shakspeare Society, for distribution to its members.

LIEUTENANT-COLONEL CUNNINGHAM is the fortunate possessor of Charles Lamb's copy of the 1679 folio of Beaumont and Fletcher's Works, the very volume to which Lamb devoted an *Elia* Essay. It has all the passages marked for his *Specimens*, and better still, a good many manuscript notes by Coleridge, the last of which is, "I shall not be long here, Charles! I gone, you will not mind my having spoiled a book, in order to leave a relic.—S. T. C., Oct. 1811." Charles Lamb has made two good emendations in *The Two Noble Kinsmen*, in which Fletcher helped Shakspeare. In the poor prefatory song, with its poverty-stricken "daisies, smellless, but most quaint,"—and this of Chaucer's "day-ea eyes,"—which, of course, is not Shakspeare's, and possibly not Fletcher's, Lamb alters the first two lines of the last verse, and makes *chough* rhyme to *cuckoo*. At p. 338, vol. xi., Dyce, Lamb well emends:—

"Hip. Though much unlike (*unliking*),
You should be so transported, as much sorry
I should be. . . ."

WE understand that Professor Delius's paper on the Quarto and Folio Editions of *King Lear* will appear in English in the New Shakspeare Society's Transactions at the same time as it does in German, in the German Shakspeare Society's *Jahrbuch*. The paper has been translated by Miss Eva Gordon, of Pixholme.

MR. F. C. S. ROPER, F.L.S., President of the Eastbourne Natural History Society, has just completed a *Flora of Eastbourne; being an Introduction to the Flowering Plants, Ferns, &c., of the Cuckmere District, East Sussex*. The volume will be published by Mr. Van Voorst.

MR. BELL, Head-master of Christ's Hospital, writes to the *Times* on the subject of the proposed memorial to Charles Lamb. He has received suggestions to devote the fund that should be raised to one or more of the following objects:—An English essay prize, in the shape of books or medals (which might bear on one face the profile of Lamb); a scholarship for the encouragement of the study of English literature and composition; a "mural or sculptural record." The first proposal has received the most support; but we are sorry to learn that the sum yet raised for the purpose amounts only to 25*l.* 13*s.* The popularity of the *Essays of Elia* is so great, and the value for students of English literature of the brief comments accompanying the *Selections from the Dramatists* so unique—to say nothing of Lamb's other claims on our regard and almost on our affection—that we cannot help thinking that the proposal must have escaped the notice of Lamb's thousands of admirers. We have great pleasure in most cordially recommending it to their notice.

A MOVEMENT has been started for placing a memorial tablet over Byron's grave at Hucknall-Torkard. Mr. Richard Edgcumbe takes the lead in this project, which is supported by some powerful names—Tennyson, Disraeli, Wilkie Collins, Murray, &c. The venerable Trelawney accords a qualified sanction to the scheme. But many will agree with him in considering that the limits which it assumes are altogether too cramped, and that nothing short of a public statue to Byron in

London is deserving of much consideration. In fact, the precise proposal of a tablet at Hucknall is hardly intelligible: there is already a tablet there, and, as far as we know, it is in sound repair, and serves every requirement for that otherwise obscure and torpid little country church. Besides, it has acquired by this time an historical value which could not pertain to any substitute, even if executed in a rather more elaborate or slightly style. It is a burning shame to the English people—a reflection on their common sense, and we may say their common honesty, for cant and hypocrisy are at the bottom of it all—that fifty-one years after the death of Byron, and fifty-three years after that of Shelley, those two radiant geniuses remain without any public monumental recognition in their own country. Mr. Edgcumbe has dropped a very small stone into a very secluded part of the stream; but possibly the circles from it will spread into wider reaches. Any man, however prominent in public life or in letters, would do himself honour by coming forward decisively, and saying: "The time has arrived, and more than arrived, for raising a monument to Byron and to Shelley. Let a few of us subscribe for the purpose at once, appeal to all sorts and conditions of men to complete the subscription, commission a good sculptor to produce the statues without tedious delay, and then see whether a public site in London will be refused to us." A little boldness would probably produce a conspicuous success. As to the Hucknall Torkard project, we are reminded by it of that other scheme now going on for tinkering Keats's grave in Rome. We wish well-meaning people could be persuaded that it would not be possible for human ingenuity to better the tombstone as it stands; for this simple reason—that the personal interest attaching to that stone, as having been actually put up soon after Keats's death, and conformably to his directions, is deeper than any which could attach to a well-executed work of art—bust or what not—of the present day. We may next be hearing of a project to step a few paces to the right from the tomb of Keats, and honour the still more illustrious Shelley by violating his grave, and transporting his ashes to England: indeed, this idea has been mooted before now. But fortunately Trelawney might have something to say to any such proposal, by right of proprietorship, and he would know what sort of answer to return.

COUNT LOUIS PASSERINI and the Chevalier Gaetano Milanese are engaged upon a new edition of the works of Niccolò Machiavelli. This new edition, of which two volumes have already appeared, will include a mass of unpublished documents existing in the National Library (the Magliabechian), and will be in every respect the most complete and valuable edition of the works of Machiavelli ever published.

THE Count Passerini only a few days ago lighted upon a document in the National Library of interest to Englishmen and students of English history. Its date is March 8, 1554, and it is an application to Pope Julius III. for the deprivation of Thomas Cranmer from the See of Canterbury on account of his evil life. It is signed Roger Ascham, and is apparently written by him; and is countersigned by Mary and her husband Philip. It is in perfect order, and beautifully written. Mary signs "Maria" in a small, round, and clear hand. Philip's name is written with a lighter ink, and manifests a royal indifference to good calligraphy.

SINCE we announced the appointment of Professor Waitz to the directorship of the Commission for editing the "*Monumenta Germaniae*," more definite arrangements have been made as to the mode of conducting the publication, and with regard to the selection of those to whom the special departments are to be entrusted. It has been determined that Dr. Waitz himself shall superintend the editing of the *Scriptores*, which will continue to be issued in

folio, while the remainder of the volumes will be in quarto, Wattenbach taking the *Epistolae*, Dümmler the *Antiquitates*, and Sickel the *Diplomata*. No editor for the *Leges* has as yet been definitively appointed. The first edition of the "Monumenta," of which about 750 copies were printed, is now only to be bought at fancy prices, on which account the directing committee has in contemplation to issue a new and revised edition of the separate volumes as they originally appeared.

THE *Revue des Deux Mondes* of April 15 contains a well-timed and interesting essay, by M. Emile de Laveleye, on Ancient Irish Law, drawing the attention of continental scholars to the Brehon law, and to Sir Henry Maine's *Early History of Institutions*, some of the principal conclusions of which are skilfully advocated by M. de Laveleye. Probably the part of his essay which will be read with chief interest in England is that relating to feudalism. He adopts Sir H. Maine's theory, which traces feudalism in part to an economical origin. The chief, with more cattle than pasture, furnished the free tribesmen, who had more land than cattle, with the necessary stock, and the borrower of the cattle sank by degrees into the tenant or serf of his creditor. M. de Laveleye concurs with Mr. Oliffe Leslie, that the ancient Irish had both deliberative assemblies and courts of justice; but he seems to attach more weight than Mr. Leslie's article in the *Fortnightly Review* does to the *Crith Gablach* and the *Book of Rights*, the authority and antiquity of which are questioned by Mr. Leslie, although Dr. Sullivan lays great stress on the former in support of his own theory of the advanced development of Irish institutions in the seventh and eighth centuries. A translation of the *Crith Gablach* will be found in the third volume of Dr. Sullivan's *Manners and Customs of the Ancient Irish*.

It is announced that Professor Dümmler of Halle has been invited to accept the Chair of History at Göttingen, vacated by Dr. Waitz's removal to Berlin; and that Councillor Kuno Fischer will not leave Heidelberg, as was previously announced.

At a recent meeting of the Academy of Sciences at Vienna, Professor Sickel read a paper on the various manuscript collections extant of Alcuin's Letters, of which there are three, believed to be genuine, which have special claim to notice. One of these, made under the direction of the Abbot Adalhard of Corvey, soon after the year 814, forms part of the Harleian MSS. in the British Museum; and two collections, belonging to a period a few years earlier than the former, are now both in the Imperial Court Library of Vienna, whither they appear to have been brought from Salzburg. One of these codices contains numerous interesting letters written by Alcuin and others to Archbishop Arno of Salzburg, during his ten months' sojourn at Rome, and his subsequent visit to the royal German Court in 799, one year before Charlemagne assumed the imperial title. These letters are full of curious references to the social condition, topography, and current events of Italy and Germany, while the letters contained in the other Vienna Codex, which belong to the years 802-807, are chiefly concerned with political matters, and these were evidently regarded as of a more confidential nature, and were not so widely copied by the scholars of Alcuin, to whom we are, however, indebted for the numerous more or less complete copies of the correspondence of their master which are to be found in the public libraries of Germany.

THE Rev. Canon McClatchie's *Confucian Cosmogony*, a translation of Section XLIX. of the "Complete Works" of the Philosopher Choo Foo-Tsze, has been issued from the American Presbyterian Mission Press at Shanghai. The Chinese text accompanies the translation page by page, and besides several explanatory notes, the volume contains a life of the philosopher, whose writings

come next to the Classics in the opinion of the Chinese, and is illustrated with plates and diagrams.

PROFESSOR JOAQUIN MALDONADO MACANAZ contributes to the *Revista de la Universidad de Madrid* a biography of St. Francis Xavier, the Apostle of India. The last portion published contains some severe strictures on Buddhism. Señor Vicente de la Fuente gives a sketch of the early history of the University of Salamanca based on original documentary researches; and the Spanish Mystics form the subject of an interesting series of papers from the pen of Señor N. M. Mateos.

WE learn from *Polybiblion* that M. le Duc de la Trémoille has just privately printed the letters of Charles VIII. to Louis de la Trémoille preserved in the archives of Mme. de la Roche-Jaquelein. They relate chiefly to the campaign of 1488 in Brittany.

THE death is announced of M. Louis Danel, the *doyen* of French printers, at the age of eighty-five.

THE following Parliamentary papers have lately been published:—Appendix to Third Report on Endowed Schools and Hospitals (Scotland), vol. i. (price 2s. 4d.), vol. ii. (price 2s.); Twenty-seventh Report from the Ecclesiastical Commissioners for England, with an appendix (price 7d.); Twenty-fourth Report from the Church Estates Commissioners (price 4d.); Report and Evidence of the Enquiry held at Hull into the Loss of the Steamship *Viceroy* (price 4d.); Returns relating to Election Charges, Mercantile Marine Offices, Merchant Ships' Crews committed to Prison, Foreign Import Duties, &c.; Returns relating to Life Insurance Companies (price 1s. 10d.); Copy of Mr. Erskine's Despatch relative to the Operation of the Swedish Tariff upon the Manufacturing Interests of Sweden (price 1d.); Papers relating to Her Majesty's Colonial Possessions, part i., 1875 (price 1s. 1d.); Reports from Her Majesty's Consuls on the Manufactures, Commerce, &c., of their districts, part ii. (price 1s. 2d.); Report of the Working of the Public Health Act, 1872 (price 1s. 8d.); Report of the Royal Commissioners appointed to enquire into the Treatment of Immigrants in Mauritius (price 6s. 3d.); Appendixes to ditto (price 5s. 9d.); Correspondence relating to ditto (price 3d.); Code of Regulations, &c. (1875), issued by the Scotch Education Department (price 2d.); Return of Import Duties levied in Europe and the United States upon the Produce and Manufactures of the United Kingdom; Tables showing the estimated average Produce of the Crops in Ireland for 1874, the Emigration from Irish Ports, &c. (price 6d.); Correspondence relating to the Complaints of the Mercantile Community in Hong Kong against the action of Chinese Revenue Cruisers (price 7d.); Papers relating to the Famine, East India (price 1s. 1d.); Copies of Correspondence between the Colonial Office and any of the Colonial Governments on the subject of Copyright, &c. (price 3d.); General Analytical Index to the Reports, Minutes of Evidence, &c., before the Royal Commission on Unseaworthy Ships (price 7½d.).

NOTES OF TRAVEL.

THE Russian Society for the Encouragement of Trade and Industries has appointed a commission to consider the desirability of improving the means of communication between the White Sea and Lake Onega, with a view to developing the resources of Northern Russia. The proposal has emanated from M. Grigorief, governor of the province of Olonez.

DR. LENZ, the geologist despatched to the Ogowai River, in West Africa, by the German African Expedition, has done some further exploring work, and communicated his reports to the President. Dr. Lenz made an excursion to the

Yonanga Lake, and endeavoured, but unsuccessfully, to procure a guide to conduct him across the wooded mountains to the eastward, to the Ngunie River, the natives being afraid of hostile tribes and gorillas, which are numerous. He observes that as far as the coast tribes are concerned, habitations are only to be found on the banks of rivers, where trade in caoutchouc can easily be carried on with the Europeans. The Jesuit mission on the Gabun River is flourishing, and carpentry, joiner's work, tailoring, shoemaking, and smith's work, besides gardening, are taught. Dr. Lenz states that the slave trade is in full swing by Cape Lopez, and that hundreds of slaves come from the interior, and are sold to the Portuguese at St. Thomas and I. do Principe. The agents for this traffic are chiefly Portuguese mulattoes from the Congo country, and they live in the neighbourhood of Cape Lopez, where the numerous mouths of the Ogowai favour their operations. The slaves, bound together with chains, are conveyed in long canoes, each containing sixty people and upwards, across the sea to Ilha do Principe and St. Thomas, where they are landed on unfrequented parts of the coast, and conveyed thence to the plantations in the interior of those islands. Dr. Lenz is unable to say if any re-exportation takes place; he is certain, however, that over a thousand slaves are exported annually from the Ogowai delta to the islands mentioned. As far as regards the slavery in vogue among the inhabitants on the Ogowai and Gabun, it is of a very mild description, and the slaves are treated more as members of the family than anything else. Dr. Lenz was proposing soon to undertake his journey up the Okanda river, up which Messrs. de Compiègne and Marche had travelled in 1873. The natives speak of an important tributary coming from the south three or four days east of Lope, on the left bank of the Okanda, and of a dwarf race to the eastward about three or four feet high, called Akoa, both of which points Lenz is anxious to investigate, the latter being especially interesting on account of the probable connexion with Schweinfurth's Akka tribes.

THE recently revived shark fishery of the Northern Ice Sea in the Bay of Tereberskya, and the Peninsula Kola, is the subject of an interesting article in *Das Ausland*, April 5. Two kinds of shark are found in this region, *Scymnus borealis*, the Greenland shark, and *Selache marima*, or basking shark. It is stated that these sharks specially frequent places where sea-currents meet, and, contrary to the assertions of many naturalists, assemble in shoals; so that boats engaged in the fishery are often surrounded by a hundred or more of these sea hyaenas greedy for prey. The boats employed for fishing in deep water are from twenty to thirty tons burden, and carry five or six men, who obtain from one to two hundred kilogrammes of oil from a single fish.

Forty years ago, one Paschin received a subvention from the Russian Government to pursue this fishery, which went on slowly till 1851, when a Norwegian emigrant, Sul, took to the business. In the autumn of that year he began his shark-hunt in Tereberskya Bay, throwing into the water kitchen waste and excrement. This attracted a thousand sharks, and many were caught with hooks baited with sea calves' flesh, and dispatched with harpoons. Sul was prosperous for some time, but at last he was robbed and his tackle sunk. His example, however, excited the people of Kola to take up the occupation.

The Russians fish near the coast with small boats which can scarcely hold four men. Anchoring at a certain distance from the land, they sink a vessel pierced with holes, containing oil, tallow, or other fat, which the sea currents distribute in the neighbourhood. This causes the sharks to assemble, and they are caught with baited hooks attached to iron chains, as they could instantly bite through the strongest rope. Three of the men watch an opportunity of pulling

the fish towards the boat, and the fourth stands ready with a wooden hammer weighing twenty pounds, to strike with all his force the moment the head appears. The fish is then cut open by means of a knife with a very long handle, the oil taken and its swimming bladder inflated by a long pipe. It is then cast adrift to float. If allowed to sink, the men say, the other sharks would eat it and not care for other bait. The long handle of the knife is to secure the safety of the operator's hands from a bite by other sharks that keep swimming round the boat. Sometimes the sharks surround a boat so thickly that it cannot escape, and the crew fall victims to their intended prey.

THE Turkish papers, says the *Levant Herald*, speak highly of a number of maps of Asia Minor, Roumelia, Servia, and Yemen which have been executed by means of photo-lithography, by seven or eight officers of the Imperial Ottoman Navy, under the direction of Mustapha Djelal-ed-din Pasha. At the present moment these officers are engaged in drawing up a map of Montenegro.

THE Turkish Government is, we are happy to learn, at last grappling with the terrible famine in Asia Minor with some measure of success. But its difficulties are seriously increased by the cattle disease, which is now prevalent throughout the Empire. We are indebted for the following extract to the *Levant Herald*, a paper which has honourably distinguished itself by the zeal and discretion with which it has espoused the cause of the starving populations of Asia Minor:—

"We hear of it [i.e., the cattle disease] in Bagdad, and in Trebizond, the extreme points north and south of the eastern boundary of the empire. At Scala Nova, in the province of Smyrna, and at the Dardanelles it has wrought terrible ravages. Private letters state that in the neighbourhood of the Dardanelles the most lucky have lost fifty per cent. of their sheep, and that of many large flocks only five in every hundred are left. A recent visitor to the plains of Troy remarked the skeletons of thousands of sheep lying bleaching upon the ground. From Smyrna, we hear of vast flocks totally destroyed, and one letter tells of a shepherd who, stripped by the murrain of his entire flock, has become insane, and takes out to pasture a pocketful of white pebbles which he fondly believes to be the fleecy tribe in the possession of which he was a few weeks ago comparatively rich. What the disease has wrought in the famine districts of Asia Minor has already been told by Mr. Farnsworth. From European Turkey the accounts are no less distressing. From Adrianople, we learn that 30 per cent of the horned cattle and horses have been lost, and that sheep have died in a very much greater ratio. . . . In Macedonia, there is not only scarcity of pasture, but also of food for human consumption. . . . From the province of Gallipoli the accounts are very bad indeed. . . . In the district of Enos, in this province, the sheep are affected by lung disease. The sanitary physician of Varna reports a like affection of the flocks in the Dobrudja."

IN his recently printed consular report from Beyrout, Mr. T. S. Jago gives some interesting notes on a journey which he made through Central and Northern Syria, a country, as he says, little, if ever, visited by European travellers. From Tripoli to Latakia, a distance of about seventy-two miles, the chief thing that struck him was the almost total absence of population. The sparse cultivation met with is mainly confined to cereals; the implements used are of the rudest kind; the cattle of the peasantry are puny and undersized; and the abject appearance and condition of the denizens of the mud villages and the three small towns of Tortosa, Gébélé, and Markab, show a state of affairs the reverse of prosperous. The means of communication are simply the tracks made in the course of ages by camels, mules, and other beasts of burden. No fewer than thirteen rivers and streams have to be crossed in this distance, and there are only three bridges fit to be used. Education among these "fellaheen" is unknown, and the only person who can read is generally, besides the scheik of the village, the

resident agent of the Tripoli or Latakia money-lender, who owns the village or who advances money upon the crops. Their food is coarse bread and sour milk in summer, while in winter a few olives and dried fruit take the place of the milk. A mat of reeds, with a coverlet and a rude pillow, forms their bed. Mutton fat, with a strip of cotton rag for a wick, supplies them with a little light for their dwellings. Meat, coffee, and sugar are luxuries, like rice, sparingly partaken of by the more affluent on the occasion of marriages, religious feasts, &c. Comforts of the rudest kind are wanting with them, and their condition is one of extreme ignorance and apathy.

The best Latakia tobacco is cultivated in the most northern and elevated parts of the Ansariyeh mountains. Great care is bestowed thereon by the mountaineers, who depend upon it for their chief support. The small strips of land near their houses are carefully prepared, the earth being well pulverised and manured, and the seeds planted. The beds are afterwards thinned, the young plants pricked out, and watered once when put into the ground. The tobacco harvest is in October in the mountains, and earlier in the lower ranges. The leaves are gathered and strung upon strings of goats' hair, then left to dry in the shade, after which they are hung to the rafters of the houses for fumigation or otherwise, and thus left till the tax-gatherer comes. They are sold in loads of 100 or 150 strings. The very best kind of Latakia is known by the name of "abou riah," or father of scent, but of this a very small quantity is annually raised.

GEORGE HERBERT AT CAMBRIDGE.

Having recently pointed out an error in Walton's life of Herbert relating to the presentation to Bemerton, I should like to draw attention to his life at Cambridge. Herbert's reply to Melville's *Anti-Tam-Cami-Categoria* was written there, as one set of verses is addressed to Charles Prince of Wales, a title which he did not bear till 1816, and another refers to the attack of Melville on the candlesticks on the Royal Communion Table as something which took place *olim*. How long after 1816 the verses were written I cannot say for certain. If Mr. Grosart is right in holding that the verses addressed to the Bishop of Winchester were intended for Andrewes, the date must have been subsequent to 1819. But I strongly suspect that Montague is the bishop meant. If so, the date of some of the lines is between 1816 and 1819, though it does not follow that they were all written at the same time.

We have thus two important writings for the Cambridge period of George Herbert's life, the second being the speech addressed to Prince Charles on his return to Spain, which shows that with all his efforts at being a courtier Herbert, if he had not the qualities of a statesman on the one hand, was deficient in those of a mere courtier on the other. Everybody at court knew that Charles had come home disgusted with the Spanish match, and half inclined, if not quite inclined, to drive his father into war with Spain. Herbert, with all courtliness of tone, deliberately refused to worship the rising sun. He goes through an elaborate panegyric on the excellences of peace, applauds Charles for going to Madrid in order to seek it, and resigns himself to the prospect of war, only because he is quite sure that James will not declare war unless it is absolutely necessary. By means of these two pieces one comes to see that Herbert may really have admired James as a king who kept the peace and maintained the ceremonies of the Church. Herbert's patrons, too, Hamilton and Lennox, voted in favour of peace, so that Herbert would find himself all abroad in temporal matters when the new reign set in.

Taking these writings together, one finds that there was a certain honesty in Herbert, even in

his courtier days. The James I. of modern writers is a compound made up of a little truth and a great quantity of falsehood; and modern writers accordingly begin to shriek whenever they find any one praising James. He had no doubt plenty of faults; but I believe that any one who reads Herbert's speech diligently will see that James's real faults were not those which Herbert was likely to perceive. As for the imaginary ones, as he had not read Weldon he was not likely to know anything about them.

SAMUEL R. GARDINER.

PARIS LETTER.

Paris: April 16, 1875.

The new volume of poems by Sully Prudhomme, entitled *Les Vaines Tendresses* (Lemerre), which I announced in January, is just out, and it is in all respects worthy of the author of *Stances et Poèmes*, *Epreuves*, and *Solitudes*. It even bears evidence of progress—not that it contains poems in themselves more beautiful than those by which Sully Prudhomme had already in his former volumes earned his right to be ranked in the first order of contemporary poets, but a loftier and more ideal inspiration permeates the whole collection. His poems are all based on the same idea, namely, the want of harmony existing between man's aspirations and the weakness, the powerlessness, the narrow limits to which nature condemns him:—

"A quoi bon nos miettes d'aumône ?
Si la plèbe veut s'assourir ;
Ou nos rêves d'Etat sans trône ?
S'il plaît au peuple de servir.

A quoi bon rapprendre la guerre ?
S'il faut toujours qu'elle ait pour but
Le gain menteur, cher au vulgaire,
D'une auréole et d'un tribut.

A quoi bon la lente science ?
Si l'homme ne peut entrevoir,
Après tant d'âpre patience
Que les bornes de son savoir.

A quoi bon l'amour ? si l'on aime
Pour propager un cœur souffrant,
Le cœur humain, toujours le même
Sous le costume différent.

A quoi bon si la terre est ronde,
Notre infinie avidité ?
On est si vite au bout d'un monde
Quand il n'est pas illimité."

This idea, or rather sentiment, which is expressed in the poet's earlier works likewise, forms the keynote, the one prevailing note I might almost say, of the volume before us. He has given it an admirable philosophic expression in the lines "Sur la Mort," where he describes the anguish of the soul beside the coffin of a beloved friend, stirred by an overpowering yearning for the infinite and the eternal, yet feeling that they have no existence for it, and being alike unable either to believe or to refuse to believe in their reality. It is love that makes the poet feel how eternal and strong is the spring of hope in the human breast, rudely snapped though it may be at every moment by the crushing weight of a stern reality. Hence the title of the book, *Les Vaines Tendresses*, vain for all, but more particularly for him, for we can read in his guarded confidences the whole story, a noble and pathetic story, of an unfortunate love, voluntarily unfortunate that it might remain noble and pure. Such love as this has been the inspiring theme of many beautiful lines, but it has never found more forcible, yet at the same time more delicate expression than Sully Prudhomme has given it in the poem called "L'Obstacle." But in the volume before us it seems as if the wearied and wounded soul were beginning to reap the reward of its self-denial, the accents of despair and the traces of unavailing struggle give place to resignation, a resignation sad, indeed, but nevertheless calm and gentle, at times even happy. This is the predominant feeling traceable in "Le Rendez-vous" and in "Ce qui dure." By renouncing all claims to earthly joys the poet puts himself

out of reach of the deceptions which earthly joys bring with them; and he experiences a sense of peace and harmony which he has beautifully expressed in two of his most exquisite little pieces, called "L'Épousée" and "Le Conseil." The volume opens with a poem, "Aux Amis Inconnus," addressed by the author to those who, without knowing him, may have been touched by his verses and have found in them an echo of their own feelings and their own griefs. These lines admirably express the tie that binds Sully Prudhomme and his readers together—a tie of gratitude rather than one of admiration. He has soothed their griefs, first by sharing them, and then by ennobling them in verse—"Haud ignara mali, miseris succurrere disco." Sully Prudhomme's poems often recall to my mind William Blake's *Songs of Experience*, though he has no heavenly visions as Blake had to unlock the gates of Paradise to his dreams; he is not a mystic, but a philosopher trained in the school of Lucretius.

The spring of 1875 seems to be specially favourable to the production of good poetry. Besides the more profound and delicate effusions of Sully Prudhomme, which have little charm for the multitude, but whose beauty establishes their author's title to lasting fame, there is poetry of a more stirring and spirited kind, verses that are "Moins écrites que pensées, moins pensées que vécus," war-songs that have the true military ring, like the blare of a trumpet and the tramp of soldiers. Before the war broke out M. Déroulède, who is a nephew of M. Emile Augier, had been a young dilettante author, and had written a drama called *Juan Srenner*, which was produced at the Théâtre Français, but without any particular success. The war transformed him into a soldier and a poet. In 1873 he published *Les Chants du Soldat*; they met with a most favourable reception, and have been followed by *Les Nouveaux Chants du Soldat*, and these are at present quite the rage. The first volume has in the course of a few weeks reached a fifteenth edition, and the second volume a ninth. Patriotism of the most genuine kind has kindled the poetic impulse in the writer of these songs: they are full of the true Gallic vivacity, and though their form is often defective and even sometimes a little prosaic, there is an atmosphere of health and vigour about them, and a loyal spirit running through them that are their special attractions. "A ma Mère," "Jeanne la Lorraine," "En Avant," and some few military songs, are really remarkable. On the other hand, there is not much to be said for the comic poem in which M. Déroulède, with a singular want of taste and without any conceivable object or purpose, ridicules the weakness and want of endurance of some of his comrades in the war, nor, indeed, for the more ambitious pieces, such as, for instance, the one called "Othoniel." This sprightly and joyous young soldier can blow the trumpet-call to arms, but epic poetry is clearly not in his line. Yet it is impossible to avoid feeling genuine sympathy for the young poet who voluntarily chose to remain in the army when the war came to an end, that he might assist in training up soldiers for his country who shall be as patriotic as he is himself. His verses are all written with a view to the same purpose, and cannot fail to be productive of some result.

M. André Lemoyne's poetry is animated by a very different spirit. He is one of nature's poets, the bard, the lover of the meadow-flowers and of the woodland birds, of everything in the realm of nature that helps us to forget the stern and pressing realities of life. He is preparing a new volume of poetry for Lemerre's "Collection elzévirienne," in which his *Roses d'Anton* and his *Charmeuses* first came out. Meanwhile, not to put the patience of his friends to too severe a test, he has had a hundred copies of a fine-paper edition of his *Paysages de Mer et Fleurs des Prés* printed for them, which contains a choice selection of his most perfect little poems,

gems which show the labour of the file, and the polish of a skilful and persevering hand. There is one piece called "La Bataille" in this collection, a piece suggested by the opening scene of Dickens's "Battle of Life," which, according to my judgment, is the finest thing he has ever yet written. He blends deep human emotion with that sympathy with nature which first-hand knowledge of nature awakens, and reaches the highest and best results. Among the young poets of the day M. Lemoyne is a type of the most curious and interesting description. He has been a clerk for more than twenty years in the firm of MM. Didot the publishers, and is engaged in mechanical and tiring work from morning till night. He obtains relief from the monotonous reality of his daily life by means of the joyous exuberance of his nature, which is brimming over with gaiety and vigour, and makes him the most jovial of companions, and by such poetic dreams as are most diametrically opposed to the trivial preoccupations of daily life. He caresses his verses, shapes and polishes them one by one with the utmost fondness and deliberation, and at long intervals produces short poems whose chief characteristic is the ideal serenity that pervades them; they neither bear the stamp of genius, nor are they remarkable for brilliancy of colour; but the harmony of the verse is faultless, the form perfect, and every word exquisitely chosen. Lately, M. Lemoyne tried his skill in the domain of fiction, but without success. His *Idylle Normande* is devoid of life, the first quality necessary to a novel. The characters are not beings of flesh and blood, but incorporeal souls and ideas.

M. André Theuriot, who is also a poet, and writes pure and melodious verse, promises to become a really good writer of fiction. His two last novels, *Mlle. Guignon* and *Le Mariage de Gérard* (Charpentier), are works of considerable merit, elevated in tone and sentiment, though they possess neither the brilliant Parisian originality of Alphonse Daudet's works, nor the popular vigour and pith of Léon Cladel's peasant tales, nor the power of psychological analysis which is displayed by Ferdinand Fabre. M. Theuriot's descriptions of nature are evidently drawn by one who is himself a genuine lover of the country, one who has lived in it and has made it a part of himself, and his pictures of *la vie de province* are painted with striking truth of observation. At present he is engaged on a new book called *La Fortune d'Angèle*, which combines all these qualities in a much higher degree, and which testifies to the real progress he is making. We greatly need good novelists in France. Those who were the most distinguished some years ago are growing old and have nearly written themselves out. Erckmann-Chatrin have all but exhausted the vein of popular tales which has been the source of their brilliant successes. Hector Malot, who seemed at one time as though he were going to follow in the steps of Balzac, pours forth novel after novel from his pitifully prolific pen, of which it can only be said that they are carefully and conscientiously written, for they are wanting alike in force and imagination, without life and without originality. Gustav Droz, who displayed real power of observation in some of the pages of the *Cahier Bleu de Mlle. Cibot*, has just committed a strange error in his choice of a subject for his new novel *La Femme géante* (Hetzel), which shows a singular want of taste in a man of his ability. A widower has had the body of his dead wife carefully embalmed, and has kept it in the house beside him: after a time he wants to marry again, and then he does not know how to dispose of *La Femme géante*. His perplexity might be amusing through a few pages, but it becomes intolerably wearisome dragged out through the length of a whole volume. Jules Verne, who has so much wit and intelligence, such learning and vivid imagination, has just been putting his powers to their full use in his *Chancellor* (Hetzel), but his joyous fancy is always enlisted in the cause

of science, and his object is to instruct his readers while he amuses them, and therefore his writings belong to the instructive rather than to the literary order of books. Lastly, Victor Cherbuliez, whose rare talent as a writer no one can dispute, and whose refined, cultivated judgment, artistic feeling, and brilliant intelligence are undeniable, has just published a novel, *Miss Rovel* (Hachette), which does little credit to the author of *Comte Kostia* and *Ladislav Bolski*. This is not the public opinion clearly, for not one of Cherbuliez' novels has met with such a favourable reception as this; but I consider it inferior to all his former ones, on account of the pretentious style in which it is written, the poverty of invention and the want of elevation it displays. The English lady, who first indulges in a thousand vagaries, and then goes off to Africa with a Wesleyan missionary to convert the blacks, and ends by becoming the wife of a negro king, is a grotesque conception, it must be owned, hardly worthy of such an author as M. Cherbuliez. He has just left Geneva, with the intention of settling in Paris, where he is to have some share in the editing of the *Revue des Deux Mondes*. It is to be hoped that the change will give a new impulse to his literary talent. An interesting experiment has just been made in the domain of fiction by a young man who bears a name that is doubly famous. M. Gilbert Augustin Thierry is a son of Amédée Thierry, and a nephew of Augustin Thierry. He has tried in his *Aventures d'une Ame en peine* (Didier) to bring the historical novel to life again. The period he has chosen for his story is the close of the sixteenth and the beginning of the seventeenth century, and he gives a picture of the ecclesiastical and legal classes as they were in those disturbed times, when witchcraft still played an important part in society, and the administration of law and justice was still influenced, as in the Middle Ages, by cruelty and prejudice. It is a strange book, confused throughout, crammed full of ill-digested learning, and written in an odd style which is an ill-assorted union of the bad taste and extravagance of modern sentimental diction, with a wearisome imitation of the style of the sixteenth century. It shows, however, on the writer's part a laudable effort at describing, not only the outward aspect of a bygone time, but also the sentiments specially characteristic of a state of civilisation differing from our own. M. de Martincourt, the chief personage in the book, is vigorously portrayed, and leaves a lasting impression on the imagination.

But the historical novel is an anomaly even at its best, and M. Gilbert Thierry is hardly justified in his desire to bring it back to life. Can any historical novel bear comparison with actual history, history when it is well and vividly written? *Camille Desmoulins*, by M. J. Claretie, is a striking proof of the truth of this. Such a life is in itself a romance. This young genius, with his easy, careless, fantastic, generous temperament, throws himself with all the impetuosity of youth into the turmoil of the revolution. He leads the populace to the taking of the Bastille; by his pen he contributes as much as any to hasten on events and make them bloodier, more violent, more irreparable; he rouses the people to the assault of the Tuileries on August 10, 1792; he stands by and sees the September massacres going on; not satisfied with having been one of the most active abettors in the death of the king, he labours to bring about the fall of the Girondins, their trial and final sentence. After which a horror of all the massacres and bloodshed comes upon him, a sudden revulsion of feeling takes place, and he becomes an eloquent and fervent advocate of clemency. He enlists in the new cause with the same generous impetuosity with which he had served the old, and tries to stem the torrent he himself had let loose, but it is too late, and he in his turn is dragged off and dies for having preached the new doctrine of gentleness and humanity. In the middle of this tempestuous

existence he had married Lucile, a wife whom he adored; she shared his political frenzy, and shared also the change that came over him when he entered on a nobler course; she followed him to the guillotine after a short interval of a few days, and so was denied the consolation of dying at his side. Nothing can be more touching than their last letters to each other; they reveal the terrible desolation that filled their young hearts at the prospect of an early death, a death in which they saw, not only the end of their mutual love, but the ruin of their country and their country's liberty. M. Claretie is a writer for the daily press and a spirited and voluminous writer, but he does not let his arduous duties in that capacity wholly absorb him, and knows how to snatch hours of leisure for more serious work. His book *Les Derniers Montagnards* contained the fruit of useful research: the one on *Camille Desmoulins and the Dantonists* is no less valuable. It contains life-like portraits of Danton, Desmoulins, Héault de Séchelles, and Fabre d'Églantine, a remarkable group of men who for one short moment were the leaders of the Revolution, and then became its victims. Backed by the authority of unpublished documents he clears their memory from many calumnies, but far from constituting himself their panegyrist, he does not in the least degree try to conceal their errors and weaknesses. M. Claretie has collected some notes on the trial of the Dantonists which are particularly interesting—notes to which a double value now attaches because the documents from which they were taken were burnt during the Commune of 1871 at the Préfecture de Police.

Disastrous events such as this, which in a moment destroy the valuable records of past times, render a speedy publication of the rich store of manuscripts contained in our public libraries and archives extremely desirable. But in order to publish them, some sort of guide is necessary to lead the way into those vast collections. M. Armand Baschet has been a valuable friend to all other workers by his book on *Le Dépôt des Archives du Ministère des Affaires Étrangères* (Plon). It is a complete history of these Archives, and dates from the reign of Louis XIV. when the Dépôt was first established. The growth of the Dépôt from year to year is described, and every manuscript mentioned that has been deposited there, so that an inventory of all its contents is within the reach of every one. And now that the public have free access, so long denied them, to these Archives, M. Baschet's book will, no doubt, materially promote the production of important historical works. M. Baschet is already well known by his books on the Venetian Archives and on the papers of St. Simon. He is at present employed by the English Government in hunting up all the documents relating to England in the French Archives. His generosity in letting others share the fruits of his perseverance and intelligence has earned for him the gratitude of all other students.

M. L. Delisle has been rendering the public similar good service by his admirable work on *Le Cabinet des Manuscrits de la Bibliothèque Nationale*, the administration of that department being at present in his hands. The third and last volume has just come out in the "Grande Collection sur l'Histoire de Paris" published by the Municipality. M. Delisle's work furnishes a complete history of the inestimable riches contained in this collection, and is distinguished, as all M. Delisle's writings are, by taste and learning. Two other volumes, both very interesting, have simultaneously been added to the "Collection d'Histoire Municipale de Paris"—namely, *La Collection des Sceaux Municipaux* and *L'Histoire d'Étienne Marcel*, by M. Perrons.

CORRESPONDENCE.

THE UNIVERSITY OF MELBOURNE AND ITS PROFESSORS.

3 St. George's Square: April 19, 1875.

The Council of the University of Melbourne have an odd way of treating their Professors. If they want to get rid of one of the teaching body, they suddenly resolve to give the whole staff notice that their posts are vacant, and that they must apply for re-election. Some years ago, the University lost its most brilliant Professor—Edward Irving, the son of the great preacher and founder of the Irvingites—who would not stand this kind of treatment, and resigned as soon as he had notice of it. And lately, the then ablest Professor—C. H. Pearson, Professor of History—threw up his appointment on hearing of the Council's contemplated move. Though offered at once the Professorship of History in the University of Adelaide, Professor Pearson accepted the headship of the new College for Ladies in Melbourne, lately founded by the Scotch Kirk, and is there lecturing on history. This college is to be made, if possible, a women's university. Each professor has but one subject. Professor Harper is the Professor of English; one of the leading physicians of the town lectures on Physiology and the Laws of Health; a Cambridge wrangler on Mechanics, &c. In case any English graduates think of taking a professorship in the present University of Melbourne, they should take care to have a stringent written contract with the Council, clearly defining their rights and duties. F. J. FURNIVALL.

THE WORD "KILN" IN ENGLISH.

1 Cintra Terrace, Cambridge: April 17, 1875.

May I be allowed to make a correction in my former letter on the subject of the derivation of

the word *kiln*? I beg leave to say that the spelling *cylen* of the Welsh form was a mere momentary lapse, and that I meant to have written *cylyn*, for the simple reason that such is the spelling given in such dictionaries as contain the word.

Mr. Rhys gives valuable advice, which I hope to find useful; but I think it very hard that he should have been at no pains to look up the authorities on the subject. The *W. cylyn* is mentioned in connexion with *kiln* in Wedgwood and in Webster; though they both give examples of the word in other languages. Indeed, we find *cylene* given in Anglo-Saxon as a gloss upon the Latin *culina*, and *kylna* is given as an Icelandic word by Cleasby and Vigfusson. But what I most wish to point out is that I merely followed what I took to be very good authority, viz., the list of Welsh words occurring in English which was drawn up by Mr. Garnett and reprinted in Marsh's *Lectures on the English Language*, as reprinted by Dr. Smith in 1862, at p. 45. The word *kiln* has, in fact, been commonly regarded for many years as a stock example of a Celtic word; it appears, for instance, in the very short list given in Dr. Morris's *Elementary Outlines of English Grammar* at p. 8. Hence I did no more than cite what has been held by many English philologists for many years; and, having a strong feeling that the study of "Celtic" is difficult and dangerous ground, I thought it better to defer to the commonly received opinion in this matter. I think, then, that the error, if it be one (as I now suspect it is), may very much more fairly be charged upon others than myself, as I merely quoted a common opinion in preference to taking upon myself the responsibility of calling it in question. And I would suggest to Mr. Rhys that, if he wants to do us good service, he should read over Mr. Garnett's list and let us know how much of it we are to believe.

I hope I may now be left in peace. At any rate, I am more confirmed in my opinion than ever that the investigation of English etymology is at present no proper part of the duty of the English Dialect Society, and that we had better collect the words instead of discussing them. I hope I may be supported in this view by those who care for sound scholarship.

WALTER W. SKEAT.

THE WORD "CYLYN."

Llanymawddwy, Merioneth: April 19, 1875.

Whether the Welsh borrowed the word *cylyn* from the English, or the English from the Welsh, or whether both languages are indebted for it to a common source, I leave to others to decide; but I may be permitted to mention, that during a residence of upwards of a quarter of a century in North Wales I have not heard any other term used for a kiln, for whatever purpose intended. I have invariably heard it pronounced *cylyn* (not *cilyn*); and of this pronunciation I am reminded almost every day, as, within a stone's cast from the place where this note is written, a steep part of the road leading in the direction of Bwlch y Groes and Bala is known as *Rhiw Cylyn*, so called from a kiln which in time past stood by the side of it. Mr. Skeat's *cylen* must be a clerical or typographical error, for that form of the word is, I believe, nowhere to be found. I was not aware until I read Mr. Rhys's letter in the *ACADEMY* for April 17, that *cylyn* is at all in colloquial use in any part of South Wales. He probably refers to the upper or northern part of Cardiganshire, for in the middle and lower portions of that county the word is unknown, its synonym *odyn* being the term employed. Linguistically, northern Cardiganshire has a good deal in common with the southern parts of Merioneth and Montgomeryshire.

That the word does not occur in our older literature does not necessarily lead to the belief that it is an exotic term of recent introduction. The written literature does not contain nearly all the words of the language. There are at the pre-

sent day in common use in different parts of Wales scores of apparently genuine Welsh words which are not found in any Welsh writing that has come under my notice; and this absence from the literary language is not peculiar to words of foreign or doubtful origin. Take, for instance, *dynes* (woman), a term in daily use all over North Wales, and more or less employed in most parts of the South; yet, I think I may safely say that it is not to be found in any book, printed or manuscript, a century old. In fact, we seldom find it employed by any writer before the commencement of Welsh journalism. Whether from some misgiving as to the pedigree of *cylyn*, or from some other cause, Welsh writers seem to have avoided it, and preferred the less questionable *odyn* whenever they had occasion to mention this sort of fabric. The fact, however, that *cylyn*, to the exclusion of *odyn*, is at the present day in constant use over so large a portion of the Principality, and appears to have been so from time immemorial, looks as if the word was not an upstart among us.

Cylyn seems to be, in form at least, a diminutive of *cyl*, a word which has the same signification, and for which a printed authority of some two hundred years old might be quoted. Charles Edwards, a Denbighshire man, in *Hanes y Ffydd*, the first edition of which was published in 1671, employs the word in the ninth chapter, thus: "Dewisodd tri chant yn Carthago eu bwrw i gyl poeth, yn hytrach nag aberthu i eulun."

This passage, a little distorted, will be found in Pughe, s. v. *Cyl*. Welsh authors, especially prose-writers, up to the time of the Reformation, preferred the Southern dialect for their literary compositions. D. SILVAN EVANS.

HANDEL AND BACH.

Basebourne, near Midhurst, Sussex: April 20, 1875.

The able letter which appeared in the *ACADEMY* of April 10, signed by G. Downing Fripp, respecting the appropriation by Bach and Handel of the air "Col freddo suo velen," is incontrovertible testimony; both of these great masters undoubtedly adopted the little foundling and made it "beautiful for ever." Dr. Arne was well aware of his friend Handel's tendency to absorb airs or phrases unconsciously, and among other traditional reminiscences has transmitted the following. Handel was dictating the chorus in *Alexander's Feast* "The many rend the skies," and had arrived at the part in the allegro where the words occur "And Music won the cause," when the amanuensis remarked "That passage is Corelli's." "Then put it down," said Handel, "it is all de better for dat." The phrase in question is in the allemanda of Corelli's eighth sonata. The giant knew that he had the power of returning gold for brass, and that whatever he worked upon was to him as the metal in the hand of Cellini.

MARIA WHEELER.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Ap. 24, 2.30 p.m.	New Philharmonic Concert, St. James's Hall.
3 p.m.	Physical: Papers by Mr. J. Barrett and Dr. Stone.
"	Royal Institution: Mr. George Smith on "The History of Assyria."
"	Crystal Palace: Mr. Manns's Deneft Concert (Bülow).
3.45 p.m.	Royal Botanic.
8.30 p.m.	Amateur Orchestral Society, Royal Albert Hall.
MONDAY, April 26, 5 p.m.	London Institution: Professor Bentley on "The Classification of Plants." IV.
6 p.m.	Philosophical Club: Anniversary.
8 p.m.	Thrd Philharmonic Concert, St. James's Hall (Wilhelmj).
8.30 p.m.	Geographical.

TUESDAY, April 27, 3 p.m.	Royal Institution: Professor P. M. Duncan on "The Grandeur Phenomena of Physical Geography."
8 p.m.	Anthropological Institute: Rev. Dr. Mullens on "Origin and Progress of the People of Madagascar;" Mr. J. J. Monteiro on "The Quissama Tribe of West Africa."
WEDNESDAY, April 28, 12 noon	Civil Engineers.
4.30 p.m.	London Institution: Anniversary.
"	Royal Society of Literature: Anniversary.
8 p.m.	Society of Arts. Geological.
"	Archaeological Association: Mr. E. Roberts, "Notes on the Roman way to Verulam."
THURSDAY, April 29, 1 p.m.	Zoological: Anniversary.
3 p.m.	Royal Institution: Professor H. G. Seeley on "The Fossil Forms of Flying Animals."
5 p.m.	Zoological Gardens (Davis Lecture): Mr. J. W. Clark on "Seals and the Walrus."
6.30 p.m.	Royal Society Club.
7 p.m.	London Institution: Dr. E. A. Freeman. V.
8 p.m.	Society of Arts: Mr. H. Blackburn on "Art in America."
8.30 p.m.	Royal. Antiquaries.
FRIDAY, April 30, 7.30 p.m.	Sacred Harmonic Society, Exeter Hall: Costa's <i>Eth.</i>
9 p.m.	Royal Institution: Mr. W. N. Hartley on "The Action of Heat on Coloured Liquids."

SCIENCE.

The Native Races of the Pacific States of North America. By Hubert Howe Bancroft. Vol. I. "Wild Tribes." (London: Longmans & Co., 1875.)

THE history of this book, as well as its contents, is of public interest. Mr. Bancroft, who is a publisher in San Francisco, describes in his preface how some fifteen years ago he set himself to the task of collecting books and manuscripts relating to the Pacific States, with the view of forming a complete special library.

"After securing everything within my reach in America," he says, "I twice visited Europe, spending about two years in thorough researches in England and the chief cities of the Continent. Having exhausted every available source, I was obliged to content myself with lying in wait for opportunities. Not long afterward, and at a time when the prospect of materially adding to my collection seemed anything but hopeful, the *Biblioteca Imperial de Méjico*, of the unfortunate Maximilian, collected during a period of forty years by Don José Maria Andrade, littérateur and publisher of the city of Mexico, was thrown upon the European market, and furnished me about three thousand additional volumes."

But when, in 1869, Mr. Bancroft had accumulated some sixteen thousand books, manuscripts, and pamphlets, and determined to set to work on this enormous mass of matter, he found that a life-time was not enough to deal with it in. Knowledge of no small value to the world was there, but the facts were so imbedded in trash, that a mountain of chaff had to be sifted to get at a few grains of corn. Accordingly, with Mr. Oak, his librarian, and a number of assistants, he set to work to read the whole library and to index every passage worth recording. The system on trial stood the test, and Mr. Bancroft had before him the classified information of 1,200 authors before proceeding to condense the essence of it into a single armful of books. This great work is to be completed in five volumes. The first, now published, contains the description of the savage tribes from above the Arctic Circle down to the Isthmus of Panama. The second will treat of the more cultured races of Mexico and Central America. The remaining three will be a digest of all avail-

able information as to the mythology, languages, antiquities, and migrations both of the lower and higher races.

It is favourable to the prospects of anthropology, within the range of which science almost the whole contents of this volume belong, that its cultivators are aware of their need of business methods as well as philosophical skill. It is only by an almost mechanical process of classification that the facts, on record by hundreds of thousands as they are, can be properly brought under consideration. When this preliminary toil is done, the nice task of criticism and generalization begins. A successful anthropological result depends on this combination of labour and scientific ability. The late Professor Waitz had both qualities in a high degree, and his *Anthropologie der Naturvölker* (ably completed by Dr. Gerland) will, as the century goes on, be more and more used for the purpose he contemplated—that of helping to form a basis for a philosophy of human life. Waitz's great work—taking in, as it does, the greater part of the uncivilised world—devotes but a few hundred pages (in vols. iii. and iv.) to the tribes whom Mr. Bancroft describes at ten times the length, and from a fuller library of authorities, including many new ones. Still there is much similarity between the two works both as to materials and method, and in estimating the present volume one naturally compares it with the corresponding sections in Waitz. The American anthropologist, however, seems not to be acquainted with the work of his German predecessor, whose name does not appear among the 1,200 authors in his list. Though disadvantageous in some respects, this independence may perhaps be reckoned an advantage by students who desire information as to any particular tribe, and can take one account as at once a check and a completion to the other.

Mr. Bancroft arranges his wild tribes geographically, in groups from north to south. There was no other method so available. It could scarcely have been possible to draw absolute distinctions of race, unless between the Esquimaux type, and what may be vaguely called the American type, which includes all the rest. As for civilisation, some of the tribes are roving hunters and fishers, such as the Esquimaux and the Tinneh of the "Great Lone Land;" others have more or less native agriculture, such as some Apache and Mosquito tribes. The Pueblo or Town Indians of New Mexico, with their cities of tall houses and their local government, are somewhat too far advanced to be properly included among wild tribes at all. The same may be said of many Indian villagers in Mexico, who have not much left of the old native civilisation, and have not gained much from the Spanish invaders, but who on the whole live more as rude peasants than as savages. It does not seem easy to attempt an exact classification of the tribes according to their place in civilisation, and Mr. Bancroft does not attempt it, but merely lays out his materials for the sociologist to use. Among the multitude of points of interest in his descriptions, a few may be here selected for brief remark.

The survey starts from the extreme north, above Bering's Straits. It is curious, by the way, to see an American purist restoring the name of "Bering" to the Danish navigator's own spelling, and repudiating the Germanised form "Behring;" while, on the other hand, the Danes themselves are adopting this foreign form, and printing "Behrings-Stræde" in their maps. We first find classed as Esquimaux proper the wandering fishers who fringe the Arctic sea-coast down to Kotzebue Sound. The fullest information about this well-known race comes from the Greenland side, and Mr. Bancroft's account, taken from Western explorers, is scanty. He mentions, however, a crafty device used by them for killing the polar bear. The hunters bend pieces of stiff whalebone and freeze each into a ball of blubber; then they entice the bear to pursue them, dropping in his path the frozen balls, which he stops to swallow; when the blubber-balls thaw, the whalebones spring open, and put an end to the hapless beast. This trick was perhaps not known to the old Greenlanders. Passing farther south, we come to the Koniagas, a cluster of tribes ranging from Kotzebue Sound to the island of Kadiak. It is a somewhat interesting question, under what race these people are to be reckoned. Most ethnologists, including Waitz, treat them simply as Esquimaux. Their languages, of which vocabularies are examined in Buschmann's great work on the North American languages, are distinctly Esquimaux dialects. This, indeed, is evident from their names of tribes, e.g., the *Kwich-pagmuta*, "dwellers on the great river." The details of their civilisation, such as the use of labrets or lip-ornaments, their clothing, skin canoes, weapons, &c., have much correspondence with those of the Esquimaux. But, on the other hand, they are a taller people than the northern Esquimaux; and there is even a mention of a chief seven feet high among them. Thus it is likely that they may be a cross between the Esquimaux and others. This is almost certainly the case with the next group of tribes, the inhabitants of the Aleutian Archipelago. It has been thought from the appearance of these Aleuts that they may be more or less of Asiatic origin, and they have a tradition that they came from Asia; while Buschmann (p. 702) shows that their language is a peculiar one, though containing a number of Esquimaux words. It thus seems not unlikely that ethnological materials may exist for working out the problem whether there has been any emigration of Asiatic tribes across Bering's Straits into America, as well as the insignificant Esquimaux migration into Asia.

Among the Thlinkits or Koloshes, in the district south of Mount St. Elias, a point deserving of notice is the fairness of the native complexion (p. 97), "as fair as many Europeans" (Langsdorff); "eran de color blanco y habia muchos con ojos azules" (Perez). Much the same is said of the Haidahs of Queen Charlotte's Island (p. 157), "fair in complexion, sometimes with ruddy cheeks" (Hale), "their young women's skins are as clear and white as those of Englishwomen." From such accounts as these it appears that the North American

skin, deep yellow-brown or red-brown in most parts of the continent, lightens into remarkable fairness in this north-western district. But whether this is the result of natural change, or whether a fair race from the west has shared in the population, is quite unknown. Neither language nor custom has as yet thrown light on the complex ethnology of the west coast of North America.

Under the title of New Mexicans, Mr. Bancroft groups the tribes from California across to Texas. Mountain ranges, with desert plains between, furnish much of the geography of this wild land, where rove those fiercest of savage hordes, the Apaches and Comanches. In this region, under more favourable local conditions, are found also the Pueblo Indians of New Mexico and Arizona, who are semi-civilised town-people (Spanish *pueblo*=town). The fortified houses of these people, which were first made known by the Spanish explorers of three centuries ago, are thus described (p. 534):—

"The towns of the Pueblos are essentially unique, and are the dominant features of these aboriginals. Some of them are planted in valleys, others on mesas (i.e., plateaus); sometimes they are planted on elevations almost inaccessible, reached only by artificial grades, or by steps cut in the solid rock. . . . A Pueblo consists of one or more squares, each enclosed by three or four buildings of from 300 to 400 feet in length, and about 150 feet in width at the base, and from two to seven stories of from eight to nine feet each in height. . . . The stories are built in a series of gradations or retreating surfaces, decreasing in size as they rise, thus forming a succession of terraces. In front of the terraces is a parapet, which serves as a shelter for the inhabitants when forced to defend themselves against an attack from the outside. These terraces are about six feet wide, and extend round the three or four sides of the square, forming a wall for the occupants of the story resting upon it, and a roof for the story beneath; so with the stories above. As there is no inner communication with one another, the only means of mounting to them is by ladders, which stand at convenient distances along the several rows of terraces, and they may be drawn up at pleasure, thus cutting off all unwelcome intrusion. The outside walls of one or more of the lower stories are entirely solid, having no openings of any kind, with the exception of, in some towns, a few loopholes. The several stories of these huge structures are divided into multitudinous compartments of greater or lesser size, which are apportioned to the several families of the tribe. . . . The roofs or ceilings, which are nearly flat, are formed of transverse beams which slope slightly outward, the ends resting on the side walls; on these, to make the floor and terrace of the story above, is laid brushwood, then a layer of bark or thin slabs, and over all a thick covering of mud sufficient to render them watertight. The windows of the upper stories are made of flakes of selenite instead of glass. The rooms are large, the substantial partitions are made of wood and neatly whitewashed. . . . Houses are common property, and both men and women assist in building them; the men erect the wooden frames, and the women make the mortar and build the walls. In place of lime for mortar, they mix ashes with earth and charcoal. They make adobes, or sun-dried bricks, by mixing ashes and earth with water, which is then moulded into large blocks and dried in the sun. Some of the towns are built with stones laid in mud."

The Pueblo tribes who build these remarkable towns are, as may well be supposed, otherwise advanced in civilisation. The earliest European visitors describe them as

agriculturists, and their irrigation canals are made and kept in order by the community. They have what seems a native cleverness in such arts as weaving and wall-painting. Their organised system of town government existed in the time of Vazquez de Coronado (1540). It would, of course, be wrong to give these interesting people credit for the whole of their civilisation. Mr. Bancroft does not lay stress on the Spanish-Christian influence which was at one time strong among them, and though they have long since cast it off, to return in a measure to their old ways, yet it has left its effects. Thus, the famous name of Montezuma has been transplanted to become a legendary personage among them, and to be mixed up in their sun worship. They use the *metate* or mealing-stones, an instrument evidently imported from Mexico, and no doubt some Spaniard's hint led to their using selenite for window-panes. With all this, however, the native independent elements in Pueblo civilisation are well-marked, and we may, to a great extent, accept Mr. Bancroft's opinion that it was "a spontaneous awakening from the ruder phases of savagism" (p. 473), the Pueblos being "partially reclaimed Apaches or Comanches" (p. 476). From such an opinion, however, a practical inference must be drawn. If the same race who are in the desert the most irreclaimable of savages have become in the valleys a settled people half-way to civilisation, then it is scarcely open to doubt but that the "North American Indians" in general might, under favourable conditions and judicious treatment, have been absorbed into civilised life, instead of being "improved off the face of the earth."

EDWARD B. TYLOR.

CELSUS' ATTACK ON CHRISTIANITY.

Celsus' Wahres Wort, älteste Streitschrift antiker Weltanschauung gegen das Christenthum vom Jahr 178 n. Chr. Von Dr. Theodor Keim. (Zürich, 1873.)

ALTHOUGH this Essay has been published more than a year, it is not too late to recommend it very heartily to our readers, especially at a time when the history of the second century is so much discussed as it is at present. It belongs to a series of Dr. Keim's writings which are of no little importance to the student of ecclesiastical history, though less known probably in this country than his recent work on the origin of Christianity. Many who regret most deeply the principles and conclusions of that laborious book will find much to sympathise with in these historical essays. In discussing, for instance, the date of the Epistle to Diognetus, he is a valuable ally against those who like Overbeck would assign it to the fourth century, and his little book on the conversion of Constantine is an excellent refutation of many of Burkhardt's exaggerations. Similarly he has done good service in this attempt to define the exact position of Celsus and to reconstruct his polemic, for the first time (as it seems) in a modern language. Though the matter is arranged somewhat out of the order in which an English writer would probably have placed it, the whole is an admirable specimen of clearness and

method. It consists, first, of the text of the ἀληθὲς λόγος as quoted or epitomised by Origen, and divided into its four parts in logical sequence. Then follow short essays on two contemporary writers (as Dr. Keim holds them to be), Lucian and Minucius Felix; and thirdly, an analysis of the arguments of Celsus, an estimate of their value and of the historical conclusions to be drawn from them, ending with a discussion of the date of the composition and of the personality of the author.

The importance of the undertaking is obvious when we consider how little we know of the attacks made by cultivated heathens upon Christianity. Besides the satire of Lucian on the death of Peregrinus, we have nothing, except the late and clumsy Philopatris, which has not come down to us in the replies of Christian opponents. Fronto and Porphyry have disappeared, and Hierokles and Julian (like Celsus) have to be reconstructed mainly from the pages of their adversaries. The commonplaces of the controversy can, no doubt, be gathered from the Greek apologists, and in an especially clear manner from the first half of the *Octavius* of Minucius Felix; but Celsus was, it would seem, an abler champion than those with whom they generally had to deal. He abstained in great measure from the gross and trivial calumnies against the Christian life which were the staple of the vulgar polemics, and really had a system (such as it was) to offer in place of Christianity. He knew something, too, of its relation to Judaism, and he could employ his knowledge of the differences between Jews and Christians, between the Church and the heretics, and between the sects themselves, as potent and destructive arguments. He anticipated, in fact, almost all the modern objections to the doctrines of the Church. It is, therefore, of great importance to read what he had to say in a connected and intelligible form at once popular and trustworthy, and this Dr. Keim enables us to do.

We are also grateful for the new light which is thrown upon some of the difficult questions that surround this subject. The first relates to the general position taken up by Celsus. Three divisions of his polemic are usually recognised:—(1) the attempt to overthrow Christianity from a Jewish point of view, couched in two addresses supposed to be delivered by a Jew to our Lord and his disciples; (2) a general attack from the side of philosophy on the revolutionary character and folly of Christians, and specially on the belief common to them with the Jews of a providential dispensation of which they are the centre; and (3) a particular criticism of doctrines, many of which are explained as misunderstandings of philosophical conclusions. In addition to these Dr. Keim has brought into prominence a fourth part, and that one of great interest, namely, the system which Celsus recommends to Christians in place of their own, and which is contained in the reply of Origen from vii. 62 to the end of the book. The question may indeed be raised whether it was sharply marked off from the preceding part, but there can be no doubt of its logical distinctness. It is interesting to

note this early appeal to Christians to descend from their position as possessors of absolute truth, and to take their stand among the other religious sects of the world—an appeal heard not indistinctly in our own day, though on somewhat different grounds. Celsus was quite willing to allow Christians to worship the supreme God, if they would not so persistently refuse the respect due to the inferior deities, which he and they alike called by the name of δαίμονες. He argues among other things that the doctrine of the Son of God and the worship paid him by Christians, was a step in this direction (Origen viii. 13). He would himself possibly have been ready to accept our Lord as a δαίμων, though in some Cerinthian or Docetic sense (see viii. 39 cp. v. 2 foll.). The reply of Origen was of course that δαίμονες was not an indifferent term, but on Christian lips meant only evil spirits, and that even if there were such beings as Celsus held, they were distinct in kind from God the Word, the Son of God. Yet we cannot be surprised if Celsus expected to receive some acceptance for his theory among the various Gnostic sects, with which he seems to have had more acquaintance than with orthodox Christians. Nor can we fail to sympathise with the yearning after a mythical period when all nations were subject to “one law and one doctrine” which he shares with Maximus Tyrius and Plutarch (see Keim, p. 213).

Of the historical points treated in this essay, the most generally interesting are the date of Minucius Felix and the identification of Celsus with the friend to whom Lucian addressed his life of Alexander the impostor of Abonouteichos. Dr. Keim adopts the earlier date assigned to Minucius, which has recently been defended by Ebert, and we think with justice. The question turns chiefly on two points—the relation of the *Octavius* to Tertullian's apology, and the internal evidence which it affords as to the position of Christianity. Probability certainly inclines to the reign of M. Aurelius rather than that of Alexander Severus. The latter date seems to be based on two misconceptions—a false idea of the originality of Tertullian, and an oversight of those passages of the *Octavius* which point to an era of persecution, e.g. *jam non adorandae sed subeundae cruces*. The difference between Tertullian and Minucius is one rather of style than of originality. The quaintness and warmth of the great African is not incompatible with a vast deal of borrowing from his predecessors, Christian and heathen alike. And if he employed the language of Justin, Tatian and Irenaeus, why not also that of Minucius? The mention of Fronto seems also much in point. Granted, that he was the well-known rhetorician, the preceptor of M. Aurelius, whose letters were recovered near the beginning of this century, it is much more likely that he should be mentioned by one who was a contemporary than by a writer who lived after Tertullian. From the absolute silence of other authors with respect to his polemic, it is fair to conclude that it was a pamphlet which had its run and then dropped into obscurity. Otherwise, we have to suppose that Tertullian passed over a writing of an author, an

African like himself, which a later writer refers to as an authority worth refuting. Fronto is, in fact, the only opponent whom Minucius mentions by name, and it is not altogether an improbable conjecture (though not one of Dr. Keim's) that the speech of Caecilius, in his dialogue, is a *résumé* of his arguments. No doubt there are points of connexion, as Keim has shown, between the statements of Celsus and Caecilius, but their general position differs very decidedly in two important elements—the absence of a philosophical point of view in Caecilius, and the presence of the whole farrago of calumnies, of which Celsus knows hardly anything. One of these calumnies is specially stated to have been propagated by Fronto (*Octavius*, chaps. ix. and xxxi.), and the absence of a theoretical basis would be quite in harmony with the character of a man who, in his extant letters, now sharply and now plaintively dissuades his royal pupil from philosophical studies as destructive of his taste in rhetoric. But after all we know too little of this production of Fronto's to lay much stress upon this conjecture, especially as it is of no real importance in determining the date of Minucius. There are other arguments for the early date which will be differently estimated by different minds. We do not feel sure that Dr. Keim does not attach too much importance to the use of *reges* in the plural as indicating the double rule of Aurelius and Verus, and to the hatred of the Roman Empire expressed in chapter xxxvii., as pointing to the persecution of the year 177 (p. 156).

The date and personality of Celsus is much more difficult to determine with certainty. The name is a common one, and Origen evidently was doubtful to which of two persons of the name the book was to be assigned. He concluded, on the whole, that it was to be referred to an Epicurean who lived under Hadrian and his successors, and wrote books against magic. If this conclusion was right, we have a very probable inference that our Celsus is to be identified with the friend of Lucian, who also wrote against magic. But Origen is not quite sure of this identification, for the Celsus against whom he wrote was much more a Platonist than an Epicurean, and almost seems to have believed in the reality of magic, and to have ascribed to its means the miracles of Christ (Origen i. 68). The latter passage, however (which is well worth reading), is less conclusive than it appears at first sight. It occurs in the supposed speech of the Jew, and only acknowledges the reality of the miracles for the sake of argument, and in order to degrade them by comparison with those of the impostors of the day. That the Celsus of Origen was an enemy to the *yōmres* is clear from his language about the itinerant prophets of Palestine and Phoenicia (vii. 9, 11, but cp. viii. 48). As to the tradition which makes him an Epicurean, it may have arisen from his friendship with Lucian, who may well have been familiar with a Platonist of his temper and critical spirit, just as he was with the Stoic Arrian. Nevertheless, the fact remains that the natural inference from the language of Lucian to his friend is, that he was addressing an Epicurean; and this will always be

weak point of the identification. Dr. Keim shows that it is not an absolute necessity to draw this inference, and insists very forcibly on the likeness in character between Celsus of Origen and of Lucian, and on the whole establishes the probability of their being really one. After all, the question is of no great moment, as Celsus cannot well be later than the time of Marcus Aurelius; and we cannot prove that he was earlier.

The assumption that Celsus was a contemporary of Origen (made by the author of a book on *Supernatural Religion*) is based on two very inconclusive arguments. The first is that because Origen did not know much about the personality of Celsus, he did not know whether he was alive or dead; whereas, the fact seems to be that he knew along that he lived some time previously, it could not find out much about him. The second is that at the close of his book he speaks of Celsus' promised treatise on orality, and asks Ambrosius to find out whether he has fulfilled his promise, and if so to send it, using language which might apply to a contemporary. Perhaps the author referred to has read no more of Origen than he quotes, and is not aware that he speaks of Celsus throughout as a (hypothetically) present antagonist, and generally in the present tense. Otherwise this must be simply termed a piece of special pleading.

The discussion of the relation of Celsus to the canon is interesting and instructive, though necessarily tinged by Dr. Keim's views as to the origin of Christianity. Thus he tells us that Celsus' use of Pauline expressions, though not directly drawn from the epistles, shows "in an interesting manner the strong revival of the Pauline doctrine amongst Gnostics and churchmen in the middle of the second century, after Paul had for a considerable time previous been buried under a bushel" (p. 225). This raises, of course, immediately the fundamental question as to the Ebionism of the early Church, which we have to thank Dr. Lightfoot especially for bringing to the test of common sense and historical probability.

We are glad, however, to note the statement that "after long and mistrustful criticism it is found necessary to conclude that the Christian writers since the middle of the second century, and especially Justin Martyr, were acquainted with our Gospels" (p. 227). So, again, Dr. Keim asserts that Celsus used all the four Evangelists, and points out several passages, some of which have been before overlooked, in which he distinctly employs St. John (p. 299). He takes care, of course, to show his own view of the fourth Gospel, which this is not the place to criticise. But with the admissions of Dr. Keim on the one hand, and of Mr. Canon on the other, in respect to the history of the Canon, the apologist for the Christian revelation is able greatly to narrow the field of argument.

JOHN WORDSWORTH.

SCIENCE NOTES.

ANTHROPOLOGY.

Natives of New Guinea.—The last number of the *Proceedings of the Royal Geographical Society* contains an account of the discoveries of H.M.

ship *Basilisk*, in the year 1874. To the three races of New Guinea already known to inhabit the island—viz., the Papuans on the south, the Arfaks of the mountainous country on the north, and the Malays of the north-west—Captain Moresby has added a fourth by the discovery of another, probably a mixed race of Malays and Papuans, inhabiting the whole of the eastern peninsula of New Guinea in its northern and southern shores, from about 148° longitude to East Cape, which is in 150° 53' East longitude, and the adjacent archipelago. This race is distinctly Malayan, but differs from the pure Malay in being smaller in stature, coarser in feature, thicker lipped, and having more frizzled hair. They have high cheek bones, their noses are inclined to be aquiline, the eyes dark and beautiful with good eyebrows; many of the men have light hair and a Jewish cast of countenance; they rise to a height of from 5 feet 4 inches to 5 feet 8 inches, and are sinewy though not muscular, slight, graceful, and eel-like in the pliability of their bodies. This race merges into the pure Papuan in the neighbourhood of Cape Possession, where they vary in colour, stature, and feature; and a mixture of habits confirms the idea of a fusion of race. The new race bury their dead in the ground, and build small thatched huts over them. Their houses, like those of the Papuans, are built on piles, and communicate with the ground by means of a pole notched with steps. They are rude but successful cultivators of the ground, using stone mattocks for turning up the soil; they cultivate yams and taro. Cannibalism does not prevail largely among them, though apparently it is not unknown. They are affectionate to their children, but in some cases were willing to barter them for iron axes. They did not keep their women in the background, but allowed them to have a voice in the trading. The men are but slightly tattooed, but the women are tattooed all over in graceful patterns; the women crop their hair short, but the men wear theirs long and frizzled; the men wear a waistcloth only, but the women a short grass petticoat or ti-ti. Unlike the Papuans they possess the art of making pottery. They are better cooks than the Papuans, and boil their food as well as roast and bake it. The Papuans fish only with a hook and line and a barbed spear, but this race make fishing-nets with fibres of a small nettle-like plant. The Papuans use only outrigger canoes, but these have several kinds. They have developed a system of warlike tactics adapted to the weapons they employ, and when Captain Moresby approached them they formed up in two regular lines, the first line armed with missile spears, and the second line with clubs. This is in conformity with the system adopted by all nations similarly armed, and has, no doubt, been arrived at independently as the result of experience. Upon the whole, they must be regarded as a more civilised race than the Papuans. Up to the time of their discovery by the *Basilisk*, they appear to have had little or no acquaintance with white men.

The Antiquity of Man.—Mr. John Evans, F.R.S., in his anniversary address to the Geological Society, delivered on February 19, and since published by the Society, has summed up the evidence on this subject to the present time. Until within the last two or three years it was generally the received opinion of geologists that the earliest known traces of the occupation of this portion of the globe by man were posterior in time to what is known as the Glacial Period. Since then, however, discoveries have been made which in the opinion of some geologists cast doubt on this limitation of the age of man in Europe. Among these is the discovery of a portion of a human fibula in the Victoria Cave, near Settle, in a deposit overlain by stiff glacial clay containing ice-scratched pebbles. In common with some others Mr. Evans does not regard the age of the clay deposit as conclusively settled, and thinks it possible that it may have been either reconstituted or even accidentally

redeposited at a later period. Mr. James Geikie, however, arguing on more general grounds, has come to the conclusion that the palaeolithic deposits are of preglacial and interglacial age, and do not in any way belong to post-glacial times. If this view could be adopted, there is no doubt that many apparent anomalies would receive a simple and satisfactory explanation; but at Hoxne, Icklingham, Bedford, Ealing, Acton, and elsewhere where implement-bearing gravels occur, they repose on valleys which are cut through the boulder clay, many of the pebbles from which form constituent parts of the palaeolithic gravels, and there can therefore be no doubt that they belong to a period subsequent to the submergence during which the middle and upper glacial beds were deposited. In France the Abbé Bourgeois has attempted to carry man back to Lower Miocene times, relying on implements presumed to have been found in beds of the Calcaire de Beauce, at Thenay, near Pontlevoy. He, however, admits that the implements offer a complete identity with those found on the surface; did they, therefore, belong to these beds we should have the remarkable fact that at that remote period, characterised by mammals as distinct from those of the present day as the acerotherium is from the rhinoceros, or the mastodon from the elephant, primeval man was fashioning implements indistinguishable from those of neolithic times. Mr. Evans therefore suspects some possible error of observation as to their occurrence in these beds. But although for the present we seem unable to find any satisfactory evidence of the existence of man in Western Europe before the glacial period, it by no means follows that none such will eventually be found. It must, moreover, never be forgotten that it is not in this part of the world that a naturalist would be led to look for the cradle of the human race. This is far more probably to be sought in a warmer clime, and amidst a more luxuriant vegetation, yielding throughout the year some readily available means of subsistence both to man and to animals that would serve him for food.

Psychological Institute.—If the announcement of a new society under this designation were really calculated to promote the scientific study of psychology, it would be hailed with satisfaction by all who are interested in the study of man. Such, however, is hardly to be expected. Experience has proved that the materials for a separate psychological society apart from general anthropology, are not forthcoming otherwise than by the admission of matter that is beneath the proper dignity of science. This new institution adds another to the list of nine societies which in London alone deal with anthropological subjects, some of them in an extremely feeble and unsatisfactory manner. Such branch societies have usually had a short-lived activity, ending in stagnation; they entail separate apartments, extra salaries to secretaries, and the publication of a vast mass of rubbish in order to maintain an annual volume of Transactions. The same results might be obtained with far greater economy by the formation of special sections under the auspices of a larger society. We can only, therefore, regard the formation of this new society as contributing to the existing disorganisation through which the scientific force of the country is being frittered away.

PHYSICS.

Electric Conductivity of Lead Compounds.—Buff observed in 1850 that the electric conductivity of chloride of lead increases with the temperature instead of diminishing, as is the case with metallic substances. E. Wiedemann has confirmed this observation (*Pogg. Annalen*, cliv. p. 318), using the chloride both in the form of compactly pressed powder, and also fused and then solidified. Iodide and bromide of lead possess the same pro-

perty. It appears, however, that the conductivity is not quite like that of a metal (as was stated by Buff), for at temperatures considerably below the fusing points of the lead compounds a certain amount of electrolysis takes place, as was shown by the polarisation current when the battery was removed from the circuit and the terminals connected with a galvanometer.

Electric Conductivity of Solutions of the Chlorides of Alkalies and Alkaline Earth Metals.—The researches of Professor Kohlrausch and O. Grottrian on this subject are published in the last two numbers of *Poggendorff* (cliv. pp. 1 and 215). It was necessary in their experiments to take great care in noting the temperature and preventing or allowing for any changes in temperature, since the conductivity of electrolytes is influenced by temperature in a very high degree. The source of electricity employed was an induction apparatus, called by the authors a Sine-Inductor, and described in the *Jubelband* (p. 290). A magnetised disc is rotated in a coil of wire with such velocity as to produce from 100 to 200 currents in alternate directions in a second. The object of employing a system of currents in alternate directions is to prevent the polarisation of the electrodes.

The authors have determined the conductivities of aqueous solutions of nitric acid and of the chlorides of sodium, potassium, ammonium, lithium, magnesium, barium, strontium and calcium. Three sets of experiments were made, as nearly as possible at the temperatures 0° , 18° , and 40° . The conductivity of each substance was investigated at each of these temperatures, the strengths of the solutions varying from 5 per cent. of the anhydrous salt up to complete saturation. For a given percentage strength of the solution, it was found that the conductivity increased very rapidly with the temperature, the rate of increase being not quite uniform, but much more nearly so than might have been expected. For instance, the conductivity of potassium chloride (5 per cent. of salt) which is 421 at 0° , becomes 931 at 40° : this increase is immensely great as compared with that of the electric resistance of a metal or the pressure of a gas. When the temperature remains constant, the conductivities increase continuously with the percentage strength of the solution. The chlorides of calcium and magnesium, however, are exceptions to this rule, the solution of CaCl_2 having a maximum conducting power when it contains 24 per cent. of salt, and that of MgCl_2 similarly when it contains 19.8 per cent. Nitric acid of maximum conducting power has a specific gravity 1.1945 (at 17°C).

Ebullition of Liquids.—In a paper on the theory of ebullition (*Ann. de Chim. et de Phys.* sér. v. vol. iv., p. 335), Professor Gernez gives an historical résumé at some length of what has hitherto been effected in this direction, and then proceeds with the description of his own new experiments and the views he founds upon them. His experiments go to show that solid bodies, which provoke ebullition in superheated liquids, lose this property when they have been strongly heated; that solid bodies without chemical action on superheated liquids cease to provoke the formation of bubbles of vapour when they have been long used to maintain ebullition; and that such bodies, which have been rendered inactive by being long kept in boiling liquid or by the influence of heat, regain their activity on exposure to the air. He states, also, that bodies whose surface is not in contact with air, or which do not contain air or gas in their interior, are without action on superheated liquids, and that a gaseous atmosphere determines ebullition in a superheated liquid. M. Gernez regards ebullition as an evaporation at the surface of gases introduced into the liquid, an infinitely small quantity of gas being sufficient to maintain ebullition indefinitely. The arrangement of the experiment which was the basis of this conclusion was as follows. A small cup-shaped cavity was formed at the end of a glass rod, which was specially cleansed. The little cup

so formed could be made to contain an indefinitely small amount of air, and could be depressed mouth downwards into the liquid. The heat being properly regulated, bubbles of vapour were formed regularly at the mouth of the cup, and there only. Some of these experiments were continued for twenty-four hours, this being rendered possible by the fact that the tube in which the liquid was boiled was of considerable length, so that the vapour was condensed before it left the tube and flowed back, there being thus no waste of liquid. The air could be got rid of by arranging the cup obliquely at the end of the glass tube and then inclining it. As soon as the air escaped ebullition ceased.

Some of the views of M. Gernez are combatted by Mr. C. Tomlinson (*Phil. Mag.*, April). The latter maintains that the inactivity of a glass rod or other solid body introduced into a gaseous solution depends on its being chemically clean. A cage of fine wire gauze was submerged in soda-water, but there was no escape of gas so long as it was chemically clean. When taken out, rolled between the slightly greased hands, and again lowered into the soda-water, the gas escaped from its side in bubbles with an audible noise. Supposing a liquid, at or near its boiling-point, to be constituted like soda-water, Mr. Tomlinson refuses to admit that a solid, such as a glass rod, introduced into a boiling liquid (water for example), becomes covered with bubbles of steam by virtue of the air carried down by the rod. If the rod be unclean (that is, contaminated with a greasy film), the steam-bubbles cover it precisely after the manner of gas-bubbles, because there is adhesion between the steam-bubbles and the film, and not between the water and the film, and hence there is a separation. A chemically clean glass rod has no such action, not because the act of cleaning it deprives it of its adhering air, but because there is perfect adhesion between a vaporous supersaturated solution and a chemically clean surface.

Specific Heat of Carbon, Boron, and Silicon.—The continuation of Dr. H. F. Weber's researches on the specific heats of the elements carbon, boron, and silicon, some points in which were noticed in the *ACADEMY* for March 27, is given in this month's number of the *Phil. Mag.* These elements, which have hitherto formed the most marked exceptions to the law of Dulong and Petit, he has conclusively shown to obey the law when a certain temperature is reached. The values of the specific heats of the elements carbon, boron, and silicon, change with the temperature; these values gradually increase with an increase of temperature until a point is reached at which they are constant. This point is situated at about 600° for carbon and boron, at about 200° for silicon. The specific heat of carbon at 600° is about seven times, that of boron about two-and-a-half times, as great as at -50° . Their final constant values are, for carbon 0.46, for boron 0.50, and for silicon 0.205. The products of these numbers into their atomic weights (12, 11, and 28, respectively) are:—

5.5, 5.5, and 5.8,

values which are in keeping with the atomic heats of the metals and of the other non-metals. Dulong and Petit's law may therefore be accepted as binding in the case of all the elements; it must, however, be formulated in a manner slightly differing from that ordinarily laid down. Thus, the specific heats of the solid elements vary with the temperature; nevertheless, for every element there is a point (t°) from which the variation with the specific heat with increasing temperature is entirely insignificant. The product of the atomic weight into the specific heat (estimated at temperatures above t°) is for all the elements a nearly constant number, varying from 5.5 to 6.5.

Spectrum Photographs.—In the last number of *Poggendorff* H. W. Vogel describes a simple apparatus for photographing the spectrum of the sun, or other spectra. He removes the lens from

an ordinary photographic camera, and replaces it by a pocket spectroscope, fitted into the aperture by means of blackened cork. The sun's rays are allowed to fall on the apparatus parallel to the axis of the spectroscope. The lines, though not very sharp, are sufficiently so for many purposes, and for the comparison of absorption spectra.

Spectrum of the Aurora.—In the *Philosophical Magazine* Mr. J. R. Capron has described the results of comparison of auroral spectra with the spectra of hydrogen, carbon, oxygen, air, phosphorus, retted hydrogen, and iron. Mr. Capron considers that the conclusion of Ångström, that the "moisture" in the region of the aurora must be regarded as "nil" cannot be maintained. He sums up the present state of our knowledge of the aurora question as follows:—"The yellow-green line, and possibly also the red, are due to phosphorescence or fluorescence; the fainter lines are partly due to the spectrum, and the remaining bands or lines may be due to phosphorus and iron, the close coincidences in this latter spectrum with the auroral lines being very striking."

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (Monday, April 5).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.

Mr. W. L. Distant, of West Dulwich, was balloted for and elected a member.

Mr. Jenner Weir exhibited a number of young *Mantidae* that had emerged from an egg-case received from Oeylon.

Mr. Bond exhibited a specimen of an exotic Locust taken alive at the bottom of a well near Brighton. The species was uncertain.

Mr. Sealy read some notes on the habits of the species of *Ornithoptera* from the Malabar coast, exhibited at the last meeting. It was closely allied to *O. Amphirius*, but there were doubts of its identity. The pupa possessed the power of causing a sound. He called attention to a peculiarity in the formation of the hind wings of the males, there being a large pouch on the anal margin, filled with fluffy hairs.

Mr. McLachlan read a letter from an Englishman residing in Pueblo, Colorado, U.S., stating that from his experience of the potato beetle, the insect could live on the tubers as well as on the haulm, and that unless the English authorities took some steps to prevent the importation of potato bulbs, he believed the beetles would soon be in this country.

Mr. McLachlan also drew attention to a remark by Lieutenant Carpenter in the Report of the Zoological Collections made in Colorado during the summer of 1873, when he noticed that not a single specimen of the potato beetle was to be found to the west of the Rocky Mountains, though he believed it would be ultimately spread over that region by the agency of the seed, as the insect was of too sluggish a nature to be capable of spreading itself so rapidly by its own instinct; and his belief was further sustained by its continued absence from the Salt Lake basin, occasioned by the cheapness of vegetables in the Mormon settlement rendering the importation of potatoes from Colorado unnecessary.

Mr. Bates believed the distribution of the beetle depended more upon climatic conditions. The native home of the insect was on the eastern plateaux of the Rocky Mountains, and the climate of the Pacific Coast being more like that of the west coasts of Europe, their faunas also bore a greater resemblance. He believed the absence of the insect from the west of the Rocky Mountains to be caused by the difference of climate, and the same cause might be expected to prevent the establishment of the insect in countries like Britain, where the moisture of the atmosphere would probably be fatal to it.

Mr. Edward Saunders communicated the first part of a Synopsis of British Hemiptera (Heteroptera).

ZOOLOGICAL SOCIETY (Tuesday, April 6).

DR. E. HAMILTON, Vice-President, in the Chair. A letter was read from Dr. G. Hartlaub, F.M.Z.S., stating that the finch described by him and Dr. Finsch as new in the Society's Proceedings for 1870, p. 817, and named *Lobiospiza notabilis*, was probably only the young bird of *Amblyura cyano-virens*. Dr. A. Günther exhibited the skin of a new species of mole from British Caffraria, which he proposed to call *Chrysochloris trevelyani*. The Secretary exhibited on behalf of Mr. J. Gould, F.R.S., the original specimen of the parrot (*Apsemictus insignissimus*) spoken of by Mr. Gould in his communication to the Society on November 3, 1874 (P. Z. S. 1874, p. 499): also specimens of two other new species of birds from Northern Queensland, a new honey-eater, proposed to be called *Ptilotis flavostriata*, and a new parrot, proposed to be called *Cyclopsitta maccoyi*. Mr. Osbert Salvin, F.R.S., read a memoir on the avi-fauna of the Galapagos Archipelago. After a summary of what was known of the history and physical peculiarities of these islands, Mr. Salvin proceeded to give a complete account of the birds as at present known to us from the visits of Mr. Darwin, of the naturalists of the Swedish frigate *Eugenie*, and of Dr. Habel, whose collection afforded the principal materials upon which the present communication was based. Of the fifty-seven species of birds known to exist in the Galapagos, about two-thirds were stated to be peculiar to the Archipelago. Mr. A. G. Butler, F.Z.S., read a memoir on the Heterocerous Lepidoptera of the family *Sphingidae*, in which a complete revision of the various genera and species of this family was given. A communication was read from Dr. J. S. Bowerbank, entitled "A Monograph of the Siliceo-Fibrous Sponges," part iii., being the third of a series of memoirs on this class of sponges. A second communication from Dr. Bowerbank contained the seventh part of his contributions to a General History of the Spongiadae. Mr. A. H. Garrod read a paper on the form of the trachea in *Tantalus ibis*, in which the peculiar and numerous convolutions of that tube within the thorax of that bird were described. A communication was read from Mr. G. S. Brady, C.M.Z.S., in which he gave a revision of the known species of British marine mites, together with descriptions of some new species. Mr. C. A. Wright, C.M.Z.S., read a paper on the question of the specific identity of the weasel found in Malta, which he was inclined to refer to *Mustela boccamela*, Bp., hitherto only known to occur in Sardinia.

ROYAL HISTORICAL AND ARCHAEOLOGICAL ASSOCIATION OF IRELAND (Wednesday, April 7).

At the meeting of this Society, at Butler House, Kilkenny, a cocoa-nut shell mounted with silver as a cup was exhibited, which was given to Jonas Wheeler, Bishop of Ossory, by Queen Elizabeth. On the shell are engraved the royal arms and the letters E. R. On the rim beneath the cover is an inscription of the last century, stating that the cup was given to Dr. Wheeler by the Queen on his promotion to the bishopric, but this is manifestly incorrect, as he was appointed to the bishopric by her successor in 1613. The Hall mark shows the date of the manufacture of the cup to be 1665, and it may have been given to the learned doctor when he was made Dean of Christchurch, Dublin, in 1594. It is now the property of the Bishop of Ossory, having been given to Dr. Pocock, the late bishop, by Mrs. Wheeler, widow of a descendant of Dr. Wheeler.

The corporation of Athenry sent for exhibition an ancient seal and mace. The head of the latter is a clenched fist and forearm in solid brass, about five inches long, attached to a handle of about seven inches. The seal bears the legend *Sigillum communitatis de henri*, and for device a castle with two human heads impaled upon the battlements, the hair and beards of which are distinctly

Irish. These may, perhaps, refer to the defeat suffered by the Irish in 1316 near the town, when Phelim O'Connor, King of Connaught, and Teige O'Kelly, King of Hymany, with many chiefs, were slain. A murage charter was granted to the town in 1316. The seal probably belongs to the fifteenth century.

A resolution was proposed by Mr. R. M. Egan, and carried unanimously, to "recommend to the Commissioners of Education the importance of paying for the teaching of Irish by the national school teachers, similar to Latin and French."

GEOLOGICAL SOCIETY (Wednesday, April 14).

J. EVANS, Esq., F.R.S., President, in the Chair. For many years past Mr. J. Thomson, of Glasgow, has diligently collected and studied the Corals of the Carboniferous Limestone of Scotland, and has prepared an extraordinary collection of sections, many of which are photographed. His studies have led him to discern differences which he believes will be sufficient to form the basis of several new genera, which he described in a paper too technical for abstraction. Mr. J. M. Wilson, of Rugby, called attention to the probable existence of a considerable fault in the Lias of his neighbourhood, and also described a new outlier of the Oolite. At the same time he exhibited an interesting specimen of a Labyrinthodont from the coal-measures of Leicestershire, which appears to be distinct from the Irish species. A remarkably fine specimen of *Cruziana semiplicata* was exhibited by Mr. J. L. Tupper, who also brought forward a fine sketch of the fossil on its slab of slaty rock. This enigmatical fossil is found in the Lingula flags of North Wales, and has been variously regarded as an annelid burrow, a trilobite track, and an actual organic structure, either animal or vegetable.

LINNEAN SOCIETY (Thursday, April 15).

DR. G. J. ALLMAN, President, in the Chair.—The following papers were read:—1. "On the Nature and Productions of the Atolls of the South Pacific," by the Rev. Thomas Powell. 2. Papers on the Botany of the *Challenger* Expedition: xxv. "On the Diatomaceae collected by Mr. H. N. Moseley in Kerguelen's Land," by the Rev. E. O'Meara; xxvi. Letter from Mr. H. N. Moseley "On an edible Chinese *Sphaeria*, known as 'winter worm-grass,' parasitic on certain larvae" (this was stated by Mr. Currey to be *Torrubia sinensis*); xxvii. "On the Musci and Hepaticae collected by Mr. H. N. Moseley," by Mr. W. Mitten, F.L.S. (these were from Teneriffe, Tristan d'Acunha, Kerguelen's Land, &c.). 3. "On the Algae collected by the Rev. W. W. Gill near the Island of Mangara," by Dr. Dickie, F.L.S. 4. "List of Plants collected by Dr. A. B. Meyer in New Guinea in 1873," by Professor Oliver, F.R.S. (these were only ten in number, including two new species).

SOCIETY OF ANTIQUARIES (Thursday, April 15).

THE Rev. J. T. Fowler read a paper on recent excavations at the Chapter House of Durham Cathedral. This building, once the finest Norman chapter-house in England, was altered, or rather destroyed, in the last century, to make the place more comfortable. The apseid end, where the chair for the installation of the bishop stood, was pulled down and the stone roof destroyed. The excavations were commenced on the site of the apse in the hope of discovering the tombs of some of the bishops who were known to have been buried there, and perhaps some remains of the stone chair; but this latter expectation was not fulfilled. The first tomb-stone discovered bore the inscription "*Ranulphus Episcopus*," and covered the remains of Ralph Flambard, the minister of William Rufus, who occupied the see from 1099 to 1128. On opening the tomb the skull was found broken, but it and the rest of

the bones were *in situ*. The other contents of the coffin were a quantity of thin brown textile fabric, part of which was composed of silk, a pastoral staff plated with silver, a gold ring with a sapphire, the crumbling remains of a pewter chalice, and some wood charcoal. Sapphire rings were also found in the coffins of Geoffrey Rufus, who died in 1140, and of William de S. Barbara, who died in 1152. The coffin of the latter was evidently too short, as the feet had been awkwardly crammed in; and originally it had been too narrow, the sides having been hollowed out to allow space for the body. The slab which had covered the body of Robert de Insula, who died in 1283, was gone, and consequently the bones were not so well preserved, no traces of the legs and feet being discoverable, and the skull was reduced to a heap of white dust and red hair. The body had been sewed up in a tanned ox-hide, and placed in a wooden coffin. The coffin of Richard Kellawe (1316) contained a pastoral staff but no ring, and no traces of gold thread among the textile remains, as in the other cases.

It is probable that some method of embalming the corpses had been attempted, perhaps by the use of some bituminous material.

NUMISMATIC SOCIETY (Thursday, April 15).

J. EVANS, Esq., F.R.S., President, in the Chair. A fine early tetradrachm of Rhodes, of the Attic standard, was exhibited on behalf of Sir James Anderson, who has liberally presented it to the British Museum. A paper was read by the Rev. Assheton Pownall on the coinage of Offa, King of Mercia. The writer pointed out the unsatisfactory character of the explanation usually given of the excellence of that coinage—namely, that King Offa visited Rome, and probably brought back Italian workmen. It is, however, very improbable that the visit in question ever took place, as Roger of Wendover is the only early authority for it. But it is certain that Offa was in most things before his age, and the improvement he wrought in the coinage is likely to be one of his domestic reforms rather than the result of employing foreigners. A paper by M. Six, of Amsterdam, on the earliest bronze coins of Syracuse, was also read.

PHILOLOGICAL SOCIETY (Friday, April 16).

REV. R. MORRIS, LL.D., President, in the Chair. Mr. Fennell and Mr. Wall were elected members. The paper read was on "French Sounds in English," Part I., by Henry Nicol. After explaining that this part was introductory to the main subject of the investigation, the phonetic history of the popular Modern English words of Old French origin, and pointing out the necessity for philology of the physiological study of sounds, the writer remarked on the difficulties caused by the presence in both languages of numerous semi-gallicised Latin words introduced by literature, and by the French words we have adopted being of different dialects and ages. The history of the Latin vowels in their progress to Old French was then sketched, the chief stages of change, qualitative and quantitative, common to all the Romanic languages being distinguished. The changes were similar to those which have occurred in the Teutonic languages, consisting mainly in the lowering of Latin short *e* and *o* (close) to *è* and *ò* (open), and of short *i* and *u* to *é* and *ó*, and in all these sounds, as well as short *a*, being then lengthened when before a single consonant.

ROYAL SOCIETY (Thursday, April 22).

THE following papers were read:—"On the Action of Heat on the Absorption Spectra and Chemical Constitution of Saline Solutions," by W. N. Hartley; and "On Attraction and Repulsion resulting from Radiation. Part II.," by W. Crookes F.R.S.

FINE ART.

THE WATER-COLOUR INSTITUTE.

THIS exhibition, opened on the 19th instant, is a rather empty one. A flimsy monotony discourages the eye as it ranges over the general wall-space; although that detailed examination which is equally obligatory and wearisome for the critic does not fail to bring out here a work and there a work deserving of scrutiny and of praise. We will begin with the figure-pictures, and take at first four of the best contributors—Messrs. Herkomer, Gow, J. D. Linton, and Tenniel.

Mr. Herkomer can now compete with the most skilful painters living: such are his nicety and fineness of drawing, precision of touch, sense of character, and general balance of attainment. There is a little too much of the manner of a sketcher in what he does; also a certain indifference to beauty, tending almost to a caricaturish habit, although on full inspection the adherence to unexaggerated nature proves to be very exact. The little scene of German homely gossip in a bedroom, named *What Old Women delight in*, will explain what we mean. *Im Walde*, a party of woodmen felling fir-trees and rough-dressing the timber on the spot, is excellent; the actions being all given with as much accuracy and ease of rendering as aptness of intention and observation. Mr. Gow may almost pair with Mr. Herkomer for neat-handedness. *An Alarm*, representing a Royalist Cavalier in his mansion, startled by some noise which he hears at the door, and about to commit to the flames a handful of documents of a compromising character, while two of his confederates prepare to hide or to resist, is executed in a very quiet but none the less efficient style as regards both story-telling and realistic method. *The Appeal*, by Mr. Linton, is not equally perspicuous in subject-matter. What we can clearly discern is an elderly gentleman of the earlier seventeenth century, probably in the Low Countries, who stubbornly holds out against taking a pen presented to him by a young gallant, and signing a paper which lies before him; while a young lady, seated apart and wrapped in a travelling cloak, glowers in anxious expectancy. Perhaps we should understand by this group a parent or guardian stiffly resolved not to consent to a contract of marriage between two lovers, who have settled, if pushed to extremity, to cut matters short and elope. At all events, the work is well painted in a sober, dark, solid tone, with little or no use of body-colour; the costumes (if perchance we except that of the woman) are particularly successful in looking as though they were worn naturally by personages of the time, and not merely put on in masquerade. Mr. Tenniel has selected a very peculiar subject; and his treatment of it looks at first odd, and even repulsive, although, as one observes how carefully considered it is in detail, and how firmly designed and drawn, this feeling wears off to some extent. The work is entitled *Lighting the Beacon*—"Ha, ha! Rescue!" It represents a red-haired semi-savage peasant turned into a soldier in the early feudal time—say the eleventh century—who has mounted a ladder to light or tend the beacon-flame which summons aid in sore need; the night is dark, with swirls of gusty rain; three arrows have been shot at the man by the unseen foe, and, just as he shouts out his reassuring cry, one of them pierces his rude hauberk of scale-armour, and he dies upright, with the triumphant grin expanding to its utmost his big cavernous mouth and throat.

Market-Folk, West of Ireland, is a powerful piece of work by Mr. Small, with broad surfaces and crisp touches. It has been a terrible day of rain and slush; by the shore of a lough a young man with his donkey, and an old woman—whom we might be minded to call an old hag, but for her evident *bonhomie*—with a shapeless bundle slung over her back, are trudging home; a young

woman, hardly less heavily burdened, passes and accosts them. Hibernian ease of temper and mother-wit play upon the three faces, ploughed deep with age, or toughening with toil and exposure. Mr. Charles Cattermole paints in a style based no doubt partly on that of the late George Cattermole—especially as regards the rather crude lightness and variegation of colour—but still more closely on that of Sir John Gilbert. A little more solidity of purpose and of execution would have made a good picture of *The Monk and his Scholars*—children of both sexes, in a remote century, and of natures not easily tamed to mildness of manners or bookish lore; the artist has somehow managed with considerable skill to make one feel that his picture carries the gaze down a long vista of history. *A Birthday Ode* is a larger work, and an important one, but less commendable in the result. We see here a little boy lord, some eight years old to-day, in the time of bluff King Hal, saluted and belauded by his tenants and dependents, one of them reading out a poetical address. Mr. Staniland paints with a large amount of truth and expression *The Last Day in Old England*; a dozen emigrants of various classes, from the aged heavy-built smock-frocked countryman, a little deaf, companioned by his big and trusty dog, to the tallow-visaged swindler, probably the same person whom a wall-poster denounces as a forger. This group is seated on the wharf in a nearly unbroken row, shortly before the vessel gets under weigh; the countryman is addressed by a bluff seafaring-looking man, who, if not a fellow-emigrant, may be a mate or supercargo of the ship. The work is not strong in pictorial qualities, such for instance as composition; but its truthful sincerity compensates for much.

The Big Chief's Toilet, by Mr. W. V. Bromley, attracts attention by the uncommonness of its theme, derived from the social life of the North American Indians; the potted papoose is a quaint little figure. Mr. H. B. Roberts imitates the late excellent master, William Hunt, in subjects of thick-limbed, thick-headed country-boys, in too patent a fashion; one of his contributions, *Black Sam*, a little bumpkin dandling and admiring his puppy, is, however, worthy, or all but worthy, of his model. Of Mr. Augustus Bouvier's paintings, the best is the *Marasche Fresche, Cherry Seller, Zara*, in which the handling is considerably freer and less rapidly smooth than this artist accustoms us to. Mr. Jopling is tawdry and superficial in *Felise* (with a quotation from Mr. Swinburne's poem), and wholly amiss in the letter-comparing scene from *The Merry Wives of Windsor*; the floral painting, *White Azalea*, is a good deal better, but the elegant and complicated exuberance of the plant is cut down to meagre rudiments. Miss Mary Gow (the sister, we presume, of the accomplished painter of *The Alarm*) portrays *Enid's Wedding Morning*, after Tennyson, with something of the same nice and unforced style as her relative; there is a want, however, of poetical glow in the treatment, and Enid's mother appears more homely, and far older, than needful. *Ride a Cock Horse*, by Mr. C. Green—a little boy of the time of Charles I. astride on his rocking-horse—is delicately painted. The toy-charger, a piece of brown woodwork, its proportions chiefly made up of the big curved rocking-frame, is comically rude and babyish, and gives the whole subject a toy-like air, pleasantly appropriate. Mr. Hugh Carter paints in a style founded mainly, it would appear, on the water-colours of the Dutch artist Israels (as may be inferred when we turn to the *Sleepers* of the latter painter, an old woman and a tabby cat on two chairs, side by side); there is a touch also of the portrait-painter Boxall in Mr. Carter's *Portrait of a Lady. Preparing a Fisherman's Meal* is a capital little piece. Mr. Kilburne, whose undisputed skill would have fairer play were he to purge his style of something faint and finikin, shows agreeably in No. 158, a boating-incident,

with a verse-quotation from *Alice in Wonderland*:—

"For both our oars, with little skill,
By little arms were plied."

Miss Thompson, belaboured as she is with celebrity factitious in its origin, though sustained by very real talent on her own part, is no doubt persecuted to exhibit whatever she has by her, good, bad, or indifferent. In the present instance, she has laid hands on what appears to be a mere business-like sketch or study of a mounted soldier, and as such efficient enough; and has added to it a slight and not well-harmonised suggestion of landscape background, and produced it to the eyes of the lieges under the title *On Duty, a Trooper of the Scots Greys*. Mr. Absolon's most passable contribution is the figure of a country-girl named *Tired Out*. Mr. Haghe, the President of the Institute, sends nothing which his admirers, unless it be by force of habit, can look upon with complacency; the prominent subject, *A Christening in St. Peter's, Rome*, is a decided failure.

We have now dealt with the figure pictures, and shall reserve the landscapes and other works for a future opportunity.

THE BELGIAN GALLERY.

SOME people will not be beaten. Officials of South Kensington, and promoters of the International Exhibitions at the Albert Hall, are well known to number among them individuals strongly imbued with this tendency. A lingering and mismanaged career at that Hall was announced last year to have come to an end; and, if the announcement were allowed to hold good, we cannot say that, under all the circumstances, any loss would accrue to the cause of healthy art. A threatening intimation, however, is now issued to the effect that "The London Annual International Exhibition of Fine Arts, South Kensington, S.W., will be opened on May 1, 1875—J. H. Gammon, Manager; E. J. Vaughan, Secretary." Meanwhile the gentleman who bears the seemingly not irrelevant name of Gammon has got up, at No. 28 Old Bond Street, an exhibition termed "The Belgian Gallery, in connexion with the London Annual International Exhibition of Fine Arts, Summer Season, 1875." Thus it would seem that we are actually to have two Belgian gatherings in 1875; one at the Albert Hall, and the other in Bond Street, vamped up upon the delusive notification of last year that the Albert Hall displays would be thenceforth discontinued. Mr. Gammon informs us in a neat circular: "This gallery has been formed at the request of the Belgian artists, whom I represented for many years at the International Exhibitions, and the collection comprises many of the finest productions of the eminent masters of that school." After visiting, at the private view on Saturday last, the cramped room wherein the pictures are collected, we cannot confirm Mr. Gammon's estimate of them: on the contrary, they appear to us to be, in general calibre, slight, rough, and even rubbishy performances. We would be the last to discourage, and the first to welcome, the display of really leading or fine productions of foreign schools; but we cannot scruple to say that dealers and touters have of late pestered British visitors and critics, and annoyed or even damned British artists, by persistent hauls of all the small fry of the Continent.

We are unable to say much of the Belgian Gallery, for little could with truth be propounded in its praise, and reiterated oburgation would be tedious and unserviceable. The catalogue specifies about 180 works—oil paintings, water-colours, and sculptures. From these we may select the following:—

Gussow, *Elisir d'Amore*, coarse and common, but not inexpressive. *The Bookworm*, talented and broadly facile, with a grotesque turn. *The Antiquary*, standing on steps, and examining a picture minutely with a magnifying glass. Mdm. Ronnier, *Greek meets Greek*, a fairly clever painting of a shaggy white dog and a tabby cat, the

former in a hayloft, the latter emerging from an orifice below. Wauters, *Aldermen of Ghent assembled in Council, 16th Century*, painted with more talent than refinement—a sketch for a picture already known in London. Wüst, *In the Far West, America*, a graceful landscape of riverside forest, with cranes. Linnig, sen., *A Patron of Art, 18th Century*, one of the numerous works founded by small or smallish men on the style of the great man, Baron Leys. Van Lerius, *Quand la bise souffle*, a half-figure of a girl, impudently unfinished; it can only be regarded as a preparatory dead-colouring. Linnig, jun., *The Village Musician*, practising the violoncello in his rather Bohemian-looking apartment; an able and faithful piece of work, but somewhat low in aim. Lamorinière, *Flanders, Sunset*, the same picture (if we remember right) that was exhibited elsewhere in London last year; true in subject-matter and in sentiment, yet not in the master's highest style.

Some of the contributing painters are not Belgians. Laugée, to the best of our recollection, is a Frenchman. His picture of *The Invalid* has been familiar to Londoners for years, and is not one of his strong works. The so-called Turner, *Landscape* (39), is a palpable forgery, and a mere libel on an illustrious name.

W. M. ROSSETTI.

THE DRAWINGS OF J. F. MILLET.

Paris: April 16, 1875.

An architect, M. Emile Gavet, who was the owner of some of Théodore Rousseau's finest pictures, has besides in his possession about a hundred pastels and drawings by J. F. Millet. From these he has selected forty-six, the most perfect both for artistic and moral excellence, and is exhibiting them in a room built expressly for the purpose in the courtyard of the house of M. Francis Petit, one of our largest picture-dealers, Rue St. Georges, No. 7. The proceeds of this exhibition, which has just been opened, are to be devoted to the widow and children of the artist, whose recent death has left them poorly off. On Sundays the admission is free. Even among artists hostile to Millet's creed the exhibition has deservedly excited the greatest admiration. I regard it as one of the most important facts of the history of our contemporary school—a revelation analogous to that disclosed by the general exhibition of the drawings and studies of Eugène Delacroix, held the day before the posthumous sale of the contents of his studio. Great lessons are to be learned from it, I believe, and I cannot too strongly urge your artists and critics, whose judgments at times differ so widely from our own, to cross over to Paris before May the 6th next and pay the exhibition a visit. With your leave, I desire to record in some detail, not merely the expression of my warm admiration, but the reasons which seem to me to justify it, for a master so powerful, so essentially modern, and so imperfectly understood on either side of the Channel. In order not to trespass on your kindness I shall endeavour to be as brief as possible.

Both personally and as to his work J. F. Millet shared the fate of all the artists of his time who refused to bow their heads to the yoke of the Institut. He was branded with such epithets as *partageur*, *socialiste*, and *rouge*, though he never meddled in politics, and being of Norman descent had a marked reverence for the rights of property, besides being like many artists a believer in the principle of authority. The government bestowed no encouragement on his work, and did not buy a single one of his pictures for the Musée du Luxembourg, the exhibition which should be the depository of our national triumphs, and is an antechamber whose walls are yearly hung with the exploits of intriguing mediocrity. More-over he was the horror of the academically principled jury. His picture, *Le Bûcheron et la Mort*,

which is a philosophical and most picturesque composition, and one admirably conceived and carried out, was refused admission to the Salon of 1859; the same picture has just realised 20,000 fr. at the Hôtel Drouot in spite of the fluctuation of prices of which that establishment is at present the scene. The only order J. F. Millet ever received from the State, an order for the decoration of a chapel in the church of St. Geneviève, came to him through M. de Chennevières, the present honourable and esteemed director of the Beaux Arts. Millet died without having been able to execute it. Decorative painting, that is wall decoration, which furnishes the artist with a more expansive field than cabinet painting for the development of his thought, and requires a broader handling of the pencil and brush, had been the noble dream of his life. It was a line in which he seemed every way destined to succeed, owing to his simplicity of composition, soberness of design, harmony of colour, and originality of conception, together with a touch of mystic sentiment which happily for him—for his attempts in fresco were not convincing—he has perpetuated in two oil-pictures, called, one *Le Retour de l'Enfant prodigue*, and the other *L'Angelus dans la Campagne*.

The public were thus deceived regarding the worth of the man by the powerful faction which during the Empire either directly or indirectly controlled all the purchases and rewards consequent on the Salons, as well as the administrative orders and the art-criticisms that appeared in the leading papers and special reviews. Their misapprehension of his real merit was furthered by the nature of the medium through which he had to interpret himself to them—oil-painting and easel-pictures. After having been in early years the companion of Diaz, and having painted with skill equal to his, pictures of nymphs asleep in the forest, and young girls bathing watched by satyrs, Millet gave up such trivialities. About 1849 he settled at a little village called Barbizon, which is situated on the skirts of the forest of Fontainebleau and looks towards the plains of La Brie. On these plains, where the sun scorches the harvest in summer and the stubble-fields in autumn, and where in winter the snow lies deep, no living creature is seen save flocks of sheep and flights of crows, labourers, reapers and shepherds. It is a stern country, hard-working and healthy, and all the poetry of arduous daily labour, of dawns that are covenants of promise, of storms that are catastrophes, and sunsets that bring rest to the peasant whose fortune is linked to these changing seasons, is summed up in its uniform grey-toned fields. Millet was himself once a peasant. Up to his twentieth year he had lived on one of the fertile table-lands of Normandy, at Gréville, in the department of La Manche, had rambled the copse, tended geese, followed the plough, and led the horses to water. At Barbizon he married, and had children, wore wooden shoes, and led the frugal healthy life of a peasant, spending his days between the fields where he studied his models in all their varied action, and learnt by heart the ever-varying aspects of the element amid which they moved; and his studio, where he committed to paper or canvas his observations, his impressions, his projects. To Paris he came but seldom, and then always like a ship that makes the land only to take in water. He tried to transmit to his canvas all the sensations he had stored up in his brain and all the observations his genius had made. He worked slowly, putting on layer above layer of colour, believing that in so doing he was imitating Nature's mode of working, who raises new generations from the decay of old. He over-laboured both himself and his canvas; he never let his pictures leave his hands without a struggle, and never felt as if they were finished. He produced, one may fairly say, few perfect pictures. They are often dull and heavy. Substances different in their nature present often the same appearance. His flesh looks woolly and so do his stones, his draperies have no folds,

and the hands and feet of his figures are only realised in outline. Time will assuredly lessen these defects, and by the glorious unity it brings complete the master's design. But the public lives in the present, and the reproaches they address to the painter, those certainly that refer to want of delicacy and charm in his technical handling, if not those that bear more directly on his style, must be accepted as just.

To see Millet at his best he must be looked for elsewhere. In the latter years of his life—that life which was cut off at sixty—he discovered the medium through which his talent was to find its definite expression. Between 1864 and 1870 he executed the hundred pastels and black chalk drawings now in M. Gavet's possession, some of which he is at present exhibiting. In these Millet has demonstrated with victorious conclusiveness that the means employed by superior artists are as personal as the quality of their conception, and that they can suddenly exalt to the highest rank modes of painting which the academies, with ever-ready zeal to check liberty in the name of custom, consign to the lowest. Administrative regulations and the logic of facts are perpetually at strife. If Millet had sent one of his pastels—a specimen of his best work that is—to the Salon, it would have been classed in the drawing section of the catalogue which no one ever looks into, and hung in one of the side rooms which are hardly ever visited. In the eighteenth century, our portraitist Maurice Quentin de la Tour, used pastel with great success. His pastels have suffered less perhaps by time than contemporary oil-paintings; they have faded little, while the paintings have darkened considerably. The inconveniences inherent to every natural or human production are pretty equally balanced. Damp and the direct action of the sun are more injurious to pastel than to oils, but in the pastel the light and dark tints preserve a more exact mutual relation. The whole remains more harmonious, more true, that is to say, to the artist's first intention. It has besides, like the fresco, the immense advantage of being free from reflected lights, and of not requiring to be seen from one special point. The use of blunted crayons which crumble easily, the softness produced by rubbing with the stump or finger in order to make the colouring-powder adhere to the paper and blend the whole together, demand a moderation in the detail which is all in favour of the character of the drawing. Millet did not neglect one of these advantages. Some of his pastels are done on tinted paper, and this, with a few delicate shades superadded, is sufficient to convey the impression of a clear, cool morning. In another, *Meule et Troupeau de Moutons dans la Plaine de Barbizon*—a beautiful effect of autumn sunlight gilding and warming the landscape—he has bruised his crayons more vigorously, and obtained both depth and solidity. He has several times reproduced the soft lights of morning and the rosy cloud-flecks mounting upwards into the clear blue sky with a delicacy and transparency which the purest colourists of our day, Eugène Delacroix, Théodore Rousseau, and Corot, have only succeeded in rivalling by efforts which will lose their effect when the varnish cracks and turns yellow with time. But I am dwelling too long on the material process, and, impossible as it is adequately to describe the illusions he produces, it will be more to the purpose to say a few words on the style of his compositions. The subject is invariably some episode or aspect of country-life, and in his mode of handling there is neither exaggeration nor false sentiment. Some are rough and bold, some soft and smooth. Man plays a part in some, in others Nature's voice alone is heard. The poetry of his compositions is always vigorous and moving, and their prevailing tone is one in harmony with that of Victor Hugo's lines:—

“Booz dormait; l'herbe était noire
Les grelots des troupeaux palpaient vaguement;
Une immense bonté tombait du firmament.”

(in "Booz endormi" in *La Légende des Siècles*). Millet finds his interpretation of the sublime expression *une immense bonté* in the placid calm of the plains just touched by the moon's rays, in the shepherd's hut overlooking the sheepfold, in the harrow standing idle on the broken soil waiting for the morrow, in the silence that reigns on the hearth between the purring cat and the child asleep, the peasant plaiting a basket and the mother sewing by the light of the lamp. Further on he paints man overcome by the pitiless stroke of the sun's rays: the labourers sweat as they drive the spade into the parched earth, the sower swallows the clouds of dust his feet have raised as he strides through the furrows scattering in large handfuls the seed which is to become his daily bread; the vinedresser sits with bowed head and drooping arms at the corner of the vineyard he has been weeding. These are dread apparitions: they alarmed the *bourgeoisie*, who fancied they were conjured up by Millet to serve as Socialist engines of war, whereas he was only repeating in another language what La Bruyère had the daring to write in the very midst of the Court of Louis XIV. I cannot resist quoting this singular passage; the peasant he describes is the peasant of every country in every age of the past:—

"L'on voit certains animaux farouches, des mâles et des femelles répandus par la campagne, noirs, livides et tout brûlés du soleil, attachés à la terre qu'ils fouillent et qu'ils remuent avec une opiniâtreté invincible; ils ont comme une voix articulée, et quand ils se lèvent sur leurs pieds ils montrent une face humaine, et en effet ils sont des hommes; ils se retirent dans des tanières où ils vivent de pain noir, d'eau et de racines; ils épargnent aux autres hommes la peine de semer, de labourer et de recueillir pour vivre, et méritent ainsi de ne pas manquer de ce pain qu'ils ont semé."

This was the peasant of *le Grand Siècle*; now La Bruyère's picture is exact in one point only—the physical weariness. Millet has shown the deformations it produces, the crooked spine, the horny hands and feet, the red tanned skin, the heavy features, and the prominence of the joints under the coarse woollen garments. But the peasant is not like this from his youth upwards. Millet has also drawn those tall slim boys who go forth in the morning, hoe on shoulder, to their work, and at evening when the sun sinks below the horizon and the dews begin to fall, draw on their linen vests. These lads of La Brie are not the handsomest soldiers in our army, but they are the most enduring. Our officers can testify that the regiments which best endured the terrible hardships of the siege of Sebastopol were the regiments that had been recruited from the villages in the heart of France. Millet has represented the beauty of the peasant girls with singular grace; they are robust and rather thickset, but fresh and finely-constituted. Toil, heat, and cold soon transform them into old women, and their ugliness is further increased by the unaccountable custom of entirely concealing their hair under a folded handkerchief, the ends of which are knotted together on the forehead. But still, these human flowers have their season of bloom, their perfume, and their brilliancy. The painter's great art lies in his having made them neither pretentious, nor more attractive than they actually are, nor as making use of the external modes of gesture and expression which are peculiar to the work-people of the towns. They are plants indigenous to one particular soil, nor can they be transplanted without losing their harmony and fitness. In this respect he is unique, and in this he has again shocked the taste of the *bourgeoisie*. All their abuse is levelled at his sincerity and his power of physiological and philosophical insight, which converts his figures into real historical characters. All the honour and marks of favour have been conferred on the skilful and complaisant painters who washed and polished their shepherdesses with fine Windsor soap, and invested them with the stupid and depraved sentimentality of the peasant

women of romance. Finally, Millet has pictured the phenomena of nature, the changing seasons, autumn especially and winter, with wonderful intensity. No other painter of any school has bestowed more careful work on his foregrounds. An *Etude de Pissenlits* (dandelions), life size and drawn on the spot where they grew—some in bloom, some run to seed—shows how conscientiously he elaborated every detail, and also what grandeur he could give to the mass. In his compositions the tufts of grass and the clods of earth come to the edge of the frame, not looking as though they were cut out with a punch as in Claude Lorraine's, nor vaguely massed together as in Théodore Rousseau's, but drawn with admirable perfection. By this means he secures a firm base for all that he raises upon it, and can give their relative value to a succession of backgrounds which gradually lose themselves in the vapoury mists that rest on the horizon.

To sum up all that has been said, Millet shows himself to be an artist of the highest order, by virtue of his moral worth and his consummate knowledge of execution.

The younger men—especially the *intransigeants*, or those who will not come to terms—admire him greatly, and will get much good out of him. Let them learn from him how to think, to compose, and to realise. The Academists are in the greatest consternation. The failure of Ingres at the exhibition which was organised for the benefit of Alsace and Lorraine, and the success of a master whom they had affected to crush with the epithet *réaliste*, have so confounded them that their authorised critics murmur excuses or are dumb. The movement is a fortunate one. It is all in favour of truth, absolute and international truth, which always triumphs over ill-will in the end. It has begun just in time to further the development of the rising school, which will be called upon to give utterance to the entirely new sentiments and the plastic thoughts of the new condition of being on which France seems at last to be about to enter. PH. BURY.

ZULOAGA'S MONUMENT TO PRIM.

THE monument intended for the sepulchre of the late General Prim has just been completed at the ateliers of M. Zuloaga, St. Jean de Luz, France. M. Zuloaga is a refugee from Eybar, in Guiposcoa, and is well known for his skill in the production of smaller objects, such as jewel-cases, trinkets, &c., in iron and steel, incrustated and inlaid with gold and silver. This monument, however, is a much more important and remarkable piece of metal work, as may be judged by its mere dimensions, which are—about 11½ ft. high, 7 ft. 10½ in. long, and 4 ft. 7 in. broad. The body (*fond*) of the monument is of iron and steel, incrustated and inlaid with gold and silver in pure Renaissance style. It is composed of four square pillars of this incrustated work, which support a square sarcophagus of the same material, on which reclines the effigy of Prim of the size of life, and this again is surmounted by a canopy of open iron work, "niellé en blanc;" a cross of enamelled iron work, with the inscription "INRI" on both sides, crowns the whole. At one end (the head) of the sarcophagus are the arms of Prim, with his motto, "Honor, Valor, y Lealdad," backed by the flags of all the regiments in which he served, and with his orders and insignia below; the whole brilliantly, almost gaudily, enamelled. At the other end (the foot) is the simple inscription, "Prim," in plain Roman letters. On the sides of the sarcophagus are large medallions, with a square bas-relief between them. The medallions on the right side are the heads of Caius Marius and Attilius Regulus, with the entry of Prim into Madrid in bas-relief between; on the opposite side are the medallions of the Gracchi, with the battle of Castillejos in bas-relief between. These medallions, bas-reliefs, and the recumbent figure of Prim are of silvered bronze,

and are perhaps the least satisfactory part of the monument. They were cast at Paris, from drawings furnished by M. Zuloaga, who designed the whole. The countenance of Prim is fine, and his whole figure striking; but the medallions and bas-reliefs look coarse by the side of the fine damascene work in which they are, as it were, framed. This incrustated work, at a little distance, has the effect of a soft exquisite mosaic. Below the sarcophagus are fringes of iron scroll *repoussé* work, with skulls and hour-glasses of silvered bronze. In the interior of the canopy, which is held up by pillars of the same inlaid iron, are the words "Mejico," "Africa," on the sides; and at the ends, "Villarejo, 3 de Enero, 1808," "Cadiz, 18 Septiembre, 1808," the dates of the two revolutions in which Prim played so chief a part.

The body of Prim is still lying in state, unburied, in the Atocha Church, at Madrid, and this monument is designed to be placed there on a base of serpentine marble. Whether this will be permitted under the restoration of the dynasty he did so much to overthrow is, however, exceedingly problematical. This magnificent piece of artistic metal work was eighteen months in construction, and employed twenty-eight workmen for the inlaying work alone. We understand, with regret, that M. Zuloaga will be pecuniarily a considerable loser, as the cost of production has far exceeded the contract price. WENTWORTH WEBSTER.

ART SALES.

THE sale on March 25, at the Hôtel Drouot, of the paintings of Lansyer proved very successful. His studies of the environs of Paris, and more especially those of Brittany, are well known. The granite rocks and broom-clad landes are represented with great fidelity. The fifty-seven pictures, all of very small size, sold for 26,000 fr. (1,040l.). *Sluice of La Monnaie*, Paris, 1,060 fr.; *Bay of Douarnenez*, 340 fr.; *Environs of Ploumanach* (Finistère), 490 fr.; *High-water, Belle-Ile-en-Mer*, Morbihan, 520 fr.; *Anse of Ploumanach*, 690 fr.; *Drinking Trough near Douarnenez*, 1,000 fr.; *Afternoon Sun at Douarnenez*, 700 fr.; *Low-water, near Tregunc* (Finistère), 1,000 fr.; *Plage of Audierne* (Finistère), 690 fr.

On the 12th was sold, at the Hôtel Drouot, a small but well-chosen collection of modern pictures from Vienna:—Anastasi and Ph. Rousseau, *Farmyard*, 1,000 fr.; A. Bonheur, *Flock of Sheep*, 3,600 fr.; Brillouin, *Reading the Manuscript*, 2,020 fr., and the *Disappointed Sportsman*, 1,800 fr.; Calame, *View in Switzerland*, 5,150 fr.; Chantreuil, *Last Rays of a Setting Sun*, 3,000 fr.; Daubigny, *Landscape*, 3,950 fr.; Dansaert, *Inn of l'Ecu de France*, 1,450 fr.; Dupré, *Entrance to a Wood*, a magnificent landscape, 6,150 fr., *Sunset*, 4,000 fr., and *Cattle drinking*, 5,400 fr.; Diaz, *Path in the Forest of Fontainebleau*, 2,020 fr.; Fromentin, *Banks of the Nile*, a masterly piece, 9,000 fr., and *Environs of Cairo*, 4,500 fr.; Guillemin, *Breton Interior*, 2,700 fr.; Isabey, *Rocks of Etretat, in a Storm*, 2,600 fr.; Jacque, *Flock of Sheep driven into a Plain*, 3,200 fr.; Jongkind, *Paris in 1854, the Seine, Notre Dame, &c.*, a fine example of the master, 2,050 fr.; Leys, *Battle in the Street of a Flemish Town*, 4,300 fr.; Robert Fleury, *The Two Foscari*, one of his finest compositions, the dark and terrible legend rendered with grand simplicity, 3,000 fr.; Madou, *Conversation between two Friends*, 3,500 fr.; Millet, *Peasant Girl saving her Dog*, 2,050 fr.; Troyon, *Landscape in Normandy*, 2,780 fr., and *Valley of Cherreau*, 3,000 fr.; Willems, *Lady at her Toilet*, 5,750 fr.; Ziem, *Scutari*, brilliant effect of light over Constantinople, with the dancing of the *bavaders* contrasted with the calmness of the spectators, 7,000 fr.; the *Slave Quay*, at Venice, in the evening, 2,650 fr., and *Environs of Martiques*, 3,200 fr. The sale produced 128,828 fr. (5,153l.).

On the 14th, the Manley Hall sale was resumed

Messrs. Christie, Manson and Woods's, the remainder of the collection having been removed for sale to London. The first day was occupied with silver and silver-gilt plate; among the latter an inkstand, the cover surmounted by a lion med of a large baroque pearl, 92 guineas. A tankard sold for 44l. A two-handled fluted cup and cover, Queen Anne's hall mark, at 44s. per oz.; a pair of cups, spirally fluted, same date, guineas. Miniatures, watches, snuff boxes, and rings in agate and crystal, were sold the following day. Great interest was taken in an onyx carved as a negro's head, set with brilliant rubies, given by Tippoo Sahib to Lord Cornwallis, 278l. Enamel miniature of Mary Queen of Scots, by Bone, 54l. A pair of elephants, carved out of single blocks of lapis lazuli, with metal trappings, enriched with coloured stones, containing branches for four lights, 155l. A crystal toilet service, 210l., and glass to match. A Holy Family with St. John, in silver, set in high relief, 50l. Gold egg cups, studded with brilliant, 160l. and 170l. Silver-gilt chalice and cover, chased with classical figures, 88l.; five gold vases with seated figures of Cupids, by Como Franceschini, 180l.; pair of Chelsea bulb vases, with gros bleu medallions, subjects—Nessus, Deianira, and Cephalus and Procris, 68 guineas; deep blue coffee cup and saucer, 49l.; a pair of green and gold vases, with mythological subjects in medallions, 71l. Of the Sèvres china, a spot, richly jewelled on white ground, formerly property of Marie Antoinette, sold for 75l.; a pair of toilet pots and covers of the same set, 120l.; a rosewater ewer and dish, similar, 235l. A pair of gros bleu border, with classical subjects in medallions, similar to the service at Windsor, 1. 8s.; and another plate, turquoise border, res in grisaille, 106l. 1s. Gros bleu vase and cover, 211l. 1s. A flat two-handled vase and cover, and a pair of ewers, gros bleu, lion's masks in relief, from the Bernal collection, 231l. Vase of the Empire period, mounted in ormolu, with arabesques, 100 guineas. The amount of the two days' sale was 15,820l.

On Friday week, the magnificent collection of drawings and sketches made in India at the period of the Mutiny in 1858, by Mr. Ljunggren, member of the Society of Painters in Water Colours, accompanied the army of Lord Clyde in the campaign of Oude, immediately following the capture of Lucknow, was offered for sale. They were purchased in one lot for 3,050 guineas, by Mr. Hermon, M.P. for Preston.

NOTES AND NEWS.

German papers inform us that the Queen expressed a wish to secure the services of the great painter, Heinrich von Angeli, to paint her portrait and those of the Prince and Princess Vales and other members of the royal family. It was further reported at Vienna, where Herr von Angeli has acquired the reputation of being the living portrait-painter, that he has not only accepted the Queen's invitation to come to Windsor in the course of the present year, but has declined to leave Germany altogether, and take his residence permanently in England. It would appear that Angeli's signal success in his portraits of the Imperial German family and of Emperor and Empress of Austria has been means of directing the Queen's attention to the eminent merits as a portrait-painter.

An interesting little parish church of Crofton, Walsfield, has just been re-opened after restoration. It was originally built at the expense of Richard Fleming, Bishop of Lincoln, a native of the place, founder of Lincoln College, Oxford, died about 1431. His arms are carved on a stone shield, now somewhat worn, placed in the south porch. A chapel bearing his name is on the north aisle of the chancel of Lincoln Minster. It is the bishop's place of burial. The parishioners of Crofton in the old days founded a chantry in the

church in memory of a deceased minister, Robert Barneley, the net income of which was 5l. 1s. 5d. at the time of the dissolution. The church, as it now stands, is built in the form of a Latin cross, consisting of a nave, without aisles, a north and south transept, and a chancel. In the rector's garden are fragments of an ancient cross discovered some years ago in a field at the bottom of the hill which is the site of the present structure, where it is supposed that the Saxon church of Crofton stood. On the front of the lower fragment are two hooved animals in an impossible attitude, at the back two serpents intertwined, and at the sides two very elegant running patterns. On the front of the upper stone is a figure holding a cross, and behind is a figure inverted. The old hall at Crofton, we may add, which has lately been pulled down, formerly the residence of the Ireland family, noted Catholics and royalists, was remarkable in later days as being a boarding school for young ladies, kept by Miss Mangnall, a lady well known by her books on history, geography, and astronomy, not yet quite fallen into disuse, but better remembered, perhaps, by middle-aged ladies of the present day as "Mangnall's Questions."

A CORRESPONDENT at Rome writes to us that on the 15th inst. a debate took place in the Chamber of Deputies which is of some importance to friends of art and travellers in Italy. Whatever can be taxed has been taxed in Italy. Italy has moved into a new house, and such moves entail heavy expenses. The Government knows its duty, and however unpopular it may render itself, it insists on the country paying the bills as they become due. The only difficulty is to see that the incidence of taxation should be fair, and more particularly that the lower classes should not pay more than the higher. Taking this view, the Minister of Instruction, Signor Bonghi, has proposed that all public collections of antiquities, pictures, and other works of art shall take their share among the tax-payers of the country, and that every visitor of a museum or gallery, and of places where excavations are carried on, shall in future pay a contribution. The expense entailed on Italy by her museums and by the excavations is very considerable, and probably exceeds that of any other country. The advantages derived from the museums are chiefly enjoyed by the higher classes and by foreigners; hence, says the minister, let those who specially enjoy these works of art contribute specially towards the expense of preserving and exhibiting them. Nothing seems more just and reasonable. But of course there was opposition. Such a measure, it was objected, would drive away foreigners who spent much money in Italy. Signor Bonghi's answer was easy. The experiment had been tried in the museums at Naples, and in the excavations of Pompeii, and the result had been an increase in the number of visitors, both on the days when an entrance charge was made, and on those when the entrance was free. Signor Bonghi might have added that this measure has greatly increased the comfort of visitors. By paying one franc one has access to one of the richest and best arranged museums in the world, one is never molested by crowds, which in the south are not always pleasant, and one has the assistance of *custodi* who never expect or accept a fee. In that respect there is no place so excellently managed as Pompeii. One pays two francs there, and one is conducted by an Italian soldier, whose intelligent explanations would shame many a learned professor. All these arrangements reflect the highest credit on Signor Fiorelli, the Director of the Museo Nazionale at Naples, and the first and only scientific explorer of Pompeii, a scholar who has just been appointed by Signor Bonghi as director of all excavations carried on in the kingdom of Italy.

The objection that most museums on the Continent are open gratuitously was still more easily met by the fact that Italy had just passed through a great political crisis, and was doing all she could

to pay her way by making enormous efforts in every direction.

Exceptions will be made, of course, in favour of students who spend weeks and months in galleries and museums, carrying on some special work. This is already done at Naples, and under the direction of such men as Signor Fiorelli there is no fear of favouritism or injustice.

Paterfamilias will grumble. He comes to Florence with his wife and four daughters, and will have to pay six francs for a day at the Pitti Gallery. Can anything be done to appease him? Could family tickets be invented, expensive enough to cover a British family? Most likely they will; but if not, possibly *Paterfamilias* may in future value a Raphael more highly, or possibly he may sternly inform his daughters, that having been at the galleries all day, they need not go to the theatre in the evening.

THE Archaeological Institute at Rome, founded about forty years ago, and ever since liberally supported by the Prussian Government, has produced such splendid results for classical archaeology that the Prussians have determined to make a similar experiment in Athens. The secretary is Otto Lüders, who will be assisted, according to present arrangements, by four young archaeologists selected annually from the German Universities. The fruit of their labours, which will extend to the topography, epigraphy, and art of ancient Greece generally, will be published on the model of the admirable publications of the Institute of Rome. Once a month a meeting will be held at Athens for the purpose of discussion among the members as to new discoveries, or the explanation of objects about which new light is required. With the ready assistance of Athenian scholars, among whom some of the most distinguished have been educated in Germany, and retain their attachment to her method of archaeological research, there is every hope that the new undertaking will meet with success.

THE CHEVALIER GAETANO MILANESE, of the office of the National Archives, in the Uffizi, at Florence, in turning over a volume, *Del Provveditore delle Fortezze* (Firenze, 1607), has come upon a notice of the arrangements made for burying marbles, provided and prepared by Michel Angelo for the front of San Lorenzo. These marbles, being considered an incumbrance of the piazza, were ordered to be buried by the authorities, the duty of carrying out the order falling upon the "Provveditore delle Fortezze." The fragments so disposed of consisted of four columns, with their capitals and bases, and the architrave and frieze of the principal doorway. As it is known where they are, they should be dug up again, and compared with Michel Angelo's sketches. A photograph of a model existing in the Royal Academy of Fine Arts at Florence has just been published, which is said to be that made for Michel Angelo by Baccio d'Agnolo. As, however, he did not make the model which was commissioned, and as Michel Angelo had it made under his own superintendence, there must be a mistake here; but independently of such considerations, it is so poor in design as to be unworthy of the great artist, whose model, therefore, it cannot be. The excavation of the buried marbles might aid in settling the claims of existing designs and sketches to be considered the design selected by Leo X. for the front of his family church of San Lorenzo.

THE story of the wonderful child-painter, Frédéric van der Kerkhove, that has been the talk of Brussels for some months past, has turned out to be a complete deception. An enquiry has been made into the whole affair, and it has been found that the paintings exhibited at the Cercle Artistique at Brussels are really the work of the father, an artist of mediocre merit, and not of the poor child, who does not seem to have exhibited any remarkable artistic talent during his short life. M. van der Kerkhove père even went so far as to offer to the State a certain number of the paintings at-

tributed to his son. A contract of donation was being prepared, when the enquiry above mentioned made known the true state of affairs. Under these circumstances, the Belgian Minister of the Interior begged M. van der Kerkhove to be so kind as to withdraw his gift. The paintings in question are now being exhibited at Ghent, where they create much the same sensation as they did at Antwerp and Brussels. To the French journal *L'Art* chiefly belongs the merit of having thrown light on this curious mystification. The editor of the Brussels *Journal des Beaux Arts* still maintains the integrity of the story, and has entered on a long correspondence on the subject.

A NATIONAL exhibition of Fine Arts will be opened at Ferrara in May on the occasion of the fourth centenary of Lodovico Ariosto, which is to be celebrated in that town with great festivities. The Ferrarese Society, *Benvenuto Tisi da Garofalo*, appeals to all the artists of Italy to send contributions. Gold and bronzemedals will be awarded at the close of the exhibition.

IN *Il Raffaello* of April 6, the birthday of Raphael, there is an outline drawing of the fresco in the Casa Raffaello at Urbino, supposed to have been executed by Giovanni Santi and to have been intended to represent his wife Magia Ciarla with the infant Raphael in her lap. The head is certainly unlike Santi's usual type of Virgin, and might well have been drawn from nature.

THE Exhibition of Blois will be opened on May 1, a fortnight later than that of Montpellier, and Caen at the end of the month. The Dieppe Exhibition will be opened on July 20, and Versailles is preparing for the same date.

THE Musée de Cluny has just received the following specimens, the gift of M^{me}. Humbert de Molart:—A large enamel cup on a stem, in grisaille—subject, Lot and his daughters—in the style of Pierre Raymond; an oblong seal of enamelled gold, period of Louis XV., and several fragments of guipures, of which the most remarkable is a complete bodice, entirely in open work.

M. DE JONGE, the new director of the Museum at the Hague, has discovered in the garrets of the Moritzhaus nearly two hundred paintings which have lain rotting for half a century. They are to be placed on the ground-floor of the museum, and will be soon opened to the public, the Dutch minister having obtained a grant of 8,000 florins to defray the expense of arranging them, and of transporting all the Japanese and Chinese curiosities which occupied their place to some other place hired to receive them. Among these paintings so happily brought to light are said to be many of the first order, among which is a Titian of great beauty.

THE first number of an important work on the drawings of the old masters in the principal galleries of Italy has recently been published by P. Fuiorti, of Florence. The drawings are reproduced by one of the new processes of photolithography, and are most exact copies of the originals. Each number is to cost 1 franc, and will contain four drawings.

THE Italian journals speak very highly of a painting by the Neapolitan artist the Cav. Giuseppe Mancinelli. It represents the Presentation of the Virgin in the Temple, and is to be placed as an altarpiece in the Cathedral of Altamura.

THE sale of the late M. Galichon's collection of drawings and prints will take place on May 10 and four following days. The catalogue is now out.

THE City Companies, whose survival is mainly due to the national respect for antiquity, show very little veneration for antiquity themselves. The *Graphic* last week chronicled the dealings of the Fishmongers' and Carpenters' Companies with some noble specimens of Tudor art in Lime Street. The elaborate carvings which adorned the City mansions of the Veres and Nevilles have

been removed and dispersed, and the buildings pulled down to make room for modern warehouses. But the Merchant Taylors' Company, a so-called Conservative corporation, has not been behindhand in the work of destruction. Among the relics of the Carthusian monastery founded by Sir Walter de Manny, which survived until our own time, was the cloister surrounded by a terrace walk—a feature of considerable size and almost unique in character. In adapting the premises to the uses of the new Merchant Taylors' school, the company's architect has destroyed one-half of this interesting fragment, leaving the other half a truncated *corpus sine nomine*—a passage leading to nothing, blocked across its length by the new erection, like a railway with the *débri*s of a collapsed train.

THE *Allgemeine Zeitung* states that much surprise has been excited in artistic circles to find that the design for the curtain of the new Court Theatre at Dresden, bearing the motto *Providentia Memor*, is not, as was universally believed, the work of Makart, of Vienna, but has been sent in by Professor Ferdinand Keller, of Karlsruhe, who has received the appointed prize of 5,000 marks, and is now preparing to carry into execution his successful plan.

THE art collection belonging to the late M. Fortuny will be sent to Paris for sale at the end of this month. In addition to the large and interesting series of pictures painted by Fortuny himself of views at Portici, Rome, Madrid, Seville, Granada, and Tangiers, the collection will include many valuable specimens of Spanish and Moorish ceramic ware belonging to the fifteenth century, and textile fabrics, illustrating industrial art as far back as the eleventh century.

AN important collection of drawings by the well-known German artist Alfred Rethel is to be seen at the permanent exhibition at Düsseldorf. Among them are two large cartoons representing Charlemagne at the Council of Frankfort, and the Embassy of the Caliph Haroun al Raashid to Charlemagne.

DR. WAAGEN, in his notice of Rembrandt (*Handbook of Painting*, 1860, p. 340) writes: "In the absence of pictures by his masters, Van Swanenburg and Pinas, it is difficult to ascertain what he learnt from them." Students of Rembrandt's works will probably be interested to know that a fine work of Pynas's (canvas about 3 ft. 6 in. by 2 ft. 6 in.) may be seen at Aachen in the possession of Mr. Wings. The subject represented is the *Dismissal of Agar by Abraham*. On the right the patriarch, clothed in red with white turban, his right hand resting on the head of Ishmael kneeling before him on one knee, with his hands placed one in the other. Abraham has his left hand raised in the act of dismissing Agar, who stands before him, barefooted, in red skirt and yellow dress, with a scarf round her waist. On the left a farm, with steps leading up to the house door; a man feeding a horse, a woman, two goats, and a cow; a stream with bridge; hilly background, with ruins. The colouring, warm and true to nature, bears considerable analogy to the earlier works of Rembrandt. Signed, J. Pynas, fecit 1613 or 1603—the light, when the writer saw the picture, was not sufficiently strong for him to decide with certainty which.

THE Society for the History of French Art has just decided on publishing a quarterly journal. This Society has already, as we learn from *Polybiblion*, published *Nouvelles Archives de l'Art Français*, 1872 and 1873 (1874 in the press); and a *Mémoire pour servir à l'histoire des maisons royales et bastimens de France*, par André Félibien. It has now in the press *Les Procès-verbaux de l'Académie royale de peinture et de sculpture de 1648 à 1792*, which will give the official and detailed history of French artists during the period named, and will be completed in four or five annual volumes.

THE STAGE.

THE "MERCHANT OF VENICE" AT THE PRINCE WALES'S.

THE popular success of the revivals of legitimate drama at the Prince of Wales's Theatre, in so far as it is occasioned by peculiar attention to scene and stage management, is one that it is dangerous to repeat very often. It is the kind of success which no one theatrical director can retain in monopoly. It is very worthy, in its way, for it is not obtained by any display of mere barbaric splendour, nor merely of petty accuracies which human interest has nothing to do. It is, by a display of genuine taste and judgment, and is none the less perilous for that. For though the taste of Mr. and Mrs. Bancroft does appear to be quite exceptionally good, it is not nowadays exclusive possession. The managers who have not got it themselves may some day think it worth while to buy it of the artists and decorators, and then there will be half a dozen theatres each with the *spécialité* of the Prince of Wales's. And when that day comes, some one will find out that the art of acting is a *spécialité* too; and rather a desirable one. And then we shall see repeated striven for, right and left, the success, not of the *School for Scandal*—a success of Chippendale, a delft and marqueterie—but of *Sweethearts*: success of delicate art and human interest.

At the Prince of Wales's, all that good taste and care could do to make the Venice of the Middle Ages live before us, has been done, and a new "stage business" has been pressed into service to add to the illusion. Fragments of the Ducal Palace seem built up solidly; the sunburnt Venetians loiter lazily under the arches; a traveller arrives on the Place, beggars accost him and are rewarded, and straightway make the sign to others to enjoy a like largesse; there is the fruit stall and the water-melons; there is the curious unfamiliar mingling of narrow footway and narrow canal in the city view, and you look across from the Piazzetta to San Giorgio and the little barks. Never before was the outward life of Venice made so real to you on the stage. But the acting is not, on the whole, on a par with the stage management, and Mr. Gordon's scenery will have the largest share in the general success.

And yet, not quite the largest, for there is of character—of all but one the most important—acted with a most admirable art: an excellent delightfully sustained from end to end. It is really not too much to say of Miss Ellen Terry Portia that it is an entirely complete and satisfactory thing. It shows a quite remarkable advance upon every performance of Miss Terry's early youth; adding to the old high spirit—dashed in a jot—a new thoughtfulness and discretion, new lacking to this performance from the first line to the last. "Genius" is a word that has been used of this performance, and used, perhaps not quite rightly, for the character of Portia, pleasant as it must be to play, affords, one imagines, little room for genius—this "unlesson'd girl, unshock'd, unpractised," can neither exhibit any rare subtlety nor yield to over-mastering impulse. But Miss Terry shows here—and she shows all the part gives her the means of showing—excellent spirit, guided by excellent art. The phrase and turn of the dialogue is enriched and illustrated by a new gesture, or an altered tone. The light talk with Nerissa, the good fun when the Prince of Morocco and the Prince of Arragon are in the act of choosing wrongly—fun hidden by a good heart, and prudence too, which fears the consequence of premature disclosure—the abandonment to delirium when Bassanio has chosen wisely: these things are well done, but others, less noticeable, are as well done, and conceived sometimes with more originality. When Lorenzo is uttering to Portia the praises of Antonio, whose misadventure she is minded to relieve, Miss Terry says, "I never did repent of doing good," and follows

this with a smile and gesture of deprecation which give all possible force to "this comes too near the praising of myself." This of course is a simple point, suggested by the text to any intelligent reader of it. One praises not the doing of it, but the way in which it is done. More truly inventive is the delivery of her first lines about Bassanio. "Do you not remember, lady," says Nerissa, "in your father's time, a Venetian, a scholar and a soldier, that came hither in company of the Marquis of Montferrat?" "Yes, yes, it was Bassanio," says the actress, impulsively—the recollection is such a pleasant one. "As I think, he was so called," she adds more carefully, making you see that Nerissa is not wholly her confidant. And when Nerissa has prattled on, "He of all the men that ever my foolish eyes looked upon, was the best deserving a fair lady," she rejoins, with no personal feeling at all, but just with the common sense of truth which would give every man his due, "I remember him well, and I remember him worthy of thy praise." Here, and in many a place besides, as you contrast her with the too many actresses who render everything with a dead conventional propriety, Miss Terry reminds you of Rachel's words, "One cannot act a part by learning how to speak, and how to make gestures. One must *think*. One must *live*."

Mr. Coghlan's Shylock is neither so good as some people had hoped, nor so bad as other people have said. He is not in manner a forcible Shylock; but however unusual may be the absence of strong display of feeling, and however inconsistent it may be with the sense of many of the words he has to speak, there is some justification, or at least some apology, even in the text itself. It may be argued from the text itself, that of all the things Shylock hated and despised, he hated and despised nothing so much as sterile vehemence of expression. "Why, look you how you storm!" he says to Antonio, when the Merchant is quickly enraged with him. And Gratiano, in the trial scene, having called the Jew's desires "wolvish, bloody, starved and ravenous," is met with the rejoinder—

"Till thou canst rail the seal from off thy bond,
Thou but offendest thy lungs to speak so loud."

So that we hear much of other men storming, but never of Shylock's storming. And this much must be remembered in Mr. Coghlan's favour, when he is reproved for want of physical force. It is not then for presenting us with a Shylock outwardly calmer than any to whom we have been accustomed that I should find fault with Mr. Coghlan; but rather for inadequate indication of feeling in some places where feeling must needs have been, and where this actor himself recognises the need for its expression. At some decisive moments, with all his quietness of voice, he reaches some intensity—emotion in reticence—but then suddenly, all the look of emotion has vanished, with no cause whatever for its vanishing, and the actor in his very effort to express a strength of feeling, after his fashion, is as if struck with sudden impotence. The first great scene, in which the Jew bewails the flight of his daughter, has more than one instance of this. At one moment Mr. Coghlan is inwardly overwhelmed: at the next, purposelessly indifferent. There is a want of continuity: a lack of reasonableness in this, which well considered moments—such as that admirable one, when pausing at the door, whence Jessica has fled—do not by any means atone for.

Mr. Lin Rayne's Gratiano is entirely good, and to be praised instead of blamed because it includes a view of Gratiano's character rather more complex than that popular one which presents him as a mere jester; regardless of the fact that a few of the finest lines in all the piece are placed by Shakespeare in his mouth. Mr. Bancroft gives dignity to the Prince of Morocco, and Antonio loses not much in pathetic interest, though something in variety, by the performance of Mr. Archer. Miss Carlotta Addison is a bright Nerissa—brighter than we have seen her for a long time.

Mr. Teesdale, as Salarino, gives more importance to the character than its representative is often able to claim for it. For the Old Gobbo of Mr. Glover and the Launcelot Gobbo of Mr. Wood, we have no particular praise. The Lorenzo of Mr. Standing is perhaps a little colourless; the Solanio of Mr. Denison too evident a study in the Coghlan-Bancroft school of languor and satiety—and an imitation, remember, may have no merit, where an original may have much—and, lastly, Mr. E. H. Brooke, as Bassanio, is feeble in the expression of emotion; quite unable, for the present, to persuade one of the reality of the scenes through which the character passes.

FREDERICK WEDMORE.

WHEN *Mademoiselle Duparc* was produced in Paris, not very many weeks ago, some short account was given of it in these columns. Between its production at the Gymnase and its performance, last week and this, at the Opéra Comique in the Strand, the obligations of the author to Dumas, *fil*, have been publicly avowed. But if such avowal had been withheld it would still have been plain that *Mademoiselle Duparc* was a study in the school of Dumas, for it presents, for easy stage-solution, a social problem, and does this after all with something of the seriousness and good faith of *Les Idées de Madame Aubray*: wholly without the revolting crudity, if also without the trenchantness, of *Une Visite de Noces*. It is not a brilliant piece, nor a very forcible one, but it has many vigorous passages, and the only impotent thing about it is its conclusion. One finds this in reading the piece; one finds it also by the mere act of watching on the stage its principal interpreters. These in London are Mlle. Baittig and Mlle. Andrée Kelly—artists of intelligence, of whom, further on, we shall have a word to say. There is no surer way of finding out the weak point in a piece than in watching where its intelligent interpreters begin to fail. Their instinct, whether they know it or not, indicates the improbable word, the impossible situation; and in the play of which we speak, the weak point is in the purely arbitrary solution which M. Denayrouse has found for his difficult problem. Here Mlle. Baittig and Mlle. Andrée Kelly become notably deficient in excitement and intensity of expression. The attempted suicide is an unreal thing: so is the apparition of the convenient nun who providentially reminds the too agreeable governess that there exists this refuge for the class to which she belongs—for she is one of the women, as M. Dumas's apt pupil has informed us, who are born to work evil, without ever wishing to. Their very presence in the active world, of susceptible husbands and suffering wives, is of necessity a peril. But the wife's recourse to the open window, and the governess's recourse to the convent, are alike unreal; and it is here that the acting fails. Otherwise throughout the piece Mlle. Baittig represents the emotions of the wife competently enough, though without sweetness and softness: a representation intelligent but not touching. Mlle. Kelly, as the governess, gives us a performance of really high merit, natural and sympathetic and imaginative to a quite unusual degree. Mlle. Kelly enters absolutely into the situation she depicts, and then depicts it with a command of means not very common indeed in our younger English actresses, but less remarkable than the perfect apprehension of each changing feeling it is her business to express. In *Mademoiselle Duparc* the men have little to do, and that little is for the most part disagreeable. MM. James, Monti, Montlouis, Chantal and Perrier appear in the piece.

La Comtesse de Sommerive was to be produced, at the Opéra Comique, on Wednesday night, for the first appearance of Mlle. Laurence Gérard. The work is by Théodore Barrière and Mlle. Prébois. On Monday *Les Trente Millions de Gladiator* is to be repeated.

SIGNOR SALVINI's performance of *Othello*, given on Monday afternoon specially that the London actors who had wished to witness it might have the opportunity of doing so, was attended by a very large body of members of the theatrical profession, by whom the Italian tragedian's acting was watched with exceptional keenness.

Tom Cobb—Mr. W. S. Gilbert's long announced comic drama—is fixed for representation this evening, at the St. James's Theatre.

Much Ado About Nothing, which will be played at the Gaiety on Monday, cannot have many representations there, though the cast is a good one: including, as it does, Miss Ada Cavendish, Miss Furtado, Mr. Hermann Vezin, and Mr. Ryder.

MR. J. S. CLARKE—the American comic actor who has won much popularity in London—has returned to England for a short time; and Mr. Field, of the Charing Cross Theatre, has promptly seized the occasion to engage him for a limited number of nights at that playhouse. The other arrangements at the Charing Cross are accordingly upset for the moment.

THE drama entitled the *Guinea Stamp*, which was produced a little while ago at the Globe, without making much mark, has now given place to a revival of *Eust Lynne*. It might be a yet more popular arrangement if *Bluebeard* were played from seven to eleven.

The newest piece at the Gymnase Theatre is *Le Comte Kostia*, a drama by Raymond Deslandes and Victor Cherbuliez, drawn from the romance of the latter writer. *Le Comte Kostia* has been one of M. Cherbuliez's greatest successes in fiction. It may take rank with *Le Roman d'une Honnête Femme* as a piece of admirable writing, and, in interest for the novel reader, is perhaps above that work. But it deals for the most part with characters removed from the range of common sympathies; its people are too much of eccentricities apart from the every-day world to have a permanent or enthusiastic success at the theatre. The piece was for two months in rehearsal at the Gymnase, but during the greater part of that time M. Montigny, the director, was absent, and only on his return could the serious work begin, as he insists on minutely superintending the production of his pieces. Only the day before the first performance a most important change was made in the piece, so that the first performance itself was less finished than is generally the case at the Gymnase. Landrol has a principal character, but it does not fit him very well. Other main parts are taken by Pujol, Pradeau and Villaray, and by Mlle. Tallandiera—the actress of whom M. Dumas and M. Regnier expressed so good an opinion, before her abilities had been tested on the boards of the Gymnase.

Un Drame sous Philippe II.—at the Odéon—is the work of a very young man, M. Porto-Riche. It is a semi-historical drama, in verse, and in five acts, and is full of faults and merits: a piece to which, as we are informed, no one who sees it can be indifferent. It is fuller of strong situations than of strong characters: fuller still, perhaps, of improbabilities; but its dramatic movement and seizing interest are unquestionable, and are very rare in the work of so young an author. The piece is well mounted—M. Duquesnel, the director of the Odéon, being apparently intent upon outdoing M. Perrin, of the Français, in this matter. There are only four parts in the piece, and these are played by Talien, Gil-Naza, Masset and Mlle. Rousseil. Talien is always the same in mannerism: he speaks, so to say, in italics: he underlines every phrase. As Mlle. Rousseil's part is chiefly melodramatic, she is generally satisfactory—even striking; but when the part ceases to be melodramatic the actress ceases to be competent.

MUSIC.

CRYSTAL PALACE CONCERTS.

THE series of Saturday concerts at the Crystal Palace was brought to a close last Saturday, though there still remains to be given Mr. Manns's benefit concert, which takes place this afternoon. There were two or three special features of last week's performance which entitle it to rank as among the most interesting of the series. First among these in musical interest must be placed one of the finest renderings conceivable of Schumann's too rarely heard overture to *Manfred*, in which he has expressed with such wonderful power and beauty the character of Byron's remorse-laden hero. There are probably two reasons why this grand work is so seldom brought forward at our concerts. It is written in a vein of thought which appeals more to the sympathies of cultivated musicians than to those of the general public, though it contains some passages of remarkable beauty and charm, especially the touching phrase which occurs first in the "second subject," and again in the *coda* of the overture, and which in the subsequent incidental music to the drama accompanies the vanishing of Astarte. But in addition to its somewhat recondite character, the music is exceedingly difficult, partly from the prevalence of extreme keys, and partly, also, from the great boldness of its harmonies and modulations, which require the nicest intonation from the stringed instruments. With a second-rate orchestra so many dissonances would be heard in addition to those which Schumann has introduced that the effect would probably be excruciating. With such a band as Mr. Manns's, however, the work was safe enough, and (as has already been said) a more splendid performance has probably never been heard. A novelty of the afternoon was the production of an allegro and scherzo (presumably the first and third movements) from a new symphony by Sir Julius Benedict. A symphony is, or at least ought to be, a work of such unity of design that it cannot be fairly judged when heard only by instalments. Assuming this to be the case in the present instance, it may be doubted whether Sir Julius was well advised in submitting merely a *torso* to public criticism; and anything like a detailed notice of the work should be deferred till it is heard in its entirety. It will be sufficient to say here that its themes are melodious, and that they are treated with the practised skill to be expected from one who is so thoroughly a master of his craft as the composer. Herr Wilhelmj was heard for the second time at these concerts, on this occasion in the first movement of a concerto by Paganini. The composition can be best described by one word—trash; considered as a show-piece, nevertheless, it affords great opportunities to the soloist, and of these Herr Wilhelmj availed himself to the utmost. Probably a more astounding display of *tour de force* has never been heard. Rapid passages in double notes, and even scales in harmonics of the most extraordinary difficulty, were given by the player, not only with the greatest apparent ease, but with a faultless purity of intonation and a fullness and richness of tone which were truly marvellous. As an executant, Wilhelmj is undoubtedly one of the greatest living players; but his performance, wonderful as it is, seems wanting in that indefinable charm which, as in the case of Joachim, and (to a less extent) of some other players, such, for instance, as M^{me}. Norman-Néruda, goes straight to the heart of the hearer. With Wilhelmj one thinks most of the grand tone and the extraordinary execution; with Joachim the player is for the time altogether forgotten in the music. The remaining instrumental pieces on Saturday were the "Pastoral" symphony and the *Tannhäuser* overture; and the vocal music was contributed by Miss Sophie Löwe and Signor Foli.

As usual at the conclusion of the series, a synopsis of the works performed during the season

was appended to the programme. The list shows, happily, no diminution in the activity and enterprise evinced by Mr. Manns and the directors as compared with past years. Thirty-eight new works have been brought forward for the first time, among the more important of which have been Bach's Suite in C, and his cantata "Ich hatte viel Bekümmernisse," Barnett's "Lay of the Last Minstrel," the two movements by Benedict mentioned above, Bennett's overture to *Parisina*, Brahms's Serenade in A, Handel's *L'Allegro*, Holmes's *Jeanne d'Arc*, Joachim's violin concerto in G, Lachner's sixth Suite, Liszt's 2nd Concerto, Macfarren's violin concerto and Festival Overture, Mendelssohn's 95th Psalm, Mozart's violin concerto in D, Ouseley's *Hagar*, Raff's "Lenore" symphony, Spohr's symphony in E flat, and Wagner's *Faust* overture. There is no other concert-giving institution in this country which could furnish such a list; and no less satisfactory is it from another point of view to find that eighteen works by English composers have been brought forward in the course of the season. The unrivalled execution of the orchestra and the indefatigable zeal and ability of Mr. Manns are so well known that any encomium is superfluous; but a word of recognition ought in conclusion to be given to the marked improvement shown by the Crystal Palace Choir on all occasions when their services were called into requisition.

At Mr. Manns's benefit concert this afternoon a selection from *Lohengrin* is announced; and Dr. Bülow will perform Raff's very interesting piano concerto in C minor, which has only once been heard in London, and never at the Crystal Palace. EBENEZER PROUT.

THE Musical Artists' Society gave their fourth trial of new compositions last Saturday at the Royal Academy of Music, Hanover Square. The object of this society, as some of our readers will be aware, is to give its members an opportunity to bring forward their new works. On the present occasion the programme comprised a duo for piano and violoncello by Miss Oliveria Prescott, two duets for piano and violin by Messrs. Lea Summers and E. H. Thorne, a duo concertante for two pianos by Mr. C. E. Stephens, and vocal music by M^{me}. O'Leary Vinning, and Messrs. F. Westlake, C. Gardner, T. Parry Cole, Louis N. Parker, Arthur O'Leary, and Henry Baumer.

THE new Alexandra Palace is to be opened on May 1 with a grand musical performance under the direction of Sir Michael Costa. As at the Crystal Palace, music is intended to form a prominent feature in the attractions of the new building. A permanent orchestra of about forty performers, including some of the best instrumentalists in London, and conducted by Mr. H. Weist Hill, has been engaged; and the company have also organised a military band of twenty-eight players for open-air performances. The great central hall contains an organ second only in size to the gigantic instrument in the Albert Hall, and from the workshop of the same builder, Mr. Henry Willis; and the company have been fortunate enough to secure the services of Mr. Frederick Archer, one of our most brilliant players, as their organist. In addition to this a choir of upwards of three hundred voices has been formed for the performance of oratorios and other important vocal works; and, lastly, a series of operatic performances in English is announced to be given in the theatre, during the months of September and October, under the direction of Mr. Carl Rosa. So enterprising and comprehensive a scheme deserves, and will probably receive, a large measure of public support.

M. ERNEST REYER, the musical critic of the *Journal des Débats*, is collecting in one volume his "Souvenirs d'Allemagne," a series of articles which originally appeared in the *Moniteur*, and a number of his principal musical articles from the *Débats*. The book will be published by Charpentier, of Paris.

MESSRS. SCHOTT, the music-publishers of Mainz, announce that the vocal score of the *Götterdämmerung*, the fourth and concluding part of Wagner's great Nibelungen drama, will be published on May 1.

RUBINSTEIN's new opera, *Die Maccabäer*, was announced for production at the Royal Opera House, Berlin, last Tuesday.

THE monument erected to the memory of Robert Schumann at Leipzig has just been uncovered. It consists of an obelisk of polished grey syenite, with a bronze medallion-portrait of the composer on one side, and below it the simple inscription "R. Schumann."

SCHUMANN's opera *Genoveva*, which has seldom hitherto obtained more than a *succès d'estime*, seems to have fairly gained a footing at the Leipzig Stadttheater, having been given there nine times since March 3 to well-filled houses. The performance is spoken of by the German papers as a particularly excellent one, the principal parts being sustained by the leading members of the opera company, Frl. Mahlknecht, Frl. Keller, and Herr Gura and Ernst. On the occasion of the eighth performance Richard Wagner, who was on a visit to Leipzig, was present, and was so impressed with the excellence of the execution, that after the third act he went upon the stage to compliment the chief singers.

THE *Neue Zeitschrift für Musik* states that Johannes Brahms has resigned the conductorship of the Vienna Musikverein, and that Herbeck, late director of the Hofopertheater, is spoken of as his successor.

LITERATURE.

SIR HOPE GRANT ON THE CHINA WAR.

Incidents in the China War of 1860, compiled from the Journals of General Sir Hope Grant. By Captain H. Knollys, R.A. (London: Blackwood & Sons, 1875.)

THE many readers of Sir Hope Grant's *Incidents in the Sepoy War* will be ready to receive with cordial welcome the little volume now presented to the public on his Chinese campaign, and will be prepared for its general characteristics. There is the same simplicity and straightforwardness of narrative, characteristic of the lamented General's frank and manly personal attributes; the same frequent ignoring of self (so remarkable in an autobiographer), and slight treatment of the share borne by the narrator in very great events; the same careful editing on the part of Captain Knollys, who has accomplished his share of the task in a manner that deserves high praise. It gives an additional touch of interest to this volume, albeit one of a melancholy kind, that the printed sheets for it were laid before the writer after he had been seized with the mortal malady that deprived the country of his services; so that it may be said to appear as a sort of bequest, recording the highest one that he ever accomplished of the many varied duties entrusted to him. In other respects it can hardly reach the same historic value as his former work. There is a never-dying interest attached to the great tragedy enacted in the varied scenes round Delhi, Cawnpore, and Lucknow, and to the events which for the hour shook the whole fabric of greatness England has built up in the East; which cannot be found in the records of a campaign conducted with steady straightforward success against an empire which proved unable even to make a moderately good defence of its own heart against the attacks that its councillors up to the last treated so lightly as those of the Emperor of China plainly did the advance of the allied Powers on Peking, even after the fall of the Taku forts and of Tientsin left the road open to the capital.

There is a plain military moral of much importance that lies almost on the surface of this narrative. It may be necessary for general policy's sake that two great Powers should combine their forces to punish a common enemy, whose barbarous or semi-civilised strength would be unable to cope with either of them singly: but for any less reason than an important state necessity, such a combination is to be absolutely con-

demned. What was the consequence in this particular case? So badly were matters managed between the allies, that the jealous arrangement which was to limit their contingents to precisely equal strengths of 10,000 men each, was tacitly dropped almost from the first. The British force far exceeded this estimate. The French, with no great base like India to draw from, came far behind it. The net result was that the latter furnished a bare third of the nominal strength, and a much less proportion (as Captain Knollys well shows) of the fighting power that did the chief part of the actual work, that at the Taku forts. And yet throughout the operations, from first to last, we were compelled to keep up the official fiction that the French were there in equal strength to ourselves; to give them the place of honour at the most critical moments, a condition which allowed that stolen march of theirs on and plunder of the Summer Palace, which Captain Knollys has done rightly to expose with thoroughness in his *précis* of the evidence; and to consult at every turn of the operations their staff as well as our own, thus leaving room for that division of counsels which is almost as certain to follow, under such conditions, as night to succeed day. When to the difficulties thus created for Sir Hope Grant in the first terms of the problem put into his hands to solve; it is added that the officer associated with him in rank and power by the French was the very Count Palikao who, when clothed with brief authority in his tenure of the Paris War Office in the fatal August of 1870, made himself memorable for ever as the most blundering mismanager who ever attempted to dictate strategy to distant generals from a minister's closet: we become sensible that the British general must have had within him far higher qualities than those ever gave him credit for who had noted him merely as the methodical hard-riding colonel of a crack cavalry regiment, whose puritanism never interfered with the smart action of his squadrons, or even as the fire-eating brigadier of horse in the Delhi campaign. To have carried on without a check from first to last the operations that led to the fall of Peking, would have been no slight task had he been unfettered. To have accomplished this when burdened by the presence of Palikao as coadjutor; his opening delays, impracticable proposals for separate operations, and faltering or mistaken counsels at the crisis of the campaign: this, indeed, was no ordinary achievement. Not that we are at all disposed to admit with Captain Knollys that the Chinese expedition is to be held as pre-éminent above other very similar ones in our modern history. Indeed, the chief exception we should make to his reflections on it is to the statement that "it is scarcely too much to say that the Chinese war of 1860 may be considered the most successful and the best carried out of England's 'little wars.'" To critics less interested, the prompt and thorough punishment of the drunken tyrant King Theodore, and the humiliation of the bloody despot of Coomassie, will seem every whit as good proofs of British forethought in design, and endurance in execution. Where three successes of the same character were so com-

plete, it is a mistake to exalt one too loudly above the others. For lauded thus as excelling all other like adventurous campaigns, the advance of 10,000 picked British troops on the Chinese capital inevitably attracts comparison with the overthrow of the other and, for the time, more formidable barbarian power of China, flushed with the prestige of repeated victory and the fanaticism of a new creed, by the unaided genius of a single British leader. As a military achievement, Gordon's campaign against the Taepings as much transcends any of the wars we have spoken of as the discipline and dash of Probyn's Regiment of Horse that covered the advance of Sir Hope's columns, outdid those of the handful of coolies, officered by runaway adventurers, with which Gordon undertook the extirpation of a false faith and the restoration of a shattered empire. Nor should it be forgotten, when the Peking expedition is compared with those that have followed it, that Sir Hope had for one of his divisional generals the most brilliant officer the Indian Mutiny had raised to distinction—the future conqueror of Abyssinia. He himself is very careful to do justice to the assistance he received in the chief action at the Taku forts from Napier's abilities as an engineer. But other eye-witnesses of the Chinese campaign have said that the innate gift for tactics which had already shown itself in India from the time that that engineer first appeared at Lord Gough's side in the desperate struggle with the Seikhs in 1848, was as conspicuous in the Peking expedition as his more technical mastery of the details of his particular branch of the service. It is too early, however, for controversy on such matters. Enough to say that Captain Knollys is right to praise in the highest terms the performance of the great task entrusted to Sir Hope; nor is it necessary to this end to compare it with those other "little wars" of the results of which Englishmen have a right to feel proud, not merely for their own sakes, but because they have taught Europe that the old spirit of enterprise, energy, and courage has not wholly left these islands of ours.

Another great military lesson was to be gathered from this campaign which applied exclusively to ourselves, and happily it has not been lost on our government. This was the necessity of recognising the simple fact that India is no longer a colony to be defended from this country; but rather a separate empire under the same supreme head, which should not only provide for its own security, with the help, of course, of British counsels and British leaders, but form the base for all our foreign policy in the East. The Chinese war of 1860 should have been directed, all future wars in the Indian Ocean should be directed, not from London, but Calcutta; not by a Secretary of State at the other side of the world, but by the Viceroy of our Eastern empire. All sound military principle points to this. Nor less do the facts recorded in the work before us, where we find the Secretary for War—happily in this case the ablest Great Britain has had within the present generation—after a commander of the expedition had been ap-

pointed from the Indian staff, and troops to form it selected from the Indian army, suddenly intervening to assume the management by letters from Pall Mall, and only escaping the usual evils of such indirect and distant administration by the large discretion he had the good sense to leave to the general in command. Such confidential letters of Sydney Herbert's as are here published cannot fail to be interesting. To an observant mind no part of them is more so than the passages in which that lamented statesman deplores the cross purposes necessarily entailed by the system then in vogue of carrying on war with Indian means, and making believe that they were not Indian at all. "I regret very much," we find him, for instance, writing, "the loss of the Indian Commissariat. I fear that our people will make blunders as to native caste prejudices, and so on, which would be serious. It is another instance of the great inconvenience of having two separate civil jealous services in lieu of one with a common interest and object." Lord Herbert (the War Minister was then a peer) would have been more correct had he said that it was another instance of the absurdity of sending a large force from India without its own Indian departments to make it complete. To keep up the fiction that it came not from India but Great Britain, a raw commissariat was sent out to manage for troops whose habits they knew nothing of, and the success of the whole campaign jeopardised. This unreal and effete view of our military position in the East seems to have been abandoned thereafter; and when a like work had to be accomplished in Abyssinia, the wisdom of Downing Street made no greater blunder than the committing the care of the preparations to one of the subordinate administrations of India instead of its Supreme Government; being apparently under the delusion that the Governor of Bombay is in the semi-independent position which his predecessors occupied in the days of Clive. Such a political survival shows how forms of authority live on after the substance has long passed away.

It is not our purpose to follow with Captain Knollys the course of the Chinese campaign. To those who know the history even slightly, a reviewer's summary would be of little value; and even those who know it well may profitably study the course of the whole affair as traced in Sir Hope Grant's own clear unpretending notes, which his editor has brought into completeness and connected form with a care that has increased their value. Not the least interesting part of this interesting volume are the glimpses into Chinese imperial life afforded by the careful selection given of the State papers captured in the Summer Palace. For the edification of those who imagine that all addresses to the Emperor—who certainly in the national theory is generally, as Captain Knollys observes, "treated as a kind of divinity"—are necessarily couched in abject and flattering words, we conclude our notice of this pleasant little volume by transcribing some part of a curious letter of remonstrance to the monarch on the rumour first spreading that he was about to flee from his capital, before the barbarian enemy,

to his hunting seat at Gehol, in the interior. This document is couched in the form of a "Memorial by Tsae-tang-Yung, Censor (or chief finance officer) of the Hoo-kwang provinces," who writes:—

"The confusion and alarm are indescribable. But there has been nothing so strange as the report now heard, that your Majesty intended making a tour to Gehol. This has caused the utmost consternation, but your Minister does not believe in it. . . . If, indeed, the report is true, the effect produced will be like a convulsion of nature, and the mischief must be irreparable. In what light does your Majesty regard your people? In what light the shrines of your ancestors, or the altars of the tutelary gods? Will you cast away the inheritance of your ancestors like a damaged shoe? What would history say of your Majesty for a thousand generations henceforward? It has never been known that a sovereign should choose a time of danger and distress to make a hunting tour, supposing that thereby he would prevent trouble. If the capital should be disturbed, what would there be to save Gehol alone from being disturbed? Your Majesty is besought to return without delay to your palace, in order that the people's minds may be reassured against the enemy."

CHA. C. CHESNEY.

The Works of George Chapman. With an Introduction by Algernon Charles Swinburne. (London: Chatto & Windus, 1875.)

George Chapman: a Critical Essay. By Algernon Charles Swinburne. (London: Chatto & Windus, 1875.)

CHAPMAN'S translations of the *Iliad*, the *Odyssey*, the *Batrachomyomachia*, and the Hymns of Homer were republished by Mr. J. R. Smith in 1857. His Tragedies, Comedies, and Masques were collected and reprinted by Mr. John Pearson in 1873. The present edition by Messrs. Chatto and Windus combines the Dramatic Works and the translations, with the addition of a great many minor poems, republished now for the first time. The amount of attention which Chapman has thus received within a period of seventeen years will, to the most enthusiastic admirers of Elizabethan literature, appear a just but tardy recognition of his merits, while those who share Byron's opinion about the dramatists may be inclined to think that one republication of his works by a competent scholar would have sufficed for his fame. Chapman's Plays have been so recently made the subject of criticism in the ACADEMY (see September 1, 1873), that it will be enough to state regarding this new issue, that it is as full as that of Mr. Pearson. The present editor, Mr. R. H. Shepherd, has, however, followed a method more agreeable to the ordinary reader and really more satisfactory to the student, by modernising the orthography and not adhering to the misprints of the first editions. Thus Chapman's plays may now be read with tolerable ease; Mr. Pearson's reprint, meanwhile, retaining the attractions which old-fashioned type, quaint spelling, and chosen paper have for some tastes.

The chief feature of Messrs. Chatto and Windus' publication is the introductory Essay on George Chapman by Mr. Swinburne, a critical dissertation of such importance as to call for separate attention.

Nowhere perhaps has Mr. Swinburne composed a passage of more eloquent prose than that in praise of Marlowe which concludes the treatise. For the first time the whole truth has here been said about Marlowe, without hesitation and without stint, by one whose double gift of poetry and scholarship gives him the right to adjudicate the laurel *ex cathedra*. Nor is this noble panegyric of a singer whom many men of worth have praised, but whom none has hitherto commended duly, a mere piece of splendid rhetoric. Compared with Mr. Swinburne's prose in other portions even of this essay, the peroration is temperate in style, weighty with well-considered thought, and pregnant with such high philosophy of art as only a true poet can enunciate. This coronation of Marlowe at the hands of a brother bard has long been waited for. It is as though, reversing Shelley's line on Keats, the lyrist of our day should say to the great founder of the English stage:—

"Assume thy winged throne thou Phosphor of our throng."

Mr. Swinburne's panegyric of Marlowe grows out of his analysis of the peculiar quality of Chapman's genius. Chapman, like Jonson, was, he argues, a man who might have won distinction by his talents in many paths of life, a poet by choice of work, not by necessity of vocation. Heaviness of handling, the lack of true passion, labour substituted for immediate inspiration, analysis accepted in the stead of intuition, spoiled the best work of both:—

"The most ambitious and the most laborious poets of their day, conscious of high aims and large capacities, they would be content with no crown that might be shared by others; they had each his own severe and haughty scheme of study and invention, and sought for no excellence which lay beyond or outside it; that any could lie above, past the reach of their strong arms and skilful hands, past the scope of their keen and studious eyes, they would probably have been unable to believe or to conceive. And yet there were whole regions of high poetic air, whole worlds of human passion and divine imagination, which might be seen by humbler eyes than theirs, and trodden by feeble feet, where their robust lungs were powerless to breathe, and their strenuous song fell silent. Not greater spirits alone, such as Marlowe's and Shakespeare's, but such lesser spirits as Decker's had the secret of ways unknown to them in the world of poetry, the key of chambers from which they were shut out."

That is delicately spoken as well as deeply thought. Here, again, are sentences which form the basis of a true critique of Chapman's merits as a translator:—"For all his labours in the field of Greek translation no poet was ever less of a Greek in style or spirit. He enters the serene temples, and handles the holy vessels of Hellenic art with the stride and the grasp of a high-handed and high-minded barbarian."

In another place Mr. Swinburne remarks: "The temperament of Chapman had more in it of an Icelandic than a Hellenic poet's; and had Homer been no more than the mightiest of skalds, or the *Iliad* than the greatest of sagas, Chapman would have been fitter to play the part of their herald or interpreter."

In addition to the limitations of his genius which Chapman shared with Jonson, and to this Hyperborean barbarism of temperament,

Mr. Swinburne points out that he suffered in no common measure from obscurity of thought and diction. The discussion of this charge, which can never cease to be repeated against Chapman, leads his critic to one of the most interesting digressions in the essay. While defining what is rightly termed a want of clearness, Mr. Swinburne lays it down that "only random thinking and random writing produce obscurity; and these are the radical faults of Chapman's style of poetry." This dictum forms part of a defence of Mr. Browning, "upon whom this fault has been wrongly charged by the inaccurate verdict of hasty judges." Even *Sordello* in Mr. Swinburne's opinion is "hard—not obscure:" and to tax Mr. Browning in general with obscurity "is about as accurate as to call Lynceus purblind or complain of the sluggish action of the telegraphic wire." To express disagreement with a critic so generous and so subtle as Mr. Swinburne shows himself to be in this apology for his brother-hard, is an invidious task from which any man might be excused for shrinking. Yet something ought to be said on the side of what is generally known as common sense. Average readers will probably continue to pronounce much of Mr. Browning's work, in spite of its unique poetic quality, obscure; and it may be that they have some ground for this opinion. Does, in fact, obscurity arise solely from random thinking and random writing? Is it only the fault of a "feeble and clouded, or of a vigorous but unfixed and chaotic intellect"? Or, again, granting these positions, is it quite certain that Mr. Browning never writes at random, that his thoughts are never hazy? It might be well to quote an instance, which shall be taken literally at a venture, from *Sordello*. Here is page 309 of the edition of 1863. *Sordello* has just abandoned the higher kind of poetry which aims at presenting ideal character in verse:—

"A few adhering rivets loosed, upsprings
The angel, sparkles off his mail, and rings
Whirled from each delicate limb it warps,
As might Apollo from the sudden corpse
Of Hyacinth have cast his luckless quoits."

Whatever definition we may give to obscurity, this surely is obscure: for how does the picture of Apollo clearing his quoits from the corpse of the suddenly-slain Hyacinth help to explain the metaphor of an angel who shakes off his mail and flies skyward? It is surely possible to be obscure in poetry by a superfetation of images, by elliptical expressions, by unwarranted grammatical inversions, and by a wilful choice of recondite illustrations; and I submit that all these sources of obscurity occur in the five lines quoted from *Sordello*. A classic poet by taking more trouble to master his own thoughts and to conform to the language of his nation, would have attained to limpidity of expression; nor would he have affected the fame of an oracle by wrapping up thoughts of no remarkable originality, however just and forcible, in complicated swathes of oblique phrases. What folk call Mr. Browning's obscurity is, in a great measure, due to his habit of stating simple propositions perplexedly. A seraph cannot be concocted by involving some common creature of the imagination, *κοῦφόν τι καὶ πτηνόν*, in an intellectual haze,

however luminous; and we are reasonably disappointed, after threading the mazes of a more than Cretan labyrinth, to find at its centre no Minotaur, but only an ordinary calf. It is, however, ungrateful to prosecute a polemic against the style of a poet to whom, for originality of fancy, subtlety of analysis, depth of thought, and novelty of form, English literature owes so much as it does to Mr. Browning. I would only suggest that it is possible to admire him most ardently, while admitting that at times he is not only difficult, but also, from whatever causes the critic chooses to assign, obscure.

Chapman's own dicta on the subject of obscurity are worthy of all notice. "That Poesy should be as perval as oratory, and plainness her special ornament, were the plain way to barbarism." Again: "That *energia*, or clearness of representation, required in absolute poems, is not the perspicuous delivery of a low invention; but high and hearty invention expressed in most significant and unaffected phrase." Nothing could be better. If all poets acted up to this rule, the charge of obscurity would be blown back from their grave and heightened utterances against the wits of those who used it. Milton, who thought it was the poet's function "with a solid and treatable smoothness to paint out and describe" all fair, wise, and sublime passions and actions of humanity, will never be found, in spite of his sometimes abstruse argument, to have led his reader by the light of a Will-o'-the-Wisp into the middle of a morass or to the side of a dry heath. The labour spent upon his lines is amply repaid by the thoughts contained in them.

Without attempting to notice more than a few points of interest discussed by Mr. Swinburne in this essay, I may call attention to one remark, which, coming from a poet of high station, should be well weighed by all critics and students:—

"Only the silliest and shallowest of pedants and sciolists can imagine that a question as to the date or the authorship of any poem can be determined by mere considerations of measure and mechanical computation of numbers; as though the language of a poem were divisible from the thought, or (to borrow a phrase from the Miltonic theology) the effluence were separable from the essence of a man's genius."

No one has more right than a born poet to express a dictum of this kind upon the false methods of criticism applied to his own art by men who are not poets. We feel sure, while reading it, that Shakspeare and Sophocles would have confirmed the verdict, and have smiled at the attempt to prove the birth-dates of their tragedies by counting syllables.

This review began with the peroration of Mr. Swinburne's essay; nor can it end without a further most emphatic recommendation of the whole triumphal passage which opens with "The name of Chapman" and closes with "the name of Christopher Marlowe." All lovers of style, for whom strong thoughts conveyed in splendid language and rhythmic periods of cadenced prose yield pleasure pure and undefiled, will find a music far above singing in this noble piece of English.

J. A. SYMONDS.

Cobden Club Essays. Local Government and Taxation. (London: Cassell, Petter & Galpin, 1875.)

THE early economists would have been puzzled at these Essays. Quesnay and his followers thought only of a central government with duties limited by natural law, and Adam Smith's general conception of government was nearly the same. He remarks, indeed, that public works for local convenience are best left to local administration, but without indicating how the line is to be drawn between local and general convenience, or how the local authorities are to be constituted. Taken in its full extent there are three main enquiries concerning local government: first, its sphere and objects; secondly, the constitution of the governing bodies, with their relations to the central government; and, thirdly, the method of taxation. Each of these enquiries, again, branches into three, the first two of which are subsidiary to the last. We can investigate the actual character of local institutions, their history, and the principles according to which they ought to be framed or reformed. Pure Benthamite philosophy would have concerned itself little with the two first of these branches; it would have proceeded at once to determine from general principles the whole theory of local government. This volume of Essays is one of several indications of a change in the method of English political philosophy, and of the substitution of the inductive and historical for the *à priori* method. It shows a conviction that one of the best contributions both to the philosophy of local government and to practical legislation respecting it, is to be found in a study of the system existing in different countries, and of its history in each, with the changes it has undergone, the causes of its development or degeneracy, and the traditions and other conditions under which it has to work.

Mr. Brodrick's essay, with which the volume opens, is an admirable example of the method of studying the subject from this point of view. The historical investigations which his and other essays in the volume contain have, moreover, an independent interest, which ought to attract readers who may not be disposed for the drier branches of the subject. The essays whose historical connexion is closest are not those which lie together on the three kingdoms at the beginning of the book, but those farthest apart, namely, Mr. Brodrick's on England and Mr. Morier's on Germany; M. de Laveleye's in the middle, on Belgium and Holland, being an excellent companion to both. On several points these three essays serve to illustrate, supplement, and correct one another. Mr. Morier and M. de Laveleye bring into view some aspects of the history and structure of English local government which might escape the reader of Mr. Brodrick's excellent essay by itself; and the latter, again, considerably modifies an impression which might be derived from Mr. Morier, with respect to the perfection of English local institutions, and the inherent aptitude of the English people for self-government. The history of English local government, as Mr. Brodrick narrates it, is

the history of a decline in self-government on the part of the bulk of the people in both country and town.

"It is impossible," as he says, "to survey county administration without being struck by the extraordinary absence of self-government in rural communities; nine-tenths of the population in an English county having, at this moment, less share in local government than belonged to all classes of freemen for centuries before and for centuries after the Norman Conquest, and not merely less share in local government than belongs to French peasants at the present day, but less than belonged to French peasants under the eighteenth century monarchy."

Of the degeneracy of boroughs, as shown in the famous Report on Municipal Corporations, Mr. Brodrick is driven to confess

"that such a mockery of self-government should have prevailed so widely for more than a century must ever be a reproach to constitutional monarchy in England, and a warning against a presumptuous reliance on the political virtues of the English people."

These passages are the best comment on Mr. Morier's observation that

"it is marvellous to observe how, partly owing to the free instincts of the English race, partly to their tenacious hold on what was old, partly to their adaptability to what was new, we succeeded in avoiding all the blunders made by our Continental kinsmen."

The real practical lesson to be learnt from English history is that inherent political instincts and capacities are not among the conditions under which the problem of local government has to be worked out in this any more than in other countries. The Russian peasant, as may be gathered from Mr. Ashton Dilke's instructive essay, might dispute Mr. Morier's proposition that "the spirit of free association may be looked upon as the *differentia* of the Teutonic race." And M. de Laveleye tells how the loss of public spirit early contributed to deprive the bulk of the people alike in England and in other Teutonic countries of self-government. They "got tired of administering justice. They neglected to attend the public assemblies. From indifference, from discouragement, sometimes from fear, they let the administration pass into the hands of the leading men. History proves that men have been deprived of their rights as often by indifference and apathy as by the usurpation of those who wished to enslave them."

Both political philosophy, one may add, and historical science will always have an obstacle to contend with, so long as assumptions respecting inherent qualities of race are admitted to a place in their theories by men of the intellectual calibre of Mr. Morier.

One of the historical aspects of the subject which Mr. Morier's essay brings into view is that an "economic law"—the necessity for a division of labour consequent on the increasing complexity of both public and private business—played a part in depriving the poorer classes both in England and Germany of their ancient rights of local self-government. And two lessons are to be learned from this operation of economic causes; namely, on the one hand, the importance of economic considerations in framing political institutions; and, on the other hand, the fallaciousness of the economic doctrine, on which one school of political thinkers has built, of the necessary harmony

of private with public interest. A good example of the manner in which economic conditions are to be taken into account in the organisation of local institutions is afforded by Mr. Brodrick's remarks (p. 31) on the respective dimensions of the county, the union, and the parish, as determining in some degree the nature of their management and the classes who can take part in it.

Mr. Morier sets in a clearer light than Mr. Brodrick does, an important aspect of two great English local institutions, trial by jury and the commission of the peace; in both of which local is combined with central government, and Professor Gneist's theory, concisely expounded by Mr. Morier, holds good, that local bodies in England are public bodies doing the work of the State, not mere deputies doing the work of the locality. On the other hand, the English magistrate virtually holds office by the right of his acres; and, as Mr. Mill says in his *Representative Government*, "the Quarter Sessions is the most aristocratic institution which now remains in England, far more than the House of Lords, for it grants public money and disposes of important public interests, not in conjunction with a popular assembly, but alone." Mr. Morier's erudition in German political and historical philosophy does credit to the English diplomatic body to which he belongs; but he seems to have forgotten that he has, in Professor Stubbs, a countryman as learned in English constitutional history as either Professor Gneist or Professor Sohm. Had he studied the former as carefully as the two latter, he might have modified some of his statements, and he would hardly have reproduced the story of the creation of 60,000 knight's fees as evidence of William the Conqueror's political genius.

The editor expresses regret on behalf of the Cobden Club that it was impossible to include in it several important countries besides those whose local institutions are discussed in the volume. It would, however, have far exceeded our limits to notice more than a few points in some of those it contains. Mr. McNeel Caird's on Scotland is the only one which touches on the incidence of local taxation; and it is a mark of good sense and clearness of thought that he does not pretend that the rough canons laid down by writers of theoretical treatises enable him to determine exactly on whom every local tax falls. Speaking of dwelling-houses, he says:—

"In a community which is prosperous and increasing in population, and the demand for houses consequently great, the house-rates, as a rule, will fall ultimately on the tenant. In a community which is declining, the rates will fall ultimately on the landlord. Between the extremes the demand will fluctuate, and the rates be ultimately divided between landlord and tenant in every variety of degree."

Some of Mr. Caird's positions on this branch of the subject, qualified as they are, might be shown to need further qualification; but his essay has a value independent of the point.

The volume on the whole is, in our judgment, one of the most valuable contributions to political science and history which has been made in England for many years.

T. E. CLIFFE LESLIE.

WHIST.

The Laws and Principles of Whist. By Cavendish. Tenth Edition, revised and greatly enlarged. (London: De la Rue & Co., 1874.)

In a former article we alluded to the fact that the literature of card-playing was almost entirely devoted to one game, Whist, the high intellectual character of which had gained for it the earnest attention of many able thinkers and writers. It will be interesting now to notice Whist literature a little more fully.

The game appears to have been formed on a principle now much in vogue, namely, progressive evolution. The earliest ancestor we can trace for it, is a game called Triumph, or *trump*, in common use at the beginning of the sixteenth century; but it was not till 1720 that Whist can be said to have taken its present form, the first clear description of it being the well-known *Short Treatise on the Game of Whist*, by Edmond Hoyle. This immortal personage taught whist professionally, and his book was a print of memoranda he was in the habit of giving his pupils.

We need not do more than mention a dramatic satire, *The Humours of Whist*, published in 1743; and *Whist*, a poem in twelve cantos, that appeared in 1791. The next work of importance was Mathews' *Advice to the Young Whist Player*, published at Bath, in 1800. This, and Hoyle's work, furnished till a few years ago the standard guides for whist-playing; they contain sound useful maxims, and may be read, even in the present more advanced state of knowledge, with advantage.

In 1839 there was announced a *Traité du Whist*, by M. Deschapelles, a fine French player. It was conceived on a large plan, but only a fragment appeared, of such singular merit and originality as to lead us to regret that the author, who died some years afterwards, never carried out his grand conception.

Passing over other works and writings on whist of no value, we may come at once to what may be called the more modern scientific development of the game. Thoughtful men, by giving constant attention to it had been led to perceive that it was capable of being played in a manner in advance of that contemplated by Hoyle and Mathews, and the improved modes became gradually introduced, though nothing had been done to reduce them to a systematic form, or to lay them clearly before the public.

In December, 1861, a suggestion was made, in an article on Card Games in *Macmillan's Magazine*, that "it would be a great boon if some good authority would publish a set of model games of whist, with explanatory remarks, such as were found so useful in chess, for example."

We have reason to believe that this suggestion gave rise to the work mentioned at the head of our article; the main object of which, in its original form, was the publication of a series of model hands, with notes and explanations, so contrived as to illustrate the improved modern play.

The book had, as it deserved, a great success, and it was followed by two other treatises—one by the late Mr. James Clay.

M.P. for Hull, being an able dissertation on the more refined points of modern play; the other, on the Theory of Whist, being an attempt to reduce the new rules into a logical connected system.

These works have been undoubtedly instrumental in producing a great revolution in whist-playing generally, as they have been the means of spreading widely among the public the knowledge which before was confined to small coteries of club players.

As a further proof of the interest excited by the modern literature of Whist, we may mention two articles that have lately appeared in our highest class periodicals: one, in *Fraser's Magazine* for April, 1869, "Whist and Whist Players," by a well-known essayist; the other "Modern Whist," in the *Quarterly* of January, 1871.

Cavendish's work has lately reached its tenth edition, which has been carefully revised, and has received some additions and alterations. It would be superfluous to say anything in commendation of the book generally; its large circulation is sufficient testimony to the estimation in which it is held. We need only remark on some specialities of the present edition.

So far as we can judge, the general rules, or, as the author calls them, "principles," of play appear to have undergone no material alteration, except in one case, that of the *discard*. The former rule was, always to discard from your weak or short suit; and, in order not to mislead your partner, this rule was to be followed implicitly in all cases, even at the risk of unguarding an honour. But it came to be seen that this often involved disadvantage, when the game was in danger; and the rule has been modified as follows:—

"It is clear that if the opponents declare great strength in trumps (by leading trumps or asking for them), your chance of bringing in a suit is practically *nil*. You should, therefore, in such cases abandon the tactics you would otherwise adopt, and play to guard your weaker suits by discarding from your best protected suit, which is generally your longest suit.

"If this system of discarding is comprehended by the two players who are partners, it follows as a matter of course that when trumps are *not* declared against you, your partner will assume you are *weak* in the suit from which you originally threw away. But when trumps are declared against you he will give you credit for *strength* in the suit from which you originally threw away.

"In the first case he will refrain from leading the suit from which you have discarded; in the second he will, unless he has a very strong suit of his own, select for his lead the suit in which you have shown strength by your discard."

This is an admirable rule, which ought to be made absolute in all good whist circles.

Another good novelty is an attempt to systematise certain exceptional modes of play, arising out of accidental circumstances, and which are usually called *coups*. These have generally been shown in isolated examples, and it has been assumed that they are to be dictated on the spur of the moment by the genius of the player. Cavendish, however, tries, and not unsuccessfully, to reduce some of them to general forms which, if borne in mind, will often prompt their application in a systematic way.

We are sorry to see that an alteration, in our opinion for the worse, has been made in

the form of the illustrative hands. These have constituted the best and most original feature of Cavendish's work, and it would be a pity if they should lose in usefulness and value. We never heard any reasonable objection to the original common-sense form, which made the fortune of the book, and should be glad to see it restored.

In two appendices to this edition the author has proposed extensions of what are called *conventional* modes of play, designed with the view of giving information to the partner;—one in leading from suits of more than four cards, the other in what he terms "echoing" the ordinary signal for trumps.

No authority can be higher than his own for any recommendations on these heads; but the general subject of conventions at whist is now assuming a grave form, and is beginning to call for the earnest consideration of intelligent and upright-minded players. Certain conventional arrangements have been allowed to be necessary, in order to ensure that regular and systematic play which is the essence of the modern game; but they have lately been carried to an extent which has met with much criticism. The "signal for trumps" (a conventional mode of play of two indifferent cards, in order to call on your partner to lead trumps, when it is to your advantage) is the most prominent example of this. It is adopted in the London clubs, but is objected to in many country whist circles of good players; and we believe it is universally and absolutely forbidden on the Continent, where the game is cultivated now almost as much as in England.

Cavendish being a thoroughly practical book, the author has not troubled himself about the philosophy of these conventions. The only places where we have seen any reasoning on the subject are in Mr. Clay's work and in the *Quarterly Review* article above alluded to. Mr. Clay gives an elaborate and ingenious defence of the signal for trumps; and the *Quarterly* takes up the argument in favour of conventions generally. But in the face of so wide a disapproval as has been manifested to the trump call, we should be inclined to hesitate in encouraging further extensions of the conventional system, or at least to doubt whether the subject has been so fully and so fairly considered as it ought to be.

There is one view of the question which we think should have some moral weight; that is, the immensely increased advantage which these conventions give to superior players. Attention has lately been strongly called * to large losses at whist by inexperienced young men, with more money than brains, who are infatuated enough to play for high stakes with players of much higher skill. There can be no doubt that, owing to the modern conventions, the pull of the better players over them is much increased.

It has been said that whist is not suitable for gambling, but we cannot understand such an assertion. It is surely as easy to bet 1,000*l.* on a rubber as to stake it on the red or black at Monaco; while, if high points be played, there is (which there is

not at Monaco) the additional certainty of heavy losses against superior skill. Hence high whist may be even more dangerous to inexperienced rich youth than the regulated public gambling which has excited so much condemnation.

This danger the modern signals largely enhance. We do not say that the use of acknowledged conventions to the disadvantage of inferior players can be stigmatised as unfair; but we think that, as a matter of principle, the moral expediency of such a one-sided system requires more strict examination. And, moreover, we are by no means satisfied that the conventional modes of play more recently introduced have been proved to be consistent with the legitimate constitution of the game.

It would be out of place to enter on such a large discussion here. We commend it to writers and thinkers on whist (the latter much rarer than the former) as an important social problem. W. POLE.

Untrodden Spain and her Black Country. By Hugh James Rose. In Two Volumes. (London: S. Tinsley, 1875.)

This is a somewhat provoking book. The author, who was till lately chaplain to the English, French, and German mining companies of Linares, is a parson after the late Charles Kingsley's own heart. Fond of fishing, both in sea and river, a cross-country rider, and a good shot, "hail-fellow well met" with everyone, selecting his companion for the day's walk or sport from fisherman, peasant, sportsman, miner, or country-guard, he seems equally at home with all, and able always to draw out the best points in the characters of each. He has, too, a keen eye both for the beauties of nature and for the humours and oddities of all he meets with, both man and beast. Hence the pictures he draws are generally spirited and accurate. It is only when he gives loose to a sentimental and quasi-poetic vein, when he would fain discover something noble or touching in what is only commonplace, when he endeavours to force the meditative mood, and succeeds only in maundering, that we have any fault to find with those parts of his book which at all correspond to its title. For the reader, unless Spain be altogether a *terra incognita* to him, will wonder how a detailed description of Cadiz and its well-known charitable institutions, of Cordova, and of a bull-fight at Madrid, can come under the denomination of "untrodden Spain."

The book, too, shows an utter want of any kind of arrangement. It will hardly be believed that a whole chapter giving a very readable account of the celebrated "Casa de Misericordia," or "Hospicio," of Cadiz, is headed, from its first page to its last, "A work of Mercy at Madrid." At other times the only indication is "the town whence I am writing," or the vague phrase "in the interior." The repetitions, too, are most wearying. Four times over is the same story told of the author firing his revolver at a lover of his servant, and of the conduct of the "sereno," the watchman, on that occasion. An almost identical description is given three or four times over of Spanish

* See articles in the *Times* of February 12, and in the *Saturday Review* of March 20, 1875.

cemeteries, though there is nothing at all remarkable about them. Copies of the announcements of funerals, which are just like the French "faire part;" and epitaphs, which state only the dates of birth and death, are given in one chapter in English, and in another are repeated in Spanish. So too with the sentiments: some of the pet ones are repeated *ad nauseam*; e.g., "the smell of a spring flower, or the question of a little child," "God made the country, but man made the town," with meditations on them, like the variations of a country composer on some hackneyed air, recur continually. In fact, through a great part of the book, each chapter commences as if the rest had never been written or thought of.

But why are we so severe? Because the book is worth severity. Some of the chapters—such as those on the poor, on the fish-market, on the garden, on miners, and on maidservants—are simply delightful, and several others would be equally so with a little pruning. We learn to know the personages of these chapters almost as if they were our own acquaintance. We cannot indeed help thinking that the writer will see these things with very different eyes in a couple of years time, if he continue in Spain. One drunken man saying to another "Vaya V. con Dios," will sound no more like blasphemy to him then, than its equivalent English "good-bye" does now. But it is this very newness from England, this looking at all things with strange eyes, that gives such life and freshness to his sketches. We would no more wish to exchange this for a more sober and literal view of things than we would exchange the lively prattle of a bright enthusiastic girl for the dull argument of a sexagenarian statistician. Only let us warn all sailors and others, that although the story of the dead-drunk tar in the streets of Cadiz being carried to a comfortable lodging, and having his watch and money taken from him only to be restored in the morning, may be true as an exceptional case, it is by no means the rule. It was once our duty to attend for some months a small British hospital in a Spanish port, and during that time, besides one man killed outright, the heaviest cases were those of helpless English sailors beaten almost to death by Spanish mobs.

Many chapters of the book make us long to have been with the author in his stroll through fish-markets, in his walks over the bare Manchegan hills, or to take a turn with him in the winter garden. Full well we know the difficulty of extracting the name of bird, or beast, or fish, or flower from a Spanish peasant. He has been more successful than ever we were; only we wonder that he seems never to have met with the queer stories of bird and beast mythology which have been occasionally told to ourselves in answer to enquiries about their natural history.

Though the book is entitled *Untrodden Spain*, yet it refers wholly (with the exception of a shooting trip to Galicia, in which the author studied beasts and not men) to the provinces south of Madrid; and unconsciously the author brings out most vividly the contrast between the South and the North of Spain. It is hard to see what political rule

can suit the two. Nothing can be more unlike the republican, creedless, reckless Andalusian than the royalist, mystic, tenacious Basque; the man who, bigoted and narrow-minded as he may be, is yet honest to the backbone, and will give his money, his life, his everything to the cause he believes to be right, and not only so, will bequeath it as an heirloom to his family to do the same. The picture of the North is dark just now, but that of the South, without faith in anything at all, with only its reckless sensuous enjoyment of the present, as here drawn, seems to us to be darker still. There are still many points of excellence in the Spanish character; but the prevailing ignorance, corruption, lawlessness, and, in the South, utter want of patriotism, render these of no avail. The noble and excellently managed charitable institutions of Cadiz and of Seville have no copies in the smaller towns. The model schools, equally good in their way, remain models which no one imitates. The laws are good, but are not enforced; and a corrupt justice renders the services of the excellent "Guardias civiles" powerless to put down brigandage and a hundred other evils. Truly the picture is dark, nor do we yet see from what quarter light is to arise.

Every great poet has his shadow following him in the shape of imitator or of parodist. And so the graphic and enthusiastic descriptions of the Ammergau Passion-play have produced numberless imitations. Men now find Ammergau plays everywhere, in Germany, in the Pyrenees, in Belgium—and all over Southern Europe. And so our author writes of the procession of huge wooden images at Baeza in the Holy Week, and of the movements of their wooden limbs by means of springs, in terms that could only be literally applied to the finest and most earnest acting. And the religious effect produced is estimated as superior to that of the most fervent preaching. Even the evidence of his own senses will not convince the writer to the contrary. "True," he writes, vol. ii. p. 254, "I have heard the indecent jest and the ribald sneer, but it has been beautifully said that, even of those whose lips utter such language, it may be that 'coming to scoff, they stay to hear.'" We can only say that some score of years ago, before the Ammergau mystery made it fashionable to feel thus, we turned away in disgust from such processions; and the only excuse which we then heard for the obscenity and the blasphemy which poured from the lips of man, woman, and child, on the passage of the effigy of Judas, was that "it brought good luck for the rest of the year." We thought then that this was a legacy of the Arabs to Spain; but it may be only the latest phase of Christianity.

If we have been too severe, we quote in extenuation the author's shortest chapter, "a Spaniard's estimate of English politeness:"—

"I thought the Englishman was drunk when he knocked me down; but, when he begged my pardon, I knew he was!" The above is all I shall offer on this point; it speaks for itself better than any words of mine."

Though we cannot praise the book unreservedly in its present form, we believe

that in a revised and shorter edition it would be a great favourite with the general reader, and not without value to the historian, as a lively picture of the social state of Andalusia and La Mancha during the republican years 1873-74.

WENTWORTH WEBSTER.

Histoire du Protestantisme dans l'Albigeois et le Lauragais, depuis son Origine jusqu'à la Révocation de l'Édit de Nantes. Par Camille Rabaud, Pasteur, Président de Consistoire de Castres. In One Volume 8vo. (Paris: Sandoz et Fischbacher.)

THE Albigeois and the Lauragais are two small territories close to one another in the south of France, lying on the western slope of that chain of the Cevennes which, traversing under different names the whole of the south-east of France, joins the Vosges to the Pyrenees.

The Albigeois, the capital of which is Albi, is now part of the department of the Tarn; and the Lauragais belongs to the Aude. Its capital is Castelnaudary, but its most important town is Castres.

This corner of France has always been a seed-bed of heresy, and everyone knows that the Albigeois has given its name to that Manichaean sect which spread through the whole of the south of France in the Middle Ages, and which was stifled at the beginning of the thirteenth century by the most horrible massacres.

The memory of these terrible events was not effaced from the minds of the population, and the hatred of Catholicism was still lying dormant in the hearts of the men of these southern regions, when the Reformed doctrines began to be preached in these countries. The descendants of the Albigeois embraced them with enthusiasm. No doubt the doctrines of Luther and Calvin had no relation to the theory of Manichaean dualism which had been the main point in the Albigeois faith. But if to their great advantage they differed entirely from those old opinions, they contained a still more energetic and conscientious protest against the gross errors and detestable abuses of Catholicism. Hence their rapid progress in a land where the mere name of Catholicism reminded men of terrible scenes of violence and murder. The Albigeois and the Lauragais, therefore, became at a very early time one of the centres of French Protestantism, and Castres was one of its most important churches. Yet in spite of this the history of this church and of those which surrounded it has been little known, and till now they have had no historian. They have at last found one in M. Rabaud, a native of the country, who was formerly pastor of Mazamet, and has for some years been President of the Consistory of Castres. No one is better qualified to undertake the task of writing such a history. The many ties which bind him to the country, and the just and singular esteem which he has inspired there, have given him an opportunity of consulting not only all the printed documents which could be of use to him, but also many precious MSS. which date from the period with which he deals, and which have furnished him with numberless details of the very greatest interest.

There is one thing, however, which the

student will seek for in vain in his book. That which is wanting to the history of French Protestantism is its origin. Even before Luther affixed his thesis to the door of the Wittenberg church, Lefèvre, of Etaples, taught at Paris, in 1512, doctrines analogous to those which afterwards were called Protestantism. The soil of France was therefore prepared for the Reformation. In 1521, Farel, one of Lefèvre's disciples, preached the same doctrine at Meaux, and the first name the French Protestants received was, "the Heretics of Meaux." In 1523 Le Clerc, one of these heretics, was branded on the forehead with a hot iron by the executioner. The year after, Pavannes was burnt alive at Paris in the Place de Grève, and opened the long list of the French Protestants who died for their faith. Here was the beginning of martyrdom. Thirty-seven years after the death of Pavannes, Coligny, in the conference at Poissy, presented to Catherine de Medici a list of 2,150 perfectly organised churches, and L'Hôpital estimated the numbers of those belonging to the Reformed faith at a quarter of the entire population of the kingdom.

The history of these thirty-seven years, during which Protestantism was making its way through France stealthily and silently, but with a wonderful rapidity, would be full of interest. Yet, according to all appearance, it will never be possible to write it. A profound obscurity broods over the whole period, and all that we can arrive at is a list of martyrs. From time to time a trial achieves sufficient importance to be heard of; the death of some unfortunate creature sacrificed without mercy to the passions of the day, proves that Protestantism had penetrated into such a town—and that is all. Even this martyrology is very incomplete. Hundreds, perhaps thousands, of Protestants perished during the period without history having cared to register their names. As to the hidden propagandism which in so short a time covered France with so many churches and multiplied its adherents to such a degree that they were able to hold in check for many years the whole force of Catholicism and the State, no one will ever be able to relate its history. M. Rabaud has done his best as far as his own district is concerned to fill up this regrettable gap; but documents are wanting, and the few details which he has been able to collect about the foundation of the Albigeian churches come to but very little. On the other hand, there are innumerable documents relating to the following period, which begins when the first General Synod met at Paris in 1559. By this time the churches have organised themselves; each town has a consistory at its head; it keeps its registers, and the Protestants have become more numerous, grow bolder, and in many places cease to think of concealing themselves. For this period, which ends with the Edict of Nantes, as well as for the following, when under the protection of the Edict the churches enjoyed a degree of rest, details are abundant, and M. Rabaud has only to make his selection. They are often sad enough. Nowhere did religious war rage more severely than in the part of France with which M. Rabaud has to deal. It seems as

if the cruel memories of the crusade against the Albigeois were still in the air, and that both parties were doing their best to repeat its horrors. The Parliament of Toulouse distinguished itself above all the sovereign courts of France by the severity with which it hunted after and punished heretics; and in this case severity meant cruelty and perfidy, for the most solemn oaths were disregarded when the Huguenots were in question. Gentlemen and soldiers were scarcely behind the magistrates in this. To put to the sword the whole garrison of a captured château, to massacre the entire population of a town, or of a village—men, women, and children—were ordinary occurrences repeated almost at every moment. During these long religious wars, every seigneurial castle was a fortress, every little town was surrounded by ramparts, and, if battles were rare, skirmishes, surprises, sieges, assaults were so incessant, that the historian refuses to take account of them.

The mountainous territories of the Albigeois and the Lauragais furnished rude soldiers to the Huguenot armies. It was there that the greatest part of that army was levied which was called the Viscounts' army, because it was commanded by seven gentlemen who bore that title, and which, 8,000 strong, descended into Lower Languedoc as far as Alais, and afterwards fighting without giving truce, reascended towards the north by the Vivarais to the borders of the Loire, beating at Ganat a far more numerous Catholic army which attempted to bar its passage. It then broke up the blockade of Orleans, where the Catholics were besieging the Princess of Condé, carried by storm Beaugency and Alois, and rejoined the rest of the Protestant forces under the walls of Chartres, after an expedition which was certainly the most extraordinary of the time, and which traced its progress in the most marvellous exploits.

Under the *régime* of the Edict of Nantes, the churches of the Albigeois and Lauragais breathed freely, and gave themselves a strong organisation. But when in Richelieu's time the religious wars began afresh, they once more played an important part. Castres was for some time Rohan's headquarters. Mazamet was taken and burnt by the Marquis de Ragny (1628), and horrible cruelties signalised afresh the Catholic victories. The peace which followed the taking of Rochelle restored tranquillity in these countries, but not for long. Under Louis XIV. the persecution once more began; the long list of tyrannical measures by which the great king prepared for the revocation of the Edict of Nantes afflicted the churches. Then came the revocation itself, when thousands of Protestants emigrated, the rest dissimulated, and bent their heads for a time, so that Louis XIV. could believe for an instant that there were no longer any Huguenots in France. Here M. Rabaud's story ends. We hope that he will continue it, and give us the history of the churches of the Albigeois during the period of the Desert, and of their reorganisation after '89. He is the more bound to do so, as he has shown that he possesses the qualities which make the exact, the learned, and the conscientious

historian. We have only to wish that he would enter less into detail, and would endeavour to draw a more complete picture of the general situation. Others may perhaps demand more impartiality in an historian. We cannot agree with them. In the strict and narrow sense of the word, M. Rabaud is not impartial. Between the victim and the executioner, he has made his choice long ago; and when he has to tell the story of some odious perfidy, or some hideous massacre, his indignation finds vent in strong language, and he grows really eloquent in branding the Catholic persecutors. Let us say once more that we cannot blame him for this. It is enough that he is a conscientious historian, and that he consults authorities of every kind, checking Catholic and Protestant documents by one another. We cannot ask him to silence the feelings of which his heart is full. But we think that he has given way to them too often, and that the blame which he has justly accorded to the persecutors would have gained something if, without being less vigorous, it had been less frequently expressed.

Perhaps, too, he has allowed himself to be completely absorbed in his own particular subject, and has not paid close enough attention to the general history of French Protestantism. For example, he thinks that the massacre of St. Bartholomew was premeditated, and prepared long beforehand by Charles X., which we cannot believe to have been the case. M. Rabaud's book, too, would have gained in interest if he had more frequently attached his special facts, if it were only by brief indications, to the events which were taking place in the rest of France. In this he has not avoided the general error of monographs.

Yet, in spite of these defects, M. Rabaud's book is most interesting and instructive, and seems destined to take a notable place in the already numerous collection of books which treat of the local history of French Protestantism in different provinces, or in different towns. The general history of the Reformed Church of France has still to be written. De Felice's brief volume is only an abridgement; in short, an elementary work, useful and serviceable, no doubt, but one in which the subject is scarcely more than cursorily touched. Yet this is the only existing complete book, the only general history which the French churches possess. On the other hand, we have abundance of fragmentary histories and of original documents. To the *France Protestante* of the Brothers Haag, an incomparable work, and to the numerous documents which the Société de l'Histoire du Protestantisme français has published in its *Bulletin* for twenty-two years, we can now add a large number of monographs. That which M. Rabaud has now done for the Albigeois and the Lauragais, M. Douen has accomplished for St. Quentin and the churches of the Aisne, the younger M. Athanase Coquerel for Paris, M. Vaurigaud for Brittany, M. Lièvre for Poitou, M. Crottet for Saintonge, M. Corbière for Montpellier, M. Hugues for Anduze, M. Borel for Nîmes, M. Neff for the Pays de Gex, etc. Thus by degrees the stones of the future edifice are being collected. They are now sufficiently numerous. May an his-

torian at last arise from among the Protestants of France—a man who has the good will, the leisure, and the talent. He will now be able to write a complete history of the Reformed Church, and to raise to it the monument which it may justly claim.

E. COQUEREL.

NEW NOVELS.

Ralph Wilton's Weird. By the Author of "The Wooing o't." (London: Bentley & Son, 1875.)

Bluebell. By Mrs. G. C. Huddleston. (London: S. Tinsley, 1875.)

Felicia. By M. Betham-Edwards. (London: Hurst & Blackett, 1875.)

His Queen. By Alice Fisher. (London: H. S. King & Co., 1875.)

Edith Dewar. By Colin Rae-Brown. (London: Sampson Low & Co., 1875.)

ONE of the sharpest thorns in the cushion of the discreet novel-reader is the fatal frequency with which, to use Mr. Swiveller's figurative language, his gazelles marry market gardeners. One would imagine that the knack of novel-writing had something of the nature of fair-money about it, so odd is the uncertainty of its appearance and disappearance. Some half-a-dozen times in every season we come across a first book which without showing startling genius seems to possess some talent, and to have at any rate a little of that peculiarity of savour without which there is nothing good in literature. Then we wait for the second book with a dreary and depressing foreknowledge of what that second book will most probably be. Of what it too often is we may see an example in *Ralph Wilton's Weird*. The *Wooing o't* was not a great novel, but it had some interest and something of its own.

Mrs. Alexander's present book is as utterly commonplace in character and incident as anything we ever read. Its characters, besides some dummies, are three. There is an angelic governess of democratic principles, who is induced at last to incline to an adoring lover, because he "for once rose above the conventional gentleman into a natural true man." There is a good cousin who is the hero, and who is caressingly styled by the author "our patrician soldier." There is a wicked cousin, who profanely suggests of the angelic governess that she would be a "delightful travelling companion." This annoys the good cousin very much, which is natural, but, perhaps, unreasonable, as, according to his biographer, who ought to know, "it must not be asserted that the possibility of some tie less galling and oppressive than matrimony had never presented itself to his mind." However, the wickedness of the wicked cousin does no harm, and the goodness of the good cousin leads him to the heroic resolve to do as he wishes, and marry the angelic governess. His course of true love is only interrupted by one prodigious difficulty; his beloved has changed her address, and he has to ask the postman where she lives. Having by the aid of that useful officer surmounted this huge obstacle, he marries her, and is rewarded for this virtuous act with a large fortune.

Bluebell can be recommended to all those readers who are not too proud to take what they can get, and who can overlook a rather slangy exuberance of diction and occasional carelessness of writing, as a decidedly lively and amusing book. The first two volumes give a pleasant picture of that Paradise of artless flirtation, Canada. The flirtation is very artless indeed, and by no means up to the standard which an exacting proficient in the mystery might demand. But the benevolent philosopher may be mildly amused at beholding the portraiture of a state of things in which all creation is regarded as so much "cover" behind which kissing (our author would call it osculation) may or may not be effected. The English scenes of the third volume are not at all bad. But we should really be obliged to Mrs. Huddleston if she would, in consideration of our nerves, kindly spare us such sentences as the following:—"He had just thrown 'Peep-of-Day' at his nurse's head, which had been unwisely offered to him as a substitute for his favourite trumpet." If Canadian nurses are really subject to such unutterable barbarities, we hope it is handsomely "considered in their wages." Perhaps a worse fault, indicating as it does not merely carelessness of writing but confusion of thought, is the way in which the names and circumstances of to-day are used in speaking of the time before the Crimean war. But the book is readable, and for this now rare mercy one cannot be too thankful.

It is unnecessary to describe the agonies of reviewing *Felicia*, because Shelley has kindly done the description ready to our hand in *Peter Bell the Third*. Like the reviewers there mentioned, we were "gaping and torpid" by the time we reached the end. Whether the book, judged by measure and balance, be actually longer than its fellows we cannot say, and nothing would induce us to take it up again for the purposes of calculation. But its utter dullness makes it appear endless. It is impossible to describe the plot, for there is none, or the characters, for they are like Mr. Pope's "most women." There is certainly a hero; we can say thankfully that we never met such a hero before, and hope fervently that we may never meet such a one again. Alexander Smith once happily and tersely summed up the characteristics of the class to which this hero belongs in the words "a ginger-beer bottle burst." But this bottle has not even strength of mind or body enough to burst him. The man—his name is the Reverend Mr. Strickland—divides his time between quarrelling with his bread and butter and lamenting his hard fate at being left breadless and butterless. Every thing and person that is brought into contact with him—the Thirty-nine Articles which he can't stomach, the six hundred a-year which he gives up because of this squeamishness, the school-boys he has to teach, the young women whom he can't make up his mind to marry when they are willing, and who very sensibly change their minds by the time he has made up his own—all serve as occasions for endless moaning and groaning, while the remaining characters of the book (including five other clerical gentlemen) chiefly stand round him exclaiming "Poor

dear man, how he is tried!" As a sort of secondary subject we have German music-mania, which is not much more deftly or amusingly treated than the reverend hero's woes. Miss Edwards has chosen to invent the impossible word ἀδελπότης, which she is pleased to tell us is, when placed on a tombstone, a "meekest inscription." A lady is not bound to know Greek, still less to use it; but if she does use it, it might just as well be correct. As it happens, ἀδελπότης, which we suppose she means, would be a singularly arrogant epitaph.

Miss Alice Fisher has apparently set her heart upon composing a novel which shall be as unlike as possible to the well-known "disappointing little book," by being exceedingly bitter to the taste at first, and afterwards decidedly sweet. She has selected her means for the accomplishment of the first part of this end with great care and judgment, by writing the work throughout in the present tense. In our idler moments we have often speculated on the possible motives which may incite persons of presumably sound mind to the commission of this too common atrocity. It must, unlike most other sins, give its perpetrators a great deal of trouble, and it is difficult to imagine even the most depraved taste deriving any satisfaction from the result. In the second place, Miss Fisher has written the first hundred pages of her book in the most extraordinary patchwork of jargon that we have ever read. If we suppose a quartette composed of Ouida, Mr. Mortimer Collins, an undergraduate in his second term, and an earnest young curate with some abilities, to be desirous of giving us an English *Croix de Berny*, some idea of the opening chapters of *His Queen* may be obtained. But at about the hundredth page the author begins to relent, and her real ability, of which she evidently has plenty, begins to assert itself, nor have we from that point anything to complain of except the abominable present tense and an occasional relapse into undue archness and jauntiness of style. Miss Fisher's power of imagining character is very considerable, and she has used it to good purpose, as far at least as the chief hero and heroine—the "he" and the "queen" of the title—are concerned. The hero is perhaps the less probable and successful of the two, certainly he is the less original, as there are numerous touches about him reminding one of the late Mr. Kingsley's earlier characters, especially Paul Tregarva. But the heroine is admirably conceived and very far from badly drawn. She is neither the ordinary commonplace woman, nor the equally ordinary white devil of innumerable plays and novels. Her perfect selfishness, a selfishness not at all greater than that of most people, but of such a clear and simple kind that it does not need or care to check or disguise itself, or, indeed, to pay any attention to itself at all, is excellently natural. None of her faults is in the least degree repulsive; one can see that they are all committed purely because of the circumstances in which she is placed. In these circumstances she does the best for herself to the best of her judgment, and, when she fails, as we all do and must fail often, one

is heartily sorry for her. When the man who loves her best in the world, and whom in a way she loves, has told her that in case of his death, which is very probable, he has left her the whole of his fortune, she goes to church and sits looking affectionately at him, and thinking how happy she will be with some one else when he is dead. Why should she not? She desires the end, and is far too logical not to desire the means. We do not know that Miss Fisher quite understands and appreciates her own creation, and this (with the present tense) rather mars our enjoyment of the book. But it is a book of extraordinary promise, of very great interest, and of unquestionable power, and were the faults we have mentioned (which lie only on the surface) removed, would be a most distinguished success.

It is, we think, Mr. Robert Buchanan who suggests, for the better prevention of the crime of criticism, that every critic should be compelled to publish a statement of his tastes and qualifications. Specimens are given, if we remember, which read like a cross between a census return and a leaf from one of those odd little "Like and Dislike" books with which very young ladies used to afflict their friends some ten or twelve years ago. For ourselves the plan has no terrors, but we conceive that it might with immense benefit be "passed on," in the schoolboy sense, to novelists. In default of this, we have applied a careful process of analysis to the discovery of Mr. Rae-Brown's qualifications and tastes, with the following results. Mr. Rae-Brown's ideal poet is apparently Sheridan Knowles, with copious extracts from whose beauties he enriches his work; his ideal historian would seem to be Blind Harry, and his ideal sensual pleasure is confessedly heavy tea on board a steamboat. He thinks that Ulsters were worn in 1857, that Calvin was a native of Switzerland, and that Professor Huxley is responsible for the statement that the Scots were of Irish extraction. Lastly, he thinks that a girl of eighteen, having just fallen in love, would be likely to soliloquise thus:—

"His delivery so resembles my papa's, and yet is so much more like that of one who thoroughly believes every word he utters. I am certain—I would stake my life—he is as good and gentle and kind as he is eloquent. *How happy his mother and aunt must be in the constant society of such a man!*"

After the exquisite absurdity of this last sentence, it is probably unnecessary to say that *Edith Dewar* is quite worthless as a novel. We are afraid that its disquisitions on Sheridan Knowles, on various obscure theological celebrities, and on the scenery between Glasgow and Oban, do not suffice to give it much value as anything else.

GEORGE SAINTSBURY.

SCHOOL BOOKS.

THE Clarendon Press Series is publishing the separate plays of Sophocles, as edited by Mr. Campbell for university study, and adapted for schools by Mr. Abbott (Sophocles, *Antigone*, Clarendon Press, 1874). Unless Mr. Jebb will deign to finish the school editions of Sophocles of which he has given us so small but so valuable an instalment, we can wish for nothing better. It is true that we have not here that perfection of

taste and wealth of scholarship which make the editions of the *Electra* and *Ajax* in the "Catena Classicorum" books which form an epoch in a boy's studies. But we have a useful and tolerably accurate edition which explains most difficulties, and removes obstacles to learning the lesson. The notes seem to be sometimes too technical, and generally deficient in the inculcation of grammatical facts, which are enforced with much greater spirit as an observation on the texts than when they are culled from the *hortus siccus* of a grammar. We have not space for many criticisms. καλγαίνουσ' in line 20 is surely rather "darkening" than "heaving," and the παγκύνουσ' Δηούς καλποῖς refers rather to the enfolding embrace of the landlocked bay than to the "vale" of Eleusis, where there is, properly speaking, no vale at all. But our chief quarrel is with the translations. They apparently aim at that combination of literalness and elegance which results in English prose gone mad, in expressions utterly unintelligible without the Greek text, and utterances which could be found nowhere, except perhaps in the Anglo-Indian prize tragedy of a laureate Baboo. Antigone, for instance, remarks of her brother that he is "to the vultures a sweet treasure, as they eye him for the gratification of food;" that "man is wonderful and irrepressible alike in legislation and in the defiance of law." As the plot thickens and the dénouement approaches, the English becomes more wild. The voice of his child "touches" Creon "with recognition," Haemon "panting hard cast on the pale cheek" of Antigone "a sharp breath of gory dewdrops;" and Creon, while the bier is before him on the stage, in his broken utterances of woe, exclaims to the sound of plaintive music, "The slaughter of my wife is heaped upon previous slaughter." Would it not be better to throw elegance to the winds, and copy the translations of the baldest volume in Bohn's series, than to lead boys to imagine that the greatest Greek tragedies were written in a language which veils under a false poetry of sound and form vague, unintelligible, and aimless nonsense. The last mentioned faults are entirely avoided in Mr. Sidgwick's edition of the *Bacchae* (Rivingtons, 1874). It is the work of a finished scholar and a consummate teacher. Mr. Sidgwick has condensed the *Bacchae* into 729 lines, just enough for a boy to read in one term. The play is divided into scenes, with headings which make the action intelligible, while stage directions introduced with admirable tact and taste enliven the reader, and make the duller boy understand that the play was really acted before a more crowded audience than ever fills our theatres; and perhaps moved an Athenian mob to admiration by the studied gestures of the perfect actor. The notes are short and exactly to the point; the product of a clear mind, which knows precisely what is wanted, and how it should best be given. The play thus edited is babes'-meat for the young scholar whose digestion would revolt from the long-drawn prolixities of the original work. Mr. Sidgwick has edited four other plays of Euripides and four of Aristophanes, and they deserve to be in constant use in all places of secondary education. A grammatical index adds greatly to the practical value of the play before us.

Messrs. Parker, of London and Oxford, have published among their "Greek Texts with Notes" an edition of Xenophon's *Memorabilia*. The book appears to be carefully edited, and to contain enough elucidation for the understanding of the text. Each book is preceded by a carefully drawn up argument which offers a guide through the intricacies of the dialogue, and if carefully followed might succeed in making the *Memorabilia* a little less tedious than we fear it is generally found. There is a good Greek index, and one of proper names. *Short Exercises in Latin Prose Composition*, by the Rev. Henry Belcher (Macmillan and Co.), seems to be very well suited to its purpose of teaching the rudiments of Latin to beginners.

The rules are those of the Public School Primer, and the exercises are composed after the manner of Ollendorff. It is, perhaps, better in these cases that the words of the exercise should be comparatively meaningless, than that they should consist of neatly turned epigrams as the *Eton Nuces*. We have heard of a Hebrew Ollendorff which consisted of such examples as these: "Three Jews hung up ten harps on five willow trees;" "My father-in-law's heart is inditing of a good matter." But no such absurdity is possible in a Latin book, where we are insured to Balbus and his wall. The book contains also useful examination papers and a vocabulary. Messrs. Longmans send us some editions of classical texts, bound uniformly, and apparently destined for University local examinations. *Herodotus, Book VI.*, by the Rev. H. Lovell, is one of these, and does not appear to us a very satisfactory production. The text is well and clearly printed, and each chapter has a heading which epitomises its contents; but the Introduction is dull and pompous, and would be but little intelligible to boys. The notes seem to be correct as far as they go, but it is sometimes difficult to discover their precise *raison d'être*, and why there should be so many or why no more; and although the book contains the history of the battle of Marathon, there are no maps or plans. The *Prometheus Vincit*, with notes by the Rev. North Pinder, is a much more satisfactory book. The notes are good and adequate. Their chief fault lies in this, that the action of the play is not sufficiently followed or explained, and there is an absence of those remarks on the art and the taste of the drama which make the school editions of Wecklein so admirable. The preface is well written and interesting. *Livy, Book XXI.*, with notes by Thomas Nash, M.A., is a most excellent piece of workmanship. The text is printed in clear and large type, while side-notes afford an abstract of the history and fix the attention of the learner. The notes are adequate in scholarship, and the history and antiquities are treated with fulness, interest, and completeness. Some of the general remarks on grammar and constructions are perhaps a little too obvious. The book concludes with a vocabulary of names of persons and places which is of the greatest service for easy reference. *The First Book of the Cyropaedia of Xenophon* is edited with the well-known skill of Mr. H. M. Wilkins. It contains an introduction and a running analysis. The notes are of a very business-like character, and are concerned either with the elucidation of the text or with grammatical questions. The scholarship of the notes is perfectly accurate and satisfactory, but we should have thought that it was hardly necessary to give so much assistance. Boys preparing for middle-class examinations might be expected to be able to parse of themselves such common words as πραιεταί, μύροι, ἐδίκηθη or ἦσθη. *Homer's Odyssey, Book II.*, with notes by the Rev. William Almack, appears to be a very hasty production, got up for the middle-class local examinations in 1875. The notes are meagre and unsatisfactory, and not always correct. The book seems to us such a one as could be knocked off in a few hours with the help of a Hayman and a Liddell and Scott. *St. Luke's Gospel* makes its appearance in White's "Grammar School Texts." It is well printed, and contains a very useful vocabulary. Sallust's *Catiline War* forms part of the same series, and is edited on the same plan. The practice of using special dictionaries or vocabularies is common enough in Germany, and is a useful plan to save boys from the bewilderment of looking through a maze of words in a large lexicon. *Aristophanes' The Acharnians*, with notes by Herbert Hailstone (Cambridge: E. Johnson), is a neat and scholar-like edition of the famous play. A full and elaborate argument takes the place of stage directions. The notes are short and concise, and good as far as they go; but we doubt whether sufficient help has been given in them, and whether the quotations and allusions in Latin

and Greek would always be intelligible to the young learner, or would fitly take the place of explanations in English. *The Modern Elocutionist*, by Comstock and Main, is a book which at first sight would be sure to raise a smile, but which is worth a more attentive consideration at the hands of schoolmasters than it is likely to receive. The culture of recitation is common enough in our public schools, but nothing can be more dreary or lifeless than the manner in which it is performed. The object seems to be not to rouse, or animate, or impress the audience, but to avoid the possible raising of a laugh. The tradition of oratorical delivery is kept up on the other side of the Atlantic, from which this book originally comes, and is also preserved in English Roman Catholic schools. We have seen in one of the latter a little boy of twelve years old nearly move an audience to tears by the pathos of his voice and gesture. In the volume before us very full and painstaking directions for delivery and action, given perhaps in a dry and pedantic way, are followed by extracts of a very varied character, some of which we have never heard delivered at a school. *Michod on Training* should, we suppose, certainly be reckoned nowadays as a school book, when gymnastics is asserting its old right to be placed on an equality with literary culture. A young athlete of our acquaintance assures us that it is the most sensible book he has read on the subject, and we are sure that it will do good if it tends to modify the false and exaggerated notions of training which now prevail among our schoolboys. It is a pity that with compulsory teaching of science, compulsory study of health is so neglected among us, and that the fierce race in athletic competition should, although begun in the pursuit of health and vigour, tend so often to life-long weakness or early death.

OSCAR BROWNING.

NOTES AND NEWS.

PROFESSOR HUXLEY is about to proceed to Edinburgh to undertake for the next three months the courses of lectures which Dr. Victor Carus has hitherto been giving, in the place of Professor Wyville Thompson, the Scientific Director of the *Challenger* Expedition. We regret to hear that the reason of this substitution is the failure of Dr. Carus' health.

M. MAXIME KOVALEVSKY, a Russian pupil of the distinguished Berlin publicist, Dr. Gneist, has come to England with the view of studying from our statutes and other sources the institution of justices of the peace. It is curious that we leave the study of the history of our domestic institutions so largely to foreigners; although, in default of British students, we ought to cherish a lively gratitude to such men as the Prussian Historian of the British Constitution, for sending forth scholars trained by himself to do our work for us.

MR. JAMES HINTON is meditating, we hear, a new philosophical work, which is to run in the same lines as Mr. Lewes' *Problems of Life and Mind*, and to form a kind of supplement to it.

CHIEF JUSTICE SIR EDWARD CREASY has in the press, to be published by Mr. Van Voorst, a new book entitled *First Platform of International Law*.

Cosmo de' Medici, an historical tragedy, by R. H. Horne, author of *Orion*, &c., is now going through the press. This new edition is remodelled throughout, and three new tragic scenes have been introduced. "Other Poems" will also be included in this volume, which will be published towards the end of next month.

UNDER the title of *The Royal Academy Album*, Messrs. L. Reeve and Co., in conjunction with the Fine Art Publishing Company, are preparing a volume to consist of a series of photographs of some of the most important works in the present exhibition of the Royal Academy of Arts. The

series will include specimens from Ansdell, Calderon, Elmore, Frith, Leslie, Marks, Orchardson, Pettie, Paynter, and many other well-known artists. It will be ready, it is hoped, about the end of May.

MR. HENRY SWEET has in preparation a short Anglo-Saxon Reader, with Grammar, Vocabulary and Notes, forming part of the Clarendon Press Series, and ranging with the "Specimens" of Dr. Morris and Mr. Skeat. The texts are so arranged as to give a clear view of the history both of the literature and the language, the prose extracts being selected as much as possible from original works, while those in verse represent all the principal varieties of the poetical literature. A considerable portion of the texts has been already printed, and the whole work will be ready for publication in the course of the present year.

MESSRS. BLACKWOOD AND SONS have in preparation *Legends and Traditions of the Eskimo*, with an Appendix on their habits, religion, language, &c., consisting of a selection translated from the Danish of Dr. H. Rink, and revised and edited by Dr. Robert Brown. Dr. Rink, it may be added, has resided on, or been travelling about the shores of Davis Straits, from Cape Farewell up to 73° N., for sixteen winters and twenty-two summers, first as a scientific explorer, and afterwards as Royal Inspector or Superintendent of the Southern Danish establishments in Greenland. His work is founded partly upon the verbal narratives, partly upon manuscripts, of about fifty natives from all the principal parts of Greenland, and in the case of a few, from Labrador. In the English edition the materials of both sections of the original have been condensed and arranged under the direct superintendence of the author and according to his plan, with the object of omitting all that seems to be only of mere local interest in relation to the Danish settlement on the Greenland coast, and of adapting the selection more especially to readers engaged in archaeological and ethnological studies, as well as to those who may be interested in the truthful and vivid pictures of Arctic life portrayed in most of the tales. The book will be illustrated by woodcuts drawn and engraved by natives of Greenland, the original blocks having been acquired by the publishers of the English edition.

MESSRS. A. AND C. BLACK will very shortly publish the fifth edition of Professor J. H. Balfour's *Manual of Botany*. The second volume of the *Encyclopaedia Britannica* is nearly ready.

AMONG Messrs. Chatto and Windus's announcements are: *Number Seventeen*, a new novel by Henry Kingsley; a collected edition of Dr. Westland Marston's Dramatic and Poetical Works; an exact reproduction in reduced facsimile by a photographic process of the first folio Shakspeare; and a new edition, with additional notes by John Hewitt, of Stothard's *Monumental Effigies of Great Britain*.

THE death is announced of Mr. Winwood Reade, author of *The Story of the Ashantee Campaign*, and of the Introduction to Dr. Rohlf's *Adventures in Morocco*, both published last year.

A PARAGRAPH having appeared in last week's *Athenaeum* giving an account of certain alleged discoveries of valuable historical documents at the India Office, Sir John Kaye, in a letter to the *Pall Mall Gazette* of the 27th ult., rectifies our contemporary's statement in some particulars, throwing doubt upon the supposition that the documents in question were "unknown to the officials of that department." Sir John Kaye concludes his letter by saying—

"I have always wished to see properly calendared (with copious extracts) the early memorials of the East India Company. The present Chancellor of the Exchequer, when Secretary of State for India, encouraged this undertaking, but it did not meet with any favour from the Council of India, so the scheme fell to the ground. In former days the Company kept

a historiographer, and Mr. Bruce, in that capacity, published in 1810 some bulky volumes, under the title of *Annals of the East India Company*; but no such functionary has existed for many years past, and I have not discovered that the early days of the East India Companies are regarded with much lingering interest by those who administer the affairs of her Majesty's Indian Government."

Sir John Kaye will, we are sure, be the first to rejoice that the work which he desiderates has long ago been taken in hand. The original correspondence and other documents in the custody of the India Office have been from time to time lent to the Master of the Rolls, and by his direction a full calendar, with extracts of important passages, has been prepared by Mr. Sainsbury. Two volumes bringing down the history to the year 1621 have long been printed, and one of these, if we are not mistaken, was already issued to the public at the date of Sir John Kaye's conference with Sir Stafford Northcote. One more volume, continuing the Calendar to the close of the reign of James I., is almost completed, and will shortly go to press. It may be added that some documents quoted in Bruce's *Annals* are now missing, and that whatever may be the truth about the present alleged discovery, it is within the limits of possibility that unknown papers of importance may still be brought to light.

A VERY rich collection of autograph letters and documents, formed by Dr. O'Callaghan, will be brought to the hammer at the close of this month. In it will be found a letter of Lucretia Borgia to her father-in-law, the Duke of Ferrara, dated Rome, November 27, 1501, relative to a quarrel she has with the nuns of Viterbo; no other autograph letter of hers is known to exist in any public or private collection in Europe. Signatures of her brother Caesar, and her son Cardinal Hippolyto d'Este, the patron and protector of Ariosto, are also here. Among other rarities is what is described as the oldest royal letter in Europe, perfectly preserved and hardly discoloured, that of John, King of France, who was led captive into England by Edward the Black Prince; it is dated from Windsor, November 26 (1356), and addressed to his son the Duke of Normandy; and letters of Rabelais and Rubens. Of more modern interest is a note from Charles Lamb to his friend P. G. Patmore, April 1831, containing a curious allusion to a well-known publisher of that day, "Nature never wrote KNAVE upon a face more legible than upon that fellow's: Coal-burn him in Bealzebub's deepest pit."

LIEUTENANT STUMM's book on the Khivan Expedition is to appear *chez* Messrs. Mittler, at Berlin, before Whitsuntide. An English translation will be published not many months later. The book excites a good deal of curiosity among military and geographical circles in Germany.

IN 1851, while Gawsword Church, near Macclesfield, was undergoing repairs, the workmen found three very curious mural paintings. Copies of these were fortunately made by Mr. J. F. A. Lynch, and these Messrs. A. Heywood and Son, of Manchester, propose to issue in chromolithography, accompanied by the needful explanatory comments. The paintings represent St. George and the Dragon, St. Christopher, and the Last Judgment. This picture of Doom is specially interesting, showing action in heaven, earth, and hell.

LANCASHIRE is honourably distinguished by the number of Natural History societies existing in the county, members of which belong for the most part to the artisan classes. A recent number of the *Manchester Evening News* contains a pleasant notice of the annual meeting of a Botanical Association that has been at work for fifty years in that place. The members meet on the Sunday evening at a public house, bringing with them their floral prizes, and the meeting is occupied in conversation regarding them. Sometimes a more elaborate "paper" is laid before them. One of these—an unpretending, but interesting notice of a "Botanical Excursion on the Breadalbane Mountains"—has just been

printed by Mr. Thomas Rogers, secretary of the association just named. Another testimony to the love of nature among the Manchesterians is afforded by the report of the Field Naturalist Society of that place, containing pleasantly written sketches of botanical excursions by the members last summer.

M. ROEST has just brought out a Catalogue, in two volumes, of the collection of Hebrew books made by the late L. Rosenthal in Hanover, and now in the possession of his son, a rich banker at Amsterdam. This collection is undoubtedly the richest after those of the Bodleian Library and the British Museum. M. Roest has followed the method of the British Museum Catalogue, drawn up by the late Mr. Zedner, confining himself to the titles, dates, and authors of the works, without entering into biographical details, or attacking biographers and bibliographers, as was unfortunately done by Dr. Steinschneider in his Catalogue of the printed books in the Bodleian Library. The second volume of M. Roest's Catalogue contains valuable biographical and bibliographical notes in Hebrew, made by the learned collector himself. We cannot omit to mention that M. George Rosenthal has published the Catalogue for the benefit of learning, without the wish of gaining profit from it. May this example be imitated by many others who possess important collections, of which, however, little or nothing is now known. We only require the publication of catalogues of Hebrew books, printed in Russia, Poland, the East and Leghorn, to be able, with those of Dr. Steinschneider, Zedner and Roest, to produce a complete list of Hebrew literature.

Messrs. DENTU have published a little volume entitled *A travers la Diplomatie, 1864-1867*, by M. J. Hansen, a Dane, who was sent to Paris at the outbreak of the Schleswig-Holstein war to support the cause of Denmark in France. The work is of too purely political a character to be reviewed in these columns, but students of contemporary politics will find that it throws considerable light on French and Prussian diplomacy at the critical period of which it treats.

Trübner's Record announces that Dr. Franz Teufel, one of the Librarians of the Grand-Ducal Library at Carlsruhe, is preparing for publication a critical edition of Hvāg'a 'Abd'ul'hāh Hātifi's *Timūrnamah*, which will contain the Persian text, based on a collation of all the accessible MSS., the critical apparatus, and a complete glossary, and will be preceded by the life of the poet from the likewise still inedited Biographies of Contemporary Persian Poets by the Prince Sâm Mirzā.

THE Comte de Paris has nearly completed the fourth volume of his *Histoire de la Guerre Civile des États-Unis*. It is, in the author's opinion, the most important portion of his work, dealing, as it does, with the turning-point of the war, the events that immediately followed Sherman's famous march. The volume will be published in the autumn. It has been stated that a translation of the Comte de Paris' work was about to be issued by a London firm. Negotiations were, it is true, entered into with a view to such an arrangement, but at the eleventh hour the French author announced that he would rather his history should be translated and published by Americans.

SOME of the simple sociable habits of Talfourd's and Bulwer Lytton's days still prevail in French literary circles. Thus last week there assembled in Victor Hugo's library some thirty of the leading writers and artists of Paris, and the poet declaimed a selection of the pieces that are to form the second instalment of the *Légende des Siècles*. This general title, it will be remembered, as M. Hugo announced many years ago, is to cover a trilogy, whereof "La Fin de Satan" is the *dénouement*, and "Dieu" the beginning. Both these poems are now ready for publication; therefore we

suppose the *Légende des Siècles* may be regarded as complete.

MISS DE LA RAMÉE has returned from Florence and brought with her a new novel nearly ready for publication. It is a story of Florentine life—a subject "Ouida" has had ample opportunities for studying.

ONE of the most colossal works the next generation will probably see is M. Thiers' *Memoirs*, which he is bringing down to the present time with wonderful activity. Sixteen has been mentioned as the number of volumes necessary to tell the story of the eminent statesman's life. M. Thiers is also engaged on a History of Art, of which we believe only the Italian portion is completed.

M. HETZEL publishes this week in Paris two curious volumes of the Correspondence of André Marie and Jean Jacques Ampère, the mathematician and the essayist and historian. The letters recel nearly all the famous Frenchmen of this century, from Chateaubriand, Lamartine and Balzac, to Thiers, Sainte-Beuve and Mérimée.

LÉO LESPÈS, who died last week almost a pauper at the charitable institution La Maison Dubois, was in literature about what Thérèse was in music; and his popularity was not at all unlike, in extent and quality, that of the brawny *diva* who "created" the *Femme à Barbe*. M. Léo Lespès created on his side the famous *Petit Journal*, the first newspaper sold in France for one sou. For many years Timothée Trimm was regarded as a model journalist—that is to say, a being closely resembling the embodiment of a familiar and superficial encyclopædia. He rivalled M. de Girardin. If the founder of the *Liberté* had "one idea a day," M. Léo Lespès did more: he succeeded in writing one article a day without conceiving more than one idea a month. And very naturally the composition of those daily articles, treating of every subject, from postage stamps to hippophagy, during four or five consecutive years, was regarded as a veritable phenomenon in journalism. The journalist was paid like a phenomenon, and spent his money like a prodigal prince. The *Petit Journal* is now the most popular journal in France. Its circulation was 200,000 when M. Lespès left it. Timothée Trimm—whose real name was Napoléon Lespès—began life in 1832 as a conscript in a line regiment. He employed his leisure moments in writing humorous verses, which he signed "Fusilier," and when his term of service had expired he drifted quite naturally from the barrack-room into the offices of third-class newspapers. The title of his first work will give a good idea of the kind of literature M. Lespès admired; it was called *The Green Eyes of the Morgue*! He wrote afterwards *Les Mystères du Grand Opéra*, *Les Soirées Républicaines*, *Paris dans un Fauteuil*, *Les Quatre Coins de Paris*, *Les Filles de Barabas*, &c., which are nearly all collections of desultory *chroniques* and tales contributed to journals exclusively patronised by the corporations of concierges and cabmen. Since the war M. Lespès had fallen into complete obscurity; he was admitted into a free hospital about a fortnight ago, and died last week at the age of sixty-four. Some of M. Lespès' articles in the old *Figaro* show real talent of a delicate and lively kind.

ON April 17 the bones of the Emperor Lothaire, the son of Lewis the Pious (died A.D. 855), which have been for many years preserved in the sacristy of the parish church of Prühm, were deposited, together with the various documents attesting their genuineness, within the magnificent black marble sarcophagus prepared for their reception. Considerable interest was excited among the scientific men present by the colossal dimensions of the bones, the breadth and length of which fully confirmed the historical and traditionary report of the Emperor's exceptionally large stature. The monument, which rests on

three granite steps, is surmounted by a massive white marble cover, supported on black marble columns, and bearing in gold letters the original epitaph, composed by the scholar Hrabanus Maurus, who died as Archbishop of Mayence in 856. This "Epithaphium Hlotharii Imperatoris" is as follows:—

"Continet hic tumulus memorandi Caesaris ossa
Hlotharii Magni principis atque Pii,
Qui Francis, Italis, Romanis praeiit ipsis,
Omnia sed sprexit, pauper et hinc abiit;
Nam bis tricenos monachus sic attigit annos,
Et se mutavit, ac bene post obiit.
III. Kl. Octobr."

To this is appended a record in German that "the monument has been renewed in 1874 under the rule of King Wilhelm of Prussia."

WE learn that the eminent German ethnologist, Professor A. Bastian, has been commissioned by the Imperial Government at Berlin to proceed to Central America with the view of examining on the spot several large collections serving to illustrate anthropological and ethnological enquiry, which have been offered for sale.

PROFESSOR KARL SIMROCK has completed a second and greatly enlarged edition of his modernised German version of Hartmann von Aue's *Der Arme Heinrich*, which he first brought within the reach of the reading public in 1830. Dr. Simrock has enriched this edition with a dissertation on the various compositions bearing on the myth of "Poor Henry," and all more or less closely connected with the subject of Leprosy and its cures.

THE *Allgemeine Zeitung* announces that Herr Hallberger, of Stuttgart, the editor of *Ueber Land und Meer*, intends to publish an English periodical in that city, to be entitled *Hallberger's Illustrated Magazine*, which will appear at intervals of three weeks, and is to be edited by F. Freiligrath.

THE German papers announce the death on April 17 of Dr. Hildebrand of Halle, who was well known in Germany as one of the best living exponents of the Old Icelandic, the "Norraena Tunga" of the Northmen. Dr. Hildebrand had been long engaged in preparing a new edition of the Eddas, and we regret to learn that this work, to which he intended to append numerous notes and glosses, has been left incomplete, and was only half printed at the time of his death.

MR. S. R. GARDINER writes to us that Mr. Furnivall is entirely mistaken in his statement that Mr. Irving, the late Classical Professor of the University of Melbourne, resigned his post in consequence of a sudden resolve of the Council "to give the whole staff notice that their posts are vacant, and that they must apply for re-election." Mr. Gardiner states, from personal knowledge, that Mr. Irving resigned simply because a position was offered to him which he preferred to that which he held at the University.

NOTES OF TRAVEL.

MR. J. A. SKERTCHLEY, author of *Dahomey as It Is*, is about to proceed to Western Africa, accompanied by a civil engineer and one or two scientific gentlemen, with the intention of investigating the feasibility of creating an inland sea in the vast depression which lies to the south of the Empire of Morocco. That this project is not a wild one is apparent to those who have examined the desert of El Joof, as it is termed, and who bear positive testimony to the fact of the sea having receded from that part at a recent date. The project is a much more hopeful one than the French scheme of a like nature with regard to the *chotts* of Algeria, as in the more southern region there is an important trade to be done, while Timbuctoo, which would thus be on the verge of the new ocean, would be brought within fourteen days' sail of the British Isles. The only obstacle

to be cut through is a narrow belt of land opposite the Canary Isles, and to examine this will be one of the principal aims of the present expedition. Mr. Skertchley is an old African traveller, and his experiences during a journey made in the year 1868 deserve record. In the course of that year he explored the Gabun river, and crossing from thence to the Ogowai, ascended the last-named river and travelled for a considerable distance along the equator into the interior. About 14° E. longitude he crossed a large river about a mile in width, which flows due south. His furthest point was as near as possible 15° E.; and seven days' journey beyond that to the east he was told that there lay a large lake, the waves of which when agitated by wind were gigantic. This may or may not have any connexion with the lake reservoirs of the northern Lualaba, but it is extremely probable that the large river crossed is a northern feeder of the Congo, a tributary of which the existence has long been suspected. Mr. Skertchley also informs us that Arabs stated that they could pass up the river Ogowai, and from thence to the Ongo by boat.

CAPTAIN ALLEN YOUNG proposes, in his approaching Arctic trip in the *Pandora*, to steam up Baffin's Bay, through Lancaster Sound, and down Prince Regent's Inlet; after which, should circumstances prove favourable, he will endeavour to make his way along the north coast of America as far as Behring's Straits, by way of the east coast of King William's Land, the scene of Sir John Franklin's disastrous end. Admiral Collinson, in 1851-2, found but little difficulty in making his way along the Arctic coast of North America, progress in shore being much facilitated by the action of large rivers which discharge themselves into the Frozen Sea. There is no doubt that, with the aid of steam, navigation under such circumstances would be greatly facilitated and expedited, and we sincerely hope that Captain Young may be enabled to achieve his project.

HERR WEYPRECHT, the leader of the Austro-Hungarian Polar Expedition, describes the auroral and magnetic phenomena of the region between Novaya Zemlya and Francis Joseph Land as very remarkable. He says, no pen or pencil can give any idea of the beauty of the northern lights at their greatest intensity. In February, 1874, the auroral discharge made a broad powerful stream of fire from west to east across the zenith, varied by continuous and intense swift-moving waves of rainbow-coloured light from one side of the horizon to the other. The lights also danced up from the southern horizon to the magnetic pole, making altogether the most splendid firework nature could display. He considers the region above mentioned to be one of maximum auroral manifestation. Three kinds of aurora were noticed: one a quiet regular arch, stretching upwards from the southern horizon over the zenith, and growing pale on the northern horizon. Another, consisting in more distant light bands continually changing their position and shape, and composed either of distinct rays, or different light; and lastly, the appearance of a corona, with rays streaming from, or towards, the magnetic pole. This is usually white with a slight tinge of green, and in cases of great intensity and motion, rays of prismatic colours, often very bright, shoot forth.

He detected the well-known green line by using a spectroscope; but his instrument was feeble, and the observations not to be compared with those of the Swedish expedition.

With regard to the supposed connexion between the northern lights and the weather, he found strong flaming exhibitions usually followed by storms. Magnetic disturbances were closely associated with the phenomena. He caused 3,000 readings of magnetic instruments to be made, and these have still to be reduced; the principal results are, however, as follows:—Magnetic storms are of extraordinary magnitude and frequency in that

region. They stand in the closest relation to the auroral discharges, and the disturbances are greater as the motions of the light streams become more lively, and the prismatic colours become more intense. Quiet regular arches, or ray motions, have scarcely any action upon the needle. In all disturbances the declination needle moved towards the east. Further details will be found in Petermann's *Geographische Mittheilungen* and *Der Naturforscher* for April 10, 1875.

THE French Geographical Society now numbers 1,400 members and 600 honorary members. At its last meeting gold medals were awarded to l'abbé Armand David, for his travels in China and Mongolia, 1864-74; to Dr. Schweinfurth; and to the late Captain Hall, of the *Polaris*. Silver medals were awarded to l'abbé Emile Petitot, for his thirteen years' travels in North-West America; and to MM. Alfred Marche and Victor de Compiègne, jointly, for their travels in the Gabun country, 1872-4.

THE first spring boat from Iceland to Copenhagen brings news of a volcanic outbreak in that island for which the recent ash-storms in Norway had prepared the minds of men of science. It will be remembered that an eruption of the Vatnajökul took place in the winter of 1872-73, and that it was supposed to have taken place at a point on the northern side of that vast region. That outbreak was not of great importance, and since then Mr. Watts has made an attempt to reach the volcano from the south side of the Vatnajökul, but in vain. Towards the end of last December, a trembling of the earth began to be felt in the north and east of the island, accompanied by loud rumblings, and at last from Myvatnssveit, the nearest hamlet to the Vatnajökul, a great glare began to be seen in the south, which appeared, however, to be emitted by a different crater from that in activity in 1867 and 1872. This eruption is believed to have commenced a week before Christmas, and to have ceased towards the end of February; but about the same time as the first ceased, a new volcano burst out on a tableland lying east of Myvatn, and several days' journey from the Vatnajökul crater. In the village of Myvatn the eminent politician, Jón Sigurdsson, lives, and, owing to his energetic efforts, the mild weather was used in exploring both volcanoes from that point. It was discovered that the first-mentioned volcano was not in the Vatnajökul at all, but in the Djungjufjeld, and that it is an entirely new crater. The only accurate information yet received is contained in two letters from Jón Sigurdsson to *Nordanfar*, and one from an anonymous correspondent to *Isafold*. The latter announces that on February 16 the expedition reached the eastern edge of the Djungjufjeld. The explorers climbed a ridge from which they were able to look down upon the new volcano, which is on the south-east side of the mountain, and which is merely an opening on a flat table-land. It had formed no new lava around it, except just a lava-ring round the aperture of the crater, which appeared to be about 100 feet in diameter. About 180 feet west of the crater, a sinking of the terrain in shape of a horse-shoe had been formed. At the southern edge of this sinking was another little crater, which vomited even more rapidly than the first, though not so powerfully; from this a little stream of lava was flowing towards the south-west, side by side with a stream of pure water, which by and by left it, and, flowing between the rocks on the north-west side, formed a lake there. Ash-storms continue to fall all over the eastern part of the interior of the island, and it is feared that they may seriously injure the pasture-lands.

THE LATE PROFESSOR SELWYN.

ANOTHER severe loss has been sustained by the Cambridge Professoriate in the death of Canon Selwyn, the Lady Margaret's Reader in Theology.

William Selwyn, son of the late W. Selwyn, Q.C., of Richmond, Surrey, was born in 1806, and was the eldest of the three sons, his younger brothers being the present Bishop of Lichfield and the late Sir Jasper Selwyn, Lord Justice of Appeal. He entered at St. John's College, Cambridge, obtained the Chancellor's Classical medal in 1828, and in the same year graduated in both classical and mathematical honours, taking the high degree of Senior Classic and Sixth Wrangler, and ultimately proceeded to the D.D. in 1864. In April 1829 he was elected to the Fellowship at St. John's College just vacated by Sir John Herschel, and on resigning it upon his marriage, in 1833, was himself succeeded by his brother, the Bishop of Lichfield. He was ordained in 1829, instituted to the rectory of Branstone, Leicestershire, in 1831; and after passing through rapid and successive grades of ecclesiastical preferment, became Resident Canon of Ely in 1833, Lady Margaret's Reader in Theology at Cambridge in 1855, and was appointed Chaplain in Ordinary to Her Majesty the Queen in 1859. These offices he held until his lamented death, which took place at his residence at Cambridge, on Saturday, the 24th ult., in the sixty-ninth year of his age. Professor Selwyn was not only admired for his brilliant scholarship and earnest devotion to his work, but beloved for his wit, his genial social qualities, and above all for his munificent and public-spirited liberality. When Ranke the historian visited Cambridge and dined in one of the College halls, he desired to have Professor Selwyn pointed out to him, and contemplated with divided admiration the noble and intellectual presence of the Lady Margaret's Reader, and the large stipend which he was told was attached to the professorial chair. "1,800*l.* a year," he said; "I should be glad to come to Cambridge for that." "But," asked his informant, "do you know that he gives 700*l.* a year of his income to a brother professor?" "You English are so droll," replied Ranke; "you must not ask me to believe that." It was true, nevertheless, for so long as the present Bishop of Winchester held the Norrisonian professorship, Canon Selwyn voluntarily gave up 700*l.* per annum to the augmentation of his colleague's stipend; and when the latter resigned his post to become Bishop of Ely, he still set apart the same munificent sum to form an accumulative fund (now amounting to 10,000*l.*) to found a Divinity School at Cambridge. He was an energetic member of the Company for the revision of the Old Testament, where, as well as at Cambridge, his place will be hard to fill. His death, in the full possession of his great intellectual powers, and in the midst of his useful work—he was revising proofs the day before he died—is felt as a personal bereavement by his colleagues here, and as a national loss elsewhere. Among his works are:—*Principles of Cathedral Reform*; *Horae Hebraicae on Isaiah IX.*; *Two Charts of Prophecy*; *Notes on the Revision of the Authorised Version of the Holy Scriptures*; *Notae Criticae in Versionem Septuaginta-viralem* (Exodus, i.-xxiv., Numeri, 1857, Deuteronomium, 1858); *Conversations between an M.P. and a Canon on Ecclesiastical Legislation*; *Reasons for not signing the Oxford Declaration*; *Winfrid*; *Waterloo* (with Plans); *Errors of Commission*—all published by Messrs. Bell and Daldy; a critical edition of *Origen against Celsus*; and various other theological and classical works. E. H. PALMER.

THE BRITISH MUSEUM.

THE Account of the Income and Expenditure of the British Museum for the Financial Year ended March 31, 1875, has just been issued. It includes a statement of the progress made in the arrangement of the collections, and of the most important objects added to the Museum. Among the additions to the Department of Printed Books, Mr. W. B. Rye mentions:—

"Two very rare Shakespearean tracts, purchased at Sir William Tite's sale, viz.:—

"(1.) The Meeting of Gallants at an Ordinarie.

or the Walkes in Powles. London, 1604. This very curious work contains an allusion to Shakespeare's *Comedy of Errors*, and interesting references to the plague which raged in London during 1603. (2.) *Maroccus Extaticus*; or Bankes' Bay Horse in a Trance. Printed for Cuthbert Burby, 1595; containing an account of the celebrated performing horse so frequently mentioned in the dramatic works of the seventeenth century, and alluded to by Shakespeare in *Love's Labour's Lost*. Both man and horse are said to have been burnt at Rome for witchcraft.

"A contemporary Latin account, hitherto unknown to bibliographers, of the meeting of Henry VIII. and Francis I. at the Field of the Cloth of Gold in June 1520. A French version exists in the Grenville Library.

"A copy of the *Chorus Poetarum Classicorum*: Lugduni, 1616, with the autograph and numerous Latin marginal notes in the handwriting of Ben Jonson.

"Many early English works of rarity have been purchased, including a copy of the extremely scarce first edition of Lydgate's translation of Boccaccio's *Fall of Princes*; printed by Pynson in 1494. This volume was rescued from a tobacconist's shop at Lamberhurst; portions had been cut out to wrap up tobacco and snuff.—The rare edition of the English Bible in octavo, printed in 1612–13, the year after the publication of the authorised version in folio. It was unknown to Dr. Cotton, Lea Wilson, and to Lowndes. It is in beautiful condition, and in a binding of embroidered needlework.—Giles Fletcher's *Reward of the Faithful*; London, 1623. This rare prose work, by the author of *Christe's Victoria*, was recently described by Mr. Grosart from an imperfect copy which he believed to be unique. The author died in 1623, the year of the publication of the first folio edition of Shakespeare. He denounces 'idle pamphleters and loose poets, no better than the Priests of Venus, with the rabble of stage-players and balleters, and circumference fiddlers and brokers, all which, if they were cleane taken out of the world, there would bee little misse of them.' The preface contains a remarkable exculpatory allusion to Lord Bacon two years after his disgrace. The noble birth and gallant achievements of that remarkable outlaw Robin Hood, 1678. The only prose history of Robin Hood and the only copy known.—Barbour's *Actes and Life of Robert Bruce*; Edinburgh, 1620.—R. Greene's *Historie of Orlando Furioso*; C. Burby, 1599."

"A further selection of about 500 works from the linguistic library of M. Burgaud des Marets, comprising works in Basque, in the dialects of Italy, Spain, and Portugal, and in Wallachian. This purchase has made the Museum Library exceedingly rich in Basque books.

"A collection of Romaic works from the library of the late Charles Hopf.

"A considerable collection of journals, pamphlets, books, and caricatures illustrative of the recent revolution in Spain, 1870–4.

"The collection of Music has been augmented by the purchase of several hundred volumes, comprising the works of modern German, French, and Italian composers, many in full score. The works of Glinka, Titor, Varlamov, have been added to the Russian music. A great number of important treatises on the theory of the art have been acquired, and several valuable additions made to the class of early printed music."

The greatest curiosity added to Mr. R. H. Major's Department of Maps, &c., seems to be—

"An anonymous map of Germany and the surrounding countries, engraved on copper, but with the lettering printed from type, published at Eichstatt in Bavaria, in 1491. In a legend at the top, describing the contents, occur the words: 'Gratia sit Cuse Nicolao,' showing it to be the surviving representative of an earlier map, now unknown, made by Cardinal Nicolas Krebs (called Cusanus, from his native village of Cusa on the Moselle), who died in 1464. This earlier map is apparently referred to in the preface to the German translation of Miechow's *Tractatus de duabus Sarmatiis*, entitled, *Tractat von baiden Sarmatien*, &c., Augsburg, 1618, 4to, in the following words:—'Wie wol der hochwirdig fürst und herr herr Nicolaus Cusa, der geleerten teutschen Kron, in seinem Mäpplin von disen landen vil anzaigt,' and has been treated of at length by Sebastian Münster in the 1st volume of the *Rerum Germanicarum Scriptores*

of Schardius, Basle, 1574. On the back of the map is a drawing of a coat of arms, headed by the name of the illustrious Wilibald Pirckheimer, the Xenophon of Nuremberg; thus: 'Bilibaldus Pircheymer MDXXXIX.' From this it may be inferred that he had this identical map before him when he wrote his *Germaniae ex variis scriptoribus perbrevis explicatio*; published in Nuremberg, 1530, 8vo."

We have from time to time during the past twelve months noted in these columns the chief acquisitions made by Mr. Edward A. Bond to the Manuscript Department under his control, so there is no need for us to repeat them here. The Hatton Papers are undoubtedly the most important from an historical point of view. They are officially described thus:—

"Forty-nine volumes of Correspondence and Papers of Christopher, 1st Viscount Hatton, and Daniel Finch, 2nd Earl of Nottingham, Secretary of State in the reign of Queen Anne. The earlier portion comprises much that relates to affairs of the Isle of Guernsey, of which Lord Hatton was Governor, together with extensive family correspondence, and volumes of letters of Sir Charles Lyttelton, Dr. Fell, Bishop of Oxford, Dr. Edmund King, and others. The later portion principally consists of letters from ministers at foreign courts and other public officers, including Lord Treasurer Godolphin, Sir Joseph Williamson, Sir Paul and John Methuen, in Spain and Portugal, the Duke and Duchess of Marlborough, the Duke of Ormonde, Dr. Jeremy Taylor, and other persons of note."

Among new manuscripts in this department which we have not noticed are several volumes of Ledgers and Accounts of the Theatres Royal, Drury Lane, from 1772, and Covent Garden, from 1808; and about 1,500 original charters relating to the Carew family, of Beddington.

Among additions to the Oriental Manuscripts are:—

"The fourth and last volume of Ibn Khallikān's *Lives of Illustrious Men*, written by the author's own hand, circa A.D. 1257, Arabic; a most valuable addition to the first two volumes of Ibn Khallikān's autograph acquired by the Trustees in 1864.

"The second volume of the above work, dated A.H. 747 (A.D. 1346). Folio.

"The Canon of Avicenna in two volumes, the first of which is dated A.H. 733 (A.D. 1333). Arabic. Folio.

"A volume of the Commentary of Ibn Hajar on the Sahih, or authentic collection of Muhammad's Traditional Sayings, by Al-Bukhārī. Arabic. Folio.

"A copy of the Coran, carefully written on vellum in the thirteenth century. Quarto.

"Rabbi Sandiah's Commentaries on the Psalms Proverbs, Song of Solomon, &c. Hebrew; fourteenth century. Folio.

"Mukhtasar Murshid, a glossary of Talmudic words, by Rabbi Tankhum; Hebrew. Folio.

"Discourses on the Six Days of Creation, a Nestorian work by an unknown author; Syriac. Folio.

"Syriac fragments from the Syrian Convent of Nitria, some of which were found to belong to MSS. previously acquired by the Trustees. Presented by Professor William Wright.

"Atashkadah, or Notices on Persian Poets, by Lutf Ali Beg, with illuminated title-page. Folio, bound in painted covers.

"Matla'us-Sa'dain, a History of Timur and his successors in Iran. Persian. A.D. 1646. Folio.

"Khulāsat ul-Akhbār, a manual of Oriental History, by Khwānd Amir. Persian. A.D. 1511. Folio.

"Insāb un-Nawāsib, a Shi'ah work by 'Ali Dā 'ūd of Astrabad, containing fierce attacks on the first three Khalifs and other enemies of Ali. Persian. Folio.

"Tazkirat ul-Umarā, or Lives of Indian Amirs, by Kewalram. Persian. Folio.

"Bansawali, a history of the Rajahs of Jypore. Persian. A.D. 1784. Folio.

"Journal of the Japanese Mission to Europe. Japanese. Six Parts. Folio.

"A Japanese Novel with miniatures. Quarto.

"(The above two MSS. were presented by Ernest Satow, Esq., Japanese Secretary to the British Legation in Japan.)

"A large Buddhistic work written on palm leaves in the Pali language and Cambodian character.

Presented by Dr. Campbell, Her Majesty's Consul-General, Siam.

"Hindoo Mythological Drawings, collected and accompanied with an explanatory text, by the Rev. William Malkin."

We must defer till another occasion our notice of the acquisitions made by other Departments of the Museum.

LETTERS IN THE GOTHA AND FULDA LIBRARIES.

St. John's College, Cambridge: April 20, 1875.

With your permission I desire to call attention to the collection of letters preserved in the Gotha library, and in passing to look in at Fulda.

Ernst Ranke, in his edition of the gem of the Fulda library (*Codex Fuldensis*, Marburg and Leipzig, 1868, prolegomena xxxi.), acknowledges the help of the librarian:—

"Quum liber sacer qua est vetustate atque dignitate ultra arctos bibliothecae limites cum iis qui extra sunt non communicetur, inde ab anno praecedentis decennii quinto quater Fuldam adii ibique comiter exceptus si singulas vices computo duodecim hebdomades festis diebus vix exceptis transcribendo perscrutandoque codici vovi. Quo in studio fultus, neque in paucis ab Amando Keiz bibliothecae Fuldensis diligentissimo bibliothecario quem ad lares quoque reversus literis datis de singulis lectionibus consului, adiutus, etc."

I can confirm this testimony from my own experience. On March 23, when the soldiers (the troops regularly quartered there—not, as I have since read in an English journal, a guard specially sent to overawe the bishops "assembled at the grave of St. Boniface") were drilling in deep snow, I called, without introduction or other excuse than curiosity, on the librarian. He took me into the library, though it was closed during Holy Week, and showed me manuscripts and early printed books, in number and condition deserving to be more widely known than they are. The collection contains 40,000 volumes, all in original bindings. Many examples of *incunabula*, not registered by bibliographers, are there; also not a few early MSS. of the Latin fathers, worthy the notice of the editors of the Vienna *Corpus Scriptorum Ecclesiasticorum*. The Palaeographical Society should also enter into correspondence with Mr. Keiz, who has made admirable catalogues, alphabetical and other, of the treasures under his care, and is eager to make them more widely known. The *Book of St. Boniface*, cleft by sword-cuts at top and bottom till the wounds nearly meet in the middle, the *Codex Fuldensis* of the sixth century, finely illuminated MSS. of various dates (even a *corpus turis* among the number) deserve a facsimile.

The librarian of Gotha, Dr. Pertsch, also opened his library to me on one of his few holidays, and offered again to open it on Easter Tuesday, but I had not the conscience to rob him of his rest. In the four or five hours that I could devote to the examination of the catalogue of letters, I noted the following entries which have an interest for Englishmen. The British Museum, a short time ago, sent one of its officers to Gotha to take electrotypes of English coins and medals; it might be worth while to procure transcripts of all documents important for the history of our country and its literature, not only from Gotha, but from all foreign libraries.

I register the letters as I took them down from the written catalogue, omitting the class-marks; I have inserted some papers by foreigners, if they were in any way connected with England.

From Alexander Alesius: (1) 1547, "dño G. Moro;" (2) Lips. s. a. "ad Jo. Agricolam;" (3) s. l. et a. "ad Paulum Eber" [to whom, by the way, very many letters are addressed]; (4) Apulia (?) 1543 (P "ad Justum Menium"); (5) Witi-bergae, 1539, "ad Fr. Myconium;" (6) s. l. et a. "ad Justum Menium."

From Chr. Arnold, s. l. 1648, "ad Jo. Fabricium."

From J. Arnold, Londres, 1716, to Leibnitz.

From Augustus, Elector of Saxony, to Queen Elizabeth [written by Pfeifer]: (1) Dresdae, 1574; (2) Annaburg, 1574; (3) *ibid.* 1578; (4) Dippoldiae, 1577; (5) *ibid.* 1577; (6) Dresdae, 1577; (7) *ibid.* 1581.

From Auguste Princess of Wales: (1) 20 letters (1748-70) to Frederick II. and III. of Saxo Coburg Gotha; (2) Leicester House, 1744, to E. S. Cyprian, the librarian of Gotha.

From Bacons vidua Domini Custodis, no place, date or recipient named.

From Bedford (?): (1) no place, year or recipient; (2) s. l. et a. "ad Bezam." [There are very many letters of Beza's in the collection].

From Edw. Bernard, s. l. 1690, to Job Ludolf.

From Theod. Beza, 8 id. Dec. 1581, to Cambridge University, and one from the University to Beza of the same year.

From Jean Bernouilli: (1) Groningiae, 1703, to Falkoner; (2) 1707-12 to Edmund Halley; (3) Basil, 1719-23 to Is. Newton; (4) *ibid.* 1713-29 to Woolhouse. [There is a great mass of papers of the Bernouilli family].

From John Bird, London, 1768-70 to Sulzer.

From Bothmer, Londres, 1716, to Leibnitz.

From Isaac Hawkins Brown, 1776-7, & J. Bernouilli.

From the Comte et Comtesse de Bruce, Petersb., 1778, & J. Bernouilli.

From David Stewart Comte de Buchan, Dry-borough Abbey, 1787-94, & J. Bernouilli.

From Is. Casaubonus, Lutet. Par. 1602, "ad pastores et synodum Gargoviae congregatos."

From Jo. Castellus, Lond. 1609, "ad Zastri-fel."

From Geo. Oheynasus, Lond. 1703-5, three letters to J. Bernouilli.

From Clarke [no place, date or recipient].

From Tim. Clarke, Londini, 1668, to Dr. Fabricius in Danzig.

From Geo. Cliford, Amst. 1738-43, to J. P. Breyn. [There is a vast mass of letters addressed to Breyn, e.g., by James Petiver, Wm. Sherard, Hans Sloane, J. Woodward.]

From John Collier, Lond. 1770, to J. Bernouilli.

From P. Collinson, Lond. 1744-8, to Breyn.

From Alanus Copus: (1) Lovanii 1563 [2 letters] "ad Hosium;" (2) *ibid.* 1568, to the same. [Valuable additions to the scanty materials for a history of English Romanists. Under "Tho. episc. Asaphus" there lurks a letter from Thomas Gasdwell, ex-Bp. of St. Asaph, to the same Card. Hosius].

From Guillaume Coxe, Cambridge, 1782, & J. Bernouilli.

From Jean Craig, Sellingham, 1709, to —.

From Cramer, Londres, 1727, & J. Bernouilli.

From Tilem. Cragius (? whether a Scotchman), "in exilio ex vico Borgtorff prope Cellam, 1562, ad P. Eberum."

From E. S. Cyprian, Gotha, 1744, "ad episcopum Cumberlandiae" (*sic* Qu.).

From F. Dale, Braintree 17-3 (third figure doubtful), to Breyn.

From J. J. Dillenius: (1) Lond. 1729; (2) *ibid.* 1732, to Breyn.

From Qu. Elizabeth: (1) Greenwich, 1592, "ad Ludovicum D. Wirtemberg;" (2) *ibid.* 1592, "ad Fri. Will. elector. Sax. administr.;" (3 and 4) Windsor, 1577, "ad Frid. reg. Dan.;" (5) s. l. et a. (1576), "ad Landgravium de formula concordiae scr. a Roberto Belo;" (6) Vuindsoriae, 1579, to "Fred. v. Dänem."

From James Empson, Chelsea, 1743 and 1745, to Breyn.

MS. Goth. chart. A. 282, p. 291, "Jo. Duraei dissertatio irenica." [If this peace-maker has any friends, they may note that I possess some MSS. pieces of his, and have considerable collections relating to him.]

MS. Goth. chart. A. 515 f. 148, "nomine reginae Angliae acta cum electore Saxoniae in conventu Salcensi procurante Landgrauio 1578 kal. Apr."

MS. Goth. chart. B. 19 f. 11^b, "epistola ad Eduardum regem Angliae 1548."

Early in the eighteenth century an attempt was made to unite the Lutheran and Anglican Churches (see Abp. John Sharp's Life; C. F. W. Walch, *Neueste Religionsgeschichte*, Lemgo, 1772, ii. 191-214; Hase, *Kirchengeschichte*, § 390, note k; and catalogues under "Edzardus," "Jablonski," especially in the Cambridge Library; "Puffendorf;" Nichols, *Lit. Anecd.* viii. 250). Among Cyprian's MSS. n. 294, pp. 93-138, contains a translation of one of the tracts published on the occasion: "*Die Historie der Lutherischen Kirche*, oder die Religion unsers gegenwärtigen Souverain König Georgens den Lehrsätzen der Engelländischen Kirche in allen gleichstimmig, zu einem Versuch alle guten Christen wieder [*sic*] die Lehre der Röm. Kirche, Joh. Calvin und Theodori Bezae zu vereinigen, entworfen von einem Mitglied des Magdalener Collegii zu Oxford. London: gedruckt und zu verkaufen bey Joh. Morphew, nahe an Stationers-Hall, 1714."

As an instance of the friendly intercourse between English and German churchmen, I transcribed the following letter from Wm. Cave to Cyprian:—

MS. GOTHA, 422, p. 18, *holograph*.

"Cl. V. Ernesto Sal. Cypriano

Wilhelmus Cave S. D.

in fonte salutis.

"Pridie Nonas Julias redditae sunt mihi literae tuae (Vir Cl. D^{ns} Professor plurimum honorande) sane suavissimae, eximij candoris et humanitatis testes satis luculentis. Gaudeo me a tali viro tanti aestimari, etsi immoedicas, quas mihi tribuis, laudes nullas agnosco, affectui tuo, non meritis meis ascribendas. Fateor me in literis, praecipue Ecclesiasticis, excellendis maximam aetatis meae partem trivisse. Progressus vero quem etiam in his fecerim, sentio quam sit exiguum, meoque me metiri pede dudum didici. Interim egregiam tuam humanitatem amplector et exosculor. Quod novam Hieronymi de scriptoribus editionem mediteris, facis quod te dignum est, quod nomini tuo gloriosum, quod reipubl. literariae gratum, vtile ac fructuosum erit. Non dubito quin notas vberiores et supplementum sis additurus. Suaderem vt vbi Eusebium exscripsit Hieronymus (quod semper fere solet) Graeca e regione collocentur; quod et vsui et ornatu erit. Et miror tot eruditos editores hactenus neglexisse. De varijs lectionibus conquirendis, iam non vacat, quippe ad Acidulas Tunbrigenses intra diem vnum aut alterum sanitatis causa profecturus sum. Vbi rediero, videbo quid per amicos praestare possim. Nemo interim hoc felicius accuratiusque praestare quam Dn. Grabinus, qui omnes Bibliothecarum nostrarum forales occasione Spicilegij sui diligenter excusserit. Puto me vix quidquam notitia tua dignum penes me habere, quod vel in Historiam Literariam, vel in Vitas SS. Patrum IV. primorum seculorum Anglico sermone a me dudum scriptas, non transcriberem. A libris iam longe remotus sum; cum Windesorem rediero (quod non nisi post tres quatuorve menses fiet) schedas excutiam, et siquid repererim, libenter tecum communicabo. Interim bonis avibus procedat institutum tuum. Mirifice me delectat quod narrae de nova Centuriarum Magdeburgensium editione adornanda, emendanda, continuanda, quam Cl. Schmidius tuque in vos recepistis. Gaudeo in tam felices, tam accuratas manus incidisse; cum certus sim, nihil nisi lene, moderatum, accuratum, eruditum ex Academia Helmstadiensis prodire solere. Ego opus istud semper admiratus sum, de quo quid sentiam in Praefat. Part. 2^{da} Hist. Liter. alibique satis aperui. Lepidum est quod habes de Kochio Kiloniensi, ignoto mihi capite. Merum est vigilantis somnium. Quid facit hic tanto dignum promissor hiatu? Certe helleboro purgandus est, vel ad Anticyras demum relegandus, risu, contemptu, non refutatione dignus. Orbilius (vt recte vocas) Amstelodamensis, vides quam solita humanitate me, vt et alios plures me longe maiores, tractaverit. Det illi Deus saniorum mentem. Respondi paucis, spero tamen satis ad rem. Commodum prodit libellus, dum haec scribo. Exemplar vna cum his literis ad te destinaui, inuentis inter nos amicitiae tesseram, vt rectius de hac lite iudicare possis. Responsum tuum ad Liberii Epistolas nondum vidi, vt Helmstadiensis vestra raro ad nos pervenit. Doleo tot et tam

illustres in republ. literaria viros fato nuper ereptos esse. Resarciat eorum iacturam communis Pater, augeatque illorum numerum, qui meliores literas cum pietate promoveant. Saluta meo nomine et Collegam tuum Dn. Schmidium, et Albertum Feldium. Benedicet studijs vestris *δ εὖ μάλα*, et in nominis sui gloriam, et Ecclesiae aedificationem cedant. Vale, vir doctissime, et quod coepisti, me amare pergas. certus me nihil, quod in me erit, tibi denegaturum. Isleworthae x^a ab vrbe lapide vii^a Idus Julius A^o MDCC.

CORRESPONDENCE.

THE BHARHUT SCULPTURES.

38 Clanciarde Gardens: April 27, 1875.

Louis de Zoysa Mudliar has supplied me with two additional corrections, one of some importance, the other involving an interesting point of exegesis. First, the inscription read by General Cunningham as Sudhamma Reva Sabha, should be read *Sudhammā devasabhdā*. The emendation admits of no dispute, because, according to the Buddhist texts, the *devasabhdā*, or council hall of the Trāyastriṃśa angels, is named Sudhammā. Thus vanishes the theory of the inscription containing the name of the patriarch Revata, who presided over the second General Council of Buddhism. Secondly, the curious expression *kotisānthārena* does not mean "for a layer of ten millions," but "by laying edge to edge." It is well known to Sanskrit scholars that *koṭi* has the two very different meanings of "edge" and "ten millions," and it is in the former sense that the word is here used. The original and oldest extant version of the story of Jetavana is to be found in the Chûla Vagga of the Vinaya, a portion of the Buddhist canon; and in his great commentary on the Vinaya, Buddhaghosa explains *kotisānthārena* by *koṭim koṭim paṭipādeti*, "putting edge to edge," by which is meant that the coins were so close together that their edges

touched. Of course this correction does not in the slightest degree impair the value of the discovery. It is interesting as removing a certain tautology from the passage as I at first translated it, and adding a new force to the expression, and also as illustrating the extreme importance of Buddhaghosa's commentaries, without which we should too often be driven into hopeless conjecture in dealing with the oldest Buddhist texts.

R. O. CHILDERS.

BARNABE BARNES: SHAKSPEARE, SIDNEY, ETC.

Park View, Blackburn, Lancashire: April 24, 1875.

By the kindness of his Grace the Duke of Devonshire I have had leisurely opportunity of studying critically the *Parthenophil and Parthenophe. Sonnettes, Madrigals, Elegies, and Odes* (1593) of Barnabe Barnes. With every inevitable abatement I find this unknown book to be intrinsically matterful in many deep directions, and sometimes daintily wrought. I find it, too, of absolute value in helping to a wider and more penetrative study of our English sonnet-literature generally, and of the greatest of all sonnets, those of Shakspeare, in particular, than has yet been given. (Witness the complacent ignorance of even so true a man and book as Mr. Minto in his *Characteristics*, as he shallowly and narrowly skims the surface of so rich a thing as "The Elizabethan Sonneteers.") It were easy to adduce proofs by the score of my twofold statement. Besides, there are apparently wholly unrecorded celebrations in it of Sidney and Stella, and other glories of our land and literature, and not a few noticeable unregistered words, phrases, &c. &c. Extrinsically there is the simple matter of fact that except the Chatsworth copy no other is known.

Parthenophil and Parthenophe is a goodly quarto, extending to about 160 somewhat closely-printed pages; and thus its reproduction worthily in such a very restricted impression as alone seems called for (for it is not a book for boys and girls), involves considerable cost. I invite twenty-nine to join me in the expenditure in furnishing thirty copies (stringently limited thereto); it being understood that the reproduction shall be in a handsome quarto, page for page, and letter for letter of the original, as in those of the Spenser Society, &c. By the estimate furnished I feel free to fix the price for each of us at 2l. 2s., and the carriage—the names to be entered strictly as they reach me, and each copy to be numbered and signed.

That *Parthenophil and Parthenophe* ought to be rescued from the risks of a solitary exemplar, few students of our early literature will gainsay; while, as above, on the merits, Barnabe Barnes is a genuine singer. There are in all 111 sonnets, twenty-six madrigals, and many (so-called) elegies, odes, sestines, &c., &c.

ALEXANDER B. GROSART.

THE WELSH WORDS "CYLYN" AND "DYNES."

Rhyl: April 24, 1875.

I am sorry to find myself of the number of those who break on Mr. Skeat's peace, but as to his suggestion with respect to Mr. Garnett's list I will try to carry it out as soon as the pressure of other work will permit. Were an outsider entitled to have an opinion at all in the matter, one might say that the words mentioned by Mr. Skeat in his last letter, namely, the Anglo-Saxon gloss *cylene* on the Latin *culina*, and the Icelandic *kylna* look very much as if borrowed from the Latin; *kiln* and *kell* would follow suit. The Latin *culina*, of which Festus says—"I am quoting from Andrews' *Latin Dictionary*—"Culina vocatur locus, in quo epulae in funere comburuntur," became later *culna*, which I find "pro culina" in the Halle edition (1773) of Ducange; Diefenbach has also *culnia*. Even supposing the Latin origin of the Teutonic forms admitted, we should, I think, have to regard the Welsh ones as borrowed

from English: they could not be phonologically deduced from the Latin, and I am still persuaded that they are not of Welsh origin. Nor does the valuable information contained in Mr. Silvan Evans's letter seem to me to make against this; for I gather that the word *cylyn* or *clyn* belongs to North Cardiganshire, Merionethshire and Montgomeryshire; at any rate I have not yet found that it is usual in the other counties of North Wales. *Cyl* also seems to me to be a borrowed form; his written authority for it takes us back to a time when Welsh writers borrowed English words more freely than is now the case.

Nothing could have been further from my intention than to suggest that all those Welsh words which do not happen to occur in books are not of Welsh origin; but the instance *dynes*, "woman," certainly makes for my view rather than otherwise. For I cannot help thinking that this word was not manufactured many centuries before its first appearance in print. In some parts of Wales *dynes* could hardly be used in speaking to a woman to whom one wished to be respectful; whence it may be presumed to be a slang word of no very long standing. Moreover, the poets of the fourteenth and fifteenth centuries freely used *dyn* in the feminine, especially in speaking of the ladies they loved: how late this continued I cannot now say. It is, however, highly improbable that, so long as *dyn* was so used, another feminine should be based upon it as though one formed a feminine from the Latin *homo* or the Greek *άνθρωπος*. It is worthy of note that the Old Cornish *den* also occurs in the feminine in *Beunans Meriasek*, verse 1006. Perhaps further enquiry would convince one that the word was once exclusively feminine in the Kimric languages.

One conclusion which the readers of the ACADEMY will not fail to draw from the above is that we are greatly in need of a Dialect Society in Wales: it would be easy to find plenty of work for it.

J. RHYL.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 1,	1 p.m.	Sale at Christie's of the Bredel Collection.
	2 p.m.	Royal Institution: Annual Meeting.
	3 p.m.	Opening of Alexandra Palace: Grand Concert.
MONDAY, May 3,	2 p.m.	Royal Institution: General Monthly Meeting.
	5 p.m.	Musical Association: Mr. R. H. M. Bosanquet on "Temperament; or, the Division of the Octave." II.
	7 p.m.	Entomological.
	8 p.m.	British Architects: Anniversary. Medical.
TUESDAY, May 4,	1 p.m.	Sale at Christie's of the Collection of Porcelain of James Sanders, Esq.
	3 p.m.	Royal Institution: Professor Gladstone on "Chemical Forces."
	7 p.m.	Sculptors of England.
	8 p.m.	Civil Engineers. Pathological.
	8.30 p.m.	Zoological: Papers by Mr. H. C. Sorby, Professor A. H. Garrod, and Mr. G. E. Dobson.
	"	Biblical Archaeology: Mr. H. Fox Talbot, "A Commentary with Notes on the Deluge Tablet;" Mr. W. Bosanquet on "An Historical Inscription of the Tenth Expedition of Esarhaddon;" Rev. A. Löwy on "An Unique Specimen of the Modern Syriac, or Targum Dialect, of the Jews in Kurdistan."
WEDNESDAY, May 5,	8 p.m.	Microscopical: Mr. H. J. Slack on "The Relations of Angular Aperture to Surface Markings and Accurate Vision."
THURSDAY, May 6,	3 p.m.	Royal Institution: Professor Seeley on "The Fossil Forms of Flying Animals."
	5 p.m.	Zoological Society (Davis Lecture): Professor A. H. Garrod on "Deer and their Allies."
	7 p.m.	London Institution: Dr. Freeman on "The History and Use of the English Language." VI.

THURSDAY, May 6,	8 p.m.	Chemical: Papers by Professor N. Storey Maskelyne, Dr. Flight, Mr. W. Ramsay, and Mr. J. Williams.
	"	Linnean. Inventors' Institute.
FRIDAY, May 7,	4 p.m.	Archaeological Institute.
	8 p.m.	Philological: Mr. H. Nicol on "French Sounds in English." II.
	"	Geologists' Association.
	9 p.m.	Royal Institution: Professor Cornu on "The Velocity of Light."

SCIENCE.

Life of Sir Roderick I. Murchison, Bart., etc., based on his Journals and Letters; with Notices of his Scientific Contemporaries, and a Sketch of the Rise and Growth of Palaeozoic Geology in Britain. By Archibald Geikie, LL.D., F.R.S., etc. (London: John Murray, 1875.)

It rarely happens that the life of a man of science is sufficiently rich in incident to be handled with effect by the biographer. Beyond a small circle of readers, it is hard to gain sympathy with a man's life by simply setting forth his work, quietly accomplished in the study and the laboratory, in the classroom and the cabinet, or even in the campaigns of a field-naturalist. But it was otherwise with the life of Sir Roderick Murchison. While occupying for years a prominent position as a man of science, he never ceased to be a thorough man of the world. He threw himself with energy, it is true, into his scientific labours, but he still left to himself a fair margin of time and strength for the cultivation of that intercourse with men of high social rank, which he so keenly relished. Nor did he deem the one occupation much less important than the other. If he enters in his diary the details of a geological section observed in the morning, he records with equal fidelity his recollections of the ball at which he figured in the evening. The record of this twofold life naturally gives to his memoirs more than scientific interest. The reader may not care a straw whether the boundary between the Cambrian and Silurian rocks should be drawn at this horizon or at that; but he may yet be tempted to dip into these volumes to see Murchison joining in a homely game at Lord Derby's, or to hear his personal recollections of the Emperor of Russia.

As Sir Roderick approached the evening of his life, he occupied his leisure hours with the revision of his early journals. Some men with such materials in hand would have written an autobiography; but he, with more sagacity and less literary tact, placed the journals in the hands of an experienced friend. To Professor Geikie he confided the trust of arranging these materials, and of evolving a connected narrative out of this voluminous but rather incoherent mass. The execution of the task shows that it could hardly have been entrusted to fitter hands. As an experienced geologist he has been able to trace with clearness Murchison's scientific career, to set forth the work which he accomplished, and to estimate his true position among his brethren of the hammer. As an intimate friend of Murchison, enjoying for years his closest confidence, the biographer had ample opportunity of studying his character, and he has analysed it, we believe, with equal judgment and fidelity; for while naturally turning the noble side

of Murchison well to the front, he has shown himself far above the servility of hero-worship. Finally, Professor Geikie, with his well-known facility of graceful writing has thrown the details of the biography into a charming narrative, though broken here and there by digressions on the history of the science and sketches of its foremost cultivators.

Singularly little of the future man peeps out through the early life of Murchison. For more than thirty years he was content to live without even a passing regard for that science which he afterwards loved so well and served so faithfully. The pleasures of his early life were physical rather than intellectual, and when intellectual were artistic rather than scientific. It is scarcely possible to discern the potential geologist in the wild schoolboy, leading his fellows in their mischievous pranks at Durham; or in the smart young officer, athirst for military fame in the Peninsula; or yet in the Laird of Tarradale, full of ancestral pride; or in the bold fox-hunter, with his stud at Melton Mowbray; or even in the fashionable traveller, dabbling in art and archaeology at Rome. And yet this desultory life was probably not without effect in giving shape to Murchison's future course. Indeed there can be little doubt that many of the characteristics of his scientific work may be attributed to the advantages and disadvantages of his early career.

Murchison's conversion—his complete turning round from a useless to a useful life—came to pass when he was rather more than thirty years of age. At that period we come upon a complete break in the succession of events—a kind of “unconformity” in his life—the sportsman passing into the student of science by abrupt transition rather than by gradual development. How serious a change was effected may best be told by citing a passage from Murchison's own writings—a passage which incidentally shows how smooth an entrance in those days led into the Royal Society:—

“As time rolled on I got *blasé* and tired of all fox-hunting life. In the summer following the hunting season of 1822–3, when revisiting my old friend Morritt, of Rokeby, I fell in with Sir Humphry Davy, and experienced much gratification in his lively illustration of great physical truths. As we shot partridges together in the morning, I perceived that a man might pursue philosophy without abandoning field-sports; and Davy, seeing that I had already made observations on the Alps and Apennines, independently of my antiquarian rambles, encouraged me to come to London and set to at science by attending lectures on chemistry, &c. As my wife naturally backed up this advice, and Sir Humphry said he would soon get me into the Royal Society, I was fairly and easily booked.”

Booked in this simple way, we soon find him selling off his hunters, and coming to London, in order that he might profit by the chemical lectures in Albemarle Street. It was not long, however, before he found that chemistry was not to be his forte. The enthusiastic fox-hunter could ill brook the confinement of the laboratory, and he cast around him for other fields of scientific activity. Fortunately his eye rested on the young and rising science of geology—a science which needing much observation in the field,

would offer an easy outlet for his physical activity, and came nearest to his old field-sports in the opportunity it afforded for open-air exercise. Entering the Geological Society, he soon made the acquaintance of many men of scientific mark. On the invitation of Dr. Buckland he visited Oxford, where he had the opportunity, not only of hearing the lectures of the brilliant and witty professor, but also of joining in one of his field-excursions. This excursion determined Murchison's career. Fired with the zeal of the Oxford professor, he determined to observe for himself, and buckling on his geological hammer for the first time, he started on a tour along the south coast, accompanied by his amiable and accomplished wife. From this time forth he threw himself into his new science with the same ardour which had been displayed in his field-sports; and each season he started on some fresh campaign which would furnish him with materials for his winter's work. The record of these geological journeys at home and abroad naturally forms the bulk of Murchison's memoirs.

Several years were spent in geological work of a rather desultory character, examining now one formation and now another, and thus gaining considerable experience, but without settling down to the study of any special group. This geological unrest was checked when he first turned his attention to those old and disturbed stratified rocks of Wales which in those days were vaguely known as “*grauwacke*,” or as the “transition series.” Again and again he visited these old rocks, and by the year 1835 he had so far determined their relations that he ventured to distinguish them by a special name, and forthwith christened them with that happily-chosen term—“*Silurian*.” Murchison's contributions to our knowledge of other formations were neither few nor small, but they all yield to his *Silurian* work. To unravel the details of that complicated system he was well pleased to travel any distance, and it was for this purpose that he undertook his celebrated journeys to Russia.

It was, too, in seeking to determine the base-line of his *Silurian* system that Murchison was led into the unhappy controversy with Professor Sedgwick—a man whom he so long venerated as his guide and teacher, and in whom he found for so many years a faithful and generous friend. This controversy forms a most painful episode in the narrative, but is too complicated to be entered into here. The younger geologists have now an opportunity of acquainting themselves with both sides of the dispute by studying these memoirs in connexion with the affecting explanation written by the venerable Professor when tottering on the brink of the grave, and published as the Introduction to the Catalogue of Palaeozoic Fossils in the Woodwardian Museum at Cambridge.

Viewing the life of Murchison through the medium of these memoirs, it needs but little penetration to discern the main elements of his success. As a geologist his strength undoubtedly lay in his power of quick observation in the field. Few men had a better “eye for country” than the old fox-hunter; nay, few could catch the salient features in

the structure of a country with equal facility. It was this readiness of perception, coupled with remarkable perseverance, that enabled him to accomplish so much field-work. Thus, after a few rapid traverses across Russia, he boldly sketched the general features of the geology of that empire. In this power of rapidly executing work he was greatly aided by the physical strength which his healthy mode of life had tended to develop. Murchison was rarely dyspeptic, a fact which ought to count for something as an element of success in any career; and he was a famous pedestrian, which counts for a good deal with a field geologist. But when he had sagaciously observed his facts in the field, and methodically recorded them in his papers, he left their generalisation to others. If he was a keen observer, he was a loose reasoner. This deficiency of logical power unfortunately led him at times to attack an opponent by weight of authority rather than by force of argument. Indeed, opposition to his own views, especially by the younger geologists, at once brought to the surface the weaker side of his nature. He could scarcely tolerate any modification of opinions which he had once formed; and he looked with jealousy at the slightest trespass on ground which he regarded as his own. In fact, in science, as in politics, he was a staunch Conservative of old-fashioned type. Yet his conservatism sometimes took a pleasing shape. Just as he clung tenaciously to opinions which he had formed, so he stood with fidelity to any cause with which he had once identified himself. All the world knows, for example, how bravely he espoused the cause of poor Livingstone. Without denying that there were many weak points in Murchison's character, it must be admitted that, on the whole, his life was nobly spent; and its lesson shows what may be accomplished by a man of wealth and position, with ordinary talents. Without a brilliant or philosophic mind, Murchison, by dint of sheer industry, used his powers of observation to such good purpose that he has left his mark deeply graven on the foundation-stones of geology. Whatever revolutions may be effected in the science, the name of Murchison must assuredly remain associated with that of *Siluria*. F. W. RUDLER.

Sutta Nipāta; or, Dialogues and Discourses of Gotama Buddha. Translated from the Pāli, with Introduction and Notes, by Sir M. Coomāra Swāmy. (London: Trübner & Co., 1874.)

It is to be regretted that Buddhism is chiefly known in Europe only through its later developments, and, as it were, at second hand. Even an impartial and accurate observer would probably fail to understand Christianity if it were only known to him from the modern books and practices of different Christian countries; and valuable as are the labours of those scholars who have written on the beliefs now current in Nepal, Tibet, and China, in Burma, Siam, and Ceylon, they must remain comparatively unfruitful until the more ancient Buddhist books in Sanskrit and Pāli have been published and explored.

The Pāli version of the Buddhist *Tripi-*

taka or Bible, occupies, when written in the Sinhalese character, 4,750 palm leaves, each about two feet long, and, if printed in English type of the size used in this article, would occupy about thirteen volumes octavo of 1,000 pages each: less than 100 pages of it having as yet been published or translated, and the greater part of the *Sutta Nipāta* being among the unpublished portion, this instalment of Sir Coomāra Swāmy's version of it must be very welcome to all interested in Buddhism.

Of the seventy suttas or chapters which form the *Sutta Nipāta*, thirty are here translated, about two-thirds of them being quite new to European scholars; and the translation of the remainder is to follow in a second volume. Judging from the correctness of the author's version of the *Dāthāvamsa*, one naturally relies on the general accuracy of this one; and this expectation is quite borne out by a comparison with such texts as have been published; the present version, for instance, of Uraga Sutta being much better than that given by Spiegel at page 83 of his *Anecdota Palica*.

One of the Suttas now published is particularly noteworthy from being ascribed to Kāsyapa Buddha, the last of the twenty-four Buddhas who preceded Sākyamuni the founder of Buddhism. This is the *Āmagandha Sutta* in which it is laid down that it is not the eating of unclean food which defiles a man, so much as the practice of wrong actions; one verse, the fourth, giving the thoughts and almost the very words of St. Matthew xv. 19. When Fa Hian, the Chinese pilgrim, visited India, shortly after 400 A.D., he found, near to Srāvasti, a sect of Buddhists, who rejected Sākyamuni, reverencing only the three previous Buddhas, and claiming to be followers of Devadatta, the cousin and chief opponent of Sākyamuni Buddha. These sectaries showed Fa Hian a *dāgaba* which they said was erected over the body of Kāsyapa, and another said to be built over the spot where he died. There are some isolated and inconsistent notices of Kāsyapa in Hardy's *Manual of Buddhism*, and other books, but no doctrines ascribed to him by tradition had previously been made public.

Besides the historical Buddha and the twenty-four legendary Buddhas, other Buddhas are mentioned called Pratyeka Buddhas, or those who are enlightened for themselves alone. They had sufficient wisdom to gain Nirvāna for themselves at times when no Buddha was alive, and the teachings of former Buddhas had been forgotten; but their wisdom was not sufficient to enable them to show the way to Nirvāna to others. Several of their sayings are mentioned in the native books, and *Khaggavisāna Sutta* in this collection is said to have been originally spoken by them at different times. One of the tenets of the now rapidly increasing Amarapura or Puritan sect in Ceylon is to reject the teachings ascribed to the Pratyeka Buddhas, when not confirmed by Gautama Buddha himself; there should, therefore, be some distinguishing marks about their doctrine, but this Sutta contains nothing that would not be consistent with, and very little that cannot be found in, the *Dhammapada*.

It is well known that the latter book, like

the *Sutta Nipāta*, is a collection of choice verses and passages from the other sacred books; and the commentary affects to give for each verse the place at which, and the person about whom, it was originally uttered. In the *Vāsettha Sutta*, pp. 133-138 of the *Sutta Nipāta*, there are twenty-nine verses which also occur in the *Dhammapada*, vv. 396-423, and it is instructive to notice that for each of the twenty-nine the *locus* and *persona* given in the *Dhammapada* differ from those given in the *Sutta Nipāta*.

The *Parābhava Sutta*, p. 27, deserves notice as being the pendant, as it were, to the *Mangala Sutta*, the "Buddhist Beatitudes," published by Mr. Childers in his *Khuddaka Pāṭha*; and again in this collection, p. 72. The *Salla Sutta*, p. 124, has been edited by Fausböll, at the end of his *Dasaratha Jātaka*; two other suttas have already been published by Mr. Childers, and two by Mr. Alwis; and the prose portion of the *Kasibhāradvāja Sutta* relates the same story as that translated by Hardy at p. 214 of his *Manual of Buddhism*, from the *Milinda Prasāya*, the present version from the original Pāli being, however, as might be expected, much more simple than that from the Sinhalese.

It would have added much to the value of the present volume if these former labours in the same field had been mentioned, and made use of in the appropriate places; with the exception of a general word or two in the introduction, to the effect that "a few of the Suttas in the present book . . . have been translated and published in different journals," they are passed over in complete silence. Perhaps the aim of the book, which is intended, we are told, "not so much for the critical student as for the general reader," precluded any critical discussions as to disputed passages, and may have had something to do with the omission of the text, and with the somewhat superficial nature of some of the notes, and of the remarks on Nirvāna. If so, we venture to think that the aim is a mistake. Unless the general reader is much maligned, he is scarcely likely to appreciate the *Sutta Nipāta*, however sweetened and softened to his taste.

A good book for the general reader on Buddha and Buddhism is much wanted, but can scarcely be written yet; and we hope the second volume of the *Sutta Nipāta* will be written for scholars only, and will not appear without the text. This would have been published along with the translation but for two difficulties: firstly, that of obtaining a sufficiently correct one; and, secondly, that of deciding in what character to print it. Its omission is particularly unfortunate, as Sir Coomāra Swāmy's version differs in several places (in those suttas which have already been translated) from that of other scholars; and makes use, in other places, of striking expressions the meaning of which is not clear,* or is apparently un-Buddhist.

The editor of the *Dāthāvamsa* is quite

* To give one example, at v. 31 of the *Khaggavisāna Sutta* it is said that a priest is to have a mind not "attached to this or that family." If this means that kindly feelings towards all the world are to swallow up and destroy attachment to any particular person, it is an odd way of saying it. But the same expression occurs at v. 2 of the *Metta Sutta*, p. 38, of which Mr. Childers has already given us the text

capable—favoured as he is by the valuable assistance of the able Sinhalese scholars, such as Batuwantudāve and Gunasekara—of giving a sufficiently good text of the *Sutta Nipāta*, which, doubly commentated as it has been, cannot be so very corrupt. If the text is only published in a scholarly manner, it does not very much matter in what alphabet it appears. Sinhalese, Roman, and Devanāgarī have each their advantages, but the former would probably be the cheapest and also the easiest, being that in which the MSS. are written.

We look, therefore, for the second volume, not without the text, and have meanwhile to thank the author for a valuable addition to our Buddhist library.

T. W. RHYS DAVIDS.

SCIENCE NOTES.

METEOROLOGY.

Report of the Permanent Committee of the Vienna Congress.—This Report, which has just appeared, contains the account of the meeting of the committee held at Utrecht last August, with certain appendices, the most important of which consists of letters from various meteorologists on certain questions connected with the science, and on the extent to which the resolutions adopted at Vienna will be carried out in their respective countries. The principal action of the committee has been in regard of International Meteorology. It has been decided that it is not advisable at present to attempt the establishment of an International Meteorological Institute; but, on the other hand, it has been determined to endeavour to organise a uniform scheme of publication for the returns from different countries. The greatest difficulty in all climatological studies consists in the fact that the results published in the different countries are not of the same character, and are therefore not comparable with each other. The committee have, therefore, proposed two schemes—one for the monthly summaries from all stations, and the other for the actual observations to be taken at a limited number of stations in each country, the proportion for the United Kingdom of these international stations being sixteen. If this measure can only be carried out, a great step towards uniformity will have been made. A code for Weather Telegraphy was recommended for general adoption. It does not differ very much from that first devised by Admiral FitzRoy. The other resolutions were of minor importance, but two circulars which were issued by the Committee deserve special notice. The first asks for information as to the existing meteorological organisations in the several countries; the second is intended to obtain particulars as to the stores of unpublished observations which must exist in all large meteorological institutions and observatories, and as to the terms on which copies of them may be procured.

Daily Charts in Newspapers.—We may safely expect that these charts, the publication of which was commenced on April 1 in the *Times*, will soon be adopted by other papers. The measure of illustrating the Daily Weather Report was announced in the report of the Meteorological Committee for 1873, but it is not until now that the practical difficulties of carrying it out have been finally mastered. The idea was first started by Mr. Francis Galton, and has been practically

in the *Journal of the R. A. S.* for 1869. The Pāli words there are "ananugiddho kulesu," "not greedy about houses or families," and refer to the rule binding on every priest to beg his daily food, and in doing so not to go greedily to those houses where dainty gifts might be expected, but to beg straight on from door to door until, of whatever kind of food, enough for a meal had been given to him.

carried out by Meers Shanks and Johnson, of the Patent Type Founding Company. The method is as follows:—A chart is drawn in the Meteorological Office, and this is then copied at a reduced scale, by means of a pantograph working a drill, on a block of a special material, on which the outline of the land has already been impressed. The information contained is very limited, consisting only of the isobaric lines, a few temperatures, and some words relating to the state of the sky and the sea. As soon as the chart is engraved the block is placed in a mould, and a cast of type-metal is made, which can then be set up with type as soon as it is cool. The whole process takes less than an hour.

Alterations in the Level of Rivers.—Herr G. Wex, the director of the great Danube works at Vienna, has handed in to the Imperial Academy an elaborate report on the extent to which the mean level of rivers is falling, so as seriously to interfere with navigation, while at the same time the floods are increasing in height and severity. These actions are both produced by the same cause, the clearing of forest, which causes the rain water to run more rapidly off the land, instead of being retained there to feed the springs and maintain a constant supply for the head waters of rivers. The Academy referred the subject to a committee, which has presented a report confirmatory of Herr Wex's views, and it has been resolved to endeavour to collect information on the subject of the actual discharge of rivers for a series of years, from all countries.

Relation of the Velocity of the Wind to the Gradients.—In the 6th and 7th numbers of the Austrian Journal for Meteorology, Dr. Hann gives at some length a notice of the views of Ferrel (in *Silkman's Journal* for November, 1874), who attributes the origin of storms to the mechanical action of currents at the earth's surface, in contradistinction to those who seek for their cause in the physical action of heat producing an ascending current. Dr. Hann himself is an adherent to the mechanical theory of the production of the barometrical depression at the centre of the cyclone mainly by the two agencies, the effect of the earth's rotation, and centrifugal force. As regards the former, he shows on mechanical principles that any current of air must give rise to a reduction of pressure on its left-hand side in the northern hemisphere, so that the gradient is, in great measure, an effect of the motion of the wind. In reference to the latter, he points out the error of Loomis' oft-quoted statement that centrifugal force could not of itself generate a depression of more than 0.005 in. One great difference between tropical cyclones and similar storms of higher latitudes, according to Hann, consists in the fact that in the former it is the centrifugal force, in the latter the earth's rotation, which plays the principal part. A digest of Ferrel's mathematical reasoning, dealing with a supposed spiral motion of the air, and taking account of friction, follows, with which, however, Dr. Hann does not entirely agree; but the equations show that the velocity is not strictly proportional to the gradients in all parts of the cyclone, and that the value of this velocity for the same gradient is nearly inversely proportional to the sine of the latitude, so that it is much higher in the Torrid than in the Temperate zone. All the non-periodic variations of the barometer are related to the passage of cyclonic disturbances near the place of observation, and so at the Equator, where there are no cyclones, these variations vanish. The investigation further shows that if the friction be assumed to vary as the velocity, the entire difference of pressure between the outer and inner portions of the cyclone, or the total gradient, must vary as the square of the sine of latitude, and accordingly the barometrical oscillations must increase with the latitude in that proportion. The theory would therefore not only account for the irregular oscillations of the barometer, but for their increase with the latitude.

The Origin of Cyclones.—As might be expected, the views of M. Faye, which we noticed in our issue of April 3, have not long remained unassailed, for in the *Comptes Rendus* of March 15, M. Peulin, one of the ablest contributors to the mathematical theory of the ascending currents of air, has formally challenged M. Faye to state the grounds on which he bases his ideas of the descent of the air in a cyclone from the upper regions of the atmosphere. M. Faye, in reply, simply takes the case of a "trombe," or whirlwind, and says that as this phenomenon appears while the air at the earth's surface is at rest, the entire movement must take its rise in the upper strata, whose rapid motion is visible in the passage of the clouds across the sky. In the next number, for April 5, M. Peulin rejoins that the direct connexion between waterspouts and cyclones has yet to be established by observation, and that dust-storms certainly indicate an ascending current, not a descending one. He finally proposes to test his opponent's theory by the possibility of explaining by its means the excessive rainfall of cyclones. M. Faye, in his answer, does not take up the last-mentioned question, but confines himself to a reiteration of the identity of origin of all rotatory motions, insisting on the statement that none of the ascensional theories will account for the advance of a cyclone from the place where it takes its rise.

Hailstorms in Würtemberg.—Herr Cameron, of the Statistical Office of Würtemberg, has recently published an analysis of the damage done by hail in that country in the forty-six years, 1828-73, as shown by the amount of taxes remitted to the various parishes on account of such damage. The average annual cost during the entire period is about 116,000*l.* It appears clearly from the subjoined figures that hailstorms and thunderstorms are steadily increasing in severity, for the following are the average amounts of area (in hectares) damaged on each day of storm:—

1834-43	625.5
1844-53	680.0
1854-63	840.8
1864-73	1,215.4

The districts chiefly exposed to damage are those lying on the edge of wooded mountains, while the open lowlands are comparatively exempt.

Relations between Pressure and Velocity of Wind.—In the Proceedings of the Berlin Academy for 1874, Herr G. Hagen has published a paper "On the Resistance of the Air to a Plane Surface moved in a direction normal to its Plane." He finds that the conversion of pressure to velocity accords well with the theory if the periphery of the plate be taken into account, for the friction of the air on the edge of the plate causes an increase of resistance. On the other hand, no difference was observed between plates with rough and smooth surfaces. Herr Hagen's formula is:—

$$P = (0.00707 + 0.000125 S) A v^2$$

P is the pressure, S the periphery of the plate, A its area, v the velocity of the wind. P is in grammes, S, A, and v are said to be given in decimètres.

Wind and Weather.—We are glad to welcome a German edition of Professor Mohn's handbook, *Om Wind og Vejr*,* which in its Norsk dress was almost a sealed book to British meteorologists. The work has been carefully revised and the charts re-drawn, and is issued with a preface by Dr. Neumayer. As its title shows, it is not a treatise on general meteorology, but is an eminently popular account of that portion of it which relates to practical weather knowledge, with occasional digressions into climatology, and, as might be expected, it has a special reference to the conditions of weather with which its author is most familiar—those of North-western Europe. This is hardly a defect for us in these islands, and

* *Grundzüge der Meteorologie, die Lehre von Wind und Wetter.* Von H. Mohn. Berlin Reimer, 1875.

it must be remembered that the book was originally written for use in Norway, and that most of the examples cited to prove each statement are taken from the observations at Norwegian stations.

In one respect this book contrasts favourably with other well-known text-books of the science, and this is that in only one instance are the author's own views brought into the foreground. This is as regards his theory for the motion of storms, which was first broached in his *Atlas des Tempêtes*, 1871. As will be seen from the discussions now going on in France, and from Dr. Hann's papers, these views are not universally accepted. Very little space is allotted to the description of instruments, but the explanation of the diurnal and annual march of the several elements observed is very clearly set forth, while, as might be expected from the author's antecedents, a considerable space is devoted to the treatment of hygrometric questions, especially as to the effect of aqueous vapour on the motion of storms. The distribution of temperature, pressure and wind, and aqueous vapour over the globe are shown by charts for January and July respectively; those of the first-named elements being taken from Dove's and Buchan's papers, while the last are quite new and of considerable interest. The principles laid down in the first portion of the book are finally applied to the discussion, and explanation of a series of weather charts for the North of Europe, showing, among other points of practical importance, how storms change in their character and intensity as they advance from the sea over the land, and how the phenomena recorded at the several stations are modified in consequence. The book concludes with some remarks on storm-warnings, from which we see that the author has been led by his own experience to recognise the extreme difficulty of forecasting weather on the exposed western coasts of Europe.

GEOLOGY.

A MEMOIR on the Geology of the Burnley coal-field, just issued by the Geological Survey, forms the fourteenth Report which the Survey has published in explanation of the structure of the coal-fields of Great Britain. The present volume contains a description of the highly-developed carboniferous series of North Lancashire, including the small fields of Burnley and Blackburn, and taking in the country around Clitheroe, Chorley, Haslingden, Preston, and Todmorden. The memoir has been written chiefly by Professor Hull and Mr. R. H. Tiddeman, the latter acting as general editor, assisted by Messrs. J. C. Ward, J. B. Dakyns, W. Gunn, and C. E. De Rance. Some palaeontological details are contributed by Mr. Etheridge.

In the course of a lecture at the Royal Institution on Friday, March 23, Professor Ramsay developed an interesting argument in support of his proposition that the Alps in pre-miocene times were probably higher than they are now, notwithstanding the fact that their present elevation is due to subsequent upheaval. That the Alps suffered very extensive denudation during the miocene period is amply demonstrated by reference to the enormous thickness of fresh-water and marine deposits of miocene age now spread over Switzerland; these deposits having been formed by the degradation of the old Alps. An elevation of upwards of 5,000 feet took place after the deposition of these strata, but the Alps continued to suffer denudation during the pliocene and post-pliocene ages, although it is difficult to estimate the extent of this loss. The lecturer showed by detailed calculations that the amount of material worn away in the miocene period would alone have been sufficient to raise the pre-miocene Alps to a considerable elevation.

ATTENTION has been called by the Rev. A. Irving, of Nottingham, to an interesting section of Rhaetic beds, overlain by boulder-clay, exposed

in the cutting of a railway now in course of construction between Melton Mowbray and Nottingham. It is expected that when the cutting is completed an exposure will be obtained, second only to the celebrated section at Westbury-on-Severn. It may be mentioned that an excellent account of the geological structure of the country around Nottingham has been contributed by Mr. Irving to a recent number of the *Proceedings* of the Geologists' Association. While giving a concise abstract of previous writings on this district, it embodies the results of much original observation.

A RECENT visit to the Falls of Niagara has enabled Mr. T. Belt to suggest some modifications in the views usually entertained with respect to the time occupied in the excavation of the gorge. His argument is published in the April number of the *Quarterly Journal of Science*. It is generally supposed that the entire gorge from Queenstown to the Falls, a distance of seven miles, has been excavated by the present river since the Glacial period. Sir Charles Lyell estimated that the river is cutting its way back at the rate of about one foot per annum, but Mr. Belt believes that the retrocession does not proceed at more than one-tenth of this rate. He maintains, too, that the gorge from the whirlpool to the falls was cut out in pre-glacial times, and that the present river has excavated only that portion of the gorge which is worn out in the softer beds between the whirlpool and Queenstown; its work above that point having been confined to clearing out the bed of the old pre-glacial river in the harder rocks. Mr. Belt believes that the facts connected with Niagara lend support to his views which refer the occurrence of the Glacial epoch to a more recent period than that usually assumed.

AFTER studying the earthquake phenomena of Southern Italy, Professor Suess has laid a paper on this subject before the Vienna Academy of Sciences. In this communication he describes the geological structure of Sicily and the southern part of the Italian peninsula. He concludes that the older rocks of this district, with the patches on the western coast, are to be regarded as a continuation of the Alps, while the western side of the peninsula represents a vast area of subsidence. He recognizes three classes of earthquake-shocks in Sicily and Calabria: namely, eruptive shocks, which have their centre in a volcano, and affect only the immediate neighbourhood; radial shocks, which radiate from the volcano in definite lines; and peripheral shocks, which appear to have no immediate relation with a volcano. His observations sufficiently show the connexion generally existing between volcanoes and earthquakes.

CLOSELY related to these studies of Professor Suess are those of Mr. Judd on the volcanic phenomena of Italy. A series of papers on this subject are in course of publication in the *Geological Magazine*. We understand that Mr. Judd has recently started for Hungary, where he intends to study the eruptive rocks which form so marked a feature in the geology of that area.

ALL subjects relating to Arctic exploration are just now so popular, that Mr. De Rance has done good service by collecting such scraps of information as are to be found on the geology of the Arctic regions, and publishing a concise abstract of them in the columns of *Nature*. His abstracts are accompanied by a map which exhibits what little is known of the structure of these regions.

MEETINGS OF SOCIETIES.

PHYSICAL SOCIETY (Saturday, April 10).

PROFESSOR G. C. FOSTER, Vice-President, in the Chair.—Professor H. M'Leod communicated to the society some observations on the defects of the human eye as regards achromatism.

The eye has been considered to be achromatic because it practically is so; but it is easy to offer

abundant evidence of the defects of the organ in this respect. For instance, to short-sighted persons the moon appears to have a blue fringe. In using the spectroscope the red and blue ends of the spectrum cannot be seen with equal distinctness without adjusting the focussing glass. A black patch of paper on a blue ground appears to have a fringed edge if viewed from even a short distance; while a black patch on a red ground, when observed under similar conditions, has a perfectly distinct margin. Professor M'Leod then explained that the overlapping of images in the eye produces the mental impression that there is no want of achromatism. It is interesting to note that Wollaston considered that the coloured bands of the spectrum were really divided by the black (Fraunhofer) lines, and his statement that the red end of the spectrum does not appear to have a boundary line "because the eye is not competent to converge the red rays properly," shows that he had very nearly, if not quite, discovered the achromatic defects of the eye. Dr. Young ascribes to Wollaston the merit of having observed that when a luminous point is viewed through a prism, the blue end appears to be wider than the red, the eye being incapable of recognising that the spectrum has the same width throughout its entire length. An experiment was exhibited to show the relative distinctness of a dark line on grounds of various colours. A string or wire was so arranged that its shadow traversed the entire length of the spectrum, which was thrown on a screen by an electric lamp. When viewed from a short distance the edges of the shadow appeared to be sharp at the red end, but gradually became less distinct, until at the blue end nothing but a blurred line remained.

Dr. W. H. Stone considered that the paper was specially valuable as suggesting a possible mode of investigating the relation between the defects of the eye and the personal co-efficient of error in observation.

Professor Guthrie showed a kaleidoscope devised by Mr. R. Cowper, in which the usual geometrical effects were produced by fragments of mica illuminated by polarised light.

Mr. Wilson, Demonstrator in the Physical Laboratory, South Kensington, exhibited a modification of Thomson's electrometer, which might be readily constructed at a small expense. He used two discs of glass, and replaced the usual brass quadrants by tinfoil; the connexion between the binding screws and the quadrants was effected by fusible solder and platinum wires.

The Chairman then alluded to the lamented death of a member of the Society, Mr. C. Becker, of the firm of Messrs. Elliot, whose loss will be severely felt in every laboratory in this country.

ROYAL ASIATIC SOCIETY (Monday, April 19).

SIR EDWARD COLEBROOKE, Bart., M.P., in the Chair. The Rev. S. Beal read a paper "On Mount Meru and the Origin of the Homeric Olympus," the purport of which was to show that the legends connected with Mount Meru, found in the Chinese Buddhist books, betrayed a common origin with the Greek conception of the Olympus as the abode of their gods. To prove this view, Mr. Beal proceeded to compare the nature and attributes of the deities which are represented as occupying the different zones and peaks of Mount Meru with those of corresponding Greek deities, viz., Sun, Moon, Bacchus, Demeter, Here, Hephaistos, and Athene. In the discussion which ensued Messrs. E. L. Brandreth, F. Pincott, and the chairman took part.

The Dean of Lincoln then read a paper "On the Ruins of Sigiri," by his son, Mr. T. H. Blakesley, of the Public Works Department, Ceylon. The rock of Sigiri, in the northern extremity of the Central Provinces of Ceylon, which rises some 500 feet above the surrounding plain, appears in early times to have constituted the citadel of a

fortified position, surrounded by earthworks and moats the sides of which were in some parts revetted with stone. Two quadrangular areas have been traced out by Mr. Blakesley, comprising together with the rock a space of about 600 acres, and defended not only by the walls and moats above mentioned, but on the eastern side by a large artificial lake, which was doubtless also used for the purposes of agricultural irrigation. Extensive earthworks (bunds) for the diversion of running water into particular channels may be traced in different directions for two or three miles. The locality has been for centuries thickly covered with jungle, and all that now remains of the lake is a swamp occupying only a portion of its former extent; but there are still to be seen paintings on parts of the surface of the great rock of a very remarkable character, apparently suggesting the existence of close relations between China and Ceylon. Mr. Blakesley ascribes the earthworks and some of the bunds at Sigiri to King Kasyapa the Parricide, who lived in the fifth century of our era; and the completion of the water arrangements to Parakrama Báhu in the middle of the twelfth century. Earlier than either of them—indeed as early as the first century, B.C.—are, in his opinion, the walls of cyclopean masonry still to be seen at Mapa-gala, a pair of rocks about half a mile south of the rock of Sigiri. United with the works about the latter, the whole must have constituted a military position of almost unparalleled strength against the appliances of Oriental warfare.

ZOOLOGICAL SOCIETY OF LONDON (Tuesday, April 20).

ROBERT HUDSON, Esq., F.R.S., Vice-President, in the Chair.—The Secretary read a report on the additions that had been made to the Society's Menagerie during the month of March, 1875, and called particular attention to the following animals:—An Indian wild dog (*Canis primaevus*, Hodg.) from British Burmah, presented March 3, by Lord Northbrook, the Governor-General of India; three crested black kites (*Baza lephotes*); a Himalayan magpie (*Pica bottanensis*); and a Hamadryad snake (*Ophiophagus elaps*), obtained by purchase; and a bearded falcon (*Falco biarmicus*), presented by Captain Parry, of the barque *Isabella Blyth*. A letter was read from Lieutenant R. J. Wardlaw-Ramsay, dated Tonghoo, British Burmah, November 22, 1874, containing additional remarks on the woodpecker (*Gecinurus erythropygus*) described by him at a former meeting (*P.Z.S.* 1874, p. 212, pl. xxxv.). Mr. Edward R. Alston exhibited and made remarks on a rufous variety of the Murine dormouse (*Graphiurus murinus*, Desm.) from West Africa. Mr. W. B. Tegetmeier exhibited and made remarks on two hybrid pheasants, the result of a cross between *Phasianus colchicus* and *Euplocamus nycthemerus*. Mr. A. H. Garrod read a paper on the structure of the deep plantar tendons in different birds, in which the different modes of arrangement of these tendons were pointed out, and their importance in the classification of the order insisted upon. A communication was read from Mr. R. J. Lechmere-Guppy on the occurrence of *Helix coactiliata* in Trinidad, and on the general distribution of the land and fresh-water mollusca of that island. A second communication from Mr. Guppy contained a note on a variety of *Bulimus constrictus* found in Venezuelan Guiana. A communication was read from the Rev. O. P. Cambridge, in which he gave descriptions of nine new species of spiders of the genus *Erigone* additional to those described in a former communication on the same subject. A communication was read from Mr. George Gulliver containing a description of the spermatozoa of the Lamprey (*Petromyzon marinus*). Mr. R. B. Sharpe exhibited and made remarks on some specimens of some rare species of birds of prey, lately received by the British Museum from Australia.

METEOROLOGICAL SOCIETY (*Wednesday, April 21*).

DR. R. J. MANN, President, in the Chair.—Mr. Scott read a paper, "Notes on Sea Temperature Observations on the Coasts of the British Islands." He said that it mainly related to the connexion between sea temperature and the take of fish on the coasts, and he noticed the investigations formerly carried on by the Dutch in this direction, and that now in progress under the direction of the Scottish Meteorological Society. He read a letter from Mr. F. Buckland on the subject, which, however, proposed a scheme of action which would entail heavy expenditure; while at present there was no satisfactory record kept of the take of fish on any coasts except those of Scotland. Mr. Scott then said that he had had some observations of sea temperature taken at some stations in the West of England and on the coasts of the Irish Sea, and had received some observations from Mr. W. Dymond and from Mr. N. Whitley; and he submitted some monthly mean temperatures from a few stations. He also stated that both the Trinity House and the Commissioners of Irish Lights had kindly consented to have observations taken at certain light-ships, and that instruments had been supplied for the purpose, and the enquiry was in progress. In conclusion, he mentioned the steps taken by the German Government to investigate the temperature, &c., of the sea on their Baltic and North Sea coasts, and expressed a hope that our Government would undertake a similar enquiry.

Mr. Pastorelli read a paper on "The Errors of Low-Range Thermometers." He pointed out some of the difficulties which instrument makers have to encounter in graduating thermometers from 32°-0 to -37°-0, the freezing point of mercury, as there is no intermediate fixed point. He believed that fairly accurate thermometers could only be obtained by calibration.

M. Louis Redier exhibited his new barograph, which was explained to the meeting by Mr. Symons.

Mr. Scott also exhibited Professor Wild's pressure anemometer.

ROYAL GEOGRAPHICAL SOCIETY (*Monday, April 26*).

A most interesting paper was read by Mr. Markham on "Travels in Great Tibet and Trade Routes between Tibet and Bengal." At the outset Mr. Markham observed that, until that very evening, no account of Great Tibet derived from personal observation of an actual traveller had ever been submitted to the Society, with the exception of that by Colonel Montgomerie's Pundit in 1865. He (Mr. Markham) was, however, enabled to lay before them the experiences of Mr. George Bogle, an emissary of Warren Hastings, and Mr. Thomas Manning, a private traveller—two individuals whose journals had never been published, but were now about to be utilised.

Mr. Markham then briefly touched upon the survey of Great Tibet made by the Lama surveyors in 1708, the journeys of Fathers Grueber and Dorville from Peking by way of Lhasa across Nepal to Agra, and of other priests, whose accounts had enabled Klaproth, H. Strachey and others to define the geography of the country. Mr. Markham described this latter part of the subject, and drew a striking parallel between Great Tibet and the Collao of Peru. He pointed out that communication between Tibet and Bengal was at one time frequent and unchecked, but that, according to the Lamas, it fell off after the Mohammedan conquests in India, and the jealous policy of the Chinese prevented its renewal.

At the time of the English war with Bhutan, the Teshu Lama endeavoured to make peace between the combatants, and Warren Hastings clinched the opportunity of entering into negotiations by despatching Mr. Bogle as envoy, with

the object of opening up and restoring trade between Bengal and Tibet. Mr. Markham described the journey of Mr. Bogle, by way of the Chumbi valley, across the Tsanpu, by means of flat-bottomed barges, up to Desheripgay, the Lama's residence. The Lama made a deep and lasting impression on Mr. Bogle by his winning manner, and his nephew, the Pyn Kushus, also showed him great hospitality. Both the Lama and Mr. Bogle unfortunately died in the same year, and so no permanent results came of this friendship, for when Captain Turner was sent a few years later, the Teshu Lama's successor was an infant of seven.

The other traveller, T. Manning, was a mathematical tutor at Cambridge, who determined to visit Tibet. Charles Lamb, who was his friend, tried to dissuade him, writing: "The reading of Chaucer has misled you. Do not credit his foolish stories about Cambuscan and the ring and the horse of brass. Believe me, there are no such things. 'Tis all the poet's invention. Pray try and cure yourself. Take hellebore. Pray to avoid the fiend. Read no books of voyages, they are nothing but lies; and oh! do not go to Independent Tartary." All this was in vain, and Manning set out in disguise, the Company having apparently refused to give him any commission. He went past the ring-shaped lake of Palti, crossed the Tsanpu, and reached Lhasa, where he was much struck with the Dalai Lama. He returned to India by the way he came, leaving Lhasa April 19, 1812.

Mr. Markham then gave an account of the work of exploration in Tibet done by Colonel Montgomerie's emissaries—the Pundit of 1865, who traversed Nepal, and journeyed down the Tsanpu to Lhasa; the explorer of 1871, who reached Shigatzje, and the more recent journey of the Tibetan who has surveyed Lake Namcho or Tengri-Nor. Mr. Markham concluded by enumerating the passes leading from Bengal into Tibet, and the prospects of trade between the two countries; the products of the first named, which reach Tibet by way of Nepal and Ladak, consisting of broadcloth, cottons, coral, pearls, tobacco, opium, and some rich stuffs; and the exports from Tibet being blankets, musk, cowtails, borax, ponies, gold and silver. The great wealth of the country being its flocks and herds, wool and ghee might be imported to an enormous extent.

Colonel Montgomerie explained his method of training natives for trans-frontier exploration round India after the fashion of a *cordon*. There were still, however, strips of unknown land waiting to be explored—200 miles of the course of the Upper Indus, and 350 miles of the lower Tsanpu, besides all the vast region extending between Yarkand and the desert of Gobi—and some enterprising Englishman would do well to endeavour to throw open this region.

Sir George Campbell, K.C.S.I., observed that very great credit was due to Mr. Markham for having unearthed and brought to light the valuable journals of Bogle and Manning, as well as to Colonel Montgomerie for his admirable system of exploration by native agency. He defended the exclusive policy of the Chinese, and said it was a natural policy in view of our expanding Indian empire. He drew attention to the various sources of information respecting Tibet, laying stress upon the value of Huc and Gabet's work, and expressed an opinion that trade, by way of the Assam Valley and Bathang, deserved much more attention than had been bestowed upon it.

Sir Cecil Beadon, K.C.S.I., related the steps taken during the time of his Lieut.-Governorship to revive trade with Tibet. He feared, however, it could never attain important dimensions.

Sir R. Alcock briefly expressed his entire concurrence with Sir G. Campbell's views respecting the Chinese policy.

The President (Sir H. Rawlinson) then enumerated the services rendered to the Great Trigonometrical Survey of India, and to geographical

science, by Mr. Johnson, Governor of Ladak, who in turn briefly acknowledged the compliment.

The President then announced the award of the two gold medals for the year to Messrs. Weyprecht and Payer, of the Austro-Hungarian Arctic Expedition, as well as the result of the public school examinations in geography for the gold and bronze medals of the Society. The subject of the next meeting will be "Arctic Sledge Travelling," by Sir L. McClintock.

GEOLOGICAL SOCIETY (*Wednesday, April 28*).

J. EVANS, ESQ., F.R.S., President, in the Chair. In a paper "On *Stagonolepis Robertsoni*," Professor Huxley described the investigations which he had made on the structure of this reptile, since he described it before the Society seventeen years ago. He now exhibited a collection of fragments and impressions of bone in the yellow Triassic sandstone of Lossiemouth, accompanied by a number of plaster casts obtained from the sandstone moulds. In these remains we have representatives of all parts of the vertebral column, except the axis and atlas; the vertebrae had amphicoelous centra. There are also mutilated fragments of the skull, and a considerable number of teeth; the pectoral arch, including the ankylosed scapula and coracoid, and the characteristic interclavicle; the humerus, sacrum, ilium, ischium, femora, and probably other bones. From these data it appears that the *Stagonolepis* was a crocodilian reptile, from twelve to fourteen feet in length, armed with two rows of ridged scutes on the dorsal, and with a plastron on the ventral surface. Professor Huxley's studies of the recent and extinct forms of Crocodilia have enabled him to trace the successive steps in the evolution of this group. He recognises three distinct sections—the Eusuchia, including the existing forms and the extinct species down to the later cretaceous deposits; the Mesosuchia, embracing the Crocodilian fossils from the Wealden beds to the Upper Lias; and the Parasuchia, including the Triassic forms—*Stagonolepis* and *Belodon*. It is notable that, as the older groups differ from the modern Crocodilia they approach to the Lacertilian type. Mr. H. C. Sorby described the remains of a fossil Forest of Sigillaria exposed in the grounds of the County Lunatic Asylum at Wadley, near Sheffield. From the direction in which the roots ramify through the shale Mr. Sorby has ingeniously sought to determine the direction of the prevailing winds at the time the forest flourished. Professor Nicholson offered some notes on *Favistella stellata* and *F. calicina*, with remarks on the affinities of *Favistella* and allied genera.

ROYAL SOCIETY (*Thursday, April 29*).

THE following papers were read:—"On some Particulars of the Transit of Venus, December 9, 1874, observed on the Himalaya Mountains, Mussoorie. Note No. 2, and Appendix to Notes," by J. B. N. Hennessey; "On a Continuous Self-registering Thermometer," by W. H. Cripps.

FINE ART.

ART BOOKS.

Troy and its Remains. (Murray.) The appearance of Dr. Schliemann's book on Troy in its original German form gave occasion to so much criticism in these columns that they may fairly be considered closed against any revival of the issues involved by his discoveries. We can therefore speak only of the new English dress in which the book appears, and of that only in high terms of praise towards all concerned—the translator Miss Dora Schmitz, the editor Mr. Philip Smith, and the engraver Mr. Cooper. So satisfactory, indeed, is the translation, that from the beginning we became suspicious lest under its smoothness might lurk mistakes in technical matters, but must confess to having found only one, and that is on p. 24, where the bronze tablet from Idalion

in Cyprus is spoken of as the bronze *table*. On p. 47 it is a typographical error to spell the name of Koumanoudes as Kommanoudes. In the place of Schliemann's enormous, confused, and cumbersome atlas of photographs, we have here interspersed with the text, and in a number of plates at the end, engravings—many of them admirably executed—of views and every object of importance found in the excavations. An appendix giving the results of the most recent investigations in the matter of the inscribed whorls and other objects found by Schliemann, an introduction on the vital question as to the site of Troy, and numerous footnotes, testify to the editorial care with which a once very tiresome book has now become agreeable and most interesting reading.

Chronograph of the Bow, Chelsea, and Derby Manufactories. By W. F. Tiffin. (Salisbury.) A carefully-written manual of the three manufactories arranged in parallel columns, thus enabling the reader to follow the contemporary history of each. To this Mr. Tiffin has added a table of marks, derived either from specimens in his own collection or from unquestionable authority. Many of these are probably only workmen's marks; among them is one which he assigns to Thomas Frye, the original manager of the Bow works, which has been often considered to be an imitation of the Oriental character for "jade;" but Mr. Tiffin's suggestion deserves attention. The F in the mark is reversed, and, as Frye was an engraver as well as a painter, it might naturally occur to him so to make his monogram. The vexed question of the triangle occurring on the pieces of the three manufactories has yet to be settled. Mr. Tiffin evidently writes from his own personal experience, and his book is consequently valuable.

Exhibition of Embroidery, Ancient and Modern: Catalogue of the Liverpool Art Club. The Liverpool Art Club last year added much to our knowledge of Oriental art by their Japanese exhibition. This year they appear in an exhibition of embroidery, which contains many objects of interest. Mr. J. Bowes sends several examples of Persian embroidery in gold spangles and twisted thread, and there are many pieces of ecclesiastical embroidery of great interest, among which may be particularised a velvet cope, made at Florence by order of Henry VII., and which he bequeathed by will to the Abbey of Westminster, of "clothe of gold tissue wrought with our badgies of rede roses and poortcoleys," which he says he caused to be made at "Florence in Italie." The ornamentation consists of two twining stems bearing red and white roses, the Beaufort badge introduced into the border with the SS. collar; St. Dunstan's vestments, so called from the representation of the conflict of the saint, pincers in hand; the Martyrdom of St. Thomas of Canterbury, with canopied saints completing the decorations, all in the work called *opus plumarium*. Other specimens of interest we have not space to mention.

Histoire du Costume en France depuis les Temps les plus reculés jusqu'à la fin du xviii. Siècle. Par J. Quicherat. (Paris: Hachette.) *Le Dix-huitième Siècle.* Par Paul Lacroix. (Paris: Didot.) The exhibition of the Union Centrale, illustrative of the History of Costume, has awakened attention to the subject, and has shown how instructive is the study of dress as relating to art. The history of costume in France has been undertaken by M. Quicherat, director of the Ecole des Chartes, whose erudition and serious study of the past eminently qualify him for the task. He writes, as he says, specially in the interests of artists:—

"Témoin de l'embarras où se trouvent la plupart de nos artistes lorsqu'ils ont à représenter un sujet de notre histoire ancienne, je me suis appliqué à leur procurer le manuel qui leur manquait. Ils trouveront dans le texte la notice générale du costume de chaque époque, et dans les légendes des figures, lorsque les figures elles-mêmes ne leur suffiront pas, l'indication des ouvrages auxquels ils pourront recourir."

Such is the plan of this work, which is ably carried out and profusely illustrated by engravings from original documents. M. Quicherat divides his work into thirty-two chapters, assigning four for the early periods, as many for the Middle Ages, ten for the Valois kings, three for Henry IV. and his son, four for Louis XIV., taking his youth, the height of his splendour, and the solemn monotony of his declining years, when under the influence of the ambitious woman he had married without daring to acknowledge. The remaining chapters finish the century. A love of ornament, says M. Quicherat, preceded the wearing of clothes. To stain the skin with vegetable or mineral colours, to paint the body with figures, to decorate and arrange the hair, and to suspend to the person small objects which shine at a distance, or jingle in walking, are adornments to which no nation, however primitive, is a stranger. Traversing the earlier periods, we arrive at the Middle Ages, when men's dress, which for 600 years had been short, now becomes long, a change attributed to the contact of the Normans with their countrymen in Apulia and Sicily, who had adopted the luxurious habits of the Greeks and Saracens. Under Francis I. again a sensible change took place in French manners, in consequence of the presence of ladies at Court. The King loved dress, the costumes were more elegant, and all concurred to make the French Court the most brilliant of the age. The reign of Louis XIV., in his early years, was all splendour, profusion, and magnificence; but after his morose old age the Regency appears as a carnival. Here begins the work of M. Lacroix, whose writings on the preceding ages are so well known. In this he enters on a period so near our own, yet so different, and separated by a revolution. His book is not confined to dress alone, but he gives an account of the institutions, customs, and society of this remarkable age, of which we have such lively representations in the writings and artists of the time. It is from that source that M. Lacroix takes his illustrations. Watteau, Boucher, Lancret, Cochin, Chardin, and a host of others, furnish pictures not only of costume, but also of the Court fêtes, balls at the opera, street scenes, &c. His work may be styled "The Eighteenth Century, painted by itself." The sumptuous formal elegance of the Court of Louis XIV. gave place to the greatest licence caprice and fancy could suggest. Fashions changed with manners, and the elegances of the boudoir replaced the stately solemnity of the "grands appartements." The eighteenth is the great century of French fashion in its wildest extravagance, identified with "paniers," powdered head-dress, and rouge. When Marie Thérèse arrived to marry the Dauphin, she refused to sacrifice herself to this last fashion; a family council was held at Versailles, followed by a formal order from the King, to which she had no alternative but to submit. We leave it to the reader to follow M. Lacroix to the end of the century. The interest of his book is enhanced by the circumstance of its describing the tastes and occupations of the generations which have so immediately preceded us.

L'Ornement des Tissus, Recueil Historique et Pratique. Par M. Dupont-Auberville. Cent Planches. (Paris: Bachelin Deffoerene.) The author of this work, a gentleman of Normandy of high artistic tastes, is best known to the English public by his superb collection of lace, chronologically arranged, by which he added so materially to the instruction conveyed by the International Exhibition of Lace. In Paris, M. Dupont-Auberville contributed to the Museum of Costume a series of specimens of textiles from the earliest times to the nineteenth century, also arranged in chronological order, which collection he has generously offered to the national museum. No writer is better qualified for his task, from his thorough practical knowledge of the subject. His work is to be illustrated by 100 chromolithographs, of which the first number gives a favourable earnest. He

begins with the thirteenth century, with the animals facing each other (*affrontés*), the true Persian type, which we find in the embroidered towels that decorate the izba of the Russian peasant, as well as in the costly Sicilian fabric which he gives in illustration. The furniture of the bed of Henry II. is a good specimen of Renaissance decoration, and of similar *appliqué* workmanship is a table cover executed in black velvet upon white satin, in which the grotesques rival in beauty, delicacy, and variety those on the maiolica of Urbino. On one plate M. Dupont-Auberville gives specimens of the *branche tronquée* style, derived from the Knollet stitch, imprise of the Burgundians during their faction with the Armagnacs. A gorgeous plate of which the imprise of the *roi soleil* forms the centre, shows the style formed on the inspirations of Bérain, and the ribbon pattern of the seventeenth century turning into "reserves" or medallions finishes the first number of a work of the greatest promise.

Notice Historique et Descriptive sur la Tapisserie dite la Reine Mathilde, exposée à la Bibliothèque de Bayeux, par l'Abbé Laffetay. (Bayeux, 1874.) Queen Matilda's tapestry has been so often described and so faithfully reproduced as, one would suppose, to require no further chronicle; but the Abbé Laffetay, as its curator in his capacity of librarian at Bayeux, has deemed it incumbent on him to add another notice of this tapestry of world-wide renown. Exposed on fête days during the fourteenth and fifteenth centuries in the Cathedral of Bayeux, and mentioned in an inventory of 1496, the "grande toile du Conquest d'Angleterre" had in the eighteenth fallen into oblivion, when Montfaucon drew it from its place of concealment. In revolutionary '92 it had a narrow escape from destruction, being taken to cover a baggage-waggon. When Napoleon I. was preparing his invasion of England, he caused the tapestry to be exhibited at the Louvre; it was then restored to Bayeux, and rolled round a cylinder for exhibition till 1842, when it was transferred to the library and placed in glass frames. The Abbé Laffetay enters into the question of the age of the tapestry, and considers it as belonging to the eleventh century, and contemporary with, if not the actual work of, Queen Matilda. Its admirable reproduction by Stothard is familiar to the visitors of the South Kensington Museum.

Le Missel d'Uzès. Par M. le Docteur Desbarreaux-Bernard. (Toulouse.) This learned book-collector of Toulouse has found in the library of the Abbé Péliassier, curator of the Cathedral of Uzès, a missal printed at Lyons, in 1495, hitherto unknown even to M. Péricaud, the historian of the Lyonesse works of the fifteenth century. Its title is "Explicit Missale secundum usum ecclesie Ucesiensis, impressum Lugdini per magistrum Johannem Numester de Maguncia, et Michaelem Topie. Anno domini m.cccc.xcv. Die vero septima mensis Augusti ii." This superscription, establishes a fact worthy of remark: it is the presence at Lyons, in 1495, of the printer John Numester (of Mayence) whose name appears for the first time in the copy of the "Tractatus de celebratione missarum" of Gutenberg, belonging to the library of M. Charteux at Mayence. It will be admitted that the discovery of a book printed at Lyons, at the end of the fifteenth century, by the pupil and partner of the inventor of typography, is both curious and important. M. Desbarreaux-Bernard shows that Numester, who assisted Gutenberg at Mayence, Emilianus de Orfinis at Foligno, Michel Topie at Lyons, and who is also supposed to have been called to Albi (Tarn) by Cardinal d'Amboise, should be classed among those nomadic typographers who contributed so largely to the propagation of the art of printing.

La Vie de la Sainte Vierge Marie, en vingt gravures sur bois, par Albert Dürer, Nuremberg, anno 1611, décrite en vers Latins par Chelidonius.

Réproduction, procédé de P. W. van de Weijer, imprimeur lithographe, avec une introduction de Ch. Ruelens. In 4to, parchment wrapper. (Utrecht, 1875.) The exact nature of the process by which this reproduction has been effected is a secret of the inventor, M. P. W. van de Weijer, who simply lets the public know that photography has nothing to do with it. It appears, indeed, to be far superior to any of the numerous photographic and heliographic processes now employed. The present volume, however, does not show all that can be done by its means, for it has evidently been produced from an inferior set of impressions of the prints in their second state, and of course is not better than its original. We have seen heliographic reproductions of some prints of this series superior in tone to the present; it is only fair to add, far higher in price. M. van de Weijer declares that wood engravings can be reproduced by this process without any injury being done to the originals. He is now preparing for publication Dürer's *Great Passion*, reproduced from the splendid series belonging to Dr. Straeter, of Aachen, whose prints cannot be said to have been injured, although they have apparently been subjected to intense pressure. The proofs of some of these we have seen, and they are certainly far superior to the very best heliographic reproductions that have yet appeared. The process being also less expensive, will eventually bring within the reach of the humblest purse copies of the finest woodcuts—certainly finer than late impressions that now sell for a much higher price—and inferior only to the best originals. We feel confident that the value of the latter will increase, notwithstanding Mr. Ruelens' opinion to the contrary; but a great fall in the value of copies and of inferior impressions is inevitable, and that this is really a gain from an art point of view there can be no doubt. Choice engravings of the great masters have risen so much in value of late years that they are now quite out of the reach of the general public, who are only able to gaze on them from time to time for a few minutes. They will now regain their legitimate influence. We venture to predict a great success for M. van de Weijer's process, which we should state is the result of over twenty years of patient study and experiments.

EDITOR.

THE WATER-COLOUR INSTITUTE.

(Second Notice.)

THE landscapes in this gallery are not of a very striking kind. Perhaps the two of highest quality are the large views by Mr. Hine of the verdurous downs of our southern coast—*On the Downs, Dorsetshire*, and *Near Lewes*. That aspect of softness combined with largeness and simplicity which is so characteristic of this class of scenery is finely rendered by the artist; the eye is not invited to pause at any particular point, but to spatiate and content itself. Mr. Skill gives, in his work *On the Pincian, Morning*, a true impression of the dome-thrugged prospect of Rome from that famous site, paced with staid steps by Passionists and other ecclesiastics; his *Mariannina* is a pretty little figure of an Italian peasant-child. *Llyn Idwal* is well pictured by Mr. Wimperis: he makes the scene silent and solemn, without overstraining. In some other instances this painter takes off Cox too obviously: see especially Nos. 28 and 37. Mr. Edmund Warren has always been pre-eminent in the portraiture—for it is portraiture rather than portrayal—of trees: he is an adept in their structure, their foliage, their light and shade. The examples in the present gallery are among his best: *Near Mark Ash, New Forest*; *The Two Porters, Welbeck, near Sherwood (Famous Oaks of England)*; *The Newton Forster Oak, Sherwood Forest* (same series); *Far from the busy Haunts of Men* (a deer-park). *On the Way to Llyn Idwal* shows Mr. Syer to be highly expert in the treatment of tumbling torrent-

stream and lashed boulders. Mr. Oakes, in *The Welsh Border*, is scarcely up to his own standard: he gives us an extensive and varied landscape, with all sorts of material, including a couple of viaducts, but has painted it with a comparatively lax and perfunctory hand. *San Biaggio, on the Lagune, Venice*, by Mr. J. H. d'Egville, has truth in its moist high-tinted aspect. Another picture of atmospheric effect, but hardly sufficiently dense in tone, is the *Thunder-cloud passing over the Sea*, by Mr. Orrock. *Arundel*, by Mr. T. Collier, is more a sketch than a picture, but in a natural and genuine style.

A painting by Mr. Wolf of an indignant nested pigeon in a fir-tree, intruded upon by a brace of squirrels, *Inquisitive Neighbours*, is certain to be first-rate in the most important qualities; and seldom has this all-accomplished artist-naturalist surpassed the plumage-drawing which we find here. A little more of general tone, subduing the brightness of local colouring, would make this picture as pleasant as it is excellent. The only other animal subject calling for particular mention—and in this the interior counts for fully as much as the animals—is *Temptation*, by Mr. Morin, representing three young cats in a kitchen, greedy after fish. Mrs. Harrison (*Quince*), and Mrs. Coleman-Angell (*Peach-blossom and Crackle Jar*, and *Azaleas*) show forth well among the flower-painters.

W. M. ROSSETTI.

ART SALES.

On the 20th was sold at the Hôtel Drouot, a collection of modern paintings, among which were fifteen by Corot which fetched the following prices:—*The Hut*, 8,000 fr.; *The Common*, 5,900 fr.; *The Downs*, 4,900 fr.; *The Avenue*, 3,000 fr.; *Marcoussy*, 5,000 fr.; *Pond of Ville-d'Avray*, 6,700 fr.; *Woman at the Well*, 2,350 fr.; *The Stream*, 6,200 fr.; *Corot's House*, 9,000 fr.; *Borders of Lake Nemi*, 4,000 fr.; *Road to Church*, 2,050 fr.; *Environ of Givet*, 1,730 fr.; and *Magdalen*, 1,200 fr. Chintreuil, *Meadow near Millemont*, 1,220 fr.; and the *Orchard in Bloom*, 3,800 fr.; J. M. Claude, *Rotten Row*, 3,000 fr.; Courbet, *Rock of Ornans*, 3,950 fr.; *Forest in the Autumn*, 780 fr.; *The Damp Grotto*, 1,120 fr.; *Watersport on the Coast*, 1,250 fr.; Daubigny, *The Meadows*, 2,200 fr.; De la Croix, *Education of Achilles*, 3,050 fr.; Dupré, *Marsh in the Pyrenees*, 12,500 fr.; Feytaud-Perrin, *Wimowing Corn at Cancale*, 1,700 fr.; *Fisherman's Family*, 1,700 fr.; J. Héreau, *The Thames at Billingsgate*, 1,900 fr., and *Fishing at Cancale*, 1,550 fr.; Humbert, *The Virgin, Infant Saviour and St. John*, 1,420 fr.; Jundt, *The Islands of the Rhine*, 4,500 fr.; Lansyer, *Bay of Douarnenez*, 1,050 fr.; Millet, *The Gleaners*, 12,100 fr.; De Neuville, *Fight on a Railway*, 11,500 fr.; Ribot, *Girl and Dog*, 3,800 fr.; *The Old Fisherman*, 1,420 fr.; *The Young Cooks*, 4,500 fr., and *Poultry*, 1,020 fr.; Ricard, *Portrait of the Artist*, 5,000 fr.; and of a woman, the same; A. Stevens, *The Bath*, 7,805 fr.; and *The Coquette*, 6,600 fr.; Tassaert, *Girl with Rabbit*, 5,900 fr.; Vollon, *The Golden Dish*, 5,500 fr. The sale produced 227,215 fr. (9,088*l.* 12*s.*).

THE Sainte-Seine collection, sold at the Hôtel Drouot on the 15th and following days, was most remarkable for the beauty and importance of the ancient arms, rivalling those of the Séchan sale (ACADEMY, March 6). There was no piece which came up to the famous Venetian poignard for which Baron A. de Rothschild gave 2,000*l.*; but there was a magnificent sword with iron hilt chased and damascened in gold, Italian work of the sixteenth century—it sold for 34,500 fr. (1,380*l.*); another, double-handed, of the same period, the favourite arm of the Swiss, 9,000 fr.; sword of the sixteenth century, chased and gilt, with dagger to accompany it, 16,000 fr.; another, with double guard and dagger, sixteenth century, 16,600 fr.; sword chased with birds in relief, six-

teenth century, 6,100 fr.; rapier, same period, 2,800 fr.; wheel arquebuse, 19,500 fr. Fine maiolica plate by Xanto (1558) 16,100 fr.; another with low foot, subject Lucretia, after a print of Marcantonio, 1,890 fr.; bottle with cylindrical neck, 7,600 fr.; oval dish, Limoges enamel, 1,350 fr.; two small plates, translucent enamels, 3,220 fr.; ancient silver patera, 5,650 fr.; renaissance jewel (group of "Charity") Italian, 7,305 fr.; Venus Victrix, Florentine bronze, 7,000 fr.; bronze medallion of Louis XII. and Anne de Bretagne, made 1499, a fine proof, 610 fr. Persian carpet, silk velvet of marvellous workmanship, from the Piot collection, 12,800 fr. A copy of La Fontaine's *Fables*, with illustrations by Oudry, 4 vol. folio, red morocco, given by Marie Antoinette, 2,000 fr. The sale produced 303,940 fr.

MESSRS. PUTTICK AND SIMPSON completed last week the sale of Messrs. Cramer and Co.'s musical copyrights and plates. Some of them sold as follows:—Cooper's *Introduction to the Organ*, 234*l.*; Barnett's *Mountain Sylph*, 165 gs.; Sir John Goss's *Harmony and Thorough Bass*, 451*l.*; Macfarren's *Harmony*, 159*l.*; Richter's *Harmony and Counterpoint*, 333*l.*; Cramer's *Chamber Trio for Female Voices*, 1,040*l.*, and *Vocal Gems*, 1,489*l.*; Sullivan's *Light of the World*, 271*l.*; *O ma Charmante*, 500 gs.; *Guinevere*, 303*l.*; *Sailor's Grave*, 97*l.*; *Little Maid of Arcadee*, 275 gs.; *The Young Mother*, 100 gs.; and *There sat a Bird*, 102*l.* The total amount 13,000*l.*

ON Friday and Saturday last (23rd and 24th) the dispersion of the Manley Hall collections was completed by the sale of the pictures. Never were Christie's rooms more crowded, even at the great china sales of last year, than on the present occasion, for the paintings were many of priceless value and familiar to us by exhibition and engraving. There were the masterpieces of Turner, Millais, Frith, Faed, and all the great artists of the modern school, many of which, as Mr. Woods observed, ought to have been secured for the National Galleries. The following are some of the prices:—Egg, *The Night before Naseby*, 290 gs.; MacIise, *Departure of Bayard for the War*, 405 gs.; Leslie, *Scene from Henry VIII.*, 1,300 gs.; D. Roberts, *Church of the Holy Nativity, Bethlehem* (formerly in the collection of Louis Philippe, and sold in 1853 for 483*l.*), 1,350 gs.; and his *Interior of the Cathedral of Seville*, 1,800 gs.; Collins, *The Skittle Players*, 2,300 gs.; Nasmyth, *A Water Fall*, 1,400 gs.; R. Wilson, *Lake Scene with Ruins*, 700 gs.; Gallait, *Columbus in Prison*, 850 gs.; his *Great Picture of Vargas*, on his appointment as President of the Council of Blood, sold by Gambart for 1,500 gs., realised 2,550 gs.; and a study for his celebrated picture of *Count Egmont and Horn*, 1,100 gs. A small replica of *Napoleon crossing the Alps*, by Paul de la Roche, 8 inches by 6, 40 gs., and the *President Durrant's Death*, from the Demidoff Collection, 625 gs. This completed the day's sale, which realised 32,190*l.* The great prices were reserved for the last day:—W. Field, *A Grey Day on the Thames*, a charming picture, 310 gs.; two pictures painted for the staircase at Manley Hall—*Lago Maggiore*, by Pyne, 370 gs., and *Grand Canal, Venice*, Wyld, 260 gs.; O'Neill, *The Anxious Mother*, a replica, 160 gs.; Wallis, also a replica, 7 inches by 10, of the well-known picture of the *Death of Chatterton*, 260 gs.; Leslie, *Willow, Willow*, 10 inches by 18, one of his most poetical pictures, 220 gs.; Graham, *A Spate in the Highlands*, 10 inches by 14, 410 gs.; Webster, *Sickness and Health*, 6 inches by 10, original study for the great picture, 230 gs.; Linnell, *The Rustic Bridge*, 600 gs.; Leslie, *Elopement*, the girl on one side the river, the youth on the other, 1,100 gs.; Graham, *Among the Hills*, 1,550 gs.; *O'er Moor and Moss*, 1,050 gs.; J. Linnell, *Autumn Evening*, 720 gs., *The Midday Rest*, a harvest, with a blaze of sun over the corn, 1,300 gs., and *The Tramps*, 1,060 gs.; Millais, *A Swallow flying from the Golden Woods*, 1,000 gs.; Hook, *The Lobster Catcher*, 1,410 gs.; Ansell,

Visit to the Shrine of the Alhambra, 600 gs. Then followed Millais' splendid picture *Jephthah*, for which Mr. Agnew began by bidding 2,000l., and it finally fell to him for 3,800 gs.; the picture is under glass. Frith, *Sterne's Maria*, 900 gs.; Leighton, *Venetian Lady of the XVIIth Century*, 950 gs.; Barker's well-known picture of the *Relief of Lucknow*, 970 gs. Then came the finest picture Frith ever painted, which was received with acclamations, *Before Dinner at Boswell's Lodgings*, with portraits of Johnson, Goldsmith, &c. Mr. Agnew began by a bid of 2,000 gs., which was followed by another for 3,000, and a third for 4,000. It fell to Mr. Agnew at 4,350 gs., the highest price ever gained by a painter in his lifetime. O'Neil, *The Last Moments of Raffaele*, 1,050 gs.; Faed, *A Wee Bit Fractious*, 1,900 gs., and a charming picture, *Only Herself*, 1,650 gs.; Ward's *Last Sleep of Argyll*, 800 gs., and *Last Scene in the Life of Montrose*, 800 gs., both well known by the engravings; Millais, *Chilly October*, 3,100 gs. Old Crome, five landscapes—one upright, representing a *Road Scene*, was reserved by Mr. Mendel for 1,250 gs., as there was some doubt of its authenticity, but it was sold for 1,500 gs. Three of the finest pictures were reserved to the last. Turner, *View on the Maas*, 2,600 gs. Sir Edwin Landseer, *The Deer Family*, painted for Mr. Wells, of Redleaf, sold in 1862 for 650 gs., was bought by Lord Dudley, 2,900 gs. The grandest picture concluded the sale—Turner's *Grand Canal at Venice*, from the Monroe collection, where it sold for 2,400 gs. Mr. Agnew began with a bid of 4,000 gs., and it fell to him for 7,000 gs. The ninety-seven pictures of this day's sale fetched 65,593l. 5s. 6d., making a total of 97,997l. 3s. 6d. The whole of the Mendel sale realised 150,147l.

NOTES AND NEWS.

THE Hildesheim Column, to which we alluded in a previous note (ACADEMY, April 10) as having been recently reproduced for the South Kensington Museum, is said to have been the work of St. Bernward, who was bishop of Hildesheim at the beginning of the eleventh century.

This Bishop Bernward added to his saintly character a great love for art. He was also a skilled worker in metal, and several beautiful specimens of his workmanship in the rarer metals, executed either by himself or by pupils under his direction, may be seen in a glass case in the South Court. They comprise candlesticks of rich design in silver, gold caskets elaborately carved, and exquisitely designed ornaments and reliquaries. But his great achievement was the Hildesheim column, constructed, it is evident, somewhat after the model of the Trajan column at Rome, with a spiral band of bas-reliefs winding up it, only in this instance the reliefs are scenes from the life of Christ; it is in fact a so-called "Christ's Pillar." The shaft of this column rests without other base upon four kneeling figures, supposed, like those that support the font before described, to represent the four rivers of Paradise; the bas-reliefs also begin with an allegorical figure of the river Jordan, and then follow in winding succession the Temptation of Christ, the Calling of Simon and Andrew, the Calling of James and John, the Marriage at Cana, Christ healing a Leper, the Woman of Samaria, the Healing of the Centurion's Son, the Sick Man who was let down through the roof, the Sick Woman healed, Sight restored to the Blind, the Raising of the Widow's Son, the Woman taken in Adultery, the Transfiguration, Christ casting out Devils, Dives and Lazarus, the Barren Fig Tree, Christ at the House of Zaccheus, Christ walking on the Sea, the Miracle of the Loaves and Fishes, the Raising of Lazarus, Mary Magdalene, and Christ's Entry into Jerusalem.

This magnificent work of early casting was erected on the Feast of St. Michael in 1022, and was placed in the square in front of the Cathedral of Hildesheim. It had originally a splendid capital surmounted by a crucifix, but this latter

was broken to pieces by fanatics in 1544, the column thrown down, and the capital afterwards melted down in a bell-foundry. The column itself, after many narrow escapes, was finally set up again in 1810, near the spot where St. Bernward had first placed it. The present cast was taken by F. Kusthardt, of Hildesheim, in 1874.

THE South Kensington Museum has just received a valuable gift. Mr. Wynn Ellis has presented it with the well-known marble statue *Eve at the Fountain*, by E. H. Baily, R.A., one of the most celebrated works of modern English sculpture.

MR. HOLMAN HUNT's picture, *The Shadow of Death*, is highly appreciated in Manchester, where it has been on exhibition for some weeks past. It has been visited by more than 45,000 persons.

THE private view of the picture-gallery at the Crystal Palace took place on April 27, and the prize-medals to the exhibiting artists were awarded on the same day. The judges were—Mr. Wells, R.A., Mr. Duncan, and Mr. Desanges.

It is stated that the Sultan has bought several paintings from the two great French artists, MM. Gérôme and Boulanger.

Le Temps states that the Académie des Beaux-Arts proposes to replace the typical head of Minerva, at present used on its medals and engravings, by the type of the Pallas Velletri, after Flandrin.

THE design of M. Coquart, the architect of the Ecole des Beaux-Arts, has been adopted for the Coulmiers monument, which is to be erected in Paris. Only two candidates presented themselves for the architectural *Prix Duc*, a biennial prize of 4,000 fr. It was awarded to M. Dutert.

M. SPITZER has given to the manufactory of the Gobelins, towards assisting its museum, burned by the Commune, the fine tapestry of the end of the fifteenth century, exhibited in the galleries of the History of Costume, representing the deliverance of Dôle and Salins, 1477, by the intercession of St. Anatole. The tapestry bears the arms of Mary of Burgundy, and is therefore of Flemish manufacture. The Museum of the Gobelins has likewise received the gift of an altar-frontal, representing the Entombment, also Flemish, of the beginning of the sixteenth century.

DURING the last year the Museum of Antiquities at Coire has, writes the *Journal de Genève*, been enriched with a number of Etruscan antiquities, with three marble inscriptions, found in the canton of Ticino, many bronze ornaments, and a small vase brought from the tombs at Arbeto discovered in the spring of 1874, of great value, as it is attributed by the learned to the most remote Etruscan epoch.

THE Council for deciding among the competitors for the Sèvres prize have chosen four among the eighty-five designs sent in. M. Lameire, a hydria, blue ground decorated with pastes in relief, representing a battle of cavalry, and round the neck the Labours of Hercules. M. Mayeux, a vase of nearly the same form, with palmette decoration. M. Roger, a crater, with figure handles; and M. Chenet, an ovoid vase with genii for handles, and the lid surmounted by the figure of Minerva. These vases will be modelled in plaster at the manufactory of Sèvres, and will be returned to their owners for final decoration, after which the definitive award of the Council will be given, and the vase selected, immediately executed at Sèvres, and placed in the great gallery of the Louvre.

THE *Echo des Vallées*, a journal of the Hautes-Pyrénées, announces that M. Achille Jubinal, the eminent archaeologist, has definitively purchased the old château of Mauvezin, near Escalé-Dien, the old manor of Gaston Phoebus, Count of Foix, who probably kept there his enormous hunting establishment and his pack of fourteen hundred dogs. M. Jubinal intends rendering the place in-

structive and interesting to the Pyrenean tourist, by making it a museum of the antiquities of the surrounding country, of which he has already formed a considerable collection at his house at Bagnères.

THE printing of the Report of the French jury upon the Universal Exhibition at Vienna is now completed, and the four first volumes will be distributed on the 27th. Another volume is in the press, containing reports upon the products of Algeria and the colonies, with a special report upon the objects exhibited at Vienna by the Commission of Historic Monuments in France.

ROTMANN's celebrated fresco paintings of Italian scenery under the arcades of the Hofgarten at Munich have hitherto only been known to visitors to that town; but the well-known firm of Bruckmann, of Munich, have recently rendered them accessible to all by publishing a reproduction of them in chromo-lithography, a process admirably adapted for the rendering of such works. These frescoes some years ago were falling into decay, but we understand that King Ludwig of Bavaria has had them carefully restored, and that an iron grating has been erected to let down before the arcades at night, so as to protect them from the wanton injury from which they formerly suffered.

THE popular German master Joseph von Führich celebrated his seventy-fifth birthday last February. Many honours were paid him on the occasion. The Pope sent his blessing, his fellow-artists a congratulatory address, and the town of Vienna its honorary citizenship; but, more than all, a Führich exhibition was inaugurated, consisting of 181 of his works, many of which had never before been exhibited. Fourteen of these are the cartoons for the frescoes in the Altlerchenfelder Church, in Vienna, twenty-nine are oil-paintings, and the remainder consist of drawings, sketches, and watercolours belonging to the artist himself. The exhibition is held in the Künstlerhaus at Vienna.

THE *Zeitschrift für Bildende Kunst* opens this month with a critical notice of the eighteenth century Spanish artist, Francesco Goya. The writer, Hermann Lücke, states that "Goya is an artist who is very little known in Germany." Nor are we better acquainted with him in England. In France, however, he is greatly appreciated. Several critiques upon him and a *catalogue raisonné* of his etchings had appeared even before M. Charles Yriarte wrote an exhaustive history of his life, published as a handsome quarto volume in 1867, and so brought him before the notice of all lovers of art. It is somewhat difficult to define Goya's exact place as an artist; coming immediately after the great masters of Spain, he yet cannot be called their successor, for his style is totally different. He has more affinity, perhaps, with Hogarth than any other master. His satire is coarse, though not so bitter as that of our great English moralist, but it is unrelieved by any gleams of humour. As contributions to the history of culture his etchings are certainly almost as valuable as Hogarth's works, and it is strange that while the one artist is so popular the other should remain comparatively unknown. Goya died in France in 1808, at the age of eighty-two. A portrait and a bold etching by Unger, from one of his paintings, illustrate the critique. The other articles of the number are: a continuation of Robert Vischer's "Studies in Siena;" Iwan Lermolieff's "Galleries of Rome," translated from the Russian; "Activity in Building" in Berlin, by Adolf Rosenberg; and the conclusion of Rudolf Rettenbacher's articles on the "Architectural Drawings in the Uffizi."

THE greatest landscape painter that Denmark has produced, Peter Christian Skovgaard, died on April 13. He was born near Ringsted, in Zealand, on April 4, 1817; brought up among the most beautiful scenery of Denmark, with Ezerum Lake and the splendid beech-woods on one side, and the

Cattagat on the other, he very early began to copy what he saw in nature. His mother, herself not unskilled in art, encouraged him to the full, and when he was fourteen he was sent up to Copenhagen to be a student at the Academy. He became intimate with Lundbye, and was to some extent under the patronage of Eckersberg; his talent was slow in development, and he was not precocious in discovering the true bent of his genius. Unlike most Scandinavian artists, he served no apprenticeship in Italy, and did not see Florence and Rome till 1854. In 1864 he was elected member of the Academy of Arts, at the same time as Vermehren and Exner. It was the tardy acknowledgment of the new school by the old fogies. His style is intensely realistic, somewhat cold, somewhat hard, but full of breadth, harmony, and truth of detail.

THE German papers announce that in consequence of the special application made by Professor Curtius to the Imperial German Government for the appointment of suitable persons to conduct a scientific Survey of the plain of Athens, leave of absence has been granted by Count Moltke to Herr Kaupert, Inspector of the Imperial Staff of Surveyors at Berlin, and that this officer is at present engaged in the work. After the completion of the triangulation of the plain, Herr Kaupert and his staff will proceed to make an exact survey of the city of Athens, which may serve as the basis of future topographical measurements. The explorations of the German Association are being energetically proceeded with; and recently the workmen have laid bare the foundations of ten houses in the district near the Eleusinian gate, which continues to yield the most successful results.

THE STAGE.

MR. GILBERT'S NEW PIECE.

Tom Cobb, at the St. James's, is in three acts, and has nothing serious in it; that is its only claim to be considered a comedy. It is humorous, but so are a few farces; it is funny, but so are the *Bab Ballads*. As a whole, its first act is its best, though there are bright bits in its second and third; but you feel in the second and third what you hardly have a chance of feeling in the first—at all events, not until the curtain falls upon what is certainly not a dramatic situation—that the thing is too long drawn out; the bit of good metal beaten very thin; the motive exhausted long before the end. The story will with difficulty run through three acts, and coming away at the close of them all, there is not much to remember, except that a good deal of point has been given to the farcical side of the business by Mr. Clifford Cooper, Mr. E. W. Royce, Mr. Bruce, Miss Challis, Mr. De Vere, Mrs. Chippendale, Miss Litton, and Mr. W. J. Hill.

There is a love-sick young surgeon, who gives his name to the piece. His first love is one Matilda O'Fipp, daughter of Colonel O'Fipp. The O'Fippes are of a race with which the stage and fiction have long been familiar. The Colonel is of the twenty-seventh Regiment, but objects to add in what service. He has the make-belief social position of many gallant impecunious heroes in Dickens and Thackeray and smaller writers to boot. His daughter fondly believes in his prestige, though practically accustomed to promise herself in marriage to any one who will take her father's bills. Tom Cobb has taken her father's bills, and so when the curtain rises she is engaged to be married to him. But Tom Cobb, like Hazlitt, would appear to be physically incapable of constancy, and later on we find his affections transferred to another young woman. The discovery, it is true, does not greatly wound us, for we could never take any particular interest in his earlier loves. Besides, the second young woman and her family are more amusing than the first, and newer. While Mr. Gilbert's Colonel and Matilda O'Fipp were the result of

a wholesome belief in the reality of other people's creations, the Effingham family—father, mother, son and daughter—are the product of personal observation. They are an extravagant, but at the same time a recognisable caricature of people one has actually met: people of means, very likely, but who have become convinced that in our day it is the fashion to affect to care for ideas, thoughts, romance, culture—possessions not tangible and material, in fine—and so adopt the affectation of their neighbours, adding to it a little of their own. Had Mr. Gilbert concentrated himself upon a satire on people who think intelligence “the thing,” he would have had a fine field, and would probably have been successful. But he has gone on to lay particular stress not on the fact of fashionable affectation in his Effingham family, but on the union with that of very keen regard for all material interests, so that his innocent heroine, who talks bad blank verse, and dresses in dainty grey-green gowns and hats, after Sir Joshua, is yet capable of carrying her romantic sorrows into a court of law, having been duly advised as to an award of substantial damages.

But we will not grumble with Mr. Gilbert for having brought his favourite stage “property” of cynicism, with which many a piece has made us perfectly familiar, into use in his new piece at the Saint James's. People familiar with Mr. Gilbert's comedies know that it is not in human nature to do anything with a good motive—even the admirable heroine of *Charity* is benevolent by way of an atonement, and the Broad Church clergyman who becomes a colonial bishop has probably had a past not wholly creditable, could we but know it. The moral of the last piece—*Tom Cobb* at the Saint James's—is that self-interest is at the bottom of romance; and the moral of the last piece but one—*The Trial by Jury*—appears to be that nobody is proof against the influence of a pretty young woman. We may take the moral or not, as we are minded, but we will be grateful for the fun, and will laugh when the sham worshippers of a poet who is himself not very genuine cluster round him with books ready to catch the fragments of his mind, and when his hostess asks him to give her “a great thought” much as she might ask a lady to give her a song. The humours of these people entertain one a good deal, but Mr. Gilbert has not used his material lavishly. It is not the kind of work which you would go willingly a long way to see. No piece played outside the Palais Royal or the Variétés has ever had so little substance in the long space of three acts. Mr. Gilbert is probably a man who cares something for his reputation, and proposes to maintain it. But if that be so, he must next time give us “more matter with less art.”

FREDERICK WEDMORE.

THE theatrical week has not been really a brilliant one, though four new performances have been presented to the public since we last wrote. These have been Mr. Gilbert's *Tom Cobb*, the Opéra Comique's representation of *La Comtesse de Sommerive*, the Gaiety's revival of *Much Ado About Nothing*, and Mr. Horace Wigan's revival of the *Hidden Hand*.

La Comtesse de Sommerive, at the Opéra Comique, has been disappointing, and the applause with which it was received the night that we were there is difficult to account for. Théodore Barrière, who had a principal part in the authorship, has done good work, in his time, and even in the *Comtesse de Sommerive* he has no doubt shown his usual aptitude in the management and sequence of scenes. But he has dealt with an unpleasant story, and has not concealed or modified its unpleasantness. We shall not tell it in any detail, for notwithstanding the applause with which it was received, it is not likely to be repeated very often in London. The acting was not of a kind to bring its merits

into strong relief. Mdle. Baittig has not, we think, been seen to less advantage than as the guilty mother. She was better, though not charming, as the injured but much-enduring wife in M. Denayrouse's attempt at philosophical comedy. And as Alix—a character intended to have much of pathos in it—Mdle. Laurence Gérard, who came to us a star, failed, we think, to display any qualifications for that position. The performance of these ladies appeared to us to be wanting in passion and tenderness. Neither has great command of facial play: neither has a voice that is specially sympathetic. There was nothing in this whole performance approaching in delicacy and justice of expression the acting of Mdle. Andrée Kelly, in *Mademoiselle Duparc*, of which we spoke, very briefly, a week or two ago. The men were not very ably represented. M. Monti is better suited to the eccentric comedy of *Les Trente Millions de Gladiator* than to the representation of pathos. Nor did the others notably distinguish themselves. It might be wise on the part of the management of the Opéra Comique to secure without further delay the services of the distinguished comedians whose advent has been spoken of. The *Athenaeum* has hinted at the possibility of the whole Gymnase Company coming over for a while. That company is not as good as it used to be, but it contains many trained actors, and a few gifted ones. The head of these—Mdle. Blanche Pierson—has been mentioned as likely to appear in London, whether or not her comrades do. Her appearance will give the public and the profession an opportunity they have not enjoyed since the appearance here of Desclée; for Mdle. Pierson's acting is of the kind appealing alone to somewhat sensitive observers: not at all to the many who mistake an obvious artifice for a sufficient art, and a sensation-death for an effort of genius.

Few Shaksperian parts are better suited to the talent of Miss Cavendish than that of Beatrice in *Much Ado About Nothing*—the play presented at the Gaiety on Monday last. It is in the earlier scenes that Miss Cavendish is most competent, though she nowhere notably fails. Tenderness—the absence of which tells badly on her performance of characters that require it—has little place here. Brilliancy first, and then earnestness and vigour, are the main requisites for the stage presentation of Beatrice; and these Miss Cavendish possesses in full measure, and displays with an art that is the fruit of experience and individual thought. The general cast, which is a good one for a performance which previous arrangements will prevent from being long protracted, includes Miss Furtado, Mr. Hermann Vezin, Mr. Ryder—all seen to advantage here—and Messrs. Markby, Walsam, Boyne, J. G. Taylor and Righton. We saw a few months ago at a morning performance at the Haymarket, how good was the Verges of Mr. Righton. The Shaksperian comedy is followed by *A Nice Girl*, in which Mr. Soutar, Mr. Taylor, and Mrs. Leigh appear, but which finds its chief attraction for Gaiety audiences in the fact that it affords an opportunity for the exhibition of the brisk and sprightly talent of Miss Farren.

In a few humorous observations made on Saturday night at the re-opening of the Holborn Theatre under its new name of the Mirror, Mr. Horace Wigan protested his ignorance of the past fortunes of that playhouse. The Holborn Theatre was successful once; commercially at all events with *Flying Scud*, but since then its prosperous days have been few, and a visit to it was like a premature entombment. All this Mr. Horace Wigan will no doubt essay to change. He begins his career with one of Mr. Tom Taylor's most successful adaptations, *The Hidden Hand*, in which ten years ago Miss Kate Terry played Lady Penarvon. Miss Rose Leclercq has succeeded to the part, and has studied it carefully, and represents it not without force and picturesqueness. Miss Louisa Moore is one of the younger ladies of the drama, and as graceful a one as need be. Miss

Ellen Douglas is a forcible Enid. Mrs. Fairfax is the murderous old lady. Mr. Howard takes Mr. Henry Neville's old part of Lord Penarvon. Mr. Dewar is Sir Caradoc. The piece is, as all the world knows, a very strong one of its kind; absolutely requiring good acting, yet not dependent by any means on the acting of any one performer. It is mounted at the Mirror in substantial fashion, and will probably for many weeks—perhaps months—continue to be played. Mr. C. L. Kenney has furnished Mr. Wigan with a *lever de rideau*—*Maid of Honour*—and Mr. Maltby with an afterpiece, *Make Yourself at Home*. Mr. David Fisher makes his reappearance in this last, and is sufficiently funny.

MISS HELEN FAUCIT gave her aid to the performance at Drury Lane on Friday week, in aid of the fund whose first object is to build at Stratford-upon-Avon a theatre for the acting of Shakspeare. She played with the wonted art of her later years, *Rosalind in As You Like It*. She was fairly supported. Miss Faucit has before now given her services to causes of more practical usefulness. It is excellent that any town should have a theatre devoted to the acting of Shakspeare; but that the country town where Shakspeare was born and died should have it before the capital where he worked is not perhaps an entirely reasonable arrangement. How many nights in the year is the theatre intended to be open?

Paul Pry has been played during the week at the Strand Theatre, Mr. Byron's *Old Sailors* having been withdrawn.

MR. J. S. CLARKE, the American humorous actor, has appeared, as announced, at the Charing Cross Theatre.

THE *Hunchback* is to be played at the Gaiety Theatre this (Saturday) morning.

WE forgot to call attention in our last issue to an anniversary of some interest—the fifth annual return of the first opening day of the Vaudeville Theatre, where, under the management of Messrs. James and Thorne, most of us have spent many merry evenings and very few dull ones.

WE have already called the attention of our readers to Mr. John Hollingshead's vigorous letters on the subject of the anomalies existing in the different arrangements in use for the supervision of the drama in London and the country. They appeared first in the *Daily Telegraph*, and are now re-published, and issued in pamphlet form by Chatto and Windus. To the letters to the *Telegraph* Mr. Hollingshead has added the lively letter he addressed to the *Times* on the subject of the compulsory closing of the London theatres on Ash Wednesday; and the whole forms a forcible contribution to the discussion of a subject which will never be settled to everybody's liking. The pamphlet is one of the most readable, and withal good-natured, attacks on existing institutions which we can call to mind. Some day it may be of practical effect.

THE Châtelet, as those know who know Paris well, is an immense theatre for spectacle and *drame*, and is situated where the revolutionary element may meet the bourgeoisie. The Latin quarter has got the Odéon and the Cluny all to itself, and Belleville has its own places of amusement unknown to most of the world; but the Châtelet is in central Paris, and is within easy reach of Communist workman, Republican student, and Orleanist shopkeeper. The meeting of these, only the other night, for the first representation of *Cromwell*, bade fair to be dangerous. There was a riot caused by words spoken in the piece. *Cromwell* is a posthumous work of poor Victor Séjour. He left it not quite finished, but some one had finally arranged it, and its production was looked forward to with interest, and on the given night the leading critics went down to the theatre. Taillade had the imprudence to speak some words which had previously been forbidden by the censor, and this was the cause of a tumult which renders it

useless to enter into detailed discussion of the piece, since the result of the tumult has been a prompt order for *Cromwell's* withdrawal from the stage. M. Vitu doubts if in any case "we French, whether sceptics or Catholics, could have been interested in that sombre puritanical figure, *dont les défauts, comme les qualités, blessent sur tous les points notre idéal et nos croyances*." Besides M. Taillade, who became the evil genius of the piece, Messrs. Laurent and Abel, M^{me}. Jane Essler, and others, took part in the performance.

It is five years since Emile Augier's *Gabrielle* has been played at the Comédie Française. This week it was to be reproduced, with new performers: M^{lle}. Madeleine Brohan, M^{lle}. Sarah Bernhardt, M. Coquelin, and M. Thiron. M^{lle}. Madeleine Brohan's appearances on the stage have of late become very rare.

Fanny Lear, a comedy in five acts, by Meilhac and Halévy, was revived, two or three days since, at the Paris Vaudeville, for the representations of M^{me}. Pasca, who is released, for a while, from her engagement at St. Petersburg.

Un Drame sous Philippe II. is already pronounced to be a commercial success at the Odéon, where elaborate stage trappings secure for a piece a triumph sometimes denied elsewhere to plays depending chiefly on literary merit for their attractiveness.

L'Affaire Coverley is the Tichborne story brought out on the Paris stage at the Ambigu Comique. M. Charles Bigot reports to us its success. It appears to contain at least two scenes which show much aptitude for dramatic work on the part of its author, M. Barbusse, a contributor to the *Siècle*.

MUSIC.

RECENT CONCERTS.

IT is gratifying to be able to say that the fourth concert of the British Orchestral Society, which took place on Wednesday week, showed on the whole a decided improvement in point of execution on most of those which have been previously given. This was observable, perhaps, to the greatest extent in the opening number of the programme—Mendelssohn's overture to *Melusine*. There is hardly one of the composer's orchestral works which tests so severely the mettle of both band and conductor as this charming and imaginative piece; and its performance on this occasion was marked by a refinement and finish which the previous concerts of the society had certainly not led us to expect. Of the other chief orchestral work of the evening, Beethoven's symphony in C minor, nearly, but not quite, as good an account can be given. It would be unjust to say that it was badly played, but it was here and there a little coarse, and there was a slight tendency to drag the time in the slow movement. It was very satisfactory to find two large works by English composers in the programme. The society is doing good service by affording that opportunity to native talent which is so often sought in vain. The two pieces referred to were an Intermezzo and Scherzo by Mr. Henry Gadsby, composed expressly for the society, and a "Concertino di Bravura" for the violin by Mr. Henry Holmes. Mr. Gadsby is no stranger at these concerts, having written an overture for them last year, which, as well as other of his works, has also obtained a hearing at the Crystal Palace. The Intermezzo and Scherzo are well worthy of him and deserve to be heard again. Of the two the former impressed us the more at a first hearing; its themes are very graceful, and the instrumentation is really charming. Of the Scherzo it is more difficult to speak decidedly, because the performance was in parts wanting in distinctness. Whether the fault lay with the orchestra or with the orchestration it is impossible to say without examining the score. That it

contains interesting points and clever treatment was evident; more than this cannot be said without a second hearing. Mr. Holmes's Concertino, in which the composer played the solo part, is simply a show-piece well written for the violin, but of little musical value. Of its two movements the first produces the impression of dullness, and the second of triviality. Mr. Holmes is so well known as one of our most finished violinists, that it is needless to add that he performed the work to perfection. The vocalists on this evening were Miss Julia Elton and Mr. Edward Lloyd, and the concert concluded with the overture to *Les Deux Journées*.

At Mr. Manns's benefit concert at the Crystal Palace last Saturday, that gentleman on taking his place at the conductor's desk was received with a warmth that must have shown him unmistakably how thoroughly his efforts in the cause of music were appreciated by his audience. As usual on these occasions a programme of even more than average interest was provided. The concert commenced with the overture to *Fidelio*, played to perfection by the band; after which M^{me}. Blanche Cole and Messrs. E. Lloyd and Santley sang the delightful trio, "In better worlds," from the same opera. Though this charming piece is but seldom heard apart from the stage, it certainly loses less than many operatic excerpts by its transplantation to the concert-room. The third item in the programme was Raff's masterly Concerto for the piano in C minor. This fine work has already been reviewed in these columns (*ACADEMY*, January 17, 1874), and it is therefore needless to say much about it here. A second hearing strengthens the favourable impression previously formed of it. The first movement is, from a technical point of view, its cleverest portion; but the second and third possess more charm. As on the occasion of its only previous performance in London, the solo part was in the hands of Dr. Bülow, who was in his finest play, and who contributed not a little to the success of the work. The orchestral accompaniments were rendered with that finish which is to be heard nowhere but at the Crystal Palace, and the reception of the concerto was extremely hearty. The remaining instrumental features of the concert were the well-known "Scotch" symphony and a selection from *Lohengrin*. As the entire opera is so shortly promised at Covent Garden, this selection was especially suitable as a foretaste. It comprised three numbers—the Prelude, the Bridal Procession-music from the second act, and the Introduction to the third act—all familiar to those who attended the concerts of the Wagner Society, but of which only the first had been previously heard at Sydenham. Though, like all Wagner's music, losing much from the want of stage accessories, and from separation from their context, these three pieces are of sufficient independent musical interest to be welcome at a miscellaneous concert. No finer performance could be wished than that under Mr. Manns's direction; and the brilliant introduction to the third act pleased so much as to obtain an encore. In addition to three songs by the vocalists named above, which call for no special remark, the programme also included, besides the pieces already mentioned, a "Concert-piece" for violoncello and orchestra, which served to introduce for the first time to an English audience an artist who enjoys a great reputation on the Continent. This was Herr Jules de Swert, solo violoncellist to the Emperor of Germany. The "Concert-piece," which was the composition of the performer, was hardly a happy choice, being to the last degree lugubrious and dull; we, therefore, prefer to defer a final opinion on Herr de Swert till we hear him in more interesting music, merely saying for the present that he has a very rich and pure tone, excellent intonation, and apparently unlimited execution—in a word, that he is evidently a master of his instrument. He is not, however, free from the failing common to many

vocalists, though less frequent with instrumental performers, of an excessive use of the *vibrato*.

As was observable last year, the band of the Philharmonic Society improves as the season advances—doubtless from playing more often together. The third concert, given at St. James's Hall last Monday evening, was decidedly superior to the preceding one in finish of performance. The first piece in the programme—the overture to *Melusine*—was more than creditably played, and the same may be said of other numbers which followed. The special novelty of the evening was Anton Rubinstein's violin concerto, played by Herr Wilhelmj. The whole work was originally announced; but only two movements—the first and second—were given, and the order of these was reversed. This was not only an inartistic procedure on the part of the performer, but an injustice to the composer, against which a strong protest must be entered. If Herr Rubinstein has conceived his work as a whole (and there is no reason to suppose otherwise), the logical sequence of ideas is destroyed by such a process. What would be thought of a reading of *Macbeth* in which the first act was preceded by the second? The thing is absurd on the face of it; and in the case of a musical work it is hardly less so. So far as can be judged from so distorted a rendering, the concerto is a very clever rather than a very great work. The *andante* is charming, but the *allegro* is as a whole less interesting. The solo part is enormously difficult, and not always effective. Rubinstein, himself one of the greatest living pianists, has too often forgotten that the genius of the violin and that of the piano are essentially different, and many of the show-passages for the soloist are in reality admirably adapted to the piano, but very ill suited to the violin. Herr Wilhelmj's performance was characterised by all that marvellous richness and beauty of tone, and by that unflinching certainty and purity of intonation even in passages of the utmost difficulty, which have been before mentioned as specialities of his playing. In the second part of the concert he also gave two short solos with great effect. The remaining instrumental pieces of the evening were the great *Leonora* overture, Schumann's symphony in B flat, and the march from *Athalie*, all of which are too well known to need remark. The vocalist was Mlle. Elena Corani, who was heard to great advantage in Mozart's charming song "Come scoglio" from *Così fan tutte*; but was less happy in her choice for a second piece of Elizabeth's prayer from the third act of *Tannhäuser*. Admirable as is this piece from the truthfulness of its expression, and effective as it must doubtless be on the stage, its sombre character, and the monotonous colour of the instrumentation, which is entirely for wind instruments, render it hardly adapted for the concert-room. For the fourth concert, on the 10th inst., Beethoven's Choral Symphony is announced, and a pianist new to this country, Signor Ludovico Breitner, will make his first appearance in Liszt's concerto in E flat.

The annual concert of that excellent pianist, Miss Agnes Zimmermann, took place on Thursday evening. The programme included Beethoven's sonata in A, Op. 69, for piano and violoncello, Schumann's "Etudes Symphoniques," Miss Zimmermann's sonata (No. 2, in A minor) for piano and violin, and Schubert's trio in B flat, the concert giver being assisted by Messrs. Straus and Daubert, and Mlle. Lemmens-Sherrington. As the concert took place after our going to press, we are unable to report upon it; but Miss Zimmermann is such an accomplished and thoroughly sterling artist that we risk nothing in predicting a complete success. Of her own sonata we hope to have another opportunity of speaking.

EBENEZER PROUT.

THE musical and miscellaneous library of the late Sir Sterndale Bennett was sold by auction on Monday last by Messrs. Puttick and Simpson.

The collection was a tolerably extensive one, comprising 155 lots of books and 320 of music. While very rich in some departments, it was singularly incomplete in others. The composers best represented were Bach, Beethoven, and Mendelssohn, nearly the whole of the published works of all three being found in the library. On the other hand, the collection contained comparatively few of Handel's or Haydn's works, still less (only four or five lots each) of Weber and Schumann, only one work by Schubert, and absolutely no specimens of the more modern composers, Brahms, Raff, Wagner, &c. The Mendelssohn collection, as might be expected, was peculiarly rich, and included the autograph scores of the *Hebrides* overture and the quartett in D, which realised 52*l.* and 36*l.* respectively. A set of thirteen autograph letters from Mendelssohn to Mr. C. Coventry sold for 63*l.*, and an album containing a probably unique collection of autographs and drawings, and including specimens of the writing of Beethoven, Cramer, Ferdinand David, Goethe, Sir John Herschel, Hummel, Martin Luther, Mendelssohn, Moscheles, Mozart, Sir Walter Scott, Spohr, and Weber, and drawings by the Calcotts, the Landseers, Sir John Philip, W. Mulready, Mendelssohn, and others, was knocked down, after a brisk competition, at 73*l.*

M. AND MME. ALFRED JAEHL are at present in Paris, where they have been playing with great success.

VERDI'S "Requiem" was given three times last week in Paris at the Opéra Comique. The performances at the Albert Hall, announced recently in these columns, are fixed for Saturday afternoon the 15th, and Wednesday evening the 19th inst. For the sake of those who may desire to make the previous acquaintance of the work, it may be well to mention that the vocal score in a very elegant large octavo edition is published by the firm of Ricordi at Milan, and can be obtained at their branch establishment in London, at Charles Street, Middlesex Hospital.

Two new histories of the Opera have just been published at Paris. The one is entitled *Les Treize Salles de l'Opéra*, and is by M. Albert de Lasalle. The other, simply bearing the name *L'Opéra*, is by M. Georges d'Heylli.

RUBINSTEIN'S new opera, *Die Maccabäer*, was produced on the 17th ult. with great success at the Royal Opera House, Berlin. The composer left for Paris two days later to direct there the first performance of his sacred opera *Der Thurm zu Babel*.

CONCERTMEISTER HUBERT RIES, a younger brother of Beethoven's favourite pupil, Ferdinand Ries, has lately celebrated the completion of fifty years of service at the Royal Opera at Berlin. Herr Ries was a pupil of Spohr and Moritz Hauptmann. On the occasion of his jubilee he received from the Emperor of Germany the Order of the Crown of the fourth class.

HANDEL'S *Joshua* has lately been performed in St. Petersburg. It is but seldom that any of this composer's works are to be heard in Russia.

THE deaths of two distinguished operatic artists are announced from Paris—Mlle. Caroline Vandenhuevel (*née* Duprez, the daughter of the renowned tenor singer), and M. Couderc, until recently one of the chief favourites at the Opéra Comique.

HERR RUBINSTEIN has been elected corresponding member of the Académie des Beaux Arts, in place of M. Daussoignes-Méhul, deceased.

MR. DANNREUTHER, last Friday, at his residence, 12, Orme Square, concluded a course of lectures on Beethoven, the object of which was to describe, in a manner intelligible to persons not specially learned in music, the character of the numerous technical innovations to be found in Beethoven's works, and to account for these innovations as the necessary outcome of the master's ethical and poetical nature.

LITERATURE.

INTERNATIONAL AND COLONIAL COPYRIGHT.

Report of the Hon. Secretary of the Association to Protect the Rights of Authors. The Canadian Copyright Bill of 1875.

BY the formation of the society of which Mr. Tom Taylor is the Chairman, and Mr. Moy Thomas the Hon. Secretary, public attention is once more called to the vexed question of copyright and stage-right. So many abortive attempts have been made to dispose of the grievances which, in a greater or less degree, authors have from time immemorial experienced at the hands of the Legislature, that it would not be wise to feel sanguine of the early success of the new movement. Nevertheless at the present moment circumstances appear to favour the cause of copyright reform. The Government, by introducing a Bill on the subject—although it only deals with a small fragment of the question—have given authors an opportunity of raising more important issues. They have lost no time in stating their case, and in asking the Government to deal with it. At their request, Mr. Edward Jenkins has given notice of his intention to ask Mr. Disraeli whether he will consent to the appointment of a Select Committee to enquire into the subject; and it is reasonable to expect that the right hon. gentleman, in giving his answer, will be moved by the feeling that he is an author as well as a Minister. Meanwhile the Government of Canada is now engaged in placing on the Statute Book of the Dominion a law which will probably secure to English authors who are able to comply with its provisions a substantial amount of protection; and it is, perhaps, not too much to hope that the new Act, when it comes into operation, will tend to influence the Congress at Washington to give a similar measure of protection within the limits of the United States.

The case for the authors has been both ably and concisely stated by Mr. Moy Thomas, and his report may justly be regarded as an authoritative exposition of the opinions of men who have the best claim to be heard on the subject. One piece of injustice to which he draws attention is the loss of rights resulting from the first production of a work out of the United Kingdom. Whether the work be a play or a book, if the English author, from either choice or necessity, makes arrangements for a first publication abroad, he is held to have forfeited his title to a copyright in his own country. Both Mr. Dickens and Mr. Boucicault have suffered from this anomaly of

the law; and we need hardly state that the Association proposes to secure to the author a copyright without reference to the original place of publication. Another question, also coming under the head of domestic copyright, which calls for interference on the part of the Legislature, is the dramatisation of novels. As the law now stands there is no remedy for acts of piracy of a most intolerable character. An adapter may, for his own profit, use both the characters and the plot of a novel—he may even plagiarise the language of the story, and so make up for his inability to construct a dialogue—without either asking the unfortunate author's permission or being subject to any sort of legal responsibility. Every now and then a sudden eruption of irritating controversy reminds us that the complaints so justly made by Sir Walter Scott and Mr. Dickens are not mere curiosities in literature, but that dramatic plagiarisms of works of fiction take place now as they were wont to take place thirty or fifty years ago. The Authors' Association proposes that an Act should be passed giving to the authors of works "capable of being adapted to the stage or publicly recited for profit," the sole power of dramatising such works. It has been objected that juries would find it difficult to institute a comparison between an unauthorised dramatic version of a story and the original work; but if there be any force in such an objection, it would apply equally to other things still more complicated. It would manifestly be easier for an average jury to master the facts of a dramatic plagiarism than to puzzle its way through the intricacies of an obscure patent case.

The Association proposes to deal, on the basis of reciprocity, more equitably with foreign authors and dramatists than is now the case. By the Act of 1852 (15 Vict. c. 12) only five years' protection is secured to translated works, and a foreign dramatist is required to deposit within three months after registration of the original work a literal translation of his play. An English author is not compelled to publish his play in order to obtain protection for it. Moreover, the translation itself is practically useless, because the object of the foreign dramatist is to secure, not a literal rendering of his work, but such an adaptation of it as will suit the English market. The Association is anxious to place the foreign dramatist as nearly as possible on the same footing as his English brethren; but if there must be any limitation of his rights, then it is suggested that

"he should bring out on the stage in the British dominions an adaptation or translation of his work, and should register the title of the same as an adaptation or translation of such work within three years—the time allowed for a complete translation of a book."

The Association abstains from entering into details of the copyright question in relation to the United States, the reason assigned being that "this is a matter not connected with any defect in our own law," but we do not understand that the action of the Association is limited to the remedying of defects in our own law, and certainly no subject of the kind is entitled to more consideration than the question of a copyright

treaty between the two countries. Moreover, as the committee propose to co-operate with American authors, "who," they say, "are equally with ourselves sufferers under the present system," it is, we think, desirable that they should explain the principles upon which they intend to act in this matter. The Copyright Act of 5 and 6 Vict. c. 45 is most liberal in its treatment of foreign authors. While no British author, whether resident or non-resident, is able to obtain a copyright in the United States, our law refuses to take cognisance of the nationality of an author provided that when his book is published he is domiciled in the British dominions. In the judgment given by the House of Lords in the case of *Routledge v. Low*, the principle was definitively laid down that if a literary or musical work be first issued in the United Kingdom, and if the author is resident on British soil at the time of publication, he may, irrespective of his nationality, acquire all the privileges of our Copyright Act. Washington Irving, Mr. Longfellow, Mrs. Stowe, and other American authors have, we believe, availed themselves of the liberal state of the English law in this respect. But few will deny that a concession of this nature, even if it were reciprocated by the United States, falls far short of what justice demands. Even if English authors, by personal residence in the Republic, could obtain a copyright in that country as well as their own, it is manifest that only a very limited number of them would ever profit by so slender a measure of reciprocity. We are aware that the injustice of the existing system has been mitigated by the honourable conduct of a few great American houses in paying for advance sheets of works published in this country. But these payments are still the exception, instead of the rule, and it is well known that they are merely a recognition of the value of the advance sheets as such to the American publisher. It must also be remembered that if there be an element of spontaneous liberality in the transaction, the English writer after all is in the position of receiving as an act of grace what he ought to be able to demand as a right. But there have been many appropriations which belong to a very different category. For example, the American Government has purchased for the use of its army many thousands of copies of a well-known and expensive English work on surgery. The author has not received a farthing from the United States, whereas if he had had a fair interest in the American edition he would have been pecuniarily a gainer to the amount of many thousands of dollars. Similar examples might be cited, but it would be a waste of space to multiply illustrations of a condition of things the existence of which is only too notorious.

The Association announces its intention to act in concert with American authors; and assuredly the class thus referred to has a strong interest in promoting an international copyright. At the present time the American reading world is inundated with cheap reprints of English books, and the effect of the large circulation enjoyed by these works, which cost American publishers

either nothing at all, or only what they give for advance sheets, is of course to subject the American author to a competition which depreciates the value of his literary wares, and therefore injures his pecuniary interests. It is true that, except as a matter of sentiment and good feeling, we have nothing to do with this point of view; but having regard not only to all the fine things that are said in praise of our common origin and our common literature, but also to the ordinary principles of fair play, it is surely not unreasonable to expect that one day the two great Anglo-Saxon nations will be willing to agree to a system of international copyright at least as liberal as that which exists between Great Britain and France or Germany.

The position of the law of copyright in Canada has also claimed the attention of the Authors' Association. The law in that dependency has the twofold disadvantage of being very complex and, at the same time, a practical nullity. At an early period large numbers of piratical reprints were imported into Canada from the American border, and in 1847 an Imperial Act was passed enabling Her Majesty to suspend so much of the Copyright Act of 1812 as prevented the introduction of reprints into the colonies, provided the local legislatures gave adequate protection to English authors. The Canadian Act sought to discharge this obligation by imposing a duty of $12\frac{1}{2}$ per cent.—subsequently raised to 20 per cent.—on American reprints, and accordingly an Order in Council legalised on these terms the trade in such reprints. In 1868 another Colonial Act was passed, which granted copyright privileges to English authors whose works were printed, published, and registered in Canada, and the importation of all pirated editions of such works was absolutely prohibited. There is grave reason to doubt the legality of this statute; but this is a matter of no practical importance, for hitherto Canadian legislation of every kind has utterly failed to protect the long-suffering authors of the mother country from piracy and plunder. The Act of 1868 proved a dead letter, while, owing to the difficulties incident to the collection of a paltry duty assessed upon fictitious values, the sums credited to English authors have been so contemptible that they would hardly have paid the cost of transmission to this country. It appears that after Mr. Charles Reade, Mr. Wilkie Collins, and Archbishop Trench had executed certain elaborate formalities set forth in the Act, they would have been entitled to receive on account of the duties which last year were collected on American reprints of their books an aggregate sum of two shillings and sixpence, Canadian currency—surely the sorriest jest a Custom House ever played.

The Bill lately introduced into the Canadian Parliament does not differ essentially in its leading principles from the Act of 1868. It provides that

"any person domiciled in Canada or any part of the British possessions, or being a citizen of any country having an international copyright treaty with the United Kingdom, may, by a simple act of registration, costing one dollar, obtain a copyright in Canada."

This apparently very satisfactory provision is qualified by subsequent clauses. Clause 10 provides that an author may obtain an *ad interim* copyright for a period of one month after the date of publication elsewhere; but, unless his work be printed and published in Canada within a month, he is no longer secured protection against pirated editions. English authors would thus be able to deal directly with Canadian publishers, and by timely publication of their works in the Dominion secure the benefit of a permanent copyright. On the other hand, it is by no means clear that, if an author were unable to comply with the requirements of Clause 10, he would be allowed to take up a copyright at a later period, while Clause 15 gives to Canadian publishers the power to acquire a species of copyright in books which have been published in the United Kingdom, but not copyrighted by their authors in the Dominion. The Canadian publisher, it appears, would be enabled to enjoy a monopoly of such works against American reprints; and although the bill declares that the importation of copies legally printed in the United Kingdom shall not be prohibited, yet if the colony were flooded with cheap Canadian editions which paid no royalty to the author, this concession would be of little practical value. But Mr. Mackenzie's Government has shown so fair a spirit towards English authors that it is impossible to believe that it contemplates the building up of a Canadian monopoly at their expense. No changes at variance with the Act of 1842 can be made without Imperial legislation, and probably the appointment of a Select Committee of the House of Commons would afford the best guarantee that when Parliament is called upon to deal either with this or with any other branch of the copyright question, it would have before it all the materials necessary to enable it to arrive at a just decision. F. W. CHESSON.

Wanderings in the Interior of New Guinea.
By Captain J. A. Lawson. (London: Chapman & Hall, 1875.)

A FEW weeks ago the President of the Royal Geographical Society, in alluding to Captain Moresby's recent survey of the eastern and only remaining unknown part of the coast of New Guinea, expressed an opinion that this *terra incognita* was so rapidly being opened up that it would soon cease to form a virgin field for exploration. To this reply was made that the interior was still wholly unknown, a state of things due partly to the unhealthiness of the coast lands, and partly (though on this head accounts have greatly differed) to the treacherous and savage character of the natives. Had the meeting been possessed of the experiences narrated in the book now before us, they would undoubtedly have enlightened the discussion.

Captain Lawson's work is certainly one of the most remarkable books of travel that have appeared for some time. We learn from it that this island, which is either the third or second largest in the world (authorities differ on the point), presents no exceptional difficulties in the way of explorers, and that its physical features are such as

amply to reward all researches. The author informs us that he reached New Guinea in June, 1872, having sailed thither from Sydney in a brig which was in the habit of making trading voyages between the two countries. He landed at a village called Houtree, situated on the west side of the Gulf of Papua, and according to his observations in longitude $143^{\circ} 17' 8''$ E., and latitude $9^{\circ} 8' 18''$ S. From hence he appears to have struck northward and to have penetrated right across the island to a point within thirty or forty miles of the north coast. Here we must remark that the sketch-map accompanying the work, though nicely drawn, has apparently been compiled solely from the narrative and is a little misleading. There is no scale, nor are bearings given; while we learn, after communicating with the author, that the furthest point reached is not due north (as might be assumed from the map), but north by west, of Houtree, the starting-point.

It is impossible in the limited space of a short review to convey a fair idea of the wonders of this country as related to us. In all equatorial regions creation seems to run riot and exaggerate its productions, but those of New Guinea would seem fairly to eclipse all others. Butterflies whose expanded wings measure a foot across, scorpions and spiders thirteen inches in length, apes over five feet high, snakes (or rather a snake) forty feet long, fresh-water fish ten and twelve feet long, trees three hundred and thirty-seven feet high, and, to crown all, a mountain overtopping by more than 3,000 feet the giant Mount Everest in the Himalayas, the hitherto highest known mountain! The height of this wonderful peak, which its discoverer has perhaps appropriately named Mount Hercules, is stated by him to be 32,783 feet above the sea, but this calculation cannot of course be considered as absolutely exact. Captain Lawson has since modestly disclaimed any great pretensions to accuracy in his observations, while even if he had possessed the best appliances, the measurement of such a lofty peak would have been a long, delicate, and troublesome geodetic operation. Still, it is quite conceivable that the mountain may be one of the loftiest known. A partial ascent of the eastern side of Mount Hercules made by the author and his native followers appears to require more explanation. In nine hours (stoppages included) they managed to climb to a height of 25,000 feet, an exploit which, both for the rate of progress and for the extraordinary height attained, surpasses anything we have heard of.

The fauna discovered by Captain Lawson is vastly different from the specimens hitherto met with. Wallace pointed out that New Guinea with its luxuriant forests, uniformly hot, moist and evergreen, presents a wonderful contrast to Australia with its open plains, dried-up rivers, and changeable temperature and climate, and that, nevertheless, the mammalia appeared to be closely connected, no fewer than fourteen, out of a total of seventeen known specimens in New Guinea, being marsupials. But in the present work we read of buffaloes, bisons, wild oxen, deer, foxes, and *moolahs* or New Guinea tigers, a species not unlike the Bengal repto-

sentative of the same royal family, and a skin of one of which the author has been fortunate enough to bring home. The lovely birds of Paradise for which this island is so famous were also met in great variety and numbers, as well as a beautiful red and blue kingfisher, apparently identical with the *Tanysiptera* of Wallace.

We should be glad to hear that the author's health, which we believe has suffered disastrously from his explorations, would admit of his reading a paper before the Royal Geographical Society or some similar body. There are several points on which it would be very desirable to have further information, while the results of his journey, though perhaps not strictly available for incorporation in our maps, are so remarkable as to be fully worthy, if proved to the satisfaction of scientific authorities, of some recognition. He has discovered, besides Mount Hercules, two active volcanoes, an extensive lake of from sixty to seventy miles long, a large river, which, according to native account, debouches into the sea two days' journey beyond his furthest point, and a fine cataract 900 feet wide, with a fall of 179 feet. This river, we venture to think, is very probably the large river the traces of which Captain Moresby came across in the vicinity of Cape Della Torre. It is difficult, from the extremely scanty information we still possess of the island, to form any clear notion of its geography; but the interior is evidently extremely mountainous, the principal range or backbone of the island being the one of which Mount Hercules and other mountains form part, while to the south there occurs another range, which our author named the "Papuan Ghauts," on account of their similarity to the Western Ghâts of Hindostan. The former of these two New Guinea mountain chains is probably connected with the Owen Stanley Range, in the south-east of the island. On his return journey Captain Lawson crossed several rivers, which, in his opinion, all flow into some large river to the east—a very probable circumstance, as the Fly River, according to the observations of the present Admiralty Hydrographer, must drain a very large part of the eastern half of the island.

Regarding the disposition of the natives, Captain Lawson speaks highly of those he met on the south coast, though he lost two of his followers, and narrowly escaped with his own life in an *embroglio* with some natives in the north. But this is hardly to be wondered at. The Europeans who trade here do not scruple to rob the natives in the meanest fashion, while the Chinese and Malays murder each other (and no doubt occasionally the aborigines also) in cold blood. What wonder that the savages should learn like habits? Gold is known to exist in the island, and silver Captain Lawson found to be very common. Under these circumstances, it is more than probable that the talked-of project of colonising the eastern portion of New Guinea from Sydney will shortly be practically carried out. And spite of discouraging ministerial replies, and the anti-annexation fever, which, though it has received an unkind check in the case of the Fiji Archipelago, is still prevalent, we cannot but regard with complete satisfaction the pro-

spect of one of the fairest and most productive of the unclaimed regions of the earth falling to the share of England.

C. E. D. BLACK.

EPOCHS OF HISTORY.

- (1) *Edward III.* By the Rev. W. Warburton. With Three Maps.
- (2) *The Houses of Lancaster and York, with the Conquest and Loss of France.* By James Gairdner. With Five Maps. (London: Longmans & Co., 1875.)

THESE books, the second of them by the well-known editor of the *Paston Letters*, form part of the series entitled "Epochs of History," edited by Mr. E. Morris. The materials for history have now become so extensive, and our modern histories are on so large a scale, that it has become necessary, for schools at least, to supply small and cheap books which give a complete picture of some short period, and illustrate those characteristics which exhibit the life of a people as well as the policy of their rulers. Edward III.'s reign gives us a complete picture of this kind, and Mr. Warburton has done it full justice. The materials at his command are far better than those available for the history of the Wars of the Roses, and he has had the advantage of Mr. W. Longman's *Life and Times of Edward III.* having appeared so recently. Most of us know the reign mainly from Froissart's picturesque work, but that courtly and chivalric narrative hardly touches the moral aspects and deeper social and political movements of the epoch. Froissart was himself attached to the English court, and his last book ends at the death of Richard II. with a lament over the downfall of the great House of Edward III. It is remarkable, however, that in the later revisions of his work, with which we have only lately become acquainted, Froissart alters his tone, and manifests an increasing dislike of England and the English. Public opinion throughout Europe had turned against them, and a sympathy was felt for France in her time of distress which had not existed in the early years of the war. The frightful desolation of the country round Paris deeply impressed Petrarch when he revisited France in 1360, and we can see how the great struggle interested the Italian chroniclers such as the Florentine Villani—who is the only writer that mentions the employment of cannon at Creci by the English, though Froissart speaks of their use at Quesnoy, in Hainault, four years before (i. ch. 47). Florence was, in fact, deeply concerned in the English king's campaigns. Her leading banking-houses, the Bardi and Peruzzi, had been supplying the funds for the invasion of France, on the security of the English taxes, the collection of which had been put into their hands. A letter is extant from the magistrates of Florence (Ellis's *Original Letters*, iii. i. 41), imploring the King to pay his debt to these houses; but his success came too late to save them, and they became bankrupt just before his victory, involving Villani and many others in their ruin. Then, again, the Black Prince's fatal expedition into Spain in support of Pedro the Cruel

gave France a most valuable ally, and as John of Gaunt married Pedro's daughter, the later contest with Spain had the character of an embittered war of succession, and the English fleet was destroyed by the Spanish off Rochelle. The movement in Flanders under Van Artevelde, in favour of Edward, had worn itself out, and a reaction had set in. All the circumstances which had at first favoured the English were now reversed, and few such brilliant reigns have had such a disastrous and dishonoured close. Mr. Warburton has well drawn out the contrast, and has shown the change of opinion on which so much depended:—

"The newly annexed districts hardly disguised the reluctance with which they submitted to English rule, and even the provinces which had never been separated from the English dominion began to feel that they belonged by natural right to France, and to turn their eyes towards Paris as the proper centre of their national life. The time was long passed for Aquitaine to glory, as it once did, in its independence of the king who reigned at Paris; and the existence of a foreign principality within the geographical limits of France was doomed from the moment that it became 'an anachronism'—that is to say, a fact out of keeping with the times."

He also rightly lays stress on the changed tone of the Parliament in England. Immediately after the disaster at Rochelle it represented to the King in plain language that, in consequence of the withdrawal of the franchises of many seaports, they were ruined and uninhabited, and the shipping nearly annihilated; that merchants were so interfered with in their affairs by various ordinances of the King that they had no employment for their ships, and consequently hauled them up on the shore to rot; that the masters of the King's ships impressed and took the ablest seamen of other vessels, which were thus left without persons to manage them, so that many of them were lost and the owners ruined. The prosperity of the nation too and its financial resources had fallen to a very low ebb towards the end of the reign. Wheat stood at famine price in the year 1369-70. All these causes combined led to the important meeting of the "Good Parliament" in 1376 which overthrew the power of John of Gaunt for a while, and attempted a series of reforms.

Here Mr. Warburton's narrative is overlapped by that of Mr. Gairdner, who has rightly begun with the close of Edward III.'s reign, when the seeds of the great Civil War of the Roses were already sown, and the Duke of Lancaster was already the object of intense suspicion to the elder branch of the royal house. The period of the Civil War itself is very obscure, and needs all the light which the course of previous events can throw upon it. The Tudor writers, Hall and Holinshed, look back on it from the Lancastrian point of view, and their statements must be received with caution; but through their influence on Shakspeare they have completely moulded our present conceptions of that age. Though Mr. Gairdner is well acquainted with the contemporary testimony, he is somewhat loath to give up the traditional view, and perhaps this may be to some extent right. But is not the evidence for Gloucester's having plotted against Richard II. in 1397 more than doubtful? Was

the Parliament really "desirous of restoring authority to its old foundations" (p. 45)? It was surrounded by the King's troops, and was largely composed of "militibus qui non fuerunt electi per communitatem, prout mos exigit, sed per regiam voluntatem" ("Annales," in Riley's *Trokelowe*, p. 209). Nothing else can explain its delegating its whole powers to a committee of twelve lords and six commoners, special friends of the King, who were to act after its dissolution. The King even obtained a bull from the Pope to confirm its acts, as the "Annales" complain, "quamvis corona, &c., fuerint ab omni tempore retroacto adeo libera quod dominus summus pontifex nec aliquis alius extra regnum se intromittere debeat de eisdem," the exact view of the early as well as the later English church. Again, is there any real contemporary authority for Bishop Merks' speech in favour of Richard II.? Modern writers of course accept it on Shakspeare's authority. So, again, the stories about Henry V.'s youth can have very little foundation; for that about Judge Gascoigne, Lord Campbell can only quote "the constant tradition of Westminster Hall!" The Elizabethan chroniclers never missed a picturesque story, but, unhappily, such stories—e.g., that about Cardinal Beaufort's deathbed—are mostly too good to be true. The well-known story of Margaret of Anjou and her boy flying into a forest, and being saved by an outlaw, comes only from the Continuator of Monstrelet, who puts it at an impossible date, and places the scene of it in Hainault; Margaret, however, was in France from 1463 to 1471. So, again, the account of Warwick going to France to demand Bona of Savoy for Edward IV. is not in the oldest authorities. The details of the story about the two little princes being murdered in the Tower come from *The History of Richard III.* attributed (doubtfully) to Sir Thomas More, the first very readable book in modern English prose. But the mistakes and contradictions in that famous book are the real foundations for Horace Walpole's *Historic Doubts*, most of which disappear when the real dates and circumstances are compared. The murder itself was not doubted by well-informed contemporaries such as Comines and Du Bellay, but the prison houses of those ages did not give up their secrets, and it was only the popular imagination which created the details of Arthur's murder by John, or Richard II.'s by Exton. Perhaps our author might have referred more to the foreign authorities at a period when the English chroniclers are nearly worthless. Sharon Turner was the first who gave anything like a tolerable account of the Wars of the Roses, and Pauli has added something. The foreign writers show us that the quiet ending of Henry IV.'s reign was mainly due to the death of his restless enemy the Duke of Orleans, who had sent a French army to Milford Haven to support Owen Glendower. The struggle between France and Burgundy largely influenced the course of English affairs. The two claimants of the English throne were for some time pawns on the French chess-board. Hence the French and Burgundian chroniclers are of great use here. Comines was at Calais, looking on the turmoil

in England with the keenest observation, and Chastelain shares to the full the Burgundian hate to Warwick the Kingmaker, whom he describes as a miserable creature always dropping at the nose. Perhaps some picturesque touches might have been added out of Capgrave, e.g., the scene at Henry IV.'s death-bed, and Henry V.'s wakening on the morning of Azincour; in the night all noise was forbidden in the army, nothing was heard but the rushing of the rain; and when the King awoke, he asked the time, and "they said, it is the hour of Prime. Then said the King, now is good time, for all England prayeth for us, and therefore be of good cheer, and let us go to our journey." The welcome of Henry V.'s army in England after the victory "with an enthusiasm that knew no bounds" is too strongly put. Hear the other side: "His coming home was a subject of sorrow, his nobles being so oppressive" (*Political Songs*, ii. pp. xxvii., xxix.). But Mr. Gairdner's general account of the way in which the War of the Roses sprang out of the French war is excellent. When Henry V. invaded France, there was a mad king, an intriguing and vindictive queen, and a factious nobility. By his marriage with the mad king's daughter the curse was transferred to his own line, and the civil war broke out when there was an imbecile king, a partisan and vindictive queen, and a nobility engaged (as Comines remarks) in a faction fight for place.

The maps, too, are very effective: we should have almost liked one or two more; like that in Mr. Kirk's *History of Charles the Bold*, which illustrates the parallel march of Margaret's and Edward's armies in 1471, when both were making a push for Tewkesbury, Margaret in the low ground along the Severn, while Edward's cavalry rode through the hot summer day along the waterless Cotswold range. A little map, like that in p. 97, of Henry V.'s march from Harfleur to Azincour, tells more than whole pages of description could do, and the other maps are equally good. A general reference to the atlas has little effect on students; a map opposite the page at once draws attention. Both Mr. Warburton's and Mr. Gairdner's books hold their own well in the series, and the series itself promises to be of much use.

C. W. BOASE.

Musical Composers and their Works. By Sarah Tytler. (London: Daldy, Isbister & Co., 1875.)

MISS TYTLER has followed up her biographical volumes on "Old Masters" and "Modern Painters" by an unpretentious "Handybook" on Musicians. The modest preface disarms adverse criticism: "The book is designed for the use of young people in the course of their musical education, and for older persons who have neither time nor opportunity to refer to original sources of information;" it is "a simple account of the great men of whom it treats, and of their works," and it is neither attempted nor desired to make it exhaustive. Thus the authoress introduces her work, and it remains for the reviewer to acknowledge heartily

that she has given more and better than she professes.

Exhaustive this collection of biographies may not be, yet as the list runs from Dunstable to Wagner, and even includes a line or two on the Christy Minstrels, the reader cannot complain. The authoress has evidently been most anxious to do equal justice to schools and individuals. The writings of especial exponents are freely drawn upon, and with the exception of a rather droll dislike to the irregularities, the uncomfortable manifestations of genius, and a corresponding admiration for the ordered talents of middling men, Miss Tytler's accounts are fair as they are intelligent. A few words are given to the mention of the various musical instruments, which have grown in perfect appliance with the growth of musical science, the demands of composers, and the capabilities of *virtuosi*. Then comes a too short chapter on the earlier writers: Dunstable (who flourished in the first half of the fifteenth century, and whose fame rests on his epitaph by Fuller, and on one extant composition), Bull, Gibbons and Purcell—Englishmen all; Palestrina (who, according to Mr. Hullah, learnt his art of a Belgian settled in Rome), the Scarlattis and Stradella, Italians. These names fill, as regards music, the sixteenth and first half of the seventeenth centuries. Tribute, it may be seen, is paid to the place occupied by England in the early annals of music.

With Bach, Handel, Gluck, Haydn, the limits of the biographies expand in scale, and are proportionably pleasant and profitable. The moral of biography, says Emerson, lies herein, that you cannot hear of personal vigour of any kind, of great power of performance, without taking fresh resolution; and these four men, unlike as they might be in colour and depth of genius, are of those pioneers and captains in art who, as Cecil said of Raleigh, could "toil terribly." The notice of Mozart follows the touching story of his life into close personal detail. Miss Tytler seems rather over-anxious to run down the Weber family out of which Mozart chose his first love in one sister, and afterwards his wife in another; indeed, she adds a sensational touch to the pathetic and quickly run career by pointing bitter shafts at the "exacting selfishness" and "incapacity" of Mozart's wife. Costanze was probably only a commonplace woman, who grew hypochondriacal and consequently burdensome after her marriage, but at any rate she kept her husband's love to the end, and it may be inferred had some worthy charm. The trick of heightening effect by too curious a scrutiny into the domestic life of artists is not worthy of our authoress. It certainly jars upon one, while a smile is provoked, to read Miss Tytler's condescending comments upon Beethoven's yearning out of his grand solitariness for a companion soul who might give him love, and "strengthen him in virtue." Nor is it pleasant to follow her lead in realising the grotesque side of the Master. "The gods of fable are the shining moments of great men:" may we not, for heaven's sake, keep our hero-worship clear of the interviewing spirit, and escape knowing what genius eats for dinner, or how it fastens its shoes?

Seldom, however, I must add, does Miss Tytler err through the want of taste and right feeling.

The biographies of Weber and Mendelssohn have been fully brought before the public in the memoirs from which Miss Tytler quotes; the same with Spohr, Schubert, Schumann, Chopin and Moscheles. The bulk to which the notice of the last named has swelled relatively to its neighbours is only to be justified upon the ground that the incidents in the life of that worthy man are a commentary upon the artists with whom he was associated. But Moscheles is a musician after the biographer's heart—personally industrious, genial and domestic: she never quite warms to the more erratic composers. The notice of Chopin, for instance, is marked by repugnance: his music is found unhealthy, however sweet, and Moscheles is twice quoted to stamp it as "hardly the work of a profound musician," and exhibiting harsh *inartistic* modulations so like those of a dilettante! The life of Chopin affords only too much excuse for moralising and for "telling" anecdotic points: Mr. Haweis is chiefly drawn upon, who in his turn seems to have borrowed from Liszt's exquisite monograph on Chopin, without paying interest. Chapter vii. disposes of Cherubini, Spontini, Rossini, Bellini and Donizetti somewhat perfunctorily. It is strange that Miss Tytler does not seem aware that Cherubini's *Medea* has often been given in the London opera season, when she speaks of its holding a high place in the German repertoire. In the paragraph on Spontini it might have been as well to indicate his importance in the development of orchestration. But into these concluding chapters of her volume the writer has attempted to crowd so many subjects, that to miss a point here and there is almost inevitable, especially in compiling principally at second hand. The reader may infer from these comparatively slight errors how little cause for fault-finding can be discovered.

An effort to notice all the modern and contemporary composers of mark is a distinctive feature of these biographies, and though in some cases merely a name is given, it is done in such a way as to indicate the place of the artist in the modern history of music, and makes the book more complete. The last chapter is devoted to Richard Wagner, and is drawn chiefly from the writings of Mr. Dannreuther and his translations of Wagner's pamphlets.

Miss Tytler again shows her conscientious spirit of justice in a tribute to the energy and power of the modern master; and as an example of her style of treatment when rarely venturing out of personal history or quoted criticisms into independent opinion, it may be given:—

"Of the indomitable energy of the man, who, while he himself acknowledges the absurdity of his youthful aspirations, and, while he professes such a gradual mental growth and development as have demanded, in a fitting sacrifice, the modification of many of his views and paradoxes, and even the relinquishment (as in contradiction of his more mature convictions) of some of his work, yet who has still held strenuously by the inspirations of his genius and worked it out with unflagging zeal and dogged persistence, there cannot

be a question. Of his partial success, also, there is no longer room for a difference of opinion. In spite of strong opposition and prejudices at least as violent as the composer's partialities, Wagner's high place in the concert room is now an accomplished fact. It has again and again been admitted lately in very different quarters that no candid judge can any longer deny the great merit, even if it be alloyed with great faults, of his instrumental music. Henceforth, in this line at least, Wagner's must be a potent name in the musical world."

This rather long-winded but candid paragraph is a fair instance of the intelligent way in which Miss Tytler observes and states, while the mistaken tribute of placing the essentially dramatic Wagner in high position in the "concert room," where his works can only find representation by a species of musical mutilation, shows how wise the writer has been in limiting her original matter to the biographical, and relying for musical criticism on the writing of others.

The object of the book has been to place the lives of musicians before the reader, not merely in their artistic aspect, but in their general relations; at the same time to indicate on accepted authorities the position of each artist as regards his predecessors and successors, and the especial characteristics of his work.

The volume as it stands is well compiled, and forms about the best simple hand-book on the subject that has yet appeared in England.

A. D. ATKINSON.

CANON SWAINSON ON THE THREE CREEDS.

The Nicene and Apostles' Creeds: their Literary History, together with an Account of the Growth and Reception of the Sermon on the Faith, commonly called "The Creed of St. Athanasius." By C. A. Swainson, D.D. (London: John Murray, 1875.)

"WHEN in the very conception of a problem, the intellectual activity is engaged in the service of a religious interest, a scientific solution is not to be looked for," says the learned biographer of a well-known controversialist; but when the sentiment has been taken out of its fine setting, every body must admit that it cannot be accepted without qualification. Most historians write with a bias of some sort, ecclesiastical historians never without one. Chroniclers of creeds and ritual would never have the heart to go through with their work were there not some exciting interest in the background, and in nine cases out of ten it is a controversial one. Waterland's *History of the Athanasian Creed* was compiled under the spur of controversy by its author in the eighteenth century: Canon Swainson's, it may be said without disparagement, in the nineteenth. Controversialists are just as apt to be influenced by a pure love of truth as other men, but the charm of their labours consists in the hope that they shall find truth on their side.

One of the first reflections which the perusal of Dr. Swainson's book suggests is to how great an extent orthodoxy and heresy changed sides in the Middle Ages, and have so remained ever since. In the good old days of the Fathers it was the boast of the church to have but one creed; and of

Arianism to bring out a new creed every day. In medieval times orthodox creeds multiplied in number and increased in length till they became interminable in both respects: and most of them gloried in a name which earlier ages would have shrunk from attributing even to the creed of the Church, viz. that of "the Catholic faith." That this name has proved a serious snare to most advocates of the early origin of the Athanasian Creed, Dr. Swainson has proved to demonstration from the stern logic of facts. "Catholic faiths" grew on every bush, and in as great profusion as blackberries. Even of "faiths" or "symbols" of St. Athanasius there were not a few. Charlemagne called the creed of Pelagius the heretic the creed which he had learnt in the Catholic church, had always held, and held then. Persons who scouted the notion that the great Karl could have so demeaned himself as to have published the Athanasian Creed as a work of St. Athanasius, to the confusion of all after ages, for controversial purposes, must have been in blissful ignorance that it was he who first quoted this creed of Pelagius, in a purely controversial work, as the creed of St. Jerome. Now, if he did this, why not the other?

Next, it is quite certain that the "Fides Athanasii" to which his monks on Mount Olivet referred the Pope, in justification of their doings in the East, could have been no other than this creed; for of all the treatises on the faith either written by or ascribed to St. Athanasius, no other was ever quoted, or could be quoted, in direct support of the "Double Procession," as it is called. Dr. Swainson, indeed, asserts that this is also taught in one version of a "libellus fidei" ascribed to St. Athanasius. Had he quoted the passage, instead of trusting to his recollections of it, he would have probably seen his mistake. The "libellus" in question went by more names than one. As the "symbol of Pope Damasus," and as a "sermon by St. Augustine," it has been interpolated with the words, "de Patre Filioque procedentem;" but as "libellus fidei S. Athanasii," never.

It is the creed alone, then, that can have been in the hands of these monks of Charlemagne; and as they depose to having received from him a homily of St. Gregory in which the same doctrine was set forth, the probability is that the creed also, which they had with them, was put into their pockets by him. At all events, their mention of it is the first explicit historical testimony to its existence. The second is a capitulary which Pertz asserts—and has re-asserted in the most positive terms, on his accuracy being impeached, offering to maintain it against all comers—their master published just before this, or just after, in which it is said:—"These are the things which all ecclesiastics are ordered to learn: the Catholic faith of St. Athanasius," &c. A document so designated by him about this time could hardly fail to have been identical with the one quoted by his monks. It is the first and only mention in his capitularies of any document bearing that name. Next in order come the treatises written, as they state, by his express order in proof of the Double Procession, in which the citations

from this creed are sufficiently marked and prominent.

All these being literally the earliest historical testimonies producible for its existence, and all alike referring to him as their author or promoter, it would seem impossible for an unprejudiced mind to come to any other conclusion than that, by whomsoever it was named or composed, all subsequent ages are indebted for their knowledge of it, and for their knowledge of it under its false name, to him.

Dr. Swainson has certainly not improved his position by drifting away from these moorings: and he seems unconscious that whether it included every clause then which it includes now, is a point quite secondary. No doubt the creed which St. Isidore characterised as the Apostles' was the identical creed which goes by that name now, though it is recited by us with two more clauses than it was by him. No doubt the creed described in our Articles as the Nicene Creed is identical with the creed published at Nicea, though it is now used with the additions made to it by the Council of Constantinople. True, the genesis of a creed is a subject of antiquarian interest for scholars, especially when it tends to remove fallacies, yet its importance is relative; and beyond all question what even scholars want to know most about the Athanasian Creed is, (1) when it was first used as a whole; and (2) who invented its name. Till this has been solved, the points on which Dr. Swainson has expended so much laudable research and industry—viz., how soon it assumed the complete form it now bears; how many different readings are to be found in the earliest copies of it; and last of all, how many false brethren it had, will fail to attract the general public. Now and then, indeed, when it has been shown conclusively that one of the stock passages hitherto quoted in evidence for it refers to another equally spurious piece, named after the same saint, but long since forgotten, a real service has been done for all time.

The object of Charlemagne in directing attention to this creed in a capitulary, and to the creed of Pelagius in the Caroline Books seven or eight years before, was, as Dr. Swainson truly remarks, not so much to convert the Greeks to his way of thinking on the Procession, as the Pope. Both were forgotten by him as soon as the purpose for which they were produced by him had been served. He had too many irons in the fire by far to think over much of one; and it is a characteristic of his professions of faith that he coins a new one for each occasion, and never employs the same twice. It was simply because the Athanasian was found most harmonious for recital and easiest to learn by heart, in addition to its dialectic merits, that it obtained in after ages first a place in the Breviary, and then deference to it as a standard interpreter of the faith in the schools.

What Dr. Swainson's book will be consulted for most abroad and at home is the profusion of MSS. which he has looked through and extracted from, whether making for or against his own view of this creed. He has given us a long list of early psalters and books of devotion which do not contain

the "Quicunque;" yet he has not kept back any which do; and of those which do he lets others tell the probable date with laudable candour.

But he might have spoken more plainly than he has about the evidence to be derived from MSS. in general. The testimony of MSS. is worthless when it runs counter to history. In short, whenever they do so they impeach their own genuineness or antiquity. Even the character in which they are written is purely negative. No MS. written in Lombard characters, for instance, can be earlier than the seventh century, but it may well be for that matter of the eighth, ninth, or tenth. Similarly, the earlier characters only prove that a MS. written in them may have been written earlier; they fail in proving, apart from other considerations, that it actually was. If it would be more consonant with history to assume that a MS. was written in the ninth century, whose character might justify the supposition that it was written in the eighth, we must not create a difficulty which does not exist in history, by begging unnecessary prestige for a MS. There is not a single MS. which has been produced as yet, in evidence of the existence of this creed in earlier times, that would be robbed of its due by being ascribed to the ninth or even the tenth century. And whenever the general question of MSS. has been more carefully considered from this point of view than it yet has been, Dr. Swainson may rest assured that not one of those which perplex him occasionally will survive criticism in regard of that which in some quarters they have been held to prove.

Dr. Swainson will be read on the Apostles' and Nicene Creed with interest undisturbed by controversy; but he has hardly gone to the roots of either: he fails to identify the first with the baptismal creed of the West; and he cannot tell us when or how the last assumed the enlarged form in which it was promulgated at Chalcedon as having been received at Constantinople. This, I trust, readers of Dr. Smith's forthcoming *Dictionary of Christian Antiquities* (Art. "Councils of Constantinople") will find solved for them.

EDMUND S. FROULKES.

NEW NOVELS.

Clarice Adair. By Mrs. Randolph. (London: Sampson Low & Co., 1875.)

Jerpoint: An Ungarnished Story of the Time.

By M. F. Mahony. (London: Chapman & Hall, 1875.)

Earthward and Skyward. By Arthur Penrice. (London: S. Tinsley, 1875.)

The Lion in the Path. By the Authors of "Abel Drake's Wife," and "Gideon's Rock." (London: Chapman & Hall, 1875.)

Sketches of Life among my ain Folk. By the Author of "Johnnie Gibb of Gushetneuk." (Edinburgh: Edmonston & Douglas, 1875.)

Hall's Vineyard. By M. J. Franc. (London: Sampson Low & Co., 1875.)

Clarice Adair is described as a Society Novel, and it is not without diffidence that one approaches a story which has to do with that peculiar world, of which one knows

about as much as Lord Francis Hervey does of Celtic antiquities. The pivot of the plot is a mystery connected with the inheritance of landed property, which may be recommended to the notice of Sir Henry Maine, and M. Emile de Laveleye, and other students interested in gavelkind, and similar odd customs. The father of Clarice Adair was "the reigning baronet" in a family which possessed two estates, of which one was invariably held by the second son of that dignity. Now Sir Jasper saw no good in this wild custom, and privily abolished it, keeping his own counsel, and yet deluding himself with the idea that every one understood the change. Among people who did not understand it was Miss Lilian Orville, a young lady who smoked and frequented the best of bad society. She laid her snares for the Baronet's second son Cecil, and married him, after he had thrown dust in his father's eyes by engaging himself to a certain Miss Constance Moorsom. As Miss Moorsom had no male relatives, Cecil suffered nothing except the disgust of Lilian at missing the second estate. Unable to live at Linton with her husband's family, she eloped with a Portuguese Count who gave her diamond ear-rings. Now the heroine of this Society Novel, Cecil's sister Clarice, was an infant phenomenon, whose "playfellow" was Shakspeare, who played "dreamy German music," read dreamy German metaphysics, and sighed for a kindred soul, and—which is strange—for Society. In fact, the motive of all the women in the story is dear Society. Within the charming precincts Clarice meets a kindred soul, Leonard Mervyn, who, though unable to outdo her in quoting Shakspeare, is her master when it comes to Longfellow and dreamy German poetry. But Lilian's sister Hermione, whose brilliant but improper japes we could wish to see printed separately in an appendix, as they are prudently omitted from the text, severs her from Leonard's company, and in despair she accepts Lord Burton, who presents her with a "superb diamond ring." An elderly friend recalls her to duty, and as soon as Leonard hears that she has dismissed Lord Burton, he orders another superb diamond ring. Now mark, Lilian and the Count, and the illicit diamonds were all smashed in a railway accident, which had formed no part of their profligate scheme of pleasure. This, daughters of England, this is the end of girls who smoke cigarettes, who wear dressing-gowns as gorgeous as any that spring from the fancy of the author of *Guy Livingstone*, who go to *bals de mariées*, and to "compromising *petits soupers*," where it is *chic* to have an *attaché*. Intellect, on the other hand, and dreamy German music, are rewarded by superb diamond rings, and even the rejected Lord sends a sapphire bracelet to the cruel fair.

Jerpoint is not the name of an Indian god, nor of an Australian bird, nor of a new kind of lace. It is the story, described as *ungarnished*, of a small Irish town rejoicing in this odd title. To tell the truth, we prefer our Irish stories garnished, after Mr. Lever's early manner, to Irish society in fiction without hamper, whisky, widows, duels, drunken doctors.

and rather broad stories, is perhaps a little dull, and rather mean. Any one who likes may follow the thread of small intrigues, and semi-political, semi-commercial cabals, which would be dreary in Balzac, and are desolation itself in *Jerpoint*. Will it be believed that in this Irish novel, only one horse-whipping occurs, and that it is not done, as Major Pendennis hoped Arthur was not plucked, "in public"?

Mix up Jules Verne, Captain Mayne Read, *The Coming Race*, and Hans Pfaal's wonderful voyage, throw in a commonplace love story, and you have *Earthward and Skyward*. As no one reads the successive efforts of feeble imaginations, which try to find in the Moon, or the planet Mars, the originality of plot which they seem to be aware is denied to their search on earth, there is little need to say much about *Earthward and Skyward*. Mr. Penrice is not De Foe, or Poe, or even Lord Lytton, and his description of impossible adventures has no interest or *vraisemblance*. We are as profoundly bored by the people in Mars, "a charming race of beings," who did not know old age, as by the vacancy of the satellite Io, in which evolution has probably not yet developed human life. If Mr. Penrice wishes to be read, he must confine his fancy within the "flaming walls of the world."

If there be a certain dry humour in asking a conundrum in nine hundred pages, it is the only humour which is to be found in the *Lion in the Path*. The book might as well have been styled a *Bird in the Bush*, for any reference that we can discover to the monarch of the desert. The authors have expanded the anecdote of a child-marriage in the reign of Charles II.—the "fact-material," we are told, is from Lord Macaulay's History—into a very long and excessively dull historical romance. Here are a man and woman, married when girl and boy, and who, though they have never met since their wedding, yearn after each other in the most mystical fashion, at the mature ages of twenty-five and thirty. "The white grand arms are stretched forth yearningly in the darkness. . . . Year after year has she sunk down upon the wall, and cried out in unendurable anguish of soul, as she cries now—Father of mercies! when will this end? My husband! Must I live, must I die like this? Oh, no! you will come! But when—when?" "When will this end?" we too exclaim, in unendurable anguish of soul, long, long before, like Socrates in the *Republic*, we spy the haven of *finis*.

General Lord Langton, the exiled lover, seeks the owner of the soul, and of the grand white arms, whose style is as opulent as her charms, for she speaks of the "person" and "faculties" of her mare Bonnie Ball. But the General is ever thwarted by one Mary Medina Preston, whose dark intrigues are told in a manner which, as Bohn's crib to Aeschylus says, "rivals the obscurity of the original." The wiles that defied the police of William, and the spies of James, puzzle the modern reader as profoundly, and besides, he has no crown staked on unravelling them. What is more obvious is the absurdity of the General's adventure with a wrecker, and of Lady Hermia's easy stratagem of dressing

up a grey mare in black gauze, to personate a ghostly steed. There is an absolute want of local colouring, and a plentiful lack of grammar; in fact, only a schoolboy who had exhausted Scott and still pined for more, could possibly struggle through *The Lion in the Path*.

It is very hard to tear oneself away from *Sketches of Life among my ain Folk*, not so much because the contents are thrilling, as because the cover is glazed and glutinous. The fingers cling fondly to it, and only part with a little crack. This is a drawback to the pleasure given by stories of Aberdeenshire peasant life, which are told with good taste, simplicity, and propriety. The language will prove troublesome to a Scotch lowlander, and nearly hopeless to an Englishman:—

"Aw'm sayin', man, ye needna comnach yer sipper; that will dee nae gweed to naeboddy. Tak your sowens! Ye're latin them grow stiff wi' caul', for a' the tribble t'an was at keepin' them het to you."

In a dialect of this kind, the annals of the poor may be short, but are scarcely to be called simple. Students of Scotch morality will be interested in "Baubie Huie's Bastard Geet." The Bothie system claims rather a coarse Theocritus, whom it finds in the realistic author of these sketches.

As the name of Miss Braddon carries a suggestion of murders, bigamies, forgeries, "laws torn up, and a new face of things," so that of the author of *Hall's Vineyard* is short for all the horrors of Temperance Tales. Ruined hearths, broken hearts, a numerous and neglected offspring, blossom in profusion. On the other side of the way is the virtuous family of total and prosperous abstainers, who parade their blessings and virtues in a rather pharisaical manner. In this tale of Australian life, the "temperate" do not seem so curious about their eating, as in a former work by Miss Franc, *John's Wife*, where all parties were pigs of one sort or another. Miss Franc must be singularly unfortunate in her experiences of humanity if she has not met a few people of self-control enough to hit a medium between Total Abstinence and Total Inebriety. Must every one be what she calls "an Imbibee" who does not swallow the pledge? Yes, says Miss Franc—though yes must not be put within inverted commas—

"And there are voices from the far-bush [what is a far-bush?] echoing in our ears; voices from the pathless scrub, from poor inebriates wandering forth to die; voices from deep water-holes, from empty shafts, from lonely scrub, all echoing with the sad increasing cry, 'Drink, drink, drink.'"

It is difficult to be sure whether the "lonely scrub" is a person or a place; and surely a water-hole is the very place for a total abstainer to pass a happy day. A. LANG.

THE HUSSITES IN BOHEMIA.

Zur Geschichte des Husitenkthums culturhistorische Studien. Von Friedrich von Bezold. (München: Ackermann, 1874.)

THE author of this work, a young Munich writer, has already attained some distinction by his historical researches. In 1872 he published a work entitled *König Sigmund und die Reichskriege gegen die Husiten bis zum Ausgang des dritten Kreuzzugs*, in which

he displayed a thorough knowledge of his subject, a careful examination of facts, and a power of graphic description which cannot fail to interest his readers. We are happy to learn that he intends to continue his "studies" on the Hussite movement, and that we may gather from these that there are still some rich gleanings to be found in the works of Berger, Krummel and Grünhagen, as well as in those of Palacky, Höfler and other earlier writers. But it is not from published records alone, however valuable and authentic, that Herr von Bezold selects his materials. He has ransacked the treasures contained in the Library at Munich; sources of information which might well qualify such an author to write a full and complete history of the Hussites. This, however, he makes no attempt to do, being satisfied if he brings clearly before us some special feature of his great subject from some point of view hitherto disregarded. He very truly says that we ought, above all things, to grasp the intellectual basis of this complex Hussite movement. That which we designate by the single term Hussite is, in reality, a mingling together of religious, national, and politico-social tendencies and efforts. It is only by a close study of its separate elements, in so far as such a distinction is possible, that we can form a judgment of the movement as a whole. Herr von Bezold proves, by convincing arguments, that among these elements the necessity for reform in religion ought to hold the highest place, instead of representing it, as too many writers have done, as a mere pretext for the furtherance of national plans, and perceiving nothing more elevated in this great rising than the struggle of the Czechs against the Germans. He points out the powerful influence of Wicliffe—on which we now possess the admirable work of Lechler—in animating and sustaining that ardent desire for reform which spread so rapidly in Bohemia even before the advent of John Huss; he clearly marks the difference between the moderate Hussite party which had its special seat at Prague, and the radical party of the Taborites, a difference which forcibly reminds us of that which existed between the Presbyterians and the Independents, and he does not hesitate to undertake the defence of the Taborites from many accusations which have been made against them. Here again an analogy to the history of the Revolution in England strikes us at once—the Independents have, for a lengthened period, been misjudged from the hostile reports of the Royalists and the Presbyterians, and the Taborites from those of the Catholics and the Utraquists of Prague. Not until our own day have historians begun to regard both parties with other eyes than those of their most embittered enemies. There are many points of similitude between the Taborites and the Independents, not the least remarkable of which is, that those opinions in regard to religious toleration to which the latter owed so much were held by the former, and distinguished them very favourably from their opponents.

The social efforts of the Hussites were closely connected with their opinions on religious reform. It would not be difficult to

point out some of their ideas on social questions which resemble in a very remarkable degree ideas which at the time of the Reformation were more widely diffused and more plainly expressed, and which were also the result of a religious impulse. Foremost among these was the ignoring of the distinction between the priesthood and the laity, which was expressed by Luther under the phrase "a universal priesthood," and the principle of the equality of all men, and, as a natural consequence, the setting aside of all distinctions of rank. We are not surprised to find, however, that it is principally the radical Taborite writers who represent this democratic tendency. It was this extreme party, too, which acknowledged the "sovereignty of the people," which made a display of their hatred against all higher culture, and which sometimes went so far as to demand an equal division of property; nay, further, it may even be said that the theory of the emancipation of women, in its modern sense, was already adopted by these societies. We see in the Bohemian Revolution to what these tendencies led. Herr von Bezold has not failed to give due prominence to them. While he describes the effect of the Hussite Revolution on the peasants and the citizen classes, he shows how the military element of that revolution eventually overpowered all others.

In his slight sketch of Ziska we find he remarks, as a specially interesting fact, that he was elevated to the ranks of the lesser nobility (*Ritterstand*) when he was well advanced in years, a fact which can hardly be brought to agree with Palacky's assertion that Ziska would not recognise any distinction of rank. The author rightly lays stress upon the important position assumed by the noble leaders in the radical armies, by which their character was in no slight degree affected. He shows convincingly that in this way the radical party ceased to represent the opinions and wants of the people from which they had themselves sprung, and became at length alienated from those classes (p. 75). Estranged at the same time alike from the peasants and the citizens, they brought on their own ruin. The social changes which they had contemplated were not reached at all, and the religious reforms only very imperfectly. They were only too successful, though by no means to the advantage of the country, in opening a way for the gratification of the hatred of the Slaves for the Germans, without succeeding in completely excluding the German element. The final result of the conflict was the material and intellectual ruin of Bohemia. But that which Bohemia lost in this great revolution has been gained by the nations which surround her, in the development of intellectual liberty.

Here Herr von Bezold brings to a close his intelligent labours. We trust that we may meet with him again on the same field of enquiry; for the great religious and social movement of the sixteenth century, which agitated Germany and extended throughout the whole of Europe, can never be clearly understood till the links are found which connect it with the Hussite War.

ALFRED STERN.

RECENT VERSE.

Under the Dawn. By George Barlow. (Chatto and Windus.) What is meant by "the dawn," or why Mr. Barlow is said to be "under" it, we do not understand; but then there are many things in this volume hard to be understood. It seems that the author is an old offender, and that on previous occasions the critics have called him an imitator of certain great poets still rather young. He combats these strictures in twenty-two angry and somewhat incoherent pages of prose. But his prose is daylight and music in one compared with his verse. He lives in a land where "pink laughs tinkle," where the "glance of a song-bird is shining," and where he is a witness of such unusual visions as these:—

"Blackstained woe upon faces,
As when a man presses grapes,
And abundant rustle of grapes
I heard, and I saw strange shapes,
And white, bruised arms of our graces,
And necks made red at the napes."

Having quoted Mr. Barlow as a visionary, we proceed to give an instance of his elegant and appropriate use of simile:—

"For as the wind in the dark,
Coming down in a railway train
In summer, is blown in vain
Round that travelling swift-winged spark,
So is death but a toothless shark
To a soul whose life is pain."

May one without offence enquire if it is usual for the wind to come down in a railway train? And what spark? And are we to hold that the wind or the train is a toothless shark? or is the whole passage nonsense? The reader may judge of Mr. Barlow's power as a metrist by another excerpt:—

"I, Man, the lordly spirit of all things,
Thus tortured, wail!
I, Man, the fairest of all tall things
That walk or fly or sail,
Gather the common outcry of all small things
With face not pale."

Mr. Barlow, posing as the fairest of all tall things, very appropriately indites a poem to his own beauty, which it appears

"did save
From a foul, inglorious grave
My sad genius many times,"

and which he reminds, in another place, of an extraordinary ride his lady and he had by night, when they occupied themselves in this way:—

"By many moons and flaming
Immense red trees,
We flew together, aiming
Our flight at these."

Such ridiculous verse as this volume is stuffed with degrades the art of poetry more than twenty times as much mere humble doggerel. Before closing, we must mention that Mr. Barlow dedicates a poem to Mr. Swinburne, in which he addresses him as "my pale, strong brother, my sweet-winged brother," and promises him some promiscuous portions of some human frame, lips and hair, and so on, in another world. Silliness and impertinence go hand in hand.

Studies in Verse. By Charles Grant. (John Pearson.) Among the Elizabethan poets there are one or two, Breton for instance, and Southwell, whose lyrics are on such a level of elegant excellence, that it is almost impossible to quote from them to advantage. Without claiming for Mr. Grant quite so high a place in literature as that held by Father Southwell, we may say that the pleasure his verses give us is of the same serene and gracious kind. Perhaps he is most of all like those German poets of the last generation who culminated in Friedrich Rückert. When we say that Mr. Grant's "Love's Triumph" compares not unfavourably with "Liebesfrühling," we mean to pay him a great compliment. That exquisite cycle of love-poems is characterised by the same delicacy, purity, and sincerity as this,

though by more brilliance and fervour. The child-like poems in this volume are full of quaint and quiet fun, and indeed there is hardly a page that is not pleasant reading. We are the more glad to say this, because we did not like the author's first work, *The Charm and the Curse*. The outward appearance of the little book, original, delicate, and modest as it is, is a good signboard to the wares within.

By Helicon: an Adventure (Bingham & Co.).—There ought to be a law compelling new writers of verse to state their sex and age on the title-page of their productions. This unpromising-looking blue pamphlet, without name or prefatory note, has puzzled us a good deal, because there are some things in it that no one living need be ashamed to have written, and which yet are not quite in the manner of any one. These anonymous pamphlets are hateful; we know not who may have laid a snare for our feet in them. We will take for granted that *By Helicon* is the work of an unknown author, and merely say, parenthetically, that if any recognised writer is playing us a trick, he ought to be ashamed of himself. The poem is written "in iambo-trochao-spondaic-hexameters," and great trouble has been taken to make them correct in position and accent. The author has evidently spared no pains to avoid the laxity of such hexameters as those in *Evangeline*, and to gain exactness in prosody. All this, however, we gladly leave to the attention of those interested, and proceed to the consideration of the poem. There really is a great deal in it that is wonderfully dainty and charming. It consists of a description of a dream the writer has in which the nine Muses come to him, white-robed and hand in hand, and speak to him. After they have spoken they pass away in light, and he gazes after them, but—

"Not long paused I thus: my cloak I gathered about me,
Set my feet to the springing turf and sprang and straightway
Dart-swift over the lawn flew, arrowy into the greenwood.
Cowslip and crocus and daisy and buttercup swifter and swifter
Chased one another beneath my feet, till flower and greensward
Green and gold to one foam were blent of a flying river.
Into the midnight copse by thorn and bracken and briar,
Onward I hastened, straining mine eyes, but swifter the glory
Glanced and vanished and glanced and vanished and utterly vanished."

The poem proceeds to describe another vision, or a fulfilment of the first, wherein the wanderer comes, in a wood-surrounded hollow of the hills, on four of the Muses. Here let him speak:—

"One as a daffodil, one as a violet, one in a kirtle
Hued as of orient pearl, and one was robed as a rose is;
One had a lute and one had a flute and one to the measure
Footed in unison airily over the sun-bright meadow;
All her length the fourth lay, smiling among the flowers.
Earth seemed air unto her that was footing it, lighter than dews are,
When to the noon they ascend and are woven, a vesture for heaven;
Fleet was the melody, fleet were her feet, not a sight of the music
Never so swift was it, never so slow, but in rhythmic beating
Straight she translated, embodied it visibly, lending to vision
Equal delight as to ear in the euphony fleeting and flowing,
Languidly swaying, or airily lissom, or mazyly flitting,
Flitting as zephyr of Hesperus through the crepuscular pine-wood,
Hasting or pausing, it seemed as herself were the soul of the measure."

Finally, Apollo comes and addresses the wanderer. His address is not so good; it is tame. The merit of the poem lies in its descriptive passages, which are full of vigour and grace. The author should recollect that, being able to indite such exquisite lines as

"a streamlet

Plaintive and ferny that stole with low soliloquy seaward,"

it is disgraceful to write such very bad ones as

"Seemed to be silent for the space of half-an-hour,"

which no power in Parnassus or by Helicon could scan. We shall always be glad to meet with this author again; perhaps next time he will come forth from under the veil of anonymity.

Reuben and other Poems. By Robert Leighton. (Daldy, Isbister & Co.) *Reuben* is a drama in five acts, and mostly in blank verse. In it Mr. Leighton takes about the same position with regard to old Thomas Heywood, the Elizabethan dramatist, that Alexander Smith took with regard to Shakspeare. It is a mild and gossipy comedy, poetising humble country life somewhat in the way that such tragedies as *A Woman Killed with Kindness* and *An English Traveller* did the same life two hundred and fifty years ago. The language is smooth, gossipy, and adorned with such transpontine oaths as "sblood" and "zounds." Sometimes the scenes are very realistic. This is a breakfast-piece:—

Jane. Now, try a cup of this. What! done already!

You've taken nothing! Do begin again.

Reuben. Thank you, I've eaten heartily, very heartily;

So heartily, indeed, my heart is full.

Jane. I'd rather that your stomach were. But stay,

I want to speak to you. This afternoon

I go to spend the evening with Eliza,

Who accuses us that we do not return

Her frequent visits hither. I will go

Early, and take my needlework, and you

Will come and fetch me home."

The reader would never guess how soon the mention of "black-snouted toads" that "startle the dead dogs" breaks in upon this mild dialogue! The other poems are tales, semi-comic ones, in rhyme, and a quantity of "Musings," twenty-nine of them, all in the same metre.

Arca: a Repertory of Original Poems, Sacred and Secular. By Francis Meredyth, M.A. (Trübner.) Canon Meredyth criticises his own verses so impartially and so correctly that we need do no more than quote his own words:—

"I could do better than I yet have done,
Yet not so far excel what I have writ,
As to make all the difference between
Obscurity and Fame."

Claude and Etheline, and other Poems. (Bombay: Cooper & Co.) This is a very solemn story of a lady of English birth, voyaging to India, with her lover, who is cast ashore in a storm on the coast of Natal, and who eventually marries a savage, but mild, person of colour, and spends the rest of her life in a kraal, as the Zulu's Bride. When she is very, very old, she meets with her first love, in a promiscuous manner, and dies at once. This tragical tale is adorned with lyrics, of this species:—

"Like a lion he does tread,
Yebo;
And he proudly holds his head,
Yebo;
Like an eagle's is his glance,
See his noble form advance,
Yebo, yebo, yebo,
Yebo."

Which is exactly like the song "Willow" in the *Bob Ballads*.

The Ritualist's Progress. By A. B. Wildered Parishioner. (Tinsley.) One of the good-natured satires in weak verse that have almost entirely disappeared from the secular world. EDITOR.

NOTES AND NEWS.

WE understand that on Monday next Mr. Disraeli will receive a deputation of authors on the question of home and foreign copyright.

CAPTAIN R. BURTON is engaged in bringing out a work on Broad Sword and Fencing, which will contain the fullest and most minute information with regard to the present state of the art in every school in Europe. The neglect into which this important branch of education has fallen in this country is by no means creditable to us, and we trust that Captain Burton's work may do something toward removing it. The book will be beautifully illustrated.

PROFESSOR WHITNEY is staying in London for a few days, preparatory to starting for Germany, where he will remain until September. His object in going to Germany is to help Dr. Roth in a new variorum edition of the *Atharva-Veda*, a new (though unfortunately corrupt) MS. of the latter having lately been brought to Europe. It will be remembered that the only edition of this work accessible to scholars is the one published by Professors Whitney and Roth.

DR. JOLLY, the translator of Professor Whitney's *Lectures upon Language* into German, is also in London at present, for the purpose of examining certain MSS. in the British Museum.

THE Elementary Grammar, Reading-book, and Syllabary of the Assyrian language, by Mr. Sayce, will be out in about a week, and the first part of the companion *Manual of Ancient Egyptian*, by Mr. Le Page Renouf, may be expected to appear about the same time. It is contemplated to bring out before long an *Assyrian Delectus*, consisting of selected texts, with notes on difficult passages and words, and a glossary, which will form a necessary sequel to the Grammar and Reading-book.

A NEW work by Professor D. Ferrier, of great interest for scientific readers, is in preparation. It will be entitled *Functions of the Brain experimentally Investigated*, and will be published by Messrs. Smith, Elder and Co. The same publishers promise Mrs. Henry Fawcett's much expected novel for May 15.

A NEW serial story entitled *Her Dearest Foe* will commence in the June number of *Temple Bar*.

THE authoress of *Rosa Noel* and *The Sisters Lawless* has in the press a new novel to be called *Loving and Loth*.

A NEW edition, revised throughout, of Dr. Draper's *History of the Intellectual Development of Europe* is in the press, and will be issued in a cheaper form by Messrs. George Bell and Sons.

PROFESSOR SCHRADER, of Jena, the founder of the German School of Assyriologists, who not long ago declined the Chair of Hebrew at the University of Heidelberg, has now been appointed Professor of the Oriental Languages at the University of Berlin, and elected a member of the Royal Academy of Prussia.

THE second part of Professor Bernhard ten Brink's *Chaucer: Studies on the History of his Development and on the Chronology of his Writings*, will be published very shortly by Messrs. Trübner, of Strassburg.

MESSRS. LONGMANS announce for publication in May, *Italian Alps*, by D. W. Freshfield; *Snoiland*, by W. L. Watts; *The New Minnesinger*, by A. Leigh; *A Study of Hamlet*, by F. A. Marshall; D'Aubigné's *History of the Reformation in Europe in the time of Calvin*, vol. vi., translated by W. L. R. Oates; *Christian Psychology*, by T. M. Gormon; *Helmholtz On the Sensations of Tone*, translated by A. J. Ellis; *Dissertations, &c.*, vol. iv., by J. S. Mill; *The Signs of Character in the Human Heart*, by N. Morgan;

Healthy Homes, by C. Buckton; and *Handbook of the History of the English Language*, by A. H. Keane.

MR. LEWIS FARLEY's pamphlet on *The Decline of Turkey, Financially, and Politically*, has been translated into German, and will be published next week at Berlin. A French translation will also shortly be published in Paris.

MESSRS. J. AND A. CHURCHILL will publish in a few days a work by Mr. Alfred H. Huth on the *Marriage of Near Kin considered with Respect to the Laws of Nations, Results of Experience and the Teachings of Biology*, which we understand will be more comprehensive than anything else on the same subject.

THE same firm have also in the press a work on the Royal Tiger of Bengal, by Dr. Fayer, author of *The Thanatophidia of India*.

WE deeply regret to see announced the death of Professor Ewald of Göttingen. We reserve a detailed notice for next week.

DR. S. P. TREGELLES died at the age of sixty-two, on the very same day as Professor Selwyn (April 24). He has gone to his rest—in his case no empty form of words, for his life was as laborious as it was to the outward eye unrewarded. Yet he has left his mark clear and deep on the textual criticism of the New Testament. He was a born critic, even though it be granted that the narrowness of his inherited form of religion led him to ascribe a greater importance to the letter of the Scriptures than is now usual among religious thinkers. It was at all events not uncultivated. He would turn aside from the study of texts and versions (versions, too, in the original, and not in a Latin translation) to the delicate irony of Lucian's Dialogues. Strange that the same man should be so devoid of humour as to embroider a useful translation of Gesenius's *Hebrew Lexicon* with futile warnings against the Biblical interpretations of which so large a part of the work consists. It was in 1844 that Tregelles first published an edition of part of the text of the New Testament, namely, the Book of Revelation, the Greek text of which was so revised as to rest almost entirely upon ancient evidence. In the introduction he expressed his intention of preparing a critical edition of the Greek New Testament, which at once involved him in many years of close study of manuscripts, Tischendorf being his only rival as a collator, and, as most will think, decidedly his inferior as an editor. His principles have been described by himself in his *Account of the Printed Text of the New Testament* (a work which is not superseded by the now favourite works of Scrivener), and in the fourth volume, mostly re-written by himself, of Horne's *Introduction to the Scriptures*. They resembled those of Lachmann, but had been reached by a different process, and were defended in a more scientific manner. Paralysis struck the pen from his hand in 1870, as he was in the act of revising the concluding chapters of the Revelation, and the last two parts had to be brought out by a friend. Whether any part of the *Prolegomena* is in a fit state for publication, we are unable to say. But the work as it stands is a noble monument of unbefriended and unendowed genius.

M. MICHEL LÉVY, the well-known Paris publisher, died suddenly a day or two since.

MRS. KINGSFORD has written to us again about her book. Inasmuch as Mrs. Kingsford in the first instance believed her personal character to be touched by the remarks of our reviewer, we felt it our duty to depart from our general rule, and to give Mrs. Kingsford the opportunity of saying all that she wished in respect of the imputations of which she complained, and in her own way. Our reviewer also came forward in the most frank and generous manner, and stated that he never intended to make such imputations as Mrs. Kingsford conceived to be implied by his article. Mrs. Kingsford now "acknowledges the

explanation" of the reviewer, but suggests that in withdrawing the supposed imputations of immoral writing from her book, the reviewer in his reply has by implication transferred them to a pamphlet of hers, a passage from which was quoted in the review—we are bound to admit, without sufficient indication of its source and context—and also alluded to in the reviewer's letter. It seemed to us at first impossible that any ingenuity could detect the presence of such a charge in our reviewer's letter; but now that it has been suggested to us that such a construction may be put upon one sentence in that letter, we beg to assure Mrs. Kingsford on the part of our reviewer that this ambiguity is merely the result of an inadvertence which he very much regrets; that nothing was further from his mind than to impute immoral writing to the pamphlet; and that there is nothing in the pamphlet which would bear out any such imputation.

THE following memorial from the Manchester Literary Club has been presented to the Trustees of the British Museum:—

"That a full, accurate, and trustworthy list of the books and pamphlets issued from the English press is a pressing want in connexion with English literature. That in France and Germany there are official lists of this description, and that consequently there is less difficulty in learning what has been written by the authors of those countries than in getting the same information about the works of our own countrymen. That such a list would not only be of high utility for the present time, but would have a permanent historical value.

"That the British Museum, having the right by law to a copy of every work published in Great Britain, is the institution wherein such a list could be best compiled. The inclusion of the privately-printed books—a large proportion of which probably find their way to the National Library—would prove of special interest and value.

"That at present there is reason to think that the British Museum fails to acquire a considerable percentage of the books and pamphlets to which it is legally entitled; that the regular and frequent issue of such a list would aid in discovering these *lacunae*; it would also then become the interest of the publisher of a book to comply as quickly as possible with the requirements of the Copyright Act, in order that the title might appear in the list, which would find its way into the hands of almost every librarian and student in the country.

"That authors and journalists in the country, who are required by law to contribute their productions to the Library of the Museum, but who are very rarely able to avail themselves of its advantages, would be materially assisted in their labours by the issue of a complete and comprehensive Catalogue of Current Publications (especially as it would comprise privately-printed books and pamphlets), and would by this means feel themselves more closely associated with the great national institution under your charge.

"That the Council of the Manchester Literary Club, whose members are resident in various parts of Lancashire, and most of whom are directly connected with literature and journalism, have reason to believe that the prayer of this Memorial may be taken as representing the feelings and wishes of men of letters generally, outside of the metropolis, and even of a large number in London who are unable to frequent the Library at will.

"That the boon thus conferred—if haply the suggestion should meet with your approval—would be materially enhanced by the publication of the Catalogue in a periodical (say, monthly) form, at a moderate cost; and your memorialists believe that such a Catalogue, while it would unquestionably be a permanent advantage to literature, would not entail any large expenditure. If not absolutely profitable in a pecuniary sense, it could probably be rendered self-sustaining."

The memorial was signed on behalf of the Club by J. H. Nodal, President; George Milner and John Page, Vice-Presidents; Charles Hardwick, Treasurer; William E. A. Axon, F.R.S.L., F.S.S.; William Hindshaw, John Plant, F.G.S.; John E. Forbes, F.G.S.; John Eglinton Bailey, and Edwin Waugh.

To this memorial, Mr. Winter Jones, the Principal Librarian, has replied:—

"I am directed by the Trustees to acquaint you that they have carefully considered the Memorial in question, but that they are not in a position to adopt the suggestion it contains.

THE French Academy has divided the Langlois prize between MM. Peissonaux for his translation of Euripides, and Gustave de Wailly for his translation of the opening books of the *Aeneid*.

THE French Academy, and the Academy of Moral and Political Sciences, have selected the following among their late members whose busts are to be placed in one of its halls: MM. Cousin, le Duc de Broglie, Guizot, Tocqueville, Rossi, Jouffroy, Villemain, Lamartine, Casimir Delavigne, Alfred de Musset, Berryer, le Comte de Montalbert, and Pierre Lebrun.

PROFESSOR AUFRECHT is to give a course of lectures at Bonn in the present session on "The Comparative Grammar of the Indo-Germanic Tongues," with an introductory course for students beginning the study of Sanskrit.

SEÑOR JULIAN APRAIZ commences in the *Revista de España* a series of sketches of the history of Hellenic studies in Spain. Juan Valdes, from certain analogies and from the names of places, came to the conclusion that the language first spoken in Spain was the Greek.

THE author of *Felicia*, reviewed in our last number, was inadvertently spoken of in the body of the article as Miss Edwards, instead of Miss Betham-Edwards.

DR. GEORGE BRANDES is about to publish his lectures on Shelley, delivered this winter before the University of Copenhagen.

THE excited controversy whether the late Bishop Grundtvig, during his lifetime the most influential man in Denmark, and whose literary bones, like Samuel's, are incessantly being dug up to work miracles with, sided or not with the extreme democratic party in politics, has just received a most important addition on the Conservative side in the pamphlet, *Grundtvig og det forenede Venstre* (Grundtvig and the consolidated Left), just published by Professor Fr. Hammerich, a life-long friend of the old post-bishop.

THE latest number of *Grimm's Deutsches Wörterbuch*, the seventh in the First Part of Vol. IV., which has recently been issued in Germany, under the editorial direction of Dr. Hildebrand, only includes the words that fall between "Garten" and "Gauner."

IN an article on the Italian Archives in the April number of the *Revista Europea*, Signor B. Tanari gives a detailed account of the Archives of Siena, organised since 1858. In them are contained all the documents relating to the building of the Cathedral of Siena, from 1259 to 1379, and to the erection of the Fonte Gaja in 1408 and 1409.

SIGNOR G. PITRÉ has edited a collection of the popular stories of Sicily, *Biblioteca delle Tradizioni Popolari Siciliane* (Palermo), accompanied with careful notes. He has added also a first attempt at a scientific grammar of the Sicilian dialect.

THE Padre Garrucci, known already as author of a history of primitive Christian Architecture, has now completed his *Storia dell'Arte Cristiana nei primi otto secoli* (Prato), with copious illustrations.

THE first of a series of articles by Mr. Swinburne, to be continued in the *Fortnightly Review*, opens with some sonorous denunciation of the new race of Shakspeare critics who attempt to discover the secrets of his workmanship by counting sounds and syllables on their fingers instead of listening for the music and meaning of the verse with their souls in their ears. Under the circumstances we are scarcely inclined to complain of a

slight superfluity—such as the critic himself notices in *Romeo and Juliet*—"of rhetoric, and (as it were) of wordy melody, which flows and foams hither and thither with something of extravagance and excess," in the controversial passages. The promised exposition of the writer's mature judgment and deliberate intuitions as to the sources and quality of Shakspeare's best metrical effects will form a very curious and interesting addition to literature, not merely on the ground of Mr. Swinburne's own eminence as a master of the imagery of sound, but also because the subject itself is in a manner new, the effect on the mind of combinations of verbal tones having never received any approach to the attention accorded in the sister arts to the equally material relations and proportions of colour and line. The editor's third paper on Diderot is mainly an account of his "Letter on the Blind," from which a passage is quoted containing a really remarkable anticipation of the hypothesis of specific development by natural selection. C. Pozzoni gives an interesting *résumé* of the state of opinion on economical controversies in Italy, where the general acceptance of the most severely orthodox views of Adam Smith and Ricardo is beginning to be diversified by the rise of a new school professing to hit the *juste milieu* between the crude utterances of the founders of the science and the visionary and metaphysical doctrines of its German professors, who think socialism may be established by the help of Caesarism. An article by Mr. Cooke Taylor, on "The Employment of Mothers in Factories," exposes the shallowness of the reasoning on which it has been proposed to restrict such employment by special legislation. There appears to be no observed connexion between a high rate of infant mortality and the employment of women in factories, and the advocates of legislation have simply dwelt on the evils of the present state of things without considering what proportion of the evils could be even nominally affected by any measures proposed. A minority of the women who work in factories are married; not all of those who are married have children; some have been deserted or are separated from their husbands; and it is only with regard to the indeterminately small proportion of those who are married, and have a husband and children, and now work to the injury of their health, that there can be even an apparent need for restriction; and this class, on careful enquiry, would probably be found much too small to make its protection compensate for the general disadvantages of minute special legislative interference.

IN the *Contemporary* Mr. Macleod introduces his favourite doctrine that political economy is the science of exchanges, by an interesting enumeration of preceding definitions from Aristotle onwards. But in the endeavour to convict other writers, and especially Mill, of confused reasoning on the subject of credit, he seldom achieves more than a verbal victory, which does nothing to advance a real understanding of the problem. Exchangeability is certainly one of the commonest notes of wealth or property, and it is possible, though not very useful, to say that economic science deals with the exchange of rights (over property) rather than with the exchange of property, which may be immaterial. But it must also be remembered that rights are not valuable in virtue of their exchangeability, but in virtue of the material circumstances which cause men to desire the exchange, and the immaterial rights which change hands under the name of credit are only exchangeable in proportion to their realisable nature; a merchant is allowed to trade upon his reasonable expectations of the profit coming to him in the future from the produce of his former investments, but this credit is not a new form of property, only an extension of the exchangeability of his money and labour as represented in his character for solvency. Dr. Carpenter continues to discuss his objections to the doctrine of "human automatism" with so much

understanding of the position that it seems curious that he can continue to repeat such flimsy arguments against it as, that if all thought is a result of molecular motion, the same molecular motion might produce the same actions as at present, without the agents being conscious of either thought or action. The consciousness of Professors Huxley or Clifford when dissenting from Dr. Carpenter may be the natural concomitant of a definite process of molecular motion in their brains, whether the motion is conditioned by antecedent motions of the same kind, or—in some unknown way—by the consciousness attendant on an antecedent molecular state. So with regard to Dr. Carpenter's other objection to the supposed discouragement of moral effort by necessitarianism: as he truly observes, it is impossible to tell which motive will have most weight with the will until the event has shown, and necessarians, like other educators, are perfectly consistent in exhorting children—or adults—to make the most vigorous efforts and to exercise the most constant self-control that they can, expressly on the old-fashioned ground that "they do not know what they can do till they try." Mr. Matthew Arnold continues to treat the theologians *von fauch* somewhat as Mr. Swinburne treats the mechanical commentators on Shakspeare; but he imprudently ventures this month on a construction of his own, which may provoke criticism in its turn.

THE *Cornhill* continues rather monotonous, two stories from one writer being perhaps nearly enough of the same good thing. The "Marriage of Moira Fergus" is a low-life counterpart of the wedded troubles of Princess Sheila, and is perhaps meant to assist the southern imagination in understanding the more elaborate picture; but Sheila and her husband do little or nothing for their *protégés*, so, artistically speaking, their right to come to life for the occasion might be questioned.

THE *Gentleman's Magazine* contains a very friendly, but seemingly well-informed, biographical notice of Gambetta, by "Spectavi," according to which the ex-dictator owes his comparative immunity from the attacks of envy to a no less exceptional freedom from personal vanity.

IN *Macmillan* Mr. Palgrave's "Story of Njed" comes to a conclusion, in the pathetic manner habitual to such art; the question which he raised in the preface to it, why early realistic art is usually pathetic, while fairy tales and romances of the Arabian Nights order always end happily, might perhaps be answered by a reference to the tendency of the mind to dwell with most attention upon the phenomena that strike it as exceptional. In simple societies the tragic exceptions to the rule of tranquillity are noticed; but when the habit of idealising misfortune has been formed, and the mind has learnt to accept it as an ordinary incident of life, good fortune (or the absence of calamity) becomes again in its turn a thing to be noticed and even on occasion idealised.

FRASER contains a study of Euripides by Mr. Froude, who explains that he never had leisure to do justice to that author till his African journey; and a curious account of an Irish heroic poem, in which primitive scraps of legend or folk-lore are mixed with Homeric (or rather Ossianic) descriptions of war and feasting.

WE have received *Guy Mannering*, by Sir Walter Scott, new edition (Routledge); *Oration delivered in Carpenters' Hall on the Hundredth Anniversary of the Congress of 1774*, by H. Armitt Brown (Philadelphia); *Forty-third Annual Report of the Trustees of the Perkins Institution* (Boston, U.S.: Wright and Potter); *The Positive Philosophy of Auguste Comte*, freely translated and condensed by Harriet Martineau, second edition (Longmans); *Un Vaincu, Souvenirs du général Robert Lee*, par M^{me}. B. Boissonnas, 3^e édition (Paris: Hetzel); *Democracy in America*, by

Alexis de Tocqueville, trans. H. Reeve, new edition (Longmans).

THE Appendix to the Report (New Series No. III.) of the Medical Officer of the Privy Council and Local Government Board contains most important papers, by Dr. Burdon Sanderson, on the Pathology of the Infective Processes; by Dr. Klein, on the Contagium of Variola Ovina, and on the Lymphatic System and its relation to Tubercle; by Dr. Creighton, on the Aetiology of Cancer; and by Dr. Thudichum, on the Chemical Constitution of the Brain. Dr. Simon states that other and equally valuable work, in aid of Pathology and Medicine, is in progress, under the direction of the Lords of the Council.

THE following Parliamentary Papers have lately been published:—Reports of the Medical Officer of the Privy Council and Local Government Board, New Series, No. II., containing thirty-six plates (price 7s. 6d.), No. III. (price 1s. 4d.); Reports of the Inspectors of Factories (price 1s.); Report on the Cultivation of Jute in Bengal, and on Indian Fibres available for the Manufacture of Paper, by Deputy Magistrate Hem Chunder Kerr (price 1s. 2d.); Correspondence relating to the Exercise of the Prerogative of Pardon in New South Wales (price 8d.); Correspondence and Reports on the Unseaworthiness of the Floating Dock *Sourabaya*, built for the Dutch Government, with plates (price 2s.); A Digest of the Statutes relating to Urban Sanitary Authorities, Second Edition (price 1s. 6d.); Report of Committee on East India Compensation of Officers (price 1s. 8d.); Annual Report of Captain Harris on the operation of the Contagious Diseases Act; Supplemental Report of the Commissioners of Church Temporalities in Ireland, &c.

NOTES OF TRAVEL.

IN the last Report of the Great Trigonometrical Survey of India will be found an interesting account of a trip made by one of the trained Asiatic explorers from Pitoragarh, in Kumaun, through Nepal into Great Tibet, and back across the Brahmaputra by the Gunduk river into British territory. More than one of the Nepal streams (as appears from this report) are crossed by means of a single rope stretched across, from which the traveller suspends himself, monkey-fashion, by his hands and feet, carrying his luggage or merchandise on his chest. For those, however, like the Asiatic explorer, whose nerves are not equal to this feat, slings are provided. Slavery exists throughout Nepal, and all castes are sold into slavery, the father having power to sell his children; but this step deprives them of caste. It is said, however, that Jung Bahadur intends to abolish the entire practice. The Brahmaputra was crossed about 83° 55' E. longitude (where it is about 250 feet wide, and has a very gentle current), on boats made of yak's hides sewn at the ends, and attached to sticks at the sides. On his return journey the explorer passed through Tansen, where there is a fort, gun-foundry, and manufactory of small arms. Inside the fort, the walls of which are about twelve feet high and made of brick and mortar, are two-storied brick buildings which are used as the Magazine, Court-house, and Treasury. Formerly 1,100 men used to be stationed here, but now there are 1,600, who are drilled by two discharged subahdars of the Indian native army. All over Nepal, in fact, military organisation is being amplified. Although the explorer was prevented from advancing further into Tibet than the vicinity of the Brahmaputra, he has contributed much valuable information concerning the Nepalese kingdom, which is still almost as unknown as if it were a foreign and not a dependent state.

AT the last meeting of the Scandinavian Society of Antiquities (*Det Nordiske Oldskriftelskab*) at Copenhagen, Professor P. G. Thorsen delivered an interesting address on the latest discoveries re-

garding the two great tumuli in Zealand, known as the Jellinghöie. It will be remembered that the northernmost of these, traditionally known as Queen Thyra's, was examined in 1820, and found to contain a tomb, and a vast collection of valuable antiquities, while the other, known as Gorm's Hill, when examined by command of Frederick VII. in 1861, was found to be no tomb at all. Professor Thorsen began by stating that between the tumuli there stand two stone monuments, of which the smaller bears this Runic inscription: "Gorm the king made these in remembrance of Thyra his wife." The larger stone bears runes to this effect: "Harald the king bade these monuments be made in memory of Gorm his father, and Thyra his mother, that Harald, who himself won all Denmark and Norway, and had the Danesfolk christened," and on the back is a rude figure of the crucified Christ. This stone is evidently from the end of the tenth century, and so fifty years later than the lesser stone. Gorm died in 940, Thyra later, and Harald Blaastand in 988. It would seem that the southern tumulus contained the bodies of Gorm and Thyra, the rune-stone having been placed before the death of either, and that the northern one would have contained the body of Harald, if his life had ended peacefully, and not by the sword of Palnatoke. The light that has been thrown on history by the reading of these inscriptions serves to demonstrate the accuracy of Saxo Grammaticus' narrative of the epoch.

LIEUTENANT CONDER reports a proposed identification of Adullam, city and cave. The traditional site was the great series of caves at Khureitun, late writers, however, giving preference to Deir Dubban. But M. Clermont Ganneau discovered the name of Aydee Mich attached to a small ruin in the Shephelah or Low Country. Lieutenant Conder has now examined this site carefully, and comes to the conclusion that he has found the ruins of the city of Adullam with "the cave" close by. It lies on the western slope of the Wady Sur, the upper portion of the valley of Elah. Its position, on a ledge 500 feet above the valley, is important for military purposes. There are the usual indications of ancient occupation in wells, stone troughs, tombs, and terraces. It seems to fulfil the topographical requirements, and the name preserves the essential letters of the Hebrew. "The cave" resolves itself into a series of small caves from twenty to thirty feet in breadth, still inhabited or used as stables. It is marked in Murray's map as the Wely Mudkor, standing about half-way between Kilah and Socoh. Lieutenant Conder points out that the present cave-dwellers of Palestine will not live in the large caves such as those of Khureitun on account of their darkness, their reputed unhealthiness, and the scorpions with which they abound.

He also suggests that Beit Jibrin (Bethogabra, the House of Gabriel) is the ancient Libnah. The camp of Beit Jibrin has furnished him with 424 names in 180 square miles: there are, on an average, three ruins to every two square miles, but most of them are early Christian. Out of the ninety-seven names in the list belonging to Judah, not counting the cities of the Negel, thirty-two had been identified before the Survey, three more recently by M. Clermont Ganneau, and thirty-three—perhaps three or four more—have been identified by Lieutenant Conder and the Survey party. In other words, the systematic survey has done in three years as much as all previous travellers put together.

THE new Quarterly Statement of the Palestine Exploration Fund contains Reports by Lieutenant Conder, and notes by Major Wilson and Captain Warren. Lieutenant Conder regards 1874 as the most eventful year of the Survey, and sums up the results. He gives us, too, some fresh identifications of places in the Hill Country of Judah, the most interesting of which is that of the Valley of Berachah in 2 Chron. xx.; whether the Hebron-

site of Eschol falls with the Vandeveldes' Eshkali, may perhaps be doubted. Lieutenant Conder's location of Bethabara at one of the principal northern fords of the Jordan is certainly plausible. He also reports on Tell Jezer and its inscribed stones; on the Muristan, where the very interesting remains of the Hospital of the Knights of St. John have been lately discovered; and on Mr. H. Maudslay's important explorations in the Rock Scarp of Mount Zion. Lieutenant Conder also writes on the line of march of King Richard, and on several of the sites of medieval tradition. Major Wilson shows both knowledge and judgment in his note on Lieutenant Conder's identification of Nob with Neby Samwil, against which we ventured to protest in noticing the last Quarterly Statement. Lieutenant Conder's exuberance leads him occasionally into remarks which are scarcely worthy of publication by his society.

DR. PETERMANN supplies his readers in No. 5 of his *Mittheilungen* with a map of California and its Gulf reduced from a four-sheet survey executed during portions of the years 1873 and 1874 by Commander G. Dewey and other officers of the United States Coast Survey. The survey, which consisted of an examination of 2,780 miles of coast-line, was completed in a short space of time, and so does not profess to give a minute delineation of every recess in the coast; but it nevertheless is sufficient for the purposes of general navigation, and being connected with the principal triangulation, is adapted for incorporation into maps and charts. One important result is to shift the whole west coast of the peninsula a little to the east, and so reduce its area.

STAFF-CAPTAIN SOBNOFSKY, whose scientific trip into Mongolia and Siberia from the side of China has been already mentioned in these columns, arrived at Han-kow by steamer from Shanghai just about the time when the European residents were holding their race meetings. The Cossacks being well known for their skill in horsemanship went through some feats at the request of the inhabitants, and were much applauded. The local authorities have shown (for Chinese) the most extraordinary favour to the Russians by giving them permission to visit every part of the town and neighbourhood (a concession never previously accorded to strangers), and to photograph any Chinese inhabitants or views at pleasure.

WITH regard to the plans for the improvements in and about the Tiber, it may be of some interest to know that in the last half of the seventeenth century a Dutch hydraulic engineer, Cornelius Meyr, was invited to Rome for the same purpose. Many of his plans were carried out, but the most important part was left undone through the jealousy of the Italian architects and engineers. Meyr, however, published them with many engravings in a book printed in Rome in 1683, under the title, "*L'Arte de' Restituire a Roma, etc.*" Dell'Ingegniero Cornelio Meyr Olandese."

We learn from the German papers that the first part of Dr. Adolf Bastian's Report of the German Expedition to the Loango Coast has been published at Jena. In this volume the experienced African explorer, who had been specially appointed to guide the directors of the Expedition in their choice of a site for their chief trading station, sets forth his reasons for fixing upon Chinchoxo on the Landana coast, about sixty miles north of the mouth of the Zaire, and gives so minutely detailed a report of the various geognostic and meteorological conditions of the district, with a careful exposition of the local fauna and flora, and the ethnological and social characteristics of the native tribes, that he in effect presents his readers with an exhaustive history of this imperfectly known portion of Central Africa. Special interest attaches to his account of the peculiar form of priest-kingship which prevails in the kingdom of Angoy, on the Loango coast, where the requirements for the dignity and the preliminary ceremonies of coronation are so

severe that few of the Loango nobles eligible for the office can be found willing to present themselves as candidates, and fewer still succeed in obtaining the distinction. Owing to these extraordinary conditions, the thrones of Angoy and of two neighbouring kingdoms of the Loango tribes where similar usages prevail, have for some years remained vacant, and consequently the bodies of their late occupants continue according to prescribed usage unburied, and are at present temporarily deposited in coffins, above ground, since their final interment cannot take place except in the presence of a properly elected successor.

THE BRITISH MUSEUM.

(Second Notice.)

WE resume our analysis of the Annual Report of the Trustees of the British Museum with an account of the additions made to the Department of Oriental Antiquities. About 3,200 new objects were placed in this collection by Dr. Birch during the past year, among the most remarkable of which are:—

"Wooden board of a coffin, on which is painted Merartef worshipping Socharis.

"Terra-cotta figure of a Canephoros, or basket-bearing priestess. From the Fayoum.

"Terra-cotta group of two Erotes or Cupids holding grapes, and thyrsus. From the Fayoum.

"A torch-bearing genius, perhaps intended for Thanatos, Death, wearing a chlamys. From the same locality.

"Several lamps from Damanhour, with the names of makers, Agathos, Faustus, and Caius, one with the HPA incised.

"Terra-cotta jug in shape of a female head, and another moulded in the form of a pigeon.

"Red granite head of a negro. From Tel Basta.

"Two arragonite heads of Rameses III. for inlaying. From Tel El Yahoudeh.

"Dark stone cylindroid weight, with inscription.

"Silex fragment of a vase, on which are engraved the name and titles of Apep, or Apophis, an unplaced monarch.

"Steatite figure of Isis, standing, with her name and titles inscribed.

"Porcelain cartouche for inlaying, having on it the name of Rameses V. From Tel El Yahoudeh.

"Green porcelain ibex, having on the base the prenomen of Amenophis III. of the 18th dynasty.

"Blue porcelain, porcelain object in shape of a flower. From Tel El Yahoudeh.

"Some porcelain tiles for inlaying, in shape of an ogive, with papyrus flowers, buds, and rosettes.

"Green porcelain cylinder, with name and titles of Thothmes III. of the 18th dynasty."

In addition to these it is only necessary to notice the very large collection of Assyrian antiquities from the excavations carried on in Mesopotamia by Mr. George Smith in 1873 and 1874, sufficient accounts of which have already been published.

In the Department of Greek and Roman Antiquities, upon which Mr. C. T. Newton reports, we observe the following among presentations by Admiral Spratt:—

"Marble fragment of a Greek inscription recording a decree of *proxenia*, granted by the people of Telos to Arion, son of Aristonikos, a native of Ptolemais. From Telos.

"Two marble fragments, apparently parts of one inscription. On one of these fragments occurs the title *MONAPXOZ*, which was applied to the chief magistrates of Cos. On the other fragment is mention of Asklepios, whose worship prevailed in that island. From Cos.

"Marble fragment of an inscription, apparently part of a decree conferring the rights of citizenship on certain persons. From Cos."

The Rev. H. F. Tozer presented two fragments of pottery found in Santorin, the ancient Thera, on a site supposed to be that of prehistoric dwellings.

Among the purchases for this department may be mentioned:—

"Twenty-one statuettes and a mask in terra-cotta,

found in Greek tombs at Tanagra. These figures are remarkable for their almost perfect preservation, and for the delicacy and refinement of the modelling. They are probably productions of the later Athenian school of art.

"Five Athenian *lekkythi* of fictile ware, with polychrome designs on a white ground; on one of which is represented Charon in his boat beckoning towards a female figure beside a *stelé*. On three of the *lekkythi* are representations of mourners bringing offerings to tombs.

"Fifty-nine gems and three pastes, mostly in intaglio. The greater part of these gems are of a very archaic character, and of that class which has been found in Rhodes, Melos, and other Greek islands associated with antiquities of the Græco-Phœnician period.

"Onyx cameo. Victory holding a bust, probably of a Roman empress; a fruit tree and an animal with reindeer horns. This cameo, which is of unusual size, is probably as late as the third century A.D. It was formerly in the collection of M. J. F. Leturcq.

"A pair of gold ear-rings, remarkable for the richness of their decoration, and their great size. They appear to be of a late period. Found in Grenada, Spain.

"An archaic Greek *amphora* of fictile ware, the design painted in black on a drab ground. On each side of the body is a lion, and on each side of the neck two cocks fighting. From Athens.

"A *pyxis* of fictile ware, round which is painted a frieze in red figures on a black ground, representing the interior of a house in which two female figures are waited on at their toilet by several attendants. Over the heads of these figures are inscribed the names Pontomedeia, Glauke, Kymodoke, Kymothea, Galene, Doso, Thaleia. This *pyxis* is one of the most beautiful extant specimens of Athenian vase painting. From Athens.

"A marble statuette of a draped female figure. The drapery is well composed, and altogether the figure is an interesting example of the later school of Greek sculpture. Found at Arnitha in Rhodes.

"A Greek inscription containing a dedication by a priest to kings of Egypt, probably Ptolemy Soter and Philadelphus.

"An alabaster jar, probably a measure, on which is an inscription in characters resembling those on the coins of Pamphylia. Found near Rhodes.

"Two alabaster vases, one of which is of the peculiar funnel shape only met with in the archaic fictile ware of Ialysos and Santorin."

"A Cupid, four small figures, a mouse, a bull, a vase-handle, and sundry small objects in bronze."

Among the Greek inscriptions received from Ephesus, part of the result of Mr. Wood's exploration of the site of the Temple of Diana, are—

"One of the duplicate bilingual inscriptions found in the *peribolos* wall. This inscription, which is in Greek and Latin, states that the Emperor Augustus out of the revenues of the Goddess Diana, had rebuilt the *peribolos* wall round her Temple. This was in the pro-consulship of C. Asinius Gallus (A.C. 6), whose name is erased from the inscription. He had been condemned by the Senate, A.D. 31.

"*Stelé*, with inscription bearing the same date as the last, and with the name of C. Asinius Gallus again erased. This inscription marks the breadth of a watercourse. From the *peribolos* wall."

Mr. A. W. Franks notes among other interesting acquisitions by the Department of British and Mediaeval Antiquities the following:—

"The head of a king, carved in ivory, of the fourteenth century, probably of English workmanship; from the Meyrick collection.

"Forty-three tiles from the site of Chertsey Abbey, Surrey.

"An ewer in pottery of the thirteenth century, in the form of a knight on horseback; a stoneware figure of Meleager, made by John Dwight at Fulham, about 1672; and an earthenware tyg, dated 1640.

"Three specimens of English earthenware; one of them, a candlestick dated 1651; another, with inscription relating to the contested election for Oxfordshire, in 1754-55.

"A Byzantine buckle set with pastes; Byzantine cameo, and two golden ornaments of uncertain age, from Ephesus.

"Carved ivory head of a tau staff of the thirteenth century; two carvings in ivory, probably of Syrian

work; two early carved Oriental boxes in ivory, and a German cup turned in ivory; an early Majolica bowl, two Majolica jars from a Spezieria, one of them dated Faenza, 1549, and four pewter plates, made at Nürnberg, with designs in relief.

"A very extensive collection of watches, illustrating the various phases through which the art of watch-making has passed, collected by the late Sir Charles Fellows, and bequeathed by his widow, Lady Fellows. It consists of eighty-seven specimens, varying in date from 1520 to 1720; two of them are stated to have belonged to Oliver Cromwell.

"A German alarm clock made at Tübingen, 1554, an old English watch in a gold filigree case, and five pocket dials.

"A very fine watch, in an enamelled case, stated to have belonged to Queen Elizabeth, in whose reign the works may have been made; the case is of the time of Charles II.

"A watch with an enamelled portrait of George II., and a curious movement of soldiers, probably alluding to the Battle of Dettingen, 1743."

To the Department of Coins and Medals Mr. R. S. Poole has added a remarkable selection from Phrygia and the neighbouring parts, collected on the spot, and comprising some rare specimens; a number of very rare coins and medallions, including pieces of Mytilene, Ephesus, Pergamus, Ilium, &c., chiefly from the well-known cabinet of Mr. Addington; an aureus of Julian the Tyrant, slain near Verona by Carinus, of which the Museum possesses only one other specimen; a gold medal, supposed to be of George Seton, Earl of Huntley, dated 1562; &c., &c.

To the Department of Zoology the most notable donation last year was the collection of shells, formed by Mrs. John Edward Gray, consisting of about 12,000 specimens, representing about 4,000 species. The most notable purchase was the series of the brilliant or richly coloured beetles of the family Buprestidae, from the collection of Mr. Edward Saunders, who had made this group his special study for many years, and had brought together 7,267 specimens in the most perfect state of preservation. Among other purchases were:—

"A series of nine skins and skeletons of large Quadrupeds from Southern Abyssinia, supplementary to the collection purchased last year, viz., the skeleton of a male Giraffe, the skins and skeletons of both sexes of a wild Buffalo (*Bubalus centralis*), the skins and skulls of a variety of Water-buck (*Kobus sing-sing*), and of a smaller Antelope (*Tragelaphus decula*), and skeletons of an adult *Rhinoceros bicornis* and *Hippopotamus*.

"The type of a new Pheasant (*Lobiophasis Bulweri*) from the interior of Borneo; presented by H. E. the Governor of Labuan, and named after the donor. This is one of the most interesting additions that have been made for some years past to our knowledge of birds. It is a bird rather above the size of a common Pheasant, and with skinny wattles on the naked head which are probably of a bright blue colour during life. The body, which is entirely of a deep black colour (each feather having a glossy margin), terminates in a long lyre-shaped snowy-white tail."

A very extensive collection of Pleistocene Mammalian remains from the Fluvialite deposit of "Brick earth" in the Valley of the Thames at Ilford, Essex, has been added to the Department of Geology by Mr. Geo. R. Waterhouse, being the entire Museum of Sir Antonio Brady, and consisting of upwards of 900 specimens. They comprise portions of the skeletons of the following animals:—The Fossil Lion (*Felis spelaea*, Goldfuss), Fox (*Canis vulpes*, Briss.), and a species of Bear, together with Elephant, Rhinoceros, Horse, Hippopotamus, Deer, Bison, and Ox remains. Of Elephant remains there are nearly 300 specimens, including tusks, molar teeth, portions of skulls and lower jaws, and other parts of the skeleton. Some few of these are referable to the *Elephas antiquus*, Falconer; the remainder appertain to the *Elephas primigenius*, or Mammoth; a series of great scientific interest, since it comprises teeth, jaws, limb-bones, and other parts, of a large number of individuals, showing the conditions of these parts at the different ages of the animal,

from the extremely young Mammoth to very aged individuals.

The value of this collection is much enhanced by an excellent catalogue of its contents which accompanies it.

The additions by Mr. Story-Maskelyne to the Collection of Minerals have been valuable rather than numerous. The number of new specimens is 814. They include native gold from various parts of Queensland and California; a series of crystals of diamond lying in the decomposed rock in which they are found at the diamond fields of South Africa; and native sulphur, in remarkably fine crystals, from Girgenti, Sicily.

The cryptogamic collections in Mr. W. Carruthers' Botanical Department have been largely increased during the past year. An extensive series of Lichens was obtained from the Herbarium of Dr. Nylander, of Paris, and the well-known Lichen Herbarium of Isaac Carroll was purchased, one especially rich in rare and unique Irish specimens. The most important acquisition, however, was the Moss Herbarium of the late Mr. Wm. Wilson, of Warrington, who devoted his life to that study; he was the author of the standard work on *British Mosses*, and of numerous memoirs on exotic species. This herbarium contains the type-specimens of those various works, and abounds in original drawings prepared with singular accuracy, and with manuscript notes of great critical value. It consists of a collection of British mosses and Jungermanniaceae, as well as a collection of foreign specimens of these two orders.

We have little space left wherein to quote from Mr. G. W. Reid's return from the Department of Prints and Drawings. The chief new examples, however—those from the collection of the eminent connoisseur, Hugh Howard—have already been noticed in our columns. We are glad to learn that considerable progress has been made with the third volume of the Printed Catalogue of Satirical Prints and Drawings; all the works of Hogarth have been described, and the allusions in which they abound exhaustively explained. In this respect, we are told, the Catalogue will probably leave nothing to be done, and will represent Hogarth completely.

NOTES OF A TOUR IN THE CYCLADES AND CRETE.

V. Crete (continued).

THE convent of Arkadi, which was regarded as the largest and richest in Crete, having an income of about 1,000*l.* a year, is now a mass of ruins. The siege of this place by the Turks, and the massacre that followed, from its tragic character, did more than anything else to attract the attention of Western Europe to the Cretan struggle. Only two of the survivors, a monk and a boy, now reside within the walls; indeed, the rest of the fathers perished at the time of the siege; the monks who now inhabit it have come from other monasteries. The present hegumen is a most ignorant man; almost the only remark he ever made was *σπάζει, σπάζει* ("it drips, it drips"), which was suggested by the effect of the pitiless rain on the patched-up roof of the room in which we were lodged, so that to avoid it we were frequently obliged to shift our position, and it even dropped on to our beds at night. At Retimo we had been told that the monastery had been rebuilt, and that we should find good accommodation; but the truth was that only two or three rooms were habitable, of which ours was the best. Throughout our tour we had to carry our provisions with us, for the natives could not supply us even with bread; wine, however, was to be had, and this was excellent. The buildings form a single quadrangle, in the middle of which stands the church; this has been repaired, as also in some measure has the western façade of the monastery; but neither of them shows any trace of Byzantine architecture, being in a debased Re-

naissance style, and the whole convent, at its best period, must have presented a striking contrast to the lordly structures of Mount Athos. A few tall cypresses in the court do their best to relieve the dismal desolation.

The following morning, at our request, the monk who had been present at the siege conducted us round the building and described to us the harrowing details. It took place on November 19, 1866. The Christians who defended it had assembled there some days before, and for greater safety had brought together the women, children, and old men from the neighbouring country within the walls. The Turks approached from the side of Retimo, and at first their commander offered the defenders terms of capitulation, but these were refused, because his soldiers were irregulars, and the Christians knew from experience that these would neither obey orders, nor suffer anyone to escape. A cannon, which the besiegers had dragged hither with some difficulty, was at first planted on a neighbouring height, but as it produced but little effect on the walls, and in the meantime the attacking parties suffered greatly from the fire of the besieged, on the following day it was brought up in front of the monastery, so as to command the entrance gate, which they blew in. After a fearful struggle, they forced their way in at the point of the bayonet, and commenced an indiscriminate massacre, in which 300 souls perished. The court ran with blood, our informant said, and was so piled with bodies that you could not pass from one side to the other. Simultaneously with this attack in front, another band of Turks made an assault from behind, where there was a postern; but close to it the powder magazine was situated, in a chamber over which numbers of monks and women and children were congregated together. As soon as the besiegers were close to the postern, the Christians set fire to the powder, and blew up all this part of the building, involving their friends and their enemies in common ruin. Large pieces of the shattered wall remain outside the new wall, and though most of the Turks were buried where they fell, yet the bones of others may be seen lying on the ground. In the midst of the massacre six and thirty Christians took refuge in the refectory, but they were pursued and all killed, and their blood still stains the walls. About sixty others collected together in a corridor, and begged for quarter, as having taken no part in the insurrection, and the lives of these were spared. The monastery was then fired, and many sick and helpless persons perished in the conflagration. The horrible narrative told by an eye-witness on the spot carried our thoughts back to the Suliotes and their destruction by Ali Pasha. It is fair, however, to remember, that this same convent was the scene of a great massacre of Mahometans by Christians at the time of the first insurrection. Barbarity is the order of the day in Cretan warfare.

As we left Arkadi, all the inmates of the monastery had assembled at the gate to wish us "God speed," and we then pursued our journey southward over uncultivated heath-clad slopes, until in an hour's time we reached the central ridge which forms the backbone of the island, and may be at this point about 2,500 feet above the sea. At first, looking back, we obtained pretty views of the convent with the gorge by its side, between the cliffs of which the distant blue sea was seen as through a frame; and from the summit the Acrotiri near Khanes unexpectedly appeared, delicately delineated on the horizon. On our left was one of the numerous forts which the Turks have constructed in commanding positions to keep the natives in check; there are said to be 200 of them in the island, but this is probably an exaggeration. The rain had now ceased, but the north wind swept over these uplands with intense bitterness. Descending on the opposite side, we struck into the best road we had seen in Crete, which leads from Retimo to the south coast, and not long after arrived at a wayside fountain, called "The

water of the stone" (*τὴν πέτραν τὸ νερό*). Our guide Pandeli informed us (and his testimony was confirmed by a peasant who was passing at the time), that it is considered to have great efficacy in curing the disease of the stone, and that this is the origin of the name. Pashley says that bottles of the water are exported for this purpose even as far as to Constantinople. We gradually came in sight of the south-west buttresses of Ida, which are far more precipitous than anything on the other side of the mountain; but of the summit we saw nothing more than tempting peeps of snow-peaks under the clouds. In the midst of a violent hail-storm we reached the monastery of Asomatos, which is three hours distant from Arkadi, and lies in the midst of olive-groves, interspersed with numerous myrtle-bushes, in a wide rich valley deeply sunk among the mountains.

This convent was left uninjured during the last insurrection, though both the Turkish and Christian forces passed by this way. It is a very poor place, resembling those which we had seen on the sides of the Thessalian Olympus, and consists of a single quadrangle, surrounded by lower buildings than those of Arkadi, while stables and other irregular tenements are grouped on to it on the outside. Within were numerous fine orange-trees, on which the fruit was still hanging, and the church stood in the centre. The *iconostasis* of this was finely carved and gilt, and from the roof hung a glass chandelier, which from its appearance must have come from Venice. From a beam on one side of the court are suspended three Venetian bells, which are said to have been concealed, and only discovered in 1873; they were inscribed with the dates 1633 and 1639 respectively, and both were ornamented with figures in relief of our Lord on the cross, of the Virgin and of St. John, while the smaller of the two had also a figure of a bishop, who the monks said was St. Spiridon. The constitution of this society is *idiorrhythmic*, or on the independent system, whereas Arkadi was a Coenobia, i.e. with a common table, stricter discipline, and a superior elected for life. Certainly, order was not predominant in the appearance of the monks of Asomatos, for they wore no distinctive dress, and only differed from common peasants in having their hair unshorn. The hegumen, in particular, with his burly figure, black bushy beard, and bronzed countenance, would have made an excellent study for one of Ribera's bandits. We were entertained in a low vaulted apartment, where a blazing fire and some of the good wine of the monastery were very welcome; in Crete and the other islands resin is not mixed with the wine, as it is on the mainland of Greece. We were told that no boars, or wolves, or bears, are found on Ida; according to the Cretan legend all the larger wild beasts were once for all expelled from the island by St. Paul: in ancient times the same thing was attributed to Hercules. Game also is scarce; we saw nothing but a few ducks and partridges and a snipe during the whole of our journey.

We continued our route towards the south-east, until at last, in crossing one of the buttresses of Ida, we came in sight of the southern sea. Gradually the Bay of Messara opened out before us, with the headland of Matala beyond, to the eastward of which appeared a depression in the hills which border the coast, marking the site of the "Fair Havens." At the same time the red sunset tints, seen through a dip in the dark mountains to the west, gave cheering signs of a change in the weather. At nightfall we found ourselves at the village of Apodulo, on the mountain-side, and here we determined to pass the night. While our dragoman was enquiring for tolerable quarters for us among the ruined dwellings, we rested at the first cottage we came to, which consisted of one long ground-floor room blackened with smoke, with a clay floor and a large kitchen range, beds and a few other rude articles of furniture, while in one corner a sheep was tethered. Its occupants were three sisters, remarkably handsome

girls, who were dressed as ordinary peasants, and engaged in cooking and other domestic occupations, but from their acquaintance with purer Greek were evidently superior to their present position. They were perfect Italian *madonnas*, having oval faces and oval eyes fringed with fine lashes and surmounted by arched and well-marked eyebrows, the upper lip short, and the nose well-cut and slightly aquiline. Besides an upper dress, they wore the usual dress of Cretan women, white trousers reaching nearly to the ankle, a short petticoat, and a handkerchief on the head. Shortly afterwards the mother entered, wearing a curious cape of woollen stuff, which hung from the head and covered the back and sides; and was followed by the old father, who carried a sort of crook, and looked a truly patriarchal old man. The parents only spoke the ordinary Cretan dialect. The Turks had destroyed all their property during the insurrection, but notwithstanding this we soon learnt how rapidly an intelligent Greek can make his way in the world. After a little conversation the old woman produced a large photograph, framed and glazed, representing a good-looking gentleman in a Frank dress; and this person we learnt was one of her sons, who had emigrated at the conclusion of the war, and now held an excellent mercantile appointment at Marseilles. We were destined, however, to a still greater surprise. Fancy our astonishment when we found that the old man's sister had married an English gentleman, and was still living in Scotland. It is a very curious history. At the time when Crete was under the dominion of Mehmet Ali, a boy and girl of the Psaraki family (for that is their name, though in Cretan it is pronounced Psaratch) were carried off with many others as slaves to Egypt. Mr. H—, who was then in that country, saw this female slave exposed for sale, and being struck with her beauty, bought her and married her. In the course of time the brother also obtained his freedom, and became a travelling servant (our dragoman was acquainted with him, having met him on several occasions); and in that capacity he once accompanied his sister and her husband on a tour on the Nile. Subsequently the married couple returned to Crete, and established themselves at Apodulo, where Mr. H— built himself a house, which was made over to his wife, as he being a foreigner could not hold it in his own name. At a later period, when they left the country and took up their residence in England, it passed into the hands of one of Mrs. H—'s brothers, the old patriarch with whom we are now conversing. This dwelling was assigned to us as our abode for the night, and in its half-ruined state a most dismal habitation it was, for our room, which partook of the nature of a cellar, was fearfully damp, possessed no door, and was partly tenanted by rabbits, which seemed to have discovered the secret of perpetual motion. Of the other children of the Psaraki family, besides those I have mentioned, one son is the priest of the parish, while two boys live at home and attend the village school, where they get their education gratis, having only to provide their books. These schools are regulated by the Demogerontia, an institution peculiar to the Cretan Christians, having no political position, but consisting of a representative council for a certain area of the country, under the presidency of the Bishop, which superintends the administration of certain properties, makes provision for widows and orphans, directs education, &c. It is now arranged that about a quarter of the revenues of all the monasteries shall be handed over to the Demogerontia for the support of the schools. These boys were quick children, and, like the girls, understood our *Romaic* much more readily than the parents did. The brother in Marseilles, Alexander, is anxious that one of them should come out to him to make his fortune, and the boy expressed himself ready to go, but his mother is unwilling to part with him.

The next morning (March 28) all our senses were delighted by a clear sky, bright sun, and

fresh and gentle breeze. This weather continued during the rest of our stay in the island. The cloudless mountain summits gave us quite a new idea of the scenery, the most conspicuous being the pyramidal form of the snow-capped Kedros (6,000 feet) the highest point that intervenes between Ida and the White Mountains. In a ploughed field in the neighbourhood of the village I found the rare and beautiful *Iris tuberosa* in flower, the greenish petals of which turn outwards with a purple lip; the gladiolus, which was growing plentifully along with it, was not yet in bud. As we continued our journey along the mountains, still towards the south-east, we obtained a distant view of the island of Gaudos, the Claudia of the Acts of the Apostles, lying far away to the west, which now belongs to the Sphakiotes; nearer to us lay an islet called Paximadi, i.e. "Biscuit," evidently from its shape. Through a depression between Kedros and the heights that separate it from the sea, the White Mountains were visible, with all the features of an Alpine chain; and next Psilorites (Ida) came in sight behind us, presenting a vast mass of snow-fields. At length, when the last range of hills was crossed, the level district of Messara, the richest in Crete, lay at our feet, reminding us of Marathon by its curving sandy shore, which fringes the soft blue water of the bay, while it is separated from the southern sea by a range of hills, beyond which lies the "Fair Havens." Descending to the low ground, where the temperature was really warm, we rode at first over irregular sloping ground, where the shepherd's horn, by which the sheep are called together, was heard in the midst of the solitudes, and thus arrive at the real plain, where orange trees were growing in the half-ruined villages, and the plane trees were budding near the watercourses. The range of Ida as seen from here, though bright with glistening snows, is not in other respects striking, as its level line is only broken by one conspicuous saddle in the ridge. The plain, which extends far inland by a gradual ascent towards the east, backed by the distant Dictæan mountains, is covered at the sides by olive groves, while the rest was a sea of young green corn, the expanse being unbroken by hedge-rows. On account of its great fertility this region has been appropriated by the Turks, and for the same reason in time of war it is the first object of attack to the Sphakiote mountaineers. In most parts of the island the land is in the hands of the peasants, and where the properties are large the *metayer* system prevails, and the cultivator receives half the produce. At a place called Mires, where we made our mid-day halt in great enjoyment under the shade of the olives, a Kaimakam resides, and we saw a group of Turks watching the paces of one of the spirited little horses which are bred here. It was for sale, and 60*l.* was the price asked for it. At an hour's distance from this we reached the village of Metropoli, where we crossed a copious stream, descending from Ida to join the main river that intersects the plain, the ancient Lethæus, and half-an-hour further on alighted at another called Hagius Deka ("Ἁγίου Δέκα"), from ten saints who were martyred here in the Decian persecution. Between the two villages, at the foot of the buttresses of Ida, and on the edge of the plain, about ten miles from the sea, was situated the ancient Gortyna.

As both Pashley and Spratt mention a Captain Elias as an important man at Hagius Deka, we enquired for his house, but were informed that he had now been dead two years, and had been succeeded by his son, Captain George. The fine old man, of whom every one speaks in terms of praise, had gone through all the fighting of the late war, though eighty years of age, but did not long survive its close. The title of Captain, which is frequently found among the Christians in Crete, is a curious concession by the rulers to the *amour propre* of the natives, being assumed in times of insurrection by the leaders of revolutionary bands,

and subsequently recognised officially, as a compliment, by the authorities. Captain George, a middle-aged man, with strongly-marked features, but a more care-worn face even than the majority of the suffering Cretans, received us kindly into his house, which had been completely ruined, but was now roofed in at the top, though there was no floor to divide the upper storey from the ground-room. He was evidently in great poverty, but, like so many others, looked superior to his present condition. In the court yard in front of the house were numerous fragments of white marble, and near the entrance was a piece of a column, and a sarcophagus with bulls' heads and wreaths of flowers of inferior workmanship, which was used as a trough.

The ruins of Gortyna cover a large extent of ground, but none of them are either anterior to the Roman period, or in good preservation. The city was divided in two parts by the stream already mentioned, which takes its name from the neighbouring village (*της Μητροπόλεως τὸ παράγι*): on an eminence on the further side of this was situated the acropolis, while below it, excavated in the hillside, was the theatre, which is now an almost shapeless mass of rubbish. Opposite to this, on the other bank, stood the Church of St. Titus, a building of massive stone, the principal remaining part of which is a double apse; from the appearance of the arches there must originally have been three apses, and the central one has three semi-cupolas. It is certainly very ancient, and, according to some archaeologists, cannot have been built later than the fourth or fifth century. At all events, it has the interest of association, for, as Gortyna was the Roman capital of the island, and contained an old-established colony of Jews (see 1 Macc. xv. 23), there is every reason to believe that it must have been the headquarters of Titus's ministrations. He is now the patron saint of Crete. The tradition of an ancient bishopric having existed on this spot is preserved to the present day in the name Metropolis. The remaining buildings, which lie dispersed over the fields, are entirely of brick and rubble; one that we saw was circular, another rectangular; the largest is the amphitheatre, situated in the neighbourhood of Hagius Deka, of which not much more than the foundations and the shape remain.

CORRESPONDENCE.

A NEW EDITION OF PEPPY'S "MEMOIRS."

York Street, Covent Garden: May 1, 1875.

In your issue of the 10th ult. there is an announcement of a new edition of Peppy's *Memoirs* with additions.

The projectors of this new edition do not seem to be aware that there is an edition now in print, great part of which is copyright, being additions made to the several republications subsequent to 1828.

The copyright of this edition belongs to us.

Any new edition must necessarily be imperfect, as it cannot include these additions, which amount to one-fourth of the whole.

It can only include the original edition, and such portions as Lord Braybrooke rejected after three careful revisions. GEORGE BELL & SONS.

MISS OTTÉ'S SCANDINAVIAN HISTORY.

British Museum: May 3, 1875.

It appears that in my review of Miss Otté's *Scandinavian History* (in the ACADEMY for April 24) I have made use of certain expressions which are liable to be misunderstood, and which have given pain to the gifted authoress. I hasten to apologise and to explain. I find that in pointing out that certain statements in the earlier chapters of the book were not in accordance with the latest archaeological discoveries, I seemed to accuse the authoress of obtaining her information from antiquated or limited sources, and I made use of the unfortunate name of Dahlmann. To all who know anything of the subject, and who have Miss Otté's volume in their hands, it is needless, of course, to say that it could not have been compiled from any German work whatever, but bears marks on the face of it of being gathered from the Danish of Suhm and Allen, the Swedish of Geijer, and the Norse of P. A. Munch, to name no lesser authorities; for general readers I may be allowed to repeat more plainly that no pains have been spared to collect materials from the best sources in the original languages. I say so much gladly, reserving my opinion that the effort to bring the work down to the level of a child's class-book has been a terrible mistake; but of this, in all probability, the authoress is wholly guiltless.

EDMUND W. GOSSE.

AN ALLUSION TO HAMLET.

4 Victoria Road, Clapham.

I do not know whether the following allusion to Hamlet has been noticed. *Satiromastix*, we all know, was Dekker's answer to Ben Jonson's *Poetaster*. It was written for Shakspeare's company, by whom it was publicly acted, and was published in 1602. Tucca, the instrument of vengeance upon Horace-Jonson, when asked his name, replies: "My name's Hamlet-revenge" (Dekker's Works, vol. i. p. 229, Pearson's edition); and when proceeding to take his revenge on Horace, he comes on the stage, "his boy after him with two pictures under his cloake" (p. 257). Shortly after he uses the pictures as Hamlet does in the scene with his mother, viz.:—

"Look here you staring Leviathan, here's the sweet visage of Horace; look parboil'd face, look; Horace had a trim long beard, and a reasonable good face for a poet (as faces go nowadays). Horace did not scrow and wriggle himself into great mens familiarity (impudently) as thou dost; nor wear the badge of gentlemen's company as thou dost thy taffety sleeves tack'd only with some points of profit. No, Horace had not his face punched full of oylet holes like the cover of a warming pan; Horace loved poets well, and gave cockscombs to none but fools; but thou lovest none, neither wise men nor fools, but thyself; Horace was a goodly corpulent gentleman, and not so lean a hollow-cheek'd scrag as thou art.

"No, here's the copy of thy countenance; by this will I learn to make a number of villanous faces more, and to look scurvily upon the world, as thou dost."

This, I suppose, proves that the incident of the two pictures was in the older Shaksperian Hamlet, where Polonius was Corambis. The German Hamlet, printed by Herr Cohn in his *Shakspeare in Germany*, represents this Corambis Hamlet, and contains the incident, but there the pictures are not carried, but hung in a gallery. "Look," says Hamlet, "in that gallery hangs the counterfeit resemblance of your first husband, and there hangs the counterfeit of your present husband." It appears then that in the early days of the Corambis Hamlet (before 1603) there was already a difference in treating this incident. Sometimes, as in the German imitation, or, as in the plate in Rowe's first edition (1709), the pictures were hung in a gallery. Sometimes they were carried in under the cloak—for they seem, in both cases, to have been large enough to show to the audience. They afterwards dwindled to miniatures. Perhaps Mr. Irving is the first Hamlet who has reduced the pictures to points, and has them only in his mind's eye.

Dekker's picture of Jonson in 1602 is noteworthy, if only for its contrast with the later Jonson, and his "mountain-belly." He was then "a lean hollow-faced scrag," with no beard, and a face "punched full of oylet holes, like a warming-pan." R. SIMPSON.

APPOINTMENTS FOR NEXT WEEK.

- SATURDAY, May 8, 3 p.m. Royal Institution: Rev. Mark Pattison on "A Chapter of University History."
 " Physical: Mr. H. Bauermann on "The Electric Conductivity of Anthracite Coal."
 8.30 p.m. Royal Italian Opera, Covent Garden (*Lohengrin*).
 MONDAY, May 10, 8 p.m. Fourth Philharmonic Concert, St. James's Hall (Beethoven's Choral Symphony).
 8.30 p.m. Geographical.
 TUESDAY, May 11, 3 p.m. Royal Institution: Professor Gladstone on "Chemical Force."
 8 p.m. Anthropological Institute: Mr. M. D. Conway on "Mythology;" Rev. A. H. Sayce on "Language a Test of Social Contact, not of Race."
 WEDNESDAY, May 12, 4.15 p.m. Civil Engineers. Photographic.
 8 p.m. Royal Society of Literature. Society of Arts. Geological.
 " Psychological: Mr. Sergeant Cox on "The Phenomena of Sleep and Dreams;" Mr. G. Harris on "The Psychology of Memory."
 THURSDAY, May 13, 8 p.m. Royal Institution: Mr. J. Dewar on "The Progress of Physico-Chemical Enquiry."
 5 p.m. Zoological Gardens: Davis Lecture (Professor Garrod on "Sheep, Oxen, and Antelopes").
 7 p.m. London Institution: Professor Morley on "The Inner Thought of Shakspeare's Plays." I.
 8 p.m. Society of Arts. Historical, Mathematical.
 8.30 p.m. Royal Antiquaries.
 FRIDAY, May 14, 3 p.m. Mr. Hallé's Second Recital, St. James's Hall.
 7 p.m. Literary and Artistic.
 7.30 p.m. Anthropological.
 " Sacred Harmonic Society, Exeter Hall (St. Paul).
 8 p.m. New Shakspeare Society: Scratch Night.
 " Astronomical Quekett Club.
 9 p.m. Royal Institution: Mr. J. Evans on "The Coinage of the Ancient Britons and Natural Selection."

SCIENCE.

Outlines of Cosmic Philosophy based on the Doctrine of Evolution, with Criticisms of the Positive Philosophy. By John Fiske, M.A., LL.B., Assistant Librarian, and formerly Lecturer on Philosophy at Harvard University. In Two Volumes. (London: Macmillan & Co., 1874.)

THIS work of Mr. Fiske's may be not unfairly designated the most important contribution yet made by America to philosophical literature. Its publication, however, in London, and the dating of its preface from Venice, prepare us for finding

its contents rather European than American. And such they are. The work is, by the author himself, called an "outline-sketch of the New Philosophy, based on the doctrine of Evolution," and more particularly of the philosophy of Mr. Spencer. But, though Mr. Spencer entitles his system "Synthetic Philosophy," Mr. Fiske prefers as name for it "Cosmic Philosophy." "This phrase," Mr. Fiske acknowledges, "has not found favour with Mr. Spencer." But he urges that Mr. Spencer's philosophy is not merely a Synthesis, but a "Cosmic Synthesis;" and maintains that, while this epithet distinguishes the Spencerian from theological and ontological systems, which, in admitting miracle, deny the persistence of Force, and profess to deal with existences not included within the phenomenal world, it equally distinguishes Mr. Spencer's Synthesis from Comte's, since Positivism "consists of an Organon of scientific methods ancillary to the construction of a system of Sociology, and has always implicitly denied the practical possibility of such a unified doctrine of the Cosmos as Mr. Spencer has succeeded in making."

But while Mr. Fiske does not claim for his book the character of an original work, it has nevertheless, he says, "come to contain so much new matter, both critical and constructive, that it can no longer be regarded as a mere reproduction of Mr. Spencer's thoughts." In saying this, the author is perfectly justified; and it is this which justifies us in calling special attention to his book. His "new critical matter is mostly to be found in the chapters relating to religion, and in the discussion of the various points of antagonism between the philosophy here expounded and the positive philosophy." These critical views and Mr. Fiske's attempt to show that "the hostility between Science and Religion is purely a chimaera of the imagination," are summed up in a theory of "Cosmic Theism." But it is to the statement and criticism of Mr. Fiske's "new constructive matter" that we must here confine ourselves.

With the exception of numerous minor suggestions scattered here and there throughout the work, this new constructive matter is found in the five last chapters of Part II. (chapters xviii. to xxii.). The earlier of these chapters lead to conclusions concerning the relations of a social community to its environment such as will, the author modestly says, "doubtless be much more thoroughly and satisfactorily presented by Mr. Spencer in his forthcoming work on Sociology." But the following chapters on the Genesis of Man, along with much expository and critical matter, contain a theory as to the part taken by the prolongation of human infancy in originating social evolution, which the author claims to be "entirely new in all its features." It is, then, these more distinctively original views that we propose here to state and criticise.

The problem which Mr. Fiske attempts to solve by his theory of the influence of a prolonged infancy is stated in the question, How did social evolution originate? The latest writer upon this subject is inclined to give up the problem as insoluble.

"I, at least," says Mr. Bagehot in his *Physics*

and *Politics*, "find it difficult to conceive of men at all like the present men, unless existing in something like families, that is, in groups avowedly connected, at least on the mother's side, and probably always with a vestige of connexion, more or less, on the father's side, and unless these groups were, like many animals, gregarious, under a leader more or less fixed."

But, he adds:—"It is almost beyond imagination how man, as we know man, could, by any sort of process, have gained this step in civilisation." Undaunted, however, by the difficulty of the problem, let us, says Mr. Fiske, "now take a step in advance of previous speculation, and see what can be done by combining two theorems:" the one furnished by Mr. Wallace, and ranking "as one of the most brilliant contributions ever yet made to the doctrine of Evolution;" the other, resulting from the researches of Sir Henry Maine, and confirmed by those of Messrs. Tylor, M'Lennan, and Lubbock.

The first of these theorems may be thus stated:—"So soon as the intelligence of an animal has, through ages of natural selection and direct adaptation, become so considerable that a slight variation in it is of more use to the animal than any variation in physical structure; then such variations will be more and more constantly selected, while purely physical variations, being of less vital importance to the species, will be relatively more and more neglected." Hence we may understand why man differs so little in general physical structure and external appearance from the chimpanzee and gorilla, while with regard to the special point of cerebral structure and its correlative intelligence he differs so vastly from these, his nearest living congeners, and the most sagacious of animals save himself. Nor need we now hesitate to affirm—"not as a concession to Mr. St. George Mivart, but as a legitimate result of our own method of enquiry"—that when "the totality of man's being" is taken into account, the difference between ape and mushroom is less important than the difference between ape and man. And without conceding aught to what Mr. Fiske characterises as "that superlative nonsense known as the doctrine of 'special creations,'" we may admit that, as affirmed by the Duke of Argyll, the eleven cubic inches of brain-space by which the aboriginal Hindu surpasses the gorilla, have a higher value for purposes of classification than the sixty-eight cubic inches by which the modern European surpasses the Hindu. For, when those eleven cubic inches of brain (or even when four or five of them) had been gained, natural selection began to confine itself chiefly to variations in psychical manifestations, and then began a new chapter in the history of the evolution of life.

Now, further, one of the most important results of the researches of Sir Henry Maine and others is that the primordial unit of society was a family group, with, indeed, women and property in common, but more permanent in its constitution than anything to be found of the kind, either among non-human primates, or among other gregarious animals. Here we have the beginning of that sociality which, as distinguished from mere gregariousness, is peculiar to mankind. But the problem we are endeavouring to

solve is just that of the origin of social evolution, or of sociality. Evidently, therefore, we state this problem in but a more concrete form as that of the origin of "permanent relationships, giving rise to reciprocal necessities of behaviour, among a group of individuals associated for the performance of sexual and parental functions," or, in a word, of the Family. The solution Mr. Fiske offers of the problem is by endeavouring to show the causal connexion between that complex intelligence of the highest mammal which natural selection is ever improving, and the comparative permanence of the family union.

His argument is as follows. Whatever may be the physical interpretation, the fact remains undeniable that, while the nervous connexions accompanying a simple intelligence are already organised at birth, the nervous connexions accompanying a complex intelligence are chiefly organised after birth. Thus there arise the phenomena of infancy, which are non-existent among those animals whose psychical actions are purely reflex and instinctive. Infancy, psychologically considered, is the period during which the nerve-connexions and correlative ideal associations necessary for self-maintenance are becoming permanently established. But that larger brain which causes in the children a prolonged infancy, gave to the parents that power of ideal representation which made the sympathy, necessary for the care of a prolonged infancy, possible. For, so closely interrelated are our intellectual and moral natures, that a high development of sympathy cannot be secured without a high development of representativeness. Of this, that cerebrum is the organ, the larger size of which is ever accompanied by a prolonged infancy. And, given that rudimentary capacity of sympathy seen in gregariousness, we can see how that family integration, necessitated by a prolonged infancy, must alter and complicate the emotional incentives to action; and, further, how the continued integration of communities into social aggregates of higher and higher complexity must cause the continued development of sympathy at the expense of the selfish instincts.

Thus, then, according to this theory, Man is created, is differentiated, that is, from the ape by a brain which has attained such a size and such convolutions that, in the struggle for existence, it more profits him that natural selection should act in increasing this size and these convolutions, than in preserving and accumulating other variations; and, as we find that both prolonged infancy, and that greater power of ideal representation which is the intellectual condition of sympathy, are consequences, or rather co-existents, and concomitants of this larger brain—the origin of that sociality is explained which, as distinguished from the mere gregariousness of Animality, characterises Humanity. This theory certainly, I think, entitles Mr. Fiske's work to be considered a distinctly important contribution to the theory of the origin of Species, and of the origin of Man in particular. I would, however, add that a further development of that theory will, I think, be found in working out the application of the principle of

the Conservation of Energy to phenomena of Origin. For we seem thus to be led to a theory of Correlative Origins; a theory, clearing the doctrine of Evolution of all those difficulties which arise from a too rigid theory of Sequential Origins; and a theory, having its verification, I believe, in the fact, not only of inorganic and of organic, but also of intellectual and social origins.

Again and again Mr. Fiske points out the newness of the phenomenon of Progress at that rate at which changes, that can be thus characterised, are observable in periods so short as millenniums, and latterly, even centuries. But how is the origin of this new cycle of Man's history to be explained? and how, more particularly, the passage out of the First Age of Civilisation into that Modern Age initiated by the revolutions which preceded the Christian era? To the solution of neither of these problems does Mr. Fiske appear to have here contributed anything of importance. And this, I venture to think, may be owing to his unquestioning acceptance of Mr. Spencer's philosophy as final, and of his Law of Progress as sufficient. Here, however, we have to deal, not with Mr. Spencer, but with Mr. Fiske. And I shall, therefore, only remark that the central defect of Mr. Spencer's "Synthetic," as of his disciple's "Cosmic" philosophy, appears to me to be the conception of the internal element in Causation as a *passivity*, rather than as a distinctly definable *spontaneity*, but *conditioned spontaneity*. And with this defect in Mr. Spencer's fundamental theory of Causation, it might, I think, beshown that all those more characteristic theories of his which have been attacked and repudiated by such thinkers as the late Mr. J. S. Mill and Professor Bain—his "Unknowable Reality," for instance, and "Universal Postulate"—are in the closest logical connexion. The statement also of Mr. Spencer's Law of Progress is also, I think, vitiated by what I venture to think his defective theory of Causation. And a law more immediately applicable than Mr. Spencer's to the concrete facts of History would appear to be required for the explanation, especially, of the later phenomena of the development of Thought and Civilisation.

I cannot, however, even hint my disagreement with certain of Mr. Spencer's principles without adding that I entirely agree with Mr. Fiske as to the general character of Mr. Spencer's presentation of the Evolution-philosophy. "To no other theory of things yet devised by the art of man can we so well apply the enthusiastic exclamation of Giordano Bruno: 'Con questa filosofia l'anima s'aggrandisce, e mi si magnifica l'intelletto.'" J. S. STUART GLENNIE.

SCIENCE NOTES.

PHYSIOLOGY.

On the Quantity of Oxygen which the Blood is capable of absorbing at different Pressures.—In a former series of experiments M. Bert determined the proportionate amount of oxygen contained in the arterial blood of animals exposed to a highly rarefied atmosphere, and ascertained that as the atmospheric pressure sinks, the proportion of oxygen in the blood sinks also at a very rapid rate. Now Fernet had proved long before that a great part of the oxygen in the blood was inde-

pendent of the barometric pressure—that it was chemically bound to the red corpuscles; he did not extend his enquiry to pressures below 647 mm. of mercury; Bert repeated his experiments and found that his law held good even at a pressure of only 8 mm.—a pressure incompatible with life. How was the discrepancy between the results obtained by exposing living animals to a rarefied atmosphere, and those yielded by the exposure of their blood at a temperature of 16° C. to be reconciled? The experiments with defibrinated blood were repeated at a temperature of 40° C., the blood being agitated for half an hour with air at the required pressure; the results obtained were intermediate between those furnished by the living animals, and those obtained with blood at 16°. The difference still remaining may be explained by recollecting that no such intimate mixture of air with blood can take place in the lungs as in an experimental tube.

Defibrinated blood may be made to absorb large quantities of oxygen by agitation with air under high pressures; but this excess of oxygen is simply dissolved in the plasma and follows Dalton's law. The proportion of the gas absorbed by the blood of living animals under increased atmospheric pressure is decidedly smaller.

The following are the general conclusions to be drawn from M. Bert's experiments (*Comptes Rendus*, 22 Mars, 1875). By agitating defibrinated blood with air at ordinary pressures, a definite compound of oxygen and haemoglobin is obtained, the proportion of oxygen in which cannot be increased by augmenting the atmospheric pressure. This compound resists dissociation at a temperature of 16° C. when exposed to a pressure of one-eighth of an atmosphere; but at the normal temperature of mammalian blood it yields up its oxygen in proportion as the atmospheric pressure is reduced.

The Temperature of the Human Body during Mountain Climbing.—Existing statements on this subject are of a very contradictory kind. Lortet, during two ascents of Mont Blanc, observed a very marked fall of temperature (from 36.3° C. to 32° C.) registered by a thermometer placed under the tongue. Allbutt and Borel, on the other hand, noticed a decided rise; the latter going so far as to assert that the rise is proportional to the amount of muscular exertion, and takes place during both ascent and descent, though greater during the former than during the latter. Calberla (*Archiv der Heilkunde*, 1875, No. 3) publishes a series of very careful observations made on himself and two guides during an ascent of Monte Rosa and one of the Matterhorn. The temperature was taken at intervals both in the axilla and in the rectum, with thermometers which had previously been compared with a standard instrument. The temperature of the atmosphere and the elevation (determined by an aneroid) were simultaneously recorded. As a result of these observations, it was found that the temperature of the body underwent but slight variations (never exceeding 1° C.); during the exertion of actual climbing it was always 2° to 3° C. higher than during repose; the instrument in the axilla always registering 1° to 2° C. less than that in the rectum.

Immunity of the Torpedo from the Effects of its own Shock.—It is commonly believed that the torpedo is not appreciably affected by the powerful discharges of electricity with which it frightens its enemies or benumbs its prey. This belief has been put to the test of experiment by Steiner, working in the Laboratory of the Zoological Station at Naples (*Reichert and Dubois Archiv*, No. 6, 1874). It is difficult to see why the current generated in the electric organs of this fish should not be propagated through its own nerves and muscles as readily as through any other conductor. The first set of experiments was made on torpedoes removed from the water. It was found that although no sensible shock was communicated to the finger when in contact with any part of the surface except that immediately over

the electrical organs, a rheoscopic frog would twitch with every discharge, even when lying on the tail of the torpedo. On substituting a small living torpedo for the rheoscopic frog, its tail, or even its whole body, might be seen to twitch whenever a shock was drawn from the larger fish. Lastly, careful observation proved that the muscles of the discharging torpedo itself contracted simultaneously with each shock; the contraction was not very vigorous, and was less marked in proportion to the distance of the muscle from the electrical apparatus. These experiments were repeated on torpedoes while still submerged in their tank, and yielded exactly the same results. Living torpedoes were next subjected to a current from several Bunsen cells. The copper terminals of the battery were made to dip into opposite corners of the tank, and the circuit closed when the fish assumed a position between them. For purposes of comparison, frogs and a species of mullet were exposed to the same currents. It was found that as the latter increased in intensity, the frog was the first to exhibit muscular twitching, the mullet next, and the torpedo last; showing that the torpedo is less sensitive to electrical stimulation than either of the animals compared with it.

On Stimulation of the Cerebral Convolutions.—Soltmann (*Centralblatt für die Med. Wissensch.*, March 20, 1875) states in a preliminary notice that electrical stimulation of the cortical substance of the brain in newly-born puppies is not followed by any muscular movements; the motorial discharge not beginning to show itself till the ninth or twelfth day after birth. He also finds that the motor areas on the surface of the brain in young animals differ both in form and dimensions from those in adults of the same species.

The Effect of Electricity on Unstripped Muscle.—Gruenhagen and Samkow (*Pflüger's Archiv*, x. 4, 5) investigate the effect of electrical irritation on the sphincter iridis of the cat and rabbit after its removal from the eyeball. The main object of the enquiry was to throw light on the nature of the shortening caused by heat both in striped and in unstripped muscle. The shortening takes place slowly in the former variety, in marked contrast to the quick contraction which follows electrical, mechanical, and chemical stimulation; in the case of unstripped muscle, the reaction is equally slow, whatever the stimulus applied. It was inferred from the experiments that the shortening caused by heat (within certain definite limits of temperature) is a true contraction, analogous to that produced by electricity. Collateral results of some interest were obtained. When the sphincter iridis is fully under the influence of atropia, electrification of the motor oculi nerve does not make the pupil contract; this may be due either to paralysis of the motor nerve-ends, or of the muscular fibres. Now, it was found that the sphincter iridis of the rabbit, after removal, could be made to contract by direct electrification whether it had previously been atropinised or not. Hence we may conclude that the terminal fibres of the motor oculi are alone affected by the alkaloid. Again, it was noticed that above a certain temperature the sphincter iridis of the cat underwent elongation instead of contraction when stimulated. The elongation was proportional to the intensity of the stimulus, and it was of a distinctly active kind; for when the stimulus ceased to operate, the muscular fibres returned to their former dimensions.

BOTANY.

A SMALL collection of dried plants from the interior of China received at Kew, from Dr. Shearer, contains many quite new and very interesting types, which will probably soon be published.

In our last Botanical Notes we announced that a new Flora of Hertfordshire was in preparation, and erroneously attributed it to Dr. Alexander

Prior, whereas it is Mr. R. A. Pryor, of Hatfield, who is engaged upon this work.

WE are glad to learn that a new building will probably be erected at Kew to receive the national botanical library and the immense collections of dried plants, at present deposited in a house which is too small and otherwise very inconvenient for purposes of study. The value of the collections at Kew to working botanists cannot be over-rated, and the admirable manner in which they are arranged is beyond all praise. There may be some difference of opinion as to the desirability of amalgamating the collections at Kew and the British Museum, but none as to the facilities and assistance afforded by the officers of both establishments to botanists in their researches. The only objection we can see to the maintenance of two collections is the possibility of the officers being rivals in the acquisition of additions to their respective establishments; but a proper understanding between them would remove this danger.

THE first volume of Dr. Hooker's *Flora of India* is the principal contribution to descriptive botany of the present year. This is a work that is greatly needed, as we possess none approaching completeness on the vegetation of the country that is probably richer in vegetable products than all the rest of our dependencies put together. The present volume contains comparatively little that is absolutely new—that is to say, descriptions of new genera and species; but its chief value is in being a compendium, so far as it goes, of all the plants known to grow in the country, written in English. It contains the polypetalous families from the *Ranunculaceae* to the end of the *Sapindaceae*, embracing descriptions of 442 genera and 2,250 species. Dr. Hooker's *Student's Flora of the British Islands* has been followed in the style and arrangement of the matter, which has caused a considerable saving of space, as compared with similar works. Several botanists have contributed to the present volume; but even with the united labours of half a dozen contributors, the completion of the work cannot be effected in less than as many years. The species number from 12,000 to 14,000, scattered over an area of 1,500,000 square miles, representing every variety of climate.

THREE or four of the last numbers of the *Botanische Zeitung* have been almost wholly occupied with an article of Celakovsky's, entitled *Vergrünungsgeschichte der Eichen von Alliaría officinalis*, or history of the development of phylloidy in the ovules of the plant named. The morphological dignity or nature of the ovule is still a moot point with physiologists, who are by no means agreed as to the significance of the monstrous conditions and transformations of this organ observed occasionally in different plants. The most logical view seems to be that it is of the same nature in all plants, though the explanations offered for different teratological phenomena exhibited by the ovule would point to a diversity of origin and dignity. Celakovsky seeks to throw some light on this subject by a careful and minute study of the different phases of transformation or malformation observed in the ovules of a proliferous inflorescence of *Alliaría officinalis*. He objects to the assumption that because the ovule sometimes develops as a shoot, the nucleus is a bud. Through this long paper he describes and figures the various modifications he has found of the leafy transformations of the ovular coats and a "funicular appendage" and the presence of a bud. He endeavours to show that the ovular shoot is not a metamorphosed state of the nucleus, and says here we have an indisputable proof that the ovular shoot is not a transformation of the nucleus, and every explanation that the latter is anything more than an outgrowth or metablast must fail. In his investigations he believes he has found the nucleus present in the same ovule in which the bud is developed, and quite independent of it.

THE arrangement of the parts of a floral whorl with relation to each other and the parts of other whorls, has always been considered of some importance by botanists, but systematic researches into the origin and development of the organs are only of comparatively modern date. In illustrated systematic works and botanical text-books it is now usual to give diagrams representing some of the principal types of arrangement, but no work has hitherto been published in which this subject is thoroughly worked out. Dr. Eichler, of Kiel, has, however, recently published the first part of a work entitled *Blüthendiagramme*, in which he illustrates the inflorescence and flowers of all the monocotyledonous and dialypetalous dicotyledonous families of which he has been able to examine sufficient material. The actual and theoretical diagrams of most of the different modifications of arrangement are given, and botanists will find it a very useful book; but in its German form it must remain unintelligible to many. The theoretical diagrams of many of the monocotyledonous families, such as the Gramineae, Cyperaceae, Centrolepideae, &c., are very interesting, and in all cases there are copious references to existing literature. To complete the symmetry of the flowers of some groups involves much labour, hence it is not surprising that there are many blanks, and that much diversity of opinion still prevails regarding the nature of some structures. The relative dignity, as it is termed, of the different organs of a flower is still a debatable point, and therefore many of the diagrams would require modification to suit different views.

MICROSCOPICAL NOTES.

A MICROSCOPICAL examination of atmospheric dust which fell in parts of Sweden and Norway on the night of March 29-30, 1875, has led M. Daubrée to believe that it proceeded from a volcanic eruption in Iceland, as it closely resembled the pumice powder from that country, and especially that of Hrafnunhur. M. Nordenskiöld, telegraphing from Stockholm, said: "Grey vitreous and fibrous powder fell here with snow on March 30: several grammes collected." M. Kjerulf sent to M. Daubrée a specimen of the same dust collected from the snow by Dr. Kars between Söndmøre and the valley of Romsdal in the west, and Trysil, in the direction of Stockholm, in the east. The dust was found to be composed of fragmentary transparent grains, some colourless, others more or less brownish yellow. Most of them were finely striated, fibrous, and full of vesicles, round or elongated, the latter being most common. Few of these grains reached the dimension of $\frac{1}{10}$ millimetre in length, and many were only from $\frac{1}{200}$ to $\frac{1}{300}$ millimetres. M. Daubrée also recognised minute crystals of pyroxene and felspar. He reminded the French Academy of several instances of dust being conveyed by air-currents to great distances. Thus in February, 1863, sand, apparently from Sahara, fell in the western parts of the Canaries, transported thirty-two myriamètres; and more recently, ashes from the Chicago fire reached the Azores in four days, accompanied with an empyreumatic odour which made the inhabitants suppose that a great forest was in conflagration. In 1783 the dry fog, which covered most of Europe for three months, was occasioned by dust from an Iceland eruption. (*Comptes Rendus*, April 19, 1875.)

FOLLOWING in the wake of Darwin, Sir J. Lubbock's interesting work on *British Wild Flowers in relation to Insects* has given fresh interest to the study of pollen grains, and Mr. Alfred Bennett, Lecturer on Botany at St. Thomas's Hospital, has contributed a valuable paper on the subject to the *Popular Science Review* for April. He observes that "in relation to their mode of pollination, flowers may be divided into two classes—the 'anemophilous,' in which the wind, and the 'entomophilous,' in which insects are the carrier agent." The plants fertilised by

wind agency, he states, have dry and dusty pollen, usually spherical, and "never spiny, or marked with conspicuous furrows, or protuberances." In plants requiring insect intervention he observes several distinct contrivances for attaching the pollen to the legs and bodies of bees, flies, &c. "The most important of them are three:—Longitudinal furrows, varying in number from three to eight or nine, and even more; the clothing of the surface of the grains with spines, or other projections; and the connecting them together by means of viscid threads." Numerous drawings illustrate this paper.

DR. LEWIS, Staff surgeon, has continued his investigations on the *Pathological Significance of Nematode Haematodes*, (published in Calcutta, Government Printing Office). He traces *Filaria sanguinis hominis* in patients suffering from chyluria, elephantiasis, and other disorders. The editor of *The Monthly Microscopical Journal* (May, 1875), which contains a notice of these researches, observes that Dr. Lewis "has abundantly shown, if not the connexion of elephantiasis, at least the undoubted relation of chyluria to the presence of these parasitic nematodes."

To facilitate the microscopical examination of the eye in cases of disease, M. Monoyer has contrived a modification of Siebel's ophthalmoscope, so arranged with prisms, that three persons can make simultaneous observations. The apparatus is described in *Comptes Rendus*, April 12, 1875.

M. MARION, in a communication to the French Academy, describes a nemertean worm *Drepanophorus spectabilis*, as possessing "a vascular apparatus which exhibits the surprising peculiarity of containing elliptical, slightly flattened red globules, like those of human blood. Their largest diameter is 0.01 mm. When a portion of the body of the worm is pressed, these corpuscles accumulate in certain parts of the circulatory system, and form a mass of an intense red colour. The movements of the globules can be followed by viewing the animal as a transparent object. They are put in motion by a colourless liquid, in which they float in a constant direction. The animal possesses a median dorsal vessel, and two lateral ones, situated on the ventral side. Below the nervous ganglions the dorsal vessel bifurcates, and anastomoses with the two lateral trunks, which follow the posterior margin of the superior ganglions, and are prolonged into a cephalic anæsa. The dorsal canal gives rise to transverse anæsa, regularly spaced. Each of these branches continues to the flank of the creature, then curves back towards the ventral surface and opens into the lateral vessel. There are, consequently, numerous capillary ramifications, exceptional amongst the nemertians, but recalling the arrangement described by M. Blanchard in *Cerebratulus Liguricus*." "The structure of the highly developed proboscis necessitates the establishment of a special genus for these nemertians;" and M. Marion adopts the name "*Drepanophorus*" proposed by Mr. Hübner (*Comptes Rendus*, April 5, 1875.)

A QUESTION of great interest to microscopists has just been brought before the Royal Microscopical Society by Mr. Slack, who contends that the extreme angles of aperture usually given to the higher objectives are bad substitutes for better correction of spherical aberration. In proof of this opinion, he showed that a glass by Zeiss of Jena, $\frac{1}{4}$, with an angle of only 68° , would display the transverse ribs of *Spirilla gemma* divided into beads, when the object was illuminated by Mr. Wenham's dark-ground reflex apparatus. C and D eye-pieces were employed for this purpose, and the beads were quite distinct, though it was not pretended that they were as well shown as they could be with a higher power and larger angle. Zeiss's half-inch, the C of his catalogue, with 48° aperture, suffices to show the cross-beading of *Pteroisigma hippocampus* with B and C eye-pieces and an achromatic condenser. A paper of Pro-

fessor Abbe was quoted, alleging reasons why no dry objectives should have apertures of more than 105° to 110° , and why it was well to restrict immersion objectives to little more than 100° , so that $\frac{1}{3}$ could work well through covering glass a fifth of a millimetre in thickness. Objectives by Zeiss upon Professor Abbe's plan were found to unite in a remarkable degree the qualities of penetration and resolution.

A few months ago Messrs. Powell and Lealand exhibited at a Scientific Evening of the Royal Microscopical Society a one-eighth immersion objective upon a new formula, worked up by an unusually deep eye-piece to a linear power of 4,000. We have had an opportunity of trying one made for Mr. Lettsom, and it is certainly a very remarkable production, able to show very minute structures for which much higher objectives have hitherto been employed. It has a considerable working distance in proportion to the magnification it affords with deep eye-pieces, and gives a wonderful view of diatoms flat enough for its angle of aperture and contiguity to the object. It has also sufficient penetration for small live objects, and has plenty of light with D and E eye-pieces, which cause no noticeable deterioration of its performance when, as should always be the case with high powers, an achromatic condenser is employed.

ACCORDING to a report made to the French Academy, the most efficacious remedies for vines attacked with the phylloxera are alkaline sulphocarbonates; that of soda being the most effective. It is applied in solution, and destroys the insects without injuring the vine. Not being, as yet, an article of commerce, it has had to be specially prepared. It is expected to be an economical application when it comes into general use, and a large demand is created.

MEETINGS OF SOCIETIES.

ANTHROPOLOGICAL INSTITUTE (Tuesday, April 27).

COLONEL A. LANE FOX, President, in the Chair. Mr. Francis Galton, F.R.S., contributed a note on the height and weight of boys aged fourteen in town and country schools. The results showed the comparative heights and weights of these boys who were fourteen on their last birthday in two groups of public schools—the one group of country schools and the other of town schools. It appeared that boys of fourteen in the country group were about $1\frac{1}{4}$ inches taller and 7 lb. heavier than those in the town group; also that the difference of height was due, in about equal degrees, to retardation and to total suppression of growth, and that the distribution of heights in both cases conformed well to the results of the "Law of Error."

The Rev. Joseph Mullens, D.D., read a paper on the Origin and Progress of the People of Madagascar. The Malagasy appeared to be a single race; no tribe was to be found secluded in any corner or in hill districts different from the people of the plains or in open provinces, such as is met with in India, Sumatra, and Borneo, nor is any portion of the people specially degraded. The Malagasy are divided into three tribes—the Betsimisarakas, the Sakalavas, and the Hovas, the last largely predominating in numbers and influence. With regard to the origin of the people, the author rejected the theory of Craufurd and others who argued for their African descent. Their language and tribal customs suggested a very different origin, for there could hardly be a doubt that the Malay entered largely into the composition of the vocabulary and grammar, and continual researches into the Malay and Malagasy languages afford more and more evidence of their resemblances. The conclusion was that the Malagasy are a Malay people following Malay customs, some of them possessing Malay eyes, hair, and

features, and speaking a Malay tongue at the present time. They were an intelligent people, orderly, were well governed, and were daily improving; and the author of the paper could see the promise of a great and useful future for them.

Mr. J. J. Monteiro read a paper on the Quissama Tribe of Angola, written with the object of correcting some erroneous statements concerning them that had formerly been brought before the Institute.

ZOOLOGICAL SOCIETY OF LONDON (Tuesday, May 4).

E. W. H. HOLDSWORTH, Esq., in the Chair.—Professor Newton, F.R.S., exhibited tracings of certain unpublished sketches of extinct birds from a manuscript in the Utrecht Library. These had been forwarded to him by M. Alphonse Milne-Edwards, and included characteristic figures of the dodo, of *Aphanapteryx Brookii* and of *Psittacus mauritanus*. Mr. H. C. Sorby, F.R.S., read a paper on the various colouring matters in the shells of birds' eggs. In this hitherto neglected field of observation spectroscopic investigation showed that the many beautiful tints of birds' eggs were due to the varying proportions of certain well-marked substances, each of which was chemically defined, and their relationship to blood and to other animal secretions pointed out. The variation in chemical composition was not greater between different species than between varieties of the eggs of the same bird, but in one group (the Tinamous), a compound existed which was not found in the eggs of any other family. Professor Garrod made remarks on the hyoid bone of the elephant, and on certain pigeons; and Mr. G. E. Dobson gave definitions of various genera of bats.

FINE ART.

THE ROYAL ACADEMY EXHIBITION.

(First Notice.)

We find in this gallery, as usual of late years, a conspicuous amount of skill and *savoir faire*, with a very moderate sprinkling of invention or aspiration. Large is the number of artists who can do what they try for, and who perform it with an amount of competence which could be completeness if it would, and which mostly stops short of that because an ordinary manual effort is the natural accompaniment of a still less intense mental endeavour; whereas the number of those who aim high, and work for permanence rather than for the eyes of exhibition hunters and the applause of a season, is small. This, indeed, is only natural: we may murmur at such a result, but we cannot be surprised at it. Great artists, lofty inventors, are never numerous; if we have a large number who perceive with acuteness, and realise with vigour, we must be unquerulous, though not exactly satisfied. Something like a new starting-point, nevertheless—a fresh ideal of work germinating in one mind, and leading others onwards—would now be very desirable. We discern nothing that approaches nearer to this than the increasing domination which Mr. Millais exercises over various exhibitors; and this is an influence of style or manner of presentment, more than anything else. It can be described in many quarters, and especially among the portrait-painters and the landscapists, and is no doubt, so far as it operates, an influence for good. The strongest and most masterly of our exhibiting artists is recognised as such by his colleagues, who would fain learn and re-apply his secret.

We propose to go through the collection, taking the works in classes according to general subject-matter. And first of the oil pictures.

Sacred Subjects.—This is an extremely small section; it hardly counts for anything in the general aspect of the walls. The one example which stands prominently out is that by Mr.

Watts, named *Dedicated to all the Churches*. We have here a Christian picture, broadened out, or (as one might say) shaded off, into a Humanitarian picture. Christ—not bearded, as in more recent art generally, but beardless, as in the earliest Christian symbols—is represented seated in the heaven on clouds, with an opening of golden light behind his head, which wears the crown of thorns. Below him, on the same clouds, are five infants—not winged cherubs, but human babes; we would understand them as indicating the feeble and unprotected, or, in the most enlarged sense, mankind: one of them is of a dark-skinned race, negro or Moorish. Christ extends his right hand, as in demonstration or appeal; the left hand points towards himself. Underneath comes a melancholy moorland, with a cottage-hut, and a little town with its steeple. In looking at the picture, one's mind reverts principally to two texts, as furnishing probably the key-note to the general conception. "Whosoever, therefore, shall humble himself as this little child, the same is greatest in the Kingdom of Heaven; and whoso shall receive one such little child in my name receiveth me." Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me." The face of Jesus is worn and suffering—a face of personal sorrow, and of sympathy and comforting. This is another Christus Consolator, of a more abstract and undefined order than the picture, once familiar to every child, produced by Ary Scheffer. It would be a very suitable altar-piece for any place of worship—gorgeous cathedral, or unadorned conventicle: the lofty might find in it edification; and the lowly, hope. In merely artistic respects, the picture is worthy of its author's capacity and attainments, though it may not rank among his very best efforts.—Mr. Poole chooses as his subject *Ezekiel's Vision*:—"And I looked, and behold a whirlwind came out of the north, a great cloud, and a fire enfolding itself, and a brightness was about it; and out of the midst thereof as the colour of amber, came the likeness of four living creatures." Ezekiel the priest is along with eight of his countrymen, captives in the land of the Chaldeans; the visionary figures, and the living wheel within wheel, have not yet appeared; but the rolling mass of clouds glows and simmers to give them birth. The figures in this picture do not count for very much; besides, we detect in them adaptations from Michel Angelo, if not also from others. The landscape is of bare and terror-moving rocks, scarped and pearly: two trees, dismal and tattered in leaf and branch, only enhance its lifeless desolation. The colour is finely compounded of blues and umbers; and the work as a whole is perhaps, for poetical invention, the fullest and highest which Mr. Poole has ever produced. Mr. Goodall contributes a very large picture of *Rachel and her Flock*, ably done in the pastoral oriental mode: an Arabian maiden crossing a sandy plain, with shallows of water. No harm comes of its being called by the painter, or accepted by the public, as illustrative of the Book of Genesis. Miss T. Thornycroft's *Design from the Parable of the Ten Virgins* is in a style not unrelated to that of Mr. Albert Moore, or of Mr. Poynter; not carried far, but with its fair share of grace and of artistic management. The figure of the sleeping damsel to the right, whose hands clasp her knees, is in especial a good piece of design. Mr. Bedford paints with propriety the humiliation of King David—"Nathan said to David, 'Thou art the Man.'" The royal criminal is here presented as decidedly aged; a point in which Mr. Bedford has been hardly true to biblical chronology, according to which, as we understand it, David was at this date about fifty-one years old. The merely pictorial demands or opportunities of his theme might have prompted the painter to adhere to this less advanced age. In departing from it, he has probably intended to reinforce the moral lesson: the hoary-headed adulterer and assassin

becomes the blacker culprit. Miss A. M. Lea portrays *St. Cecilia* in a fairly dignified but somewhat vaporous style, founded on that of Mr. Watts. As for *The Recording Angel* of Mr. Thorburn, there is about as much of the sacred in this pictorial treatment as there would be in a charade assigning the same character to the most rapid school-miss at an evening party. We observe only one other sacred subject—*By the Waters of Babylon we sat down and wept*, painted by Mr. L. Wingfield, not without expression, but otherwise in a rather showy and obvious style.

Historical Subjects.—Sir John Gilbert is thoroughly himself in his well-sized picture—*Tewkesbury Abbey, Queen Margaret carried prisoner to Edward after the Battle of Tewkesbury*. We need not wish nor hope to see this sort of subject, from this sort of point of view, ever treated better than in the work before us: the painter is now perhaps a more masterly executant in oils than even at his best in water-colours. Several horsemen, and one or two foot-soldiers, are crossing a grassy plain; a mounted knight marshals them forwards; Queen Margaret, at this crisis and crash of her fortunes, rides on with downward eyes and still resolute aspect, holding the reins of her charger. It has been a day of clouds hurtling and contending in the sky, hardly more transitory than the shock of armies and of dynasties: the sun, at setting, bursts yellow on the horizon: the lighting of the figures, distinct and warm, yet waning with the rapidly departing day, is extremely true.—Mr. Long has selected a theme full of sumptuousness and of piquancy, and destined no doubt to be exceptionally popular among the Academy visitors. It is named *The Babylonian Marriage-Market*; and is explained by a long reference to Herodotus, purporting that the ancient Babylonians were wont to marry off all their espousable girls by the neat process of putting them up to auction, from the fairest first to the ugliest last, and receiving, in biddings from the would-be husbands of the pretty ones, treasures which were immediately afterwards dispensed as bonuses to the less ardent yet purchasable bridegrooms of the ill-favoured. Mr. Long deserves to succeed, were it only for his ingenious choice of subject; combining as it does richness and archaeology, scenic drama and amusement, much beauty and some grotesque by-play, antique fact and modern innuendo. Besides, his very large picture is a work of uncommon force and tact, meeting without stint the great demands which it involves upon the executive faculty. The visages, costumes, and accessories are of the Ninevite type: the background consists of the walls of the spacious hall, an inlay of blue, yellow, or whiteish tiles forming large ornamental compositions. The auctioneer stands on his pulpit, bell in hand: his clerk holds a tablet, which he inscribes with cuneiform characters as the biddings mount up; bidders bring their jewel-cases; and an expert is at this moment examining a ruby necklace which a wealthy lord, in the prime of life, is proffering. The handsomest of all the damsels is on the show-stand, her back turned to the spectator of the picture. As she removes her veil, a murmur of admiration runs through the room; a youthful nobleman clasps his hands, and only longs to outbid competition. In front, seated on the floor, are the other expectant maidens, twelve in number. To the extreme left, one, the second of all in order of beauty, is being unveiled by an attendant, as the flower of the flock already nears the decisive instant of "going off." The next one, No. 3, gazes into her mirror. No. 10 is skirmishing with No. 8 as to their comparative comeliness; while No. 9, seated between them, indulges in a smile. No. 10 may be presumed to count, in the opinion of the judges, though not in her own, as the one neither good-looking nor ill-looking, who, according to Herodotus, was not paid for by a suitor nor yet dowered to become a wife. No. 11 begins the class of the dowered and

ugly ones; she grins frankly at a young man of the lower order, standing above and behind her, who holds up his hands, a little scared; he foresees that his poverty, but not his will, may be destined to consent. No. 12 hides her visage in her palms, and we are spared from assessing her facial demerits. In all this there is enough and to spare for the town-talk of a season; and, after that, a clever picture, highly acceptable to some rich purchaser, and indefinitely marketable afterwards, will still remain. Opposite to this hangs another of the large canvases, again a subject well chosen for popularity, and in itself approvable. Mr. Armitage portrays *Julian the Apostate presiding at a Conference of Sectarians*—Christian sectarians whose squabbles amused and disgusted the philosophic Emperor, and whom he scornfully but not hopelessly invited to concord. An ironical smile severs the lips of Julian, the bearded stoic; a bronze statue of Pallas overlooks him, and the contentions votaries of the newfangled and self-conflicting faith. A black-haired fanatic is the present speaker: two other disputants oppose him—one stubbornly, the second vehemently. Another, with the theological shibboleth boiling over irrepressibly from his lips, breaks in, and makes the confusion worse confounded. A fourth approaches from behind, bringing rolls of papyrus, by whose authority the debate is to be settled, or rather re-entangled; he holds up his hand, bespeaking silence and reverence for his panacea. If the smile of Julian is sarcastic, those of his officers and counsellors are more broadly contemptuous: one of them, with a great oak-wreath about his head, may be introduced as representing a Romanised Teuton, and thus recalling the phrase which Julian addressed to the Christian zealots (as quoted in the catalogue from Gibbon)—"Hear me! The Franks have heard me, and the Alemanni!" There is not, however, any very marked national character in this head, nor in any other: the countenances are expressive, but not interesting, and they tend towards a general ugliness. The colour, as usual with Mr. Armitage, is crude. The picture is one to be respected for its sound and sensible qualities—the planning-out of the subject, its composition, draughtsmanship, and narrative efficiency; to find keen pleasure in its art would be a different thing.

We will next take the inevitable Mary Stuart subjects, and the hardly less inevitable Queen Elizabeth. Mr. Herdman and Mr. Elmore supply the former. Mr. Herdman paints *The First Conference between Mary Stuart and John Knox, Holyrood, 1561*: Knox is just telling the Queen, "Your will, Madam, is no reason" why the Church of Rome should be the true Church, and the Reformed ministry heretical. This is an excellent picture: we could not readily find its superior in the particular class of treatment, and range of artistic quality, which the painter has proposed to himself. Knox, thoughtful, steady, unflinching, remonstrant, yet preserving the externals of respect, and anxious to preserve its essence too if practicable, is entirely good: he stands before Mary, who leans back in her chair, looking not less resolute in mood than high-spirited in character. The whole interior is painted in a fine, dark, liquid tone: the boarded floor, with a settee covered in Utrecht velvet, occupies a considerable space, yet without looking bare or unmeaning. The only point we find to reprehend is the cutting brightness of Mary's sleeves, primrose-yellow in tint. Were this altered, the picture would, we think, gain considerably in total harmony, and lose its one detail of an *ad captandum* kind. Mr. Elmore's painting is of far less significance, and its merit of execution only ordinary. It represents *Mary Queen of Scots, and Christopher Norton, at Bolton Castle*: the story being that the Queen, while confined at Bolton, asked Norton one day to hold some knitting-work which she was finishing by the fireside, Lord and Lady Scrope and others being present in the chamber. This drew suspicion upon Nor-

ton; and "two years later" (as Mr. Froude says) "the poor youth was under the knife of the executioner at Tyburn." If Norton was a "youth" two years after the trivial yet tragical incident at Bolton Castle, he ought not to have been portrayed by Mr. Elmore as a man of some thirty-eight years of age at the date of that incident. The Elizabethan subject—*Queen Elizabeth and Essex*—is painted by Mr. Wynfield. Essex has arrived from Ireland, and forced himself into the Queen's bedchamber: he kneels before her, soliciting her protection against calumniators. "The old queen, who was newly risen, without her wig, and in the hands of her tirewoman, received him very graciously; but later in the same day she ordered him into arrest, on the charge of high treason." Mr. Wynfield's is a moderately good picture: there is nothing in it which cannot be readily guessed at by people who read the statement of the subject in the catalogue, and who are familiar with the way such themes are currently treated by competent painters of the day, and by Mr. Wynfield in particular. He has, in this instance, got rid, to a greater extent than we ever observed before, of his besetting fault of opaqueness in the use of pigment: on the other hand, there is less than his usual force.

From Mary Stuart to Marie Antoinette's daughter is no difficult transition: Mr. Ward, long faithful to the royal family of France in its downfall, introduces us to this rather uninteresting *ci-devant*:—*The Orphan of the Temple, Marie Thérèse, daughter of Louis XVI., sketching the Tower of her Prison from the Garden, Paris, 1795*. The ex-Princess sits with her long flame-yellow hair let down: there is a Republican commissary, of an unintrusive but rather wooden aspect; also a spaniel lapdog, a tethered goat, and the attendant lady, Madame de Chantereine. The best point in the picture is the one which *ought* to be best: namely, the aspect of mental convalescence (as it might be termed) in Marie Thérèse; Mr. Ward succeeds in making her look as one long tried, and brought down into the depths of sorrow, now pallidly reviving, and beginning to feel herself yet a living being among the living. In other respects, this is not one of the artist's stronger works: it wants atmosphere sadly, to a degree which is not accounted for by saying that a grey day is represented. Another subject from the French Revolution period is the *Loot, 1797*, of Mr. Gow: free and easy soldiers of the Republic in Italy, turned from apostles of liberty and equality into confiscators of valuables: a Titian and other works are now under their eyes, and practically within their clutch. This is a very clever performance, touched off with facility and spirit,—in colour rather negative. A third subject belonging to the same range of history is *The French Savants in Egypt, 1798*, painted by Mr. Crowe: "When the Mamelukes charged, the cry was 'Let Messieurs the savants and the donkeys enter within the square.'" No painter is more commendable than Mr. Crowe for accurate and minute attention to the details of his subject-matter, whatever it may be: he individualises the characters, varies the actions and incidents, and rounds out the story. He paints also with great care and nicety, and never gives up anything through remissness. The present is a talented picture. Among other figures, we observe Berthollet leaning downwards from his donkey, conversing with a camp-follower outstretched on the ground; Balzac talking, with demonstrative digits, to Costaz, who has beside him an idol and other objects of antiquity; Monge all energy of argumentation, as he discusses some question with Denon; Jomard looking through his field-glass, as he leans across the saddle of his beast. The soldiers, ranged in square, encompass the learned men at some distance: two pyramids are visible afar.

W. M. ROSSITT.

THE SALON OF 1875.

Paris: May 8, 1875.

On leaving a Salon whose catalogue registers 3,802 numbers, corresponding to pictures, sculptures, drawings, etchings, lithographs, enamels, &c., &c., it is simply impossible to collect one's ideas with sufficient clearness to be able to deliver equitable judgments on such or such a performance, on this artist or on that. I, at least, find the task impossible. And such is the physical weariness of my eyes, legs, and brain, that even on the morrow I can still do no more than bring together a few general ideas.

And therefore I will confine myself to-day to these recollections of the Salon as a whole, feeling as I do that the critic gains in consideration by refusing to imitate the reporter. He is thus enabled to accept the entire responsibility of his opinions respecting persons and things.

It is pretty universally agreed that the general aspect of the present Salon is satisfactory. It is full of light. It is better painted. But there is one thing that kills it, that robs it of its character of activity and youth; and this is, above all, the contributions of those artists who have already obtained their reward, and are, therefore, allowed to pass free of duty. The majority of this privileged race consists of old folk who have only had one momentary success, the average of whose talent has always been moderate, and who abuse an imprudent article in the regulations by sending to the Salon the most old-fashioned and the most senile of productions. I insist on this observation, in order that those of your countrymen who come to Paris and are horrified by the large number of bad pictures, may take account of their origin, and not attribute them to the new generation.

That this new generation paints better than its fathers is an incontestable fact: but that it studies drawing less is equally incontestable. You are struck with this phenomenon when, after passing through the picture galleries, you descend to the garden and study the sculpture. Here, on the other hand, our school shows astonishing knowledge, brilliancy and vigour. This is because it is here necessary to have recourse to the human model, which, even with its individual imperfections, is a type of harmony that cannot be betrayed or wholly wrested from its nature; and because this necessity incessantly strengthens and upholds the education of the artist. Moreover, a man seldom lives by sculpture; and the character becomes nobler by reason of less constant relations with dealers, amateurs, and the administration, whose commands, caprices, and regulations require such constant submission from the painter. Finally, it is infinitely more difficult to draw out of a hard white block of marble an idea clear and speaking, tender or philosophical, than from a canvas, which offers all the fascination and all the resources of colour and chiaroscuro.

Our gallery of sculpture is this year all the finer because it contains the reproduction in marble or in bronze of works that met with success in previous years: the *Gloria Victis* of Mercié; the *Secret d'en haut* of Moulin; the *Young Mother teaching her Daughter to read* of Delaplanche; the *Retiarius* of Noël; *Romeo and Juliet*, &c.

Among the most applauded of the new pieces is the monument raised by subscription to Regnault in the court of the Ecole des Beaux Arts. It is called *Youth*. It consists of a young girl clad in the ancient mode, naked to the loins, raising herself on tiptoe to hang a branch of golden laurel on a crumbling wall. I need scarcely tell you that this wall recalls the park of Buzenval, where Regnault died in the defence of Paris. This elegant and delicate monument is by M. Chapu.

The other piece is by M. Préault, the old romanticist sculptor. It is a statue of Jacques Cœur, intended for the town of Bourges. The silversmith of King Charles VII. is represented standing, and gazing at the horizon with an expression calm, energetic, and intelligent. The

spirit of the costume is admirably caught. The statue too, as is but rarely the case, is interesting on all sides; at the back of the figure is an anchor resting on bales of merchandise, which gives a wonderful completeness to the general decorative effect. It is a triumph for the aged master, Auguste Préault, whom the Academicians have dragged through the mud, and the public has with scarcely any exception misunderstood, and who has been producing for the last forty years compositions as picturesque as they are original.

This recalls my attention to the romantic movement. By a chance which death has invested with its own dignity, Corot, one of the last of the romantic school, is represented here by three pictures, two of which are of the first rank. They surpass all the other landscapes in the Salon, not only by the skilful and natural arrangement of the composition, by the grandeur of the massing, by the charm of the situation, by the healthy and gentle sentiments which the whole excites, but also by the truth of the verdure, the depth and brilliancy of the blue sky. One has to admit that whatever the young school gains in skilfulness of execution it loses in sentiment, in profound study, in emotion communicated to the spectator. The ravages of photography are as terrible and mysterious as the ravages of the Phylloxera.

Among the portrait-painters M. Fantin takes first rank with the portrait of Mr. Edwin Edwards and his wife, which is as notable for its painting as for its composition. It is to be hoped that at the first re-arrangement of the pictures, this remarkable work will be better placed. The attention of the public is particularly attracted by the portrait of Mme. Pasca, a well-known actress. It is by M. Bonnat and represents the actress standing, in a white dress with border of black. And one is arrested by a *Jeune Femme en rouge*, seated in an arm-chair, by M. Jacquet.

Among historical paintings there is a superb composition by M. de Chavannes, a *Family of Fishers in Prehistoric Times*; a *Dante and Virgil in the Liars' Circle*, by Gustave Doré, executed with a brush more supple than is his wont; an immense canvas by M. Becker, *Rizpah, Concubine of Saul*, defending from the attacks of a vulture the gibbet on which hang the bodies of her seven children; a composition in the ancient style, by M. Alma Tadema, *M. Gambord in the house of a Greek Painter*. An excellent picture by M. T. P. Laurens, *L'Interdit*, a churchyard of the Middle Ages walled up by order of the clergy, and serving as charnel-house to corpses which had been refused burial.

M. Falguière, a sculptor, obtains considerable success with *The Wrestlers*, a very learned and fairly vigorous painting.

M. Manet is only represented by a single painting—*Argenteuil*—representing a boatman and his wife in a barge. The colouring is of very high quality, and the open air is well expressed. But, briefly, the official Salons are unfavourable to this style of painting, which is at once summary and energetic. M. Manet has committed an error of judgment in declining to place himself at the head of the group of artists which has tried to organise independent exhibitions.

I will also mention *Le Rétameur*, by M. Alphonse Legros; *Women in a Church*, by M. Lhermitte; a *Portrait of an Old Lady*, by M. Henner; *Women bathing in a Park*, a magnificent decorative subject, by M. Carolus Duran; *Basque Tennis-players*, by M. Gustave Colit; *Intérieur de Charcuterie*; *Armour*, by Vollon; *Clocks*, by a new exhibitor, M. Cauchois. But I must reserve all detailed notice for my second letter. I will end for the present with the comforting criticism that both the official successes, M. Cabanel and M. Bouguereau, are incomparably below the level of previous years. *Raro antecedentem scelestum deseruit poena.*

PH. BURTY.

MR. STEVENS.

MR. ALFRED GEORGE STEVENS, one of the greatest of decorative artists of these modern days, is dead; and the work which is hereafter to bear testimony to his skill—the Wellington monument in St. Paul's Cathedral—is left unfinished. Some years ago Mr. Stevens fell a victim to paralysis, and his end was hastened by heart-disease and bronchitis, to which he succumbed on May 1, at his residence 9 Eton Villas, Haverstock Hill. He was only fifty-seven years of age. Born at Blandford, Dorsetshire, in December 1817, he at eight years of age was busy painting portraits. His career being thus early marked out, his friends advised him to study the works of the old masters. For this purpose the Rev. Samuel Beste assisted him in a journey to Italy; and in the academies and galleries of Florence and Rome he diligently laboured—so diligently that he was almost a dead man to the friends he left at home, even Beste never hearing from him. It would appear that a definite course of work was suggested to him, for he has been heard to say, "I was sent to Italy to study Salvator Rosa, but I found him so bad that I would not copy him." It was during his residence in Rome that he was employed by Thorwaldsen, in whose studio he no doubt acquired considerable proficiency in the art of sculpture. About the year 1842, after a residence of nine years in Italy, he returned to England. Not seeing a course clearly open to him, he undertook various decorative works for architects and manufacturers. His works for founders are very numerous. His fire-places are unapproachable, whether in respect to the iron work or the sculptured mantelpieces and supports in which he framed them. But on this work, commonplace though it may seem, he could not help expending his rare invention and perfect manipulation. Probably the finest specimen of his ingenuity under this head is the mantelpiece in the dining-room of Dorchester House. It is a matchless, as indeed it is a priceless, work of art. Mr. Stevens assisted the late Professor Cockerell in the execution of many of his architectural works. Like a great many other men who have endeavoured to fulfil their mission in life, or rather to reach the level intended for them, he deserted, though at great personal inconvenience, the drudgery of his profession, and strove hard for the foremost position to which he had a right to aspire. Many were the competitions into which he entered, and the rejections which he experienced. He also prepared innumerable designs which were never executed. He designed gates (bronze) for the Geological Museum in Jermyn Street; models for the Memorial of the International Exhibition of 1861; designs for the decorations of the Houses of Parliament, including a fresco painting of incidents from the life of Alfred the Great; a scheme of decorations for the reading-room of the British Museum; designs for Minton's pottery. But these are only a few of his unsuccessful works. Some of these designs will no doubt be brought to light when the contents of his studio are carefully gone over. Many of them have no doubt perished, for Mr. Stevens's bump of destructiveness was very largely developed. Referring to the British Museum, we are reminded that the young lion squatting on the top of the small iron supports of the railing outside that institution is from a model by Mr. Stevens. Numerous are the houses which he has either wholly or partially decorated. In Liverpool, in America—in the latter case he had sent the whole house out in blocks to be fitted up on arrival at their destination, in London, and other cities, specimens of his workmanship are to be found. Dorchester House, Park Lane, contains the most superb of his house-decorations. Though not always happy in the business portion of his arrangements with Mr. Stevens—he could not get the embellishments of his house completed even by threats of legal proceedings—Mr. Holford is as much to be envied as would be the possessor of a gallery of undiscovered pictures by Turner.

In the dining-room of this palatial residence every description of the decorator's art is represented—carving in marble and wood, painted ceilings and panels, enamelled and metal works. Stevens was jealous of his work, and did it all himself. It has been well said that the specimens of his handicraft which he has left behind in Mr. Holford's house are alone sufficient to establish Mr. Stevens's reputation as one of the greatest decorative artists of any age. The work, however, by which his merit is to be measured, as he wished it should, is the Wellington Memorial under the dome of St. Paul's Cathedral. In the competition for this work, he was so far successful as to gain a premium for his model, and eventually received the commission for the execution of it. It is true the work has been many years in hand, but when the monument is finished, and critically examined in its completed form, Mr. Stevens will be readily forgiven his delays. Bad health, made worse by the constant "worries" of men who, as he said, did not know what art was or the length of it, had much to do with these delays. He was always making an effort to hide from the world the condition of his health. He was always busy, however; and when he could not be out working upon his larger designs, he amused himself with the decoration of his own house and studio. Although not completed *in situ*, all the models and designs for the Wellington Memorial are ready. Possibly a few minor details will be found incomplete, but in reference to these he has explained to his pupil, Mr. James Gamble, what his intentions were. It is to be hoped that this artist—who spent not only the earlier portion of his life as a student with Mr. Stevens, but also his leisure with him as his friend—will be employed to carry out what he is so well able to do—the completion of the Wellington monument. It is intended that it shall fill up one of the arches under the dome of the cathedral, the arch of the monument itself falling pretty nearly in a line with one of the windows which will light up the work in various parts. With reference to Mr. Stevens personally, it only remains to be said that he had devoted his whole life to his art, neglecting social ties and almost friendship, and despising mere worldly distinctions. Probably his best friends were Mr. Pegler, his executor, and James Gamble and Reuben Townroe, the artists who decorated the South Kensington Museum, the Albert Hall, &c.

ART SALES.

THE Salle Drouot has been crowded with visitors to the sale of the paintings and drawings of Fortuny, which began on the 24th ult. They bear the record of his life and of the various impressions of his travels. The Arab, the Spaniard, and the Italian were his favourite studies. In Spain, persons and views of Madrid, Seville, and Granada. In Morocco, the streets and inhabitants of Tangiers and scenes of private life. In Italy, ruins of Rome, Naples, and Portici. High prices were obtained:—*The Shore of Portici*, 49,800 fr.; *Bather upon the Shore of Portici*, 6,900 fr.; the same subject, bought by M. Alexandre Dumas, 3,000 fr.; *A Bather*, 5,000 fr.; *Via Giulia at Rome*, 5,030 fr.; *Grand Salon of the Colonna Palace at Rome*, 5,158 fr.; *Study of Landscape and Buildings, Environs of Rome*, 3,550 fr.; *Italian Woman at the Door of her House*, 2,150 fr.; *Environs of Rome*, 1,020 fr.; *Landscape with Running Water*, 4,700 fr.; *Procession going out of the Church of Santa Cruz, Madrid, in rain*, 20,000 fr.; *The Door of the Church of San Gines, Madrid*, 9,100 fr.; *The Result of a Carousal*, 2,030 fr.; *Bull-fight, Wounded Picador*, 4,100 fr.; *Mousquetaire of the time of Philip IV.*, 3,025 fr.; *Nobleman of the time of Charles V.*, 2,250 fr.; *Door of the Salon des Ambassadeurs of the Alcazar of Seville*, 2,600 fr.; *Staircase of the House of Pilate, at Seville*, 5,450 fr.; *Gipsies selling Flowers*, 1,650 fr.; *Court of the*

Alhambra, 24,100 fr.; *Old Trees along the Fortification*, 7,550 fr.; *Court of the Alhambra*, 27,000 fr.; *Corner of the Garden of the Adarves, at the Alhambra*, 6,100 fr.; *Salle of the Abencorages*, 7,800 fr.; *Funeral on Shrove Tuesday*, 1,800 fr.; *A Court at Granada*, 9,000 fr.; *A Gypsy Dancing in a Garden at Granada*, 5,400 fr.; *A Court at Granada*, 9,000 fr.; *Corner of Fortuny's Garden, Granada*, 9,500 fr.; another, 9,450 fr.; *Battle of Tetuan*, 9,020 fr.; *Arab Slaughterhouse*, 9,800 fr.; *Arabian Fantasia at Tangier*, 11,300 fr.; *Gipsy leaning upon an Ass*, 13,400 fr.; *Arabian Knife-grinder*, 8,550 fr.; *Halt before a House at Tangier*, 8,700 fr.; *Arabian Musician before a Moorish King*, 8,000 fr.; *Children playing in a Japanese Room*, 30,500 fr.; *Marie Luisa and her two Children*, after Goya, 10,000 fr.; *Portrait of Bayeu*, after the painting in the Museum at Madrid, 10,000 fr. Total, 715,745 fr.

On the 26th ult. Messrs. Christie and Manson sold the pictures belonging to the late Sir Edward Smirke, comprising many by his father, the late Royal Academician, best known by his illustrations of Don Quixote, Shakspeare, and other standard writers. They produced but trifling prices—*Nymphs Bathing*, 14l. 10s.; and eleven in a frame from the *Spectator*, 31l.

On the 27th ult. the collection sold was from the old masters:—Bellini, *Madonna and Child*, 80gs.; *The Supper at Emmaus*, 462 gs.; Botticelli, *Madonna*, 205 gs.; F. Francia, *Portrait of a Lady*, 48 gs.; Lorenzo Costa, *Madonna and Child*, 56 gs.; Garofalo, *Holy Family*, 44 gs.; and *Portrait of the Artist*, holding a flower in his hand, 66 gs.; Innocenza da Imola, *Holy Family* with St. Catherine and St. John, 41 gs.; Lippi, *Madonna and Child*, 52 gs.; Luini, *St. John*, 150 gs.; Murillo, *Assumption of the Virgin*, 110 gs.; Mazolino di Ferrara, *Adoration of the Shepherds*, 62 gs.; Marco d'Aggione, *St. John with Lamb*, 70 gs.; Lo Spagno, *Madonna and Child*, surrounded by cherubs, 51 gs.; Paul Potter, *Farm Yard*, 85 gs.

On the 29th ult., from the collection of the late Rev. John Lucy, was sold a pair of fine oviform Oriental vases from Fonthill, 180l. From the collection of the late Mr. Bredel, a set of four fine old Italian statuettes of metal gilt, with drapery of Oriental alabaster, 96 gs.; a tray of Florentine mosaic, from Stowe, 50 gs.; a Florentine mosaic slab, mounted in ormolu, 670 gs., and its companion 980 gs. Belonging to Miss Bredel, were sold eleven panels of old Swiss glass, painted with figures and coats of arms, 87 gs.; Louis XIV., buhl cabinet, from Fonthill, 105 gs. In the same sale was an Arabian glass suspension lamp, covered with Arabic inscriptions of the thirteenth century, 150 gs., and its companion, 93 gs.; a lamp of Persian porcelain, 150 gs.; old Chelsea turquoise vase, 48 gs.; pair of Chelsea candlesticks, 95 gs.; and a most magnificent old Chelsea group of a shepherd and shepherdess under a May tree, fifteen inches high, sold for the enormous price of 241 gs.; two Bow figures, Summer and Autumn, 36 gs.; a set of fine turquoise vases, the centre with handles formed of Cupids riding upon dolphins, 660 gs.; Mercury and a Nymph in a bosquet, 47 gs.; two pilgrims in a bosquet, 48 gs.; old Worcester vase and cover, and pair of beakers, salmon ground, 380 gs.; *Helen*, a statue by Gibson, 80 gs.; Storey of Rome, *Semiramis*, the celebrated statue, executed for Mr. Benzon, and sold by his executors, 1,500 gs.; Magni, *The Drawing Girl*, 280 gs.; Adams-Acton, *Fidelity*, 180 gs.; Biemia of Rome, *The Spinning Girl*, 90 gs.

THERE was a china sale at Messrs. Sotheby on the 26th and 27th ult., containing some important examples of Bristol porcelain:—A sugar basin, richly gilt, with classic portraits in Indian ink, 40l.; a double-handled cup, with portraits in Indian ink by Bone on a maroon ground, 50l.; and the companion, 59l.; cream ewer with laurel border, richly gilt, 37l. 10s.; pair of chocolate

cups with gold border, laurel festoons and pink ribbons, 23l. 10s.; Plymouth white figure of shepherd and shepherdess, 41l. On the 28th a white Bristol figure of Asia sold for 116l.

CHRISTIE'S sales of the week were concluded May 1, by collections of pictures belonging to the late Rev. J. Lucy and Mr. Charles Bredel, containing among them some gems of Dutch art, which have attracted to England Mr. Gruner from Dresden, M. Rutter from Paris, and representatives of the galleries of Berlin, Brussels and Cologne:—Gainsborough, *A Landscape with Girl on Pony and other Figures*, 3,485l.; Van den Capella, *River Scene*, 400l. 10s.; W. Mieris, *The Grocer's Shop*, a work of the highest excellence, 787l. 10s.; J. Wynant and Van de Velde, *A Woody Landscape*, 325l. 10s.; Watteau, a pair of pictures, *Dance Champêtre* and *Musical Composition*, 8 inches diameter, 535l. 10s.; John and Andrew Both, *Abraham with Hagar and Ishmael*, 4,725l. (bought by Colnaghi); W. van de Velde, *A Fresh Breeze*, 682l. 10s.; Romney, *The Portrait of Lady Hamilton as the Tragic Muse*, 252l., and *The Comic Muse*, 325l. In the Bredel collection:—Le Nain, *Interior*, 493l. 10s.; Watteau, *Peasants dancing*, 262l. 10s., and *A Dance Champêtre*, 525l.; Nicholas Berchem, *Woman with a Distaff*, 945l.; John Both, *A Landscape*, 1,732l. 10s.; A. Cuyp, *View of a Dutch River*, 825l., and *View on the Banks of the Maas*, 1,102l. 10s.; Cornelius Dusart, *A Farmyard*, 325l. 10s.; Minderhart Hobbema, *A Boat with two Men in it* (there was an animated competition for this beautiful picture, but it fell to the Brussels Gallery for 3,225l.); Nicholas Maas, *Interior*, 1,775l.; F. Mieris, *The Enamoured Cavalier*, 4,500l. (Colnaghi); A. Ostade, *The Trio Trac Players*, 12 inches by 10, 700l.; Rubens, *Christ triumphant over Sin and Death*, 430l.; Jacob Ruysdael, *The Ruin*, 2,310l.; Jan Steen, *Interior of a Room*, 601l. 10s.; A. van der Neer, *Winter in Holland*, 550l. 10s.; W. van de Velde, *View on the Dutch Coast during a Calm*, 787l. 10s.; Adrian van de Velde, *A Pastoral Scene*, pronounced by Dr. Waagen to be one of the finest pictures by this great master, 13½ inches by 12½ inches, originally purchased by Mr. Bredel for 700l.—after great competition was bought by Mr. Rutter for 4,515l.; Philip Wouvermans, *View on a Canal in Holland*, 1,281l.; and *Departure of a Hawking Party*, 609l.; John Wynants, *Herdsman with Cattle*, 367l. 10s.; and *Boy Angling*, said by Dr. Waagen to be one of his finest works, 1,890l. Of Baroness Dimsdale's pictures—Lucas van Leyden, *The Nativity*, 315l.; and W. van de Velde, *A Coast Scene*, 280l. Some of the Dutch pictures realised the highest prices ever known to be given.

NOTES AND NEWS.

AN interesting series of paper mosaics taken from the early Christian works in mosaic in Rome, Ravenna, and Venice, has recently been placed on the upper portion of the walls of the North Court of the South Kensington Museum. These paper impressions of the mosaics are taken, we understand, much in the same way as rubbings from brasses, and are afterwards coloured by hand. They certainly give a very fair notion of the originals. Among them we noticed the well-known mosaics referred to the sixth century representing the Emperor Justinian and his Court, and the Empress Theodora and her Court, from the Church of San Vitale in Ravenna. However well one may be acquainted with these remarkable works from book illustrations, it is almost startling to see them staring life-size at one from the walls of South Kensington. Each measures more than 8 ft. in height by 12 ft., 7½ ft., and 8½ ft. in width. Other of the mosaics are: Abraham and the Angels from the church of Sta. Maria Maggiore, Rome; figure of Sta. Agnese from the church of the saint, Rome; SS. Agnes, Pudenciana, and Praxedes, on a gold background within diaper

borders, from Sta. Prassede, Rome; SS. John, Andrew, and James, from the same church; figure of Isaiah of the twelfth century, from the basilica of San Clemente, the Birth of the Virgin, by Pietro Cavallini in the fourteenth century; and a most curious medallion representing Christ seated between two captives, one of whom is a negro, with the inscription "Signum ordinis sanctae Trinitatis et captivorum," executed by Jacobus Cosmato and his son on the gateway of the Monastery of the Trinity, Rome.

There have been several attempts made of late years to revive the almost lost art of mosaic. South Kensington has for some time employed its pupils in this mode of decoration, and a school of mosaic has recently been established at Sèvres; but we imagine that the process is too tedious to prove attractive to many workers in this impatient age. The wonderful preservation of the examples reproduced at South Kensington might well, however, tempt some of our artists to lay aside the "fleeting" art of painting, and work in mosaic "for eternity."

THE South Kensington Museum has lately received from the French Government a magnificent porcelain vase or wine-cooler, 3 ft. 4 in. in length, and 1 ft. 6 in. high, from the Sèvres manufactory. The body of this cistern is of a lapis-lazuli colour; on one side is a white oval plaque, with a representation in very low relief of a wild boar attacked by dogs; and on the other side is a similar plaque, with a deer-hunt. The handles are formed of Pan's heads with enormous rams' horns. This fine vase was chosen for the Museum by M. du Sommerard.

THE New Forest Defence Association is carrying forward its work in gallant style. Besides the promised exhibition of works of art (which will comprise an illustrative series of remarkable drawings of New Forest scenery by W. Kiimpel, and a set of large photographs by Vernon Heath, both executed expressly for the occasion), we hear of the organisation of a formidable array of petitions for the preservation of the Forest, to be signed by artists, art-school students, botanists, ornithologists, entomologists, and other scientific bodies. The New Forest is said to be rich in several peculiar breeds of moths and other insects; and contains also an unique series of fossil shells but little known to conchologists.

THE fine chronological collection of lace exhibited last year at the International Exhibition by M. Dupont-Auberville will not leave the country, having just been purchased by a private individual, with the view of presenting it to the Lace Museum at Nottingham.

THE sale of Mr. Bohn's English china will soon be followed by that of his collection of Wedgwood.

ILLUMINATIVE Art has lost one of its most skilful and experienced exponents in the late Mr. C. W. Wing, known during the last thirty years at the British Museum as the "best fac-simile copyist" of ancient illuminations, and we may also say one of its best authorities, historical and theoretical. Among other valuable work he contributed to the books of Noel Humphreys and Timbs. Under the late Sir A. Panizzi he assisted in the catalogue work of the British Museum. In 1851 he made drawings on wood from the Great Exhibition for the *Illustrated London News*. For the Exhibition of 1862, he executed drawings for publication by Messrs. Day and Son. In 1870 Mr. Wing was employed on illuminative work for the South Kensington Museum; and some hundreds of drawings on vellum made by him from illuminated manuscripts, included in the sale of the late Mr. J. B. Jarman's valuable collection, will be well remembered by collectors. The mortal disease of the heart under which he laboured for years past precluded the accomplishment of yet more important works. His son, the late Mr. William Wing, F.L.S., was for some time honorary

secretary to the Entomological Society, and a well-known naturalist. He leaves two daughters to mourn the loss of the tenderest and kindest of fathers. Mr. Wing completed his long life of unwearied industry on the 18th of last month, after a few hours' illness, at Windsor, in the seventy-fifth year of his age, having survived his wife two years and one month.

THE death of the veteran English painter, Mr. H. W. Pickersgill, has been followed by that of M. de Waldeck, the *doyen* of French painters and travellers, in his 110th year. After spending almost an ordinary lifetime in African exploration, military service by land and sea, and study in the *ateliers* of Prud'hon and David, M. Waldeck devoted twelve years to archaeological explorations in Central America, making a special study of the Toltec and Aztec ruins and antiquities, and of the flora and fauna of the country. In 1837 he published his *Voyage archéologique et pittoresque dans le Yucatan*, and in 1863 began the publication of the *Ruins of Palenque*. In 1869 he sent to the Salon two subjects of Aztec archaeology, playfully styled "Loisir du Centenaire."

The *Temps* observes that M. Waldeck had a genius for the restoration of old engravings, and reminds us that during his travels in Central America he discovered in a monastery the unique copy of the illustrations drawn by Julius Romanus and engraved by Marcantonio for a work of Aretine, which caused the banishment of the painter and engraver, and all the other copies of which were burned by order of the Pope.

MR. HENRY WALLIS and some other artists have had the series of splendid Mantegnas at Hampton Court photographed and printed in permanent pigments, for a certain number of subscribers, at two guineas each set. Having accomplished their task they think it is a pity that persons who may not have heard of the enterprise, or been personally applied to, should not have a chance of possessing this truly admirable set of prints, nine in number, twenty inches square. The secretary, therefore, desires to say that the hon. treasurer to the fund, Joseph Dixon, Esq., Barrister-at-law, 5 Brick Court, Temple, will receive further subscriptions, and that a set will be forwarded to any gentleman sending the amount to him by post-office order on Fleet Street Post-office. That the photographs are permanent makes a great difference in their value, and the charge is literally the cost of production of so many impressions on so large a scale.

M. DE SAINT-MARTIN continues and concludes in the April number of the *Revue Archéologique* an article begun in the March number on the "Site of Troy." It has nothing to do with Schliemann's recent discoveries except to say that however valuable they may be for archaeology they have no bearing whatever on the site of the Homeric Troy. Le Chevalier, he contends, when he pointed out in 1785 Bunarbashi as the site of the Troy of Homer, settled the question for good. Nowhere else in the district was to be found such a combination of natural features corresponding to those referred to in the Iliad. The strength of this argument Schliemann tried to override chiefly by constant reference to the objects found by him in Ilium Novum, but then he entirely failed to convince anyone that these objects furnished the smallest illustration of the pages of the poet. We observe also that in a short notice of Schliemann's book in *Im Neuen Reich* (1875, No. 18, p. 716), the writer speaks of "Schliemann's not Homer's Troy."

A CORRESPONDENT of the *Revue Archéologique* (April, p. 265) gives a very depreciatory account of the marble statue of Venus lately found in excavations on the Esquiline at Rome. Though the type differs from the known types of Venus, or of any other personage, he yet believes the work to be a Roman copy of some Greek original.

M. BERTRAND has a very strong opinion—and considering the opposition it will meet it had need be strong—that the conical bronze helmet found in 1872 in a tomb at Berru (Marne), and engraved pl. 9-10 of the April number of the *Revue Archéologique*, is of Oriental, that is, Assyrian origin. Neither in form, he says, nor in the pattern with which it is ornamented, can it be compared with the Gaulic, Roman, Etruscan, or Greek helmets hitherto found, whereas helmets of this form are to be seen on Assyrian reliefs. But conical helmets certainly occur on Greek painted vases, as may be seen by reference to the vases from Cyrene in the British Museum, and in this case the helmet is worn not by an Oriental but by a Greek figure. As to the ornamentation, the Berru helmet looks very much like Etruscan, though he assures us it is not so. In the same tomb with this helmet were the usual series of objects in bronze and iron belonging to the accoutrements of a warrior and of the type which is assigned to somewhere between B.C. 600-200. The tenant of this tomb had been buried not only with his armour but also with his war chariot, fragments of which were found—apparently not an uncommon proceeding in ancient Gaul.

THE Duchess Colonna (Marcello), so well known for her works in painting and sculpture, is engaged on a large picture, and has just sent to the Salon three magnificent busts—a Christ expressive of dignity and suffering, bearing the character of the Spanish school; a Roman woman, with all the haughty cruelty of a daughter of the Caesars; and a third bust called Phoebe, a Parisian type full of artistic grace, with the delicate modelling of a Clodion.

THE Japanese Government has appropriated 200,000 dollars for expenses connected with the coming Philadelphia Centennial Exhibition.

MUNICH has lost one of its well-known portrait and *genre* painters by the sudden death, a few days since, of P. Koerle, at the age of fifty-one. In Vienna, where he lived for some years before he finally settled at Munich, he was esteemed as one of the most successful portrait painters of his day; and the *genre* pictures of the time of Louis XV., which he had latterly made his special forte, were generally regarded as the very best of their kind by German art critics.

THE Athens correspondent of the *Kölnische Zeitung* announces that the buildings which are to form the focus of the great works of exploration at Athens will be ready for use by the middle of May, when the German directors of the undertaking will enter upon their new quarters. The road from the coast to the plain of Olympia will also, it is hoped, be speedily completed, and it is, therefore, anticipated that the work of excavation may be systematically organised as soon as the summer heats are over.

M. CADART, the well-known art publisher in Paris, died last week, aged only forty-five years. He will be remembered as having largely contributed to the revival of an interest in the art of etching. For some years he and a partner devoted themselves entirely to the business of publishing modern *œuvres-forcées*. The enterprise did not succeed commercially, but some friends of the movement in France, recognising M. Cadart's aptitude, energy and enthusiasm, started him afresh, and after a while he succeeded not only in bringing etching into fashion as a substitute for wood engraving in book illustration, but in interesting very many artists and amateurs in the serious pursuit of the art he loved. His albums and many series of etchings by living artists are well known in France, and are not unknown in England. We have had occasion to review in these columns different works issuing from M. Cadart's house.

A SUBSCRIPTION has been opened at Paris and Nevers for the erection of a bust in honour of Aligny, the well-known painter of the Nièvre.

M. J. Gautherin, a young sculptor of the province, who has gained some distinction in recent Salons, has been commissioned to execute the likeness of his compatriot in marble.

THE International Exhibition at the Hague will open on the 16th instant.

THE Society "Arti et Amicitiae" of Amsterdam has organised a loan exhibition of the works of contemporary artists. It includes more than 300 paintings, most of them of high class, from the cabinets of Belgian collectors. The French is perhaps the best represented of the modern schools.

THE death is announced of M. F. Florimond Boulanger, a French architect of some distinction, and an ardent disciple of Fourier.

THE Burlington Fine Arts Club has now on exhibition the sketch models of the most important works executed in marble and bronze by the late Mr. J. H. Foley, R.A.

FROM the first days of May onwards, a general exhibition of the works of Corot will be held at the Ecole des Beaux-Arts, in the large and lofty room called the Salle Melpomène. As a preliminary measure it was necessary to obtain a promise of countenance from the Director of the Beaux-Arts, and then the consent of the Director of the School. These two gentlemen both behaved with great courtesy; but is it not embarrassing, to say the least, to have to solicit and depend on the goodwill of officials who are at any time liable to be under the domination of political influences? In a capital like Paris the want of a private building that could be used for such purposes is inexplicable. The exhibition has been organised by a combination of committees consisting of the master's pupils and friends, both artists and amateurs; François the landscape-painter, is the president. They wish to make this posthumous rehabilitation of the painter, which is sure to excite strong feelings of repugnance in the Academic camp, as brilliant as possible. The loan of any valuable Corots which English amateurs may have in their possession would produce a most favourable impression in France.

THE STAGE.

"GROFLÉ-GROFLA" AT THE CRITERION THEATRE.

FREDERICK BÉRAT wrote a song that went round the world, but since the days of *Ma Normandie* no piece of light music has met with a popularity so universal as *La Fille de Madame Angot*. Its colossal success was generally attributed to the melodies of M. Charles Lecocq, and every new work of this agreeable composer has in consequence attracted at least as much attention as a Requiem by Verdi or an operatic trilogy by Wagner. But the play had merits of a kind quite distinct from the daintiness of its music, being a marvellously exact picture of the inner life of the Directory, and reproducing with singular fidelity the extravagances of the silliest age that the world has ever known. The authors had lifted a corner of the cloak that covered this dead and well-nigh forgotten period; they introduced us once more to the salons where a Mdme. de Staël or a Mdme. Tallien had ruled despotically, showed us the crowds making obeisance to the Five Kings of the Luxembourg and saluting the reigning Citizen Directress, the dancers in the Victims' Ball who had been duly qualified by the loss of a relative on the scaffold, the proverb-actors in one drawing-room, the drinkers of aesthetic tea in a second, and the periwigged conspirators in a third. They brought upon the scene the whole carnival of grotesque fashions—fops with their corkscrew canes, their serpentine curls, their muslin cravats and their boots à la Souvarow; ladies trying to revive the modes of ancient Greece in a simple cambric chemise and a tight muslin gown; dark women in fair wigs that had cost some 10,000 francs in assignats; Muscadins with their dog-ear lappets, and all the fools and follies of the day.

Nor under this mask did they fail to show that while Paris was dancing Augereau's soldiers were waiting their opportunity, and the chorus of the streets was singing that with Barras for king and Lange for queen it was scarcely worth while to have changed the government.

So the victories which Madame Angot is said to have won between the Market of the Innocents and the Seraglio of Constantinople were revived in the person of her daughter, and in consideration of this success the Parisian journalists bestowed on M. Lecocq the style and dignities of a Maestro and, when *Groflé-Grofla* was produced, sang psalms in his praise which darkly hinted at the deposition of Auber from the throne of comic opera. This second piece, however, proves no more than that M. Lecocq would have been a very elegant composer for the spinet or clavecin, and can write detached melodies of considerable grace. He is allied by his refinement to the masters of French comic opera, but entirely lacks their command of resources and the masculine vigour by which they were able to put life into the most wooden of the figures that came from M. Scribe's manufactory. Yet he has infinitely less in common with the riotous school of M. Offenbach. M. Offenbach's airs smell of wine and tobacco, M. Lecocq's music is daintily perfumed. M. Offenbach's Muse is a disorderly baggage, M. Lecocq's Euterpe is a sprightly old maid. The fairy godmother who may be assumed to preside over the fortunes of opera bouffe seems to have awarded the clown's motley to M. Offenbach, the pantaloons' crutch to M. Hervé, the columbine's wand to M. Vasseur, and the *bâton* of harlequin to M. Lecocq; and as the harlequin's office is one of some dignity and authority it is unaccountable that a musician of taste should associate his talent with the stupid ribaldry of *Groflé-Grofla*. M. Offenbach is a licensed jester and may do as he pleases; the extravagant and erring spirit of his humour may drive him from one grossness to another, till Mdme. Judic's eyes can wink no more, and Mdme. Schneider's leg is dislocated with excessive gymnastics; but as M. Lecocq has no humour, his coarseness is altogether tedious and absurd.

The English version of this play which was produced at the Criterion Theatre on Saturday is chiefly remarkable for the skill with which the conductor has marshalled his forces, and for the refined singing of Mdme. Pauline Rita. Mdme. Rita is as naturally fitted to the music of M. Lecocq as the aforesaid actresses are suited to the music of the more facetious composer. Hard work has not left her voice quite unimpaired, but her vocalisation is still most artistic and she skims over the shallows of the music with a pretty bird-like flight. The play has been pruned into propriety by the combined exertions of two writers with a result that does more credit to their sense of decency than to their sense of wit. The light is massed with insufficient skill, and so much depends upon colour in this kind of performance that we do not suppose *Groflé-Grofla* will be half so successful as the little mock-pastoral piece *Les Près St. Gervais*.

"LA BOULE" AT THE OPÉRA COMIQUE THEATRE.

La Boule is the tale of a certain hotwater bottle and has some little resemblance to the tale of a certain tub. MM. Meilhac and Halévy have never before written satire so racy, which is all the more effective because the moral is not pointed in the little set homilies that are dear to M. Sardou, but is wholly to be drawn from the action. The play is disfigured by one pantomimic scene contrived to set on some quantity of barren spectators to laugh, but for the rest there is such shrewd and trenchant observation in it as is not often heard within the walls of the Palais Royal. Moreover, it was perfectly played by four of the six best actors of that famous company. The grotesque caricature of a Recorder which M. Lheritier drew from the Palais

de Justice was needed to set in relief the stern truth of M. Gil-Péres, who gave a picture of senile depravity that recalled Otway's Senator or the Philocleon of Aristophanes. In the performance of the excellent M. Geoffroy there was no sign of waning power, though he has been playing on the Paris stage for forty years; and M. Lassouche was able to show such a mastery of his art as makes it doubtful if he be not ripening for the Théâtre Français.

The valet that M. Lassouche represented is the Iago of this domestic tragedy. In the good old days when M. Patrel was a bachelor, Modeste Belamy had indulged his little habits and made himself tolerably comfortable until his master, at forty-five, was seized with the freak of marrying a giddy young thing of eighteen. Modeste, having graciously suffered the marriage to take place, felt it his duty to make the house insupportable for the wife, and being unaided by the presence of a mother-in-law was forced to use such means as engaging Italian musicians to play at six in the morning, changing the dinner-napkins, opening the windows, having the eggs boiled hard, speaking with fond regret of the happy past, and being especially careful to vary from night to night the temperature of the hot-water bottle which was supposed to warm his mistress's bed. These operations were so skilfully conducted, that at the end of four months Mdme. Patrel declared her life to be that of a human being fastened in a sack with a malignant ape. Yet he was not a monster, this valet; he was merely a person who objected to interference with his little habits. The men of law were sent for, and the married pair having separately expounded their grievances—the musicians, napkins, windows, eggs, and hot-water bottle—were given to understand that a separation could not take place without at least one violent scene, and at least one respectable witness. The witness was found in the Baron de la Musardiére, an elderly gentleman who came to engage rooms on behalf of Mdme. Mariette, of the Folies Amoureuses, and whose respectability was proved beyond a doubt by the fact that he refused to be seen in public with any other woman than his lawful wife and to be thought capable of deceiving Mariette. He was now the poodle of this pretty creature, whose letters from St. Petersburg, costumes from Worth, carriages, grooms, jewellery and bouquets were the envy of her theatre. "Ah," sighed the concierge, who had herself been an actress, "we were not in such force at the ancient Renaissance: we had a trifle more heart, and here am I in the porter's lodge." To which Mariette made reply that it was the march of civilisation.

So the Patrels came into court and found that the balance of the judicial mind was disturbed by a domestic occurrence. The judge was already the father of seven girls, his wife was on the point of becoming a mother for the eighth time, and the possibility of an eighth girl was the cause of much prejudice to the hearing of the case. The witnesses included the valet, who had committed his evidence to writing; the musicians, who were persuaded that it was an enquiry into the legality of their licence; Mdme. Mariette, who had come to say that the Baron had been nothing more to her than a guide, a counsellor and a father; the baron's wife, who had promised her friend Mdme. Patrel to state explicitly that M. Patrel was an abominable person; and the baron, who was divided between his conflicting duties as a man of family and a man of pleasure, between the presence of his wife on the one hand and the offensive statement made by Mdme. Mariette on the other. Mdme. Patrel's counsel was speedily captivated by the actress, M. Patrel's counsel drew caricatures of his client, and when news was brought that the judge's family was increased by the birth of two girls the trial came to an untimely end, the Patrels being reconciled and the Baron being led to forgive his wife by the consideration that he should find nobody else to console him for the treatment he received from

other women. The result was simply that when Mdlle. Léontine, the new flame of the Baron, made application for the rooms that should have been occupied by her predecessor, M. Paturol felt bound to raise the rent to indemnify himself for the expenses of the suit. And the authors have pried no further into the little miseries of conjugal life.

This outline may scarcely show the play to be better than the common French farces, but it gets a peculiar flavour from a thousand passing witticisms of which a rapid sketch can take no notice. The buffoonery of human baseness has seldom been painted more vividly than in the person of this Baron de la Musardiére, and the other characters are marked out with no mean skill. The piece was produced on Wednesday at the Opéra Comique Theatre and played by the company with their usual bustle and animation.

WALTER MACLEANE.

WITH the production of *Il Gladiatore* at Drury Lane it is to be hoped that the Salvini fever will abate, and dramatic criticism will resume its ordinary calm. The reputation of the eminent Italian actor is too firmly established to be weakened by detraction, or strengthened by unmeaning adulation. It was inevitable that a foreign actor of Shakspeare should meet with opposition, for most educated Englishmen feel it their duty to make independent research for the two or three points which they believe to be essential to Hamlet's or Othello's soul, and are usually aggrieved to find that others have been afield before them with widely different results. And it was inevitable that the merely physical effort of representing a Titanic passion should serve as effectually to obscure delicate beauties as it might hide grave defects. M. Soumet's tragedy will be considered with less prejudice. He and his daughter wrote it some thirty years ago, and produced it on the boards of the Comédie Française. The actors esteemed it so little that more than one distinguished tragedian refused to appear in it; but, when the play came to be performed, the elevation of its thought, the purity of its language, and the stir and movement of its events bore down all opposition, and this work of ten years' study was placed by acclamation among the finest works of the French stage. And, in truth, M. Soumet was the only one of their writers who could wear the Roman toga with dignity. We will speak next week of Signor Salvini's performance.

On Thursday the Strand Theatre produced a comedy by Mr. Byron, called *Weak Woman*.

TO-NIGHT Mr. Blanchard produces a little farce for the Vokes family at the Adelphi; on Monday M. Hervé's *Chilpéric* is to be revived at the Alhambra Theatre, and to have the advantage of being put on the stage by Mr. Alfred Thompson; and on Saturday next the Charing Cross Theatre will produce a comedy by Mr. Herman called *Jeanne Dubarry*, and a comic opera by Messrs. Clay and Reece, entitled *Cattarina*.

M. VICTORIEN SARDOU is engaged upon a new piece, in which Mdlle. Delaporte will make her re-appearance at the Gymnase Theatre. She is engaged for two years from next autumn. The theatre will lose Mdlle. Pierson, who is going to join the company of the Vaudeville.

OF M. Hervé's new burlesque, which is called *Alice de Nevers*, and has been produced at the Théâtre des Folies Dramatiques, the celebrated critic of the *Moniteur Universel* writes:—"It makes one think of strait-waistcoats and of those chuckling imbecile laughs that one hears in the yard of a lunatic asylum. The public failed in their duty when they saw to an end this monstrous farce that Bedlam would have hooted and Charenton hissed. They should have executed it in the presence of its author. For such spectacles are not only ignominious; they corrupt as

well. They establish a school of brutal derision; their grimaces disfigure every grandeur and every virtue. Contempt no longer suffices for these scurvy jests; a burst of indignation and protest of outraged taste can alone do justice upon them." This is well said, though it comes somewhat tardily; but the pruriency of a Parisian audience is not to be extinguished by an article of M. de Saint-Victor or M. Albert Wolff. Yet the appearance of such an article is matter for congratulation.

M. JOHANN STRAUSS has obtained a great success at the Théâtre de la Renaissance with *La Reine Indigo*; the Théâtre du Palais Royal has revived *Le plus Heureux des Trois*, and ceased to play *La Boule*; but the theatrical productions of the past two weeks at Paris have been singularly few.

MUSIC.

ALEXANDRA PALACE.

THE destruction by fire of the former Alexandra Palace, on June 9, 1873, will be fresh in the memory of most of our readers, nor will they probably need to be reminded that the directors with praiseworthy courage resolved, almost while the ruins were yet smoking, that the structure should be rebuilt. Within two years from the catastrophe a new palace has arisen on the site of the former one, and it was opened to the public on Saturday last.

The object of the present article being rather to speak of the new building from a musical point of view than to give any general description of its contents, many of which if noticed in this paper would belong to the Fine Art rather than to the Musical department, it will suffice to say here with respect to its general construction that it differs materially from the former palace, consisting rather of three buildings connected by corridors than of one large hall. This form has been adopted as furnishing additional security against fire; but, as was clearly proved on Saturday, it certainly does not facilitate locomotion on occasions when a large crowd is collected.

As in the former building, and also as at the Crystal Palace, the central transept of the new palace forms an enormous music-hall, the length and breadth of which are stated in the official programme to be 386 feet and 184 feet respectively. It has one great advantage over the central transept of the Crystal Palace in being more completely enclosed, and therefore better fitted for musical performances. It will seat 12,000 visitors, and the orchestra at the north end will accommodate 2,000 performers. Of its acoustic properties it is hazardous to speak positively after a single hearing, especially as the effect of the music, as in most very large buildings, will probably vary more or less according to the position of the listener. My own experience was decidedly favourable. Seated to the left of the orchestra, and at a distance of perhaps 80 to 100 feet, I could hear distinctly every note of the solos, and the softer passages of the accompaniments. Those who were at a greater distance were less fortunate; but this may probably be partially, if not wholly, accounted for by the noise made by the crowd moving about at the end of the hall in vain endeavours to find seats.

An important feature in the orchestra is the monster organ, with the exception of that in the Albert Hall the largest instrument in London. Of this, however, it is impossible as yet to speak, simply because it is at present in a most discreditable state of incompleteness; on Saturday only twenty-two stops were ready for use out of eighty-nine which the instrument will contain when finished. Those who remember Mr. Willis's previous achievements in the matter of unpunctuality—notably in the case of the Albert Hall organ, which was not completed till some three months after the opening of the hall—will be by

no means surprised at a similar failure on the present occasion.

In addition to the large Central Hall, there is on the north-west side of the Palace a very elegant and commodious concert room, which will hold 3,500 people, and in a corresponding position on the north-east side is a theatre which will seat 3,000. No opportunity was afforded on Saturday of forming an opinion as to the acoustic properties of either of these buildings; all that can be said is that so far as may be judged from appearances they seem well adapted to their respective objects.

The opening musical festival needs but little comment. A band and chorus of 1,500 performers was marshalled under the bâton of Sir Michael Costa, and Mdlle. Titiens, Mdlle. Trébelle-Bettini, Signor Campanini, and Herr Behrené, were engaged as soloists. The most noticeable point in the programme was the entire absence of any English name. Not only were all the artists engaged foreigners, but the concert consisted exclusively (with the exception, of course, of "God save the Queen") of German and Italian music. Whoever was responsible for this, it is earnestly to be hoped that it is not to be considered an indication of any non-recognition of English music in the new building; nor perhaps is there much real ground for apprehension. The conductor of the company's band, Mr. Weist Hill, is himself an Englishman, and it is only reasonable to believe that he will show himself at least as ready to give a hearing to his fellow-countrymen as Mr. Manns (though a foreigner) has ever been at Sydenham. The total omission of English music at the inaugural ceremony was, nevertheless, unfortunate, to say the least of it, and should not be allowed to pass without protest. Apart from this point the programme left little to desire. The instrumental pieces given were the overtures to *L'Etoile du Nord* and *La Gazza Ladra*, and the marches from *Le Prophète* and *Eli*. Mdlle. Titiens sang with the chorus the "Inflammatus" from Rossini's *Stabat Mater* and the Finale to *Loreley*, and the other vocalists, whose names have already been given, each contributed a song, the four being heard together in Costa's quartett "Ecco quel fiero istante." As is always the case in very large spaces, the higher voices were heard to more effect than the contralto and bass. The concert concluded with the well-known Prayer from *Mose in Egitto*. With regard to the execution it is only necessary to say that it was excellent throughout.

In spite of the worst possible weather, the directors of the new Palace may be credited with a completely successful opening. Should the promises of the prospectus be faithfully carried out, much good may be effected for art, and it is to be hoped that in musical matters Muswell Hill may prove a worthy rival of Sydenham.

ELENEZER PROUT.

THE annual performance of the *Messiah* in aid of the funds of the Royal Society of Musicians took place at St. James's Hall last night, under the direction of Mr. W. G. Cusins.

THE Welsh Choral Union gave their first concert for the present (their fifth) season at St. James's Hall on Monday evening last, when Bennett's *May Queen* and a miscellaneous selection, consisting chiefly of Welsh national melodies, were performed.

MR. RIDLEY PRENTICE gave a piano recital at St. George's Hall last Wednesday, assisted by Herr Straus and Miss Georgina Maudsley. The chief items of the very interesting programme were Rubinstein's Sonata in A minor, Op. 19, for piano or violin, Schubert's Rondo in B minor for the same instruments, Beethoven's "Sonata Pathétique" and smaller solos by Mendelssohn, Bennett, Scarlatti, and Hird, and Bach's prelude and fugue in G minor for violin solo.

The long-expected production of *Lohengrin* is at length definitely fixed for this evening, unless (as occasionally happens with new works) a change should be made at the last moment. The cast advertised is the following:—Elsa, Mdle. Albani; Ortrud, Mdle. d'Angeri; Telramund, M. Maurel; Herald, Signor Capponi; King Henry, Herr Seidemann (his first appearance in England); and Lohengrin, Signor Nicolini. The opera will be conducted by Signor Vianesi, who has been taking immense trouble with the rehearsals in order to secure an adequate performance of this very difficult work. We understand that the *mise-en-scène* will be of extraordinary magnificence even for Covent Garden, which is famous for the splendour of its theatrical appointments.

JOHANN STRAUSS' opera-bouffe *Indigo* was produced on the 27th ult. at the Théâtre de la Renaissance, Paris. The *Revue et Gazette Musicale* characterises the work in the following terms:—"M. Johann Strauss is a musician of a delicate and careful style, his harmony is interesting, his orchestration sonorous and full of colour; his melodies are not generally distinguished by great originality, but they are pleasing and graceful, and if they sometimes happen to be commonplace, at least they are never vulgar."

THERE seems to be no end to the number of books written in Germany on Wagner's Bayreuth scheme. A new prize-essay by Dr. Ernst Koch has just been published by C. F. Kahnt of Leipzig. It bears the title "Richard Wagner's Bühnenfestspiel 'Der Ring des Nibelungen' in seinem Verhältniss zur alten Sage wie zur modernen Nibelungendichtung betrachtet."

THE CONTEMPORARY REVIEW.

CONTENTS FOR MAY.

1. "Supernatural Religion." By Professor LIGHTFOOT. IV. Polycarp of Smyrna.
2. Vivisection. By Sir THOMAS WATSON.
3. What is Political Economy? By HENRY DUNNING MACLEOD.
4. Notes of an Indian Journey. By M. E. GRANT DUFF, M.P. I.
5. Mr. Chappell and Professor Helmholtz. By SEDLEY TAYLOR.
6. The Restitution of All Things. By Professor J. B. MAYOR.
7. On the Doctrine of Human Automatism. By Dr. W. B. CARPENTER.
8. Review of Objections to "Literature and Dogma." By MATTHEW ARNOLD. V.

STRAHAN & Co., Paternoster Row.

New Edition, now ready, in 2 vols. 8vo, price 24s. cloth.

SUPERNATURAL RELIGION;
AN INQUIRY INTO THE REALITY OF DIVINE REVELATION.

Sixth Edition, carefully revised, with Eighty Pages of new Preface.

"The writer of 'Supernatural Religion' has conferred a boon on all students of theology."—*Westminster Review*.

"The book proceeds from a man of ability, a scholar, and reasoner, whose discussions are conducted in a judicial method."—*Athenaeum*.

"By far the most decisive, trenchant, and far-reaching of the direct contributions to theological controversy that have been made in this generation."—*Fortnightly Review*.

"It is not often that the gifts and acquirements necessary to the composition of so masterly and exhaustive a treatise as the present are united in the same person."—*Fall Mail Gazette*.

"We give a hearty welcome to this learned and able work. . . . The masterly examination of the evidences for the antiquity of the Christian Scriptures in these volumes, so far as we know, is an unparalleled specimen in the English language."—*Spectator*.

"It abounds with acuteness and overflows with reading."—*Academy*.

"This is beyond doubt an important book. . . . The talent is unquestionable. Independence of thought, keenness of insight, width of information are attested in every chapter."—*Literary World*.

"The style is for the most part extremely clear and forcible; the lines of argument are traced with a firm hand, and the abundance of illustrative material contained in the notes constantly enables the reader to exercise independent judgment on the statement of the text."—*Inquirer*.

"The examination of the first three Gospels in relation to the early Fathers down to the date of the Muratorian Fragment, is one of the most complete undertakings of the kind which we have in English."—*Guardian*.

"A very learned and exact book."—MATTHEW ARNOLD, in the *Contemporary Review*.

"It is written in a style so calm, with learning so weighty, and ability so great, that it at once demands attention and commands respect."—*Scotsman*.

"His work is always earnest, and generally clear, his reasonings are direct, though they sometimes appear to us overstrained, and his main conclusions it will be found difficult to shake."—*Theological Review*.

"It would be mere bigotry to deny the erudition, the logical power, and, on the whole, the reverent tone exhibited by the author."—*Standard*.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Poetical Works of Sydney Dobell. (London: Smith, Elder & Co., 1875.)

THE author of "The Roman" assured his readers in the preface to the second edition of that successful work, that he was not responsible for his title-page, which represented "The Roman" as a "Dramatic Poem," while in his own opinion he was not likely to be capable of writing a poem for ten years to come, though in the meantime he hoped to write much poetry. The author of *Balder*, in the preface to the second edition of that work, which was less successful, informed his readers that "Balderism" was a common malady of the time. In this he was probably right, though he did not succeed so well in the diagnosis of the disease. No doubt, as he supposed, want of faith was part of Balder's disease; and if the trilogy, of which we have only the first part, had been completed, we might have come to know rather more precisely than we do now what Mr. Sydney Dobell understood by faith, which, if taken in a sufficiently comprehensive sense, is a remedy for all the disorders of the human spirit, and therefore for those which afflicted a curious constellation of clever young men about the middle of the nineteenth century. As it is, one feels tempted to say,

"Curentur dubii medicis majoribus aegri."

There is probably less faith of all kinds in England now than there was a quarter of a century ago, and yet Balderism is pretty well extinct. The truth is that it was an isolated phenomenon, and arose from causes of little permanent significance, and though most of the principal poems of the movement are very long ("Festus" in its complete form is longer than the *Iliad*), they have really less to say than *Maud*, which, short as it is, succeeds in incorporating most of the substance of the Latter Day Pamphlets with most of the ideas of the spasmodic school. Mr. Bailey, the eldest of the family, was certainly, and perhaps still is, monstrously clever; at twenty-three he had sighted most of the commonplaces which for the last five and thirty years have been popular among the more intelligent sections of the half-educated, and, so to speak, had shot them flying. *Festus* is full of lines and paragraphs which, though of themselves they may not convey much to a casual reader, are sufficient to prove, if the reader is duly prepared with the thought they contained, that Mr. Bailey has been beforehand with him. Still, if this precocity had stood alone, it would not have been mistaken for genius

by the public, but the heat and excitement which accompanied it were very deceptive, as it did not occur to Mr. Bailey, or his admirers or successors, to ask what the heat and excitement were really about, or to call to mind the fact that all forces seem larger while they are unemployed. The school consisted of clever young men with a good deal of knowledge, brought up alone, and therefore ignorant both of the connexion of knowledge and of the connexion of life, who were full of sentiment and unhackneyed feeling, and had nothing in their occupations and circumstances to help that feeling to pass into action, who were too unsophisticated and too refined to be accessible to concrete temptation, and so imagined themselves monsters of satanic wickedness when they felt unpractically naughty, just as they imagined themselves heroes and sages and saints when they felt unpractically good. They all dealt in forced metaphors, which Alexander Smith handled best, and in violent descriptions of feelings which the most sympathetic outsider could not fail to trace to a commonplace origin; as they knew nothing of life, they never got far beyond duets between a man in a state of tumult about nothing, and a sympathetic woman generally more or less resigned; and they none of them, not even the author of "Festus," succeeded so well with the public as "Satan" Montgomery, who was quite as excitable, more orthodox, and rather emptier.

Mr. Sydney Dobell, without being exactly a leading representative of the school, came nearer than most of its other members to being what is generally considered a poet. In fact, his friends were of opinion that if his long trances of prayer had not brought his brain into an overwrought condition, on which accidents told so seriously that it was necessary for his physicians to prohibit intellectual exertion with increasing stringency, his genius as he grew older would have worked itself clear, and he would have produced classical and immortal works. Probably when "Balder" had been written it was already too late: it is unexampled for a poet after the age of eight and twenty to retrieve so ambitious, so elaborate, and so well-considered a failure; nor is it probable that, under the circumstances, he would have found anything in his surroundings to supply him with steady inspiration after the first fervour had burnt itself out. Probably the absorbing interest which he took in contemporary politics was really a much greater hindrance to him than failing health; even Wordsworth had to make believe a great deal (which was easy to a recluse who lived before railways and almost before newspapers) in order to make what little he did of the politics of the Napoleonic period, which was incomparably more poetical than the period of 1848; and Shelley made some progress towards weaning himself from politics by turning politics into fairy tales which sometimes, as in "Hellas," included his best work.

Apart from this drawback, he had a great measure of the poetical temperament, and the limits of his achievement are to be sought not in the defects of his endowment, but in those of his environment, which encouraged an excessive subjectivity. This

in turn misled him, and made him aim too high. However, his natural refinement of perception enabled him to see that a poem ought to have a subject and keep to it. Both "The Roman" and "Balder" tell their story much more clearly than "Festus" and "A Life Drama." "The Roman" even has an interesting story to tell, though it is characteristic of the tendencies of the school that the ironical motive which Shakspeare uses for the one scene of Mark Antony at Caesar's funeral is spun out here till it serves for a play, which winds up worthily with a reminiscence of the trial of Faithful, flavoured with some of the humours of Dogberry and Verges. "The Roman" himself owes much of his inspiration to Mazzini, but there is much that is really Miltonic and admirable (in the way in which Keble is sometimes Miltonic) in the hymn which he sings at a kind of Eisteddfod, supposed to be held in a ruined Italian amphitheatre. His first song (which, like some of the songs in the *Princess*, is in blank verse), about the poet who bends above his lyre and strikes, seems as if it ought to have had the honour of suggesting Mr. Browning's poem, headed "Transcendentalism, a Poem in Twelve Books." In "Balder" we have a less interesting subject, though in one way it marks an advance that the situation develops itself much more strictly and logically, while "the Roman," up to the last act, seems almost entirely exempt from the consequences of his own actions. Balder has shut himself up to write the immortal epic of world history, with his wife and child. The child dies; under this affliction, and the strain of solitude with Balder, the wife's reason gives way. Balder gets blasé with his work, and thinks he has exhausted the universe, and gradually gets the fixed idea that he must kill his wife. If the second part of the trilogy had been written, we should have learnt from that, instead of from Professor Nichol's introduction that—though the fixed idea ripens to purpose, and even to a commencement of execution—Amy was saved after all. The interest of the poem, such as it is, lies in the ever-recurring contrast between Amy's overwrought feeling and Balder's overstrained thought, and if the writer had known how to handle his subject on the scale of "James Lee," it might have repaid treatment. As it is, the subject is drowned under an avalanche of fluent sonorous fervour, with here and there an image which might tempt a writer whose judgment was immature; and as if this were not enough, many pages are taken up with samples of Balder's poetry, including a description of Chamounix, which Professor Nichol thinks may rival the celebrated piece of Coleridge.

If one tries to ascertain what were the special poetical gifts of Mr. Dobell, besides the general richness and loftiness and freshness of mind which won for his two long poems what it is not harsh to think a rather false success, it is natural to turn to the shorter poems. These, indeed, have not many of the exquisitely felicitous conceits which relieve the longer poems like this from "The Roman":—

"Good Father,

Which of the angels do they miss in heaven?

Ofttimes at mass I press him close, and tremble
To the sweet voices, lest at 'in excelsis'
He should remember, and go back."

On the other hand, they are more natural and less fatiguing (this does not apply to the sonnets), and for this reason it is easier to enjoy the fragmentary vivid perceptions of nature like this on the Cuckoo:—

"His voice the very colour of the cool
And equal Dawn that, like the sound of flutes,
Rose in the woody silence;"

or the fantastic picturesqueness of "The Olive."

The human interest of the shorter poems—especially of "England in Time of War"—generally centres in a very delicate apprehension, and not inadequate reproduction of what we may call raw feeling; and perhaps it is not exactly an artistic defect that, when the writer has struck the right key-note, he strikes it again and again instead of developing it.

There is one stanza in "The Magyar's New Year's Eve" which deserved a place in a better poem:—

"But we are fettered, and a bondsman's ire,
Howe'er it flash, can only end in show'rs.
Who shall unlade these limbs? Alas, the fire
Of passion will not melt such chains as ours;
We have but heated them in wrath of men
To harden them in women's tears. What then?"

Though it does not lead to anything so quotable, sympathetic readers will be still better pleased with the fancy of the widowed sweethearts of the fallen members of Garibaldi's legion constituting a new and superior religious order.

It would have been pleasanter to have found more to praise among the salvage of the innocent wreck of a nature so pure and so rich and so lofty as Sydney Dobell's.

G. A. SIMCOX.

Lives of the Archbishops of Canterbury. By Walter Farquhar Hook, D.D., F.R.S., Dean of Chichester. Vol. X. (London: R. Bentley & Son, 1875.)

DEAN HOOK's new volume does not seem to us to be so valuable or so interesting as any of its predecessors. Partly a sense of weariness must naturally creep over a writer who has pursued his subject through so many volumes; partly the lives of such men as Grindal, Whitgift, Bancroft, and Abbot, do not afford materials of direct biographical interest. But, more than this, the points of general ecclesiastical interest which centre round these archbishops are not such as win Dean Hook's sympathy or appreciation.

Under the fostering care of Elizabeth and Archbishop Parker the *via media* of the English Church had been established on a basis of common sense, if not of strict logic. It sufficed as a bulwark against Rome, and as a foundation for political unity. But those who assented to it at first hoped some day to change or modify it in the direction of their own opinions. After the frequent changes which had followed one another so rapidly it was impossible that any great sense of fixity should attach to any one ecclesiastical system. The political events of Elizabeth's reign made it impossible for the Catholic party to hope for any modifications in their favour. The Anglican Church became more decidedly

Protestant in character, and as a consequence many of the more advanced of the Protestant party in England wished to remove from its ceremonies and formularies everything that could be construed into agreement with the old ecclesiastical system. But the opinions of these ultra-Protestants, or Puritans, were looked upon with suspicion by the Queen: they rested upon principles which, if carried from religion to politics, would become extremely dangerous. Moreover, the fact that the English Church had retained its old form of government prevented any violent breach between England and the Catholic powers of the Continent. England could still claim a place in the old state-system of Europe.

Thus, from political reasons, Elizabeth was determined to keep down the Puritans. The Bishops were to aid her in maintaining peace at home: they were to act as a sort of clerical police: by means of them the unruly and turbulent were to be kept in order, and the spirit of innovation was to be firmly checked.

The long reign of Elizabeth enabled her to give greater stability to her views of Church government than had been permitted to her predecessors. The events also of her reign did much to weld together the political and religious systems which she adopted. The perils which England had to face were closely connected with religious questions. The great struggle against Spain did much to root Elizabeth's ecclesiastical system in the hearts of her people, who had to rally round some religious banner. The forms of the English Church, which were fluid at the beginning of her reign, had become rigid in their main outlines at the time of Elizabeth's death. To trace this process, with a broad sympathy for the political complications of the time, and with an impartial appreciation of the position of the contending religious parties in England, is the difficult task which lies before the ecclesiastical historian of Elizabeth's reign.

Dean Hook has not looked at the matter in this way. He considers that the Church of England, in its existing form, according to his own interpretation, came into existence all at once at the accession of Elizabeth. The "*via media Anglicana*" was not, according to him, the result of gradual development, but had from the first clearly marked principles to which its members were bound to adhere. Grindal, for instance, "had, during his exile, formed a friendship, to the detriment of his principles, with some of the leading Protestant sectaries, especially with those who were more or less under the influence of John Calvin." Dean Hook begins his account of Grindal's episcopate by laying down the broad principle: "The Catholics in our Church were desirous to retain as a proof of their Catholicism all the old habiliments, as well as the ancient rites, which could be purged from Popish superstition. Opposed to them appeared the ultra-Protestants, whose object it was to abolish every feature of Catholicism in our Church." This language has at the present day gained a certain controversial meaning, but it in no way represents the objects of the contending parties at the time. Even at the present day, after three

centuries of experiments, people seem to differ about the habiliments and rites which "can be purged from Popish superstition." How were they to know them at once before they had had time to make any experiments at all?

Dean Hook condemns the Puritans unheard. Their endeavours to turn the Reformation movement in the direction which they wished, he considers to be merely a nefarious attempt to apply Church property to one particular sect. The archbishops are estimated entirely by the vigour they displayed in repelling this attempt. His partiality destroys entirely his sense of humour, and he does not appreciate the difficulties of the episcopal position. It is true we have not many personal traits of the four archbishops whose lives he is narrating; they were not men of very strongly marked characters. But Dean Hook does not care to look upon their personal character; they are to him merely symbols of the English Church. Their episcopal adulation of James I. is defended as being the result of a natural enthusiasm at discovering that a man who had been brought up as a Presbyterian, "was, after all, a churchman at heart." He speaks indignantly of "the great lying petition, called the Millenary Petition, although only signed by 750 ministers." His apology for Bancroft leads him into a contradiction in terms: "learned and amiable as he was, he suffered from a temper which he sometimes found it impossible to control." When the judges gave their opinion that the power of the Star Chamber was enough to authorise Bancroft to enforce Canons which had not received the sanction of Parliament, Dean Hook makes the following extraordinary constitutional statement: "They only stated the law as the law then was. The will of the King was the law of the land, subject to some undefined power of interference on the part of the three estates of the land—or the Parliament."

Enough has been said to show that this volume cannot be regarded as a sympathetic or impartial history of the ecclesiastical struggle which it narrates. It has, however, all the learning and research which marked Dean Hook's earlier volumes. But is Dean Hook justified in construing Bancroft's joke against the attire of the Puritans at the Hampton Court conference, that they "conformed to the Turks rather than to the Papists," to mean that they "came in their dressing gowns to mark their contempt of ceremonies"? M. CREIGHTON.

Six Months in the Sandwich Islands. By Isabella L. Bird, Author of "The Englishwoman in America." (London: John Murray, 1875.)

AFTER a voyage from New Zealand described as "in spite of minor evils . . . a singularly pleasant one," but which to those who have not roamed so far, sounds of sufficient discomfort to have damped any but the most buoyant spirits, the author landed in "search of health" at Honolulu, which is described as consisting, besides "frame houses," of

"houses built of blocks of a cream-coloured coral

conglomerate laid in cement, of *adobe* or large sun-baked bricks, plastered; houses of grass and bamboo; houses on the ground and houses raised on posts. . . . Each house has a large garden or 'yard,' with lawns of bright perennial greens and banks of blazing many-tinted flowers, and lines of dracaena and other foliage plants, with their great purple or crimson leaves, and clumps of marvellous lilies, gladiolus, ginger. . . . Fences and walls are altogether buried by passion-flowers, the night-blowing cereus, and the tropaeolum, mixed with geranium, fuchsia and jessamine, which cluster and entangle over them in indescribable confusion."

The inhabitants decorate themselves and the walls of their rooms with garlands of ferns and flowers, and all the natives, men and women, are great riders. "The native women all ride astride, on ordinary occasions in full sacks or *holukus*, and on gala days in the *pau*," a winged dress, orange, scarlet, or white, on gay brass-bossed high peaked saddles, bare-footed, and crowned with flowers.

"A great many of the foreign ladies on Hawaii have adopted the Mexican saddle also, for greater security to themselves and ease to their horses, on the steep and perilous bridle-tracks; but they wear full Turkish trousers and jauntily-made dresses reaching to the ankles."

In some such gear, on a Mexican saddle, with four fathoms of tethering rope round her horse's neck, and riding cavalier fashion—in which manner all travelling must be done in Hawaii, "whether by ladies or gentlemen"—Miss Bird accomplished most of her adventurous journeys:—

"I even wish you could see me," she writes, "in my Rob Roy riding dress, with leather belt and pouch, a *lei* of the orange seeds of the pandanus round my throat, jingling Mexican spurs, blue saddle blanket, and Rob Roy blanket strapped on behind the saddle."

Returning from one expedition, the party have to cross a mountain river swollen by heavy rains, upon the margin of which they find a native woman on horseback, and two native men endeavouring to get the rider's horse across it. "The nearest man . . . put the lasso round the nose of the woman's horse and dragged it into the torrent," whence he threw the end of the lasso to the other native who was in advance:—

"There was a deep chasm between the two into which the animal fell as he tried to leap from one rock to another. I saw for a moment only a woman's head and shoulders, a horse's head, a commotion of foam, a native tugging at the lasso, and then a violent scramble on to a rock, and a plunging and floundering through deep water to shore."

Then "Deborah," Miss Bird's native attendant, went through, and the same process was repeated; lastly Miss Bird herself:—

"Though I had no fear of absolute danger, yet my mare was tired, and I had made up my mind to remain on that side till the flood abated; but I could not make the natives understand that I wished to turn; and while I was screaming 'No, no,' and trying to withdraw my stiffened limbs from the stirrups, the noose was put round the mare's nose, and she went in. It was horrible to know that into the chasm, as the others went, I too must go; and in the mare went with a blind plunge. With violent plunging and struggling she got her fore feet on the rock; but just as she was jumping up to it altogether, she slipped back snorting into the hole, and the water went over my eyes. I struck her with my spurs; the men screeched and shouted; the hinder man jumped

in; they both tugged at the lasso; and, slipping and struggling, the animal gained the rock and plunged through deep water to shore, the water covering that rock with a rush of foam being fully two feet deep."

Some time after we find her riding some way on a native's barebacked horse, and, her boots having disappeared, she adopts the native fashion of riding with bare feet.

Strange as was this mode of travelling for an invalid seeking health, it was not stranger than the marvellous scenes the sight of which was thereby attained. The scenery of Hawaii is singularly beautiful, and Miss Bird does only justice to its tropical luxuriance in a number of lively and interesting narratives. To those who have witnessed something of the wealth of nature in the tropics, the following account of the Kilauea woods in Kanai will not sound exaggerated:—

"There were deep ravines, along which bright fern-shrouded streams brawled among wild bananas, overarched by Eugénias, with their gory blossoms; walls of peaks, and broken precipices, grey ridges rising out of the blue forest gloom; high mountains, with mists wreathing their spiky summits, for a background; gleams of a distant silver sea; and the nearer many-tinted woods were not matted together in jungle fashion, but festooned and adorned with numberless lianas, and even the prostrate trunks of fallen trees took on new beauty from the exquisite ferns which covered them. Long cathedral aisles stretched away in far-off vistas, and so perfect at times was the Gothic illusion, that I found myself listening for anthems and the roll of organs."

Of the climate of these "Fortunate Islands" Kamehameka IV., the husband of Queen Emma, said at the opening of a Hawaiian agricultural society:—

"Who ever heard of winter on our shores? Where among us shall we find the numberless drawbacks which in less favoured countries labour has to contend with? They have no place in our beautiful group, which rests like a water-lily on the swelling bosom of the Pacific. The heaven is tranquil above our heads, and the sun keeps his jealous eye upon us every day, while his rays are so tempered that they never wither prematurely what they have warmed into life."

The genial effect of plenty on the character of the foreigners settled in Hawaii is noteworthy:—

"A man feels more practically independent, I think, when he can say to all his friends, 'Drop in to dinner whenever you like,' than if he possessed the franchise six times over; and people can indulge in hospitality, and exercise the franchise too, here, for meat is only 2d. a pound, and bananas can be got for the gathering."

The volcanos of Hawaii are numerous and active, and Miss Bird gives very minute and interesting accounts of that of Kilanea, and the vast extinct "Haleakaka."

The language of Hawaii is so easy that most foreigners acquire it readily. It contains only twelve letters, and is musical and sonorous.

The natives are a merry light-hearted people, great adepts at swimming, surf-riding on planks, wild goat catching on foot, and lassoing wild cattle, the descendants of those which Vancouver placed upon the islands.

"The educational system has been carefully modelled, and is carried out with tolerable efficiency. Eighty-seven per cent. of the whole school population are actually at school, and the

inspector of schools states that a person who cannot read and write is rarely met with."

In parts of the country where the river-beds form the only roads, the children swim to and from school every day. Distillation on the islands is illegal; foreigners who give spirits to the natives are liable to punishment, and licences to sell spirits are confined to the capital; but though, in spite of these prohibitory measures drunkenness prevails, it does not appear to be so heavy a curse to the people as the consumption of *awa* (*Piper methysticum*), the effect of which is more akin to that of opium-eating, producing the inertia and listless insobriety of the traditional lotus-eater. The *kalo* (*Arum esculentum*) forms the staple national diet. It is easily cultivated, and is exported to some extent to the Guano Islands.

"The melon and *kalo* patches represent a certain amount of spasmodic industry, but in most other things the natives take no thought for the morrow. Why should they indeed? For while they lie basking in the sun, without care of theirs, the cocoanut, the breadfruit, the yam, the guava, the banana, and the delicious *papaya*, which is a compound of a ripe apricot and a cataloupe melon, grow and ripen perpetually. Men and women are always amusing themselves, the men with surf-bathing, the women with making *lei* (garlands), both sexes with riding, gossiping, and singing. Every man and woman, almost every child, has a horse . . . to walk even 200 yards seems considered a degradation. The people meet outside each other's houses all day long, and sit in picturesque groups on their mats, singing, laughing, talking, and quizzing the *haoles* (foreigners) as if the primal curse had never fallen. . . . A life without care, and a climate without asperities, make up the sunny side of native life."

Its darker aspect is to be seen in the frequent earthquakes, the want of wealth on the part of the native government, the rapidly decreasing native population, the absence to a great extent of good roads and easy means of communication, the conflicting interests of the various foreigners settled in Hawaii, the great pressure of the American import dues on its sugar exports—the effect of which is to make the sugar-planters, who form an influential section of the foreign population, desirous that the islands should be ceded to America; and, above all, the dreadful scourge of "Chinese" leprosy. Such statements as the following appear at intervals in the newspapers:—

"All lepers are required to report themselves to the Government health officer, within fourteen days from this date, for inspection and final banishment to Molokai."

And to the leper settlement established on that island in 1865 the sufferers, irrespective of age, sex, or rank, are transported for life. Between 1866 and April, 1874, 1,145 lepers have been sent thither by the Hawaiian Government; 442 lepers have since died, and at present the number on the island is 703, including twenty-two children.

The rocky island of Molokai stands from 1,000 to 2,500 feet above the sea; and a plain of about 2,000 acres, hemmed in between the sea and a precipice 2,000 feet high, forms the leper settlement. Three miles further inland is the leper village of Kalawao.

"A noble instance of devotion has just been given by Father Damiens, a Belgian priest, who has gone to spend his life in these hideous scenes.

Besides two Roman Catholic churches, there are a Protestant chapel—with a pastor himself a leper, who is a regularly ordained minister of the Hawaiian board—and two school-houses, where the twenty-two children of the settlement receive instruction from a leper teacher."

The rations of food supplied by government are ample and of good quality—but there is no resident doctor. The lepers are necessarily dependent upon state support—and their sustenance forms a heavy drain upon the state revenues; such of them as are wealthy can obtain any luxuries they desire by purchase. A touching account is given by Miss Bird of the voluntary expatriation to Molokai of "Bill Ragsdale," a half-caste, who had filled important offices under the Hawaiian Government, and who was so little suspected of being a leper that he might have long escaped the fiat of the Board of Health had he chosen to do so. The Hawaiian government hope by the banishment of the lepers to stamp out the scourge; but we fear the evil is of deeper root.

We would call the attention of all lovers of the human race interested in the extermination of this dread calamity, to the investigation of the causes of leprosy, recently conducted by order of the Government of India by Dr. Vandyke Carter, in Norway and elsewhere, where it is rife. The causes and progress of leprosy, and the possible remedies for it, are worthy in their profound importance of the laborious investigation of our most learned medical men, and have as yet received but scant attention at their hands.

We have quoted in detail because we consider Miss Bird's a typical book of its kind, both in its excellences and its defects. While, however, we must thank the author for a good deal of miscellaneous information, and wonder at the surprising energy displayed by her in her various adventurous expeditions, we cannot say we have any desire to see our countrywomen emulate each other in traversing such rough and un-macadamised paths.

E. FRERE.

The Black Book of the Admiralty: Appendix.

Part III.* Edited by Sir Travers Twiss, Q.C., D.C.L. Published by the Authority of the Lords Commissioners of Her Majesty's Treasury, under the Direction of the Master of the Rolls. 1874. (London: Longmans & Co., and Trübner & Co. Oxford: Parker & Co. Cambridge: Macmillan & Co. Edinburgh: A. & C. Black. Dublin: A. Thom.)

SIR TRAVERS TWISS gives us another volume of appendix, containing the oldest known text of the Judgments of the Sea, or Laws of Oleron, from two MSS. in the Library of the City of London, belonging to the early part of the fourteenth century; and a text, also the oldest known, of the Good Customs of the Sea, which form the first and principal part of the *Consulate of the Sea*, from two Catalan MSS., one of the fourteenth, and the other of the fifteenth century, in the National Library at Paris. Each is accompanied by an English translation, which in the case of the *Consulate* is the first complete one that

has ever appeared, much as the work has been referred to by English and American judges and writers, who have chiefly known it from an Italian version, and have thereby been commonly led to give it the Italian name of the *Consolato del Mare*.

The learned editor has prefixed to this, as to the previous volumes, a copious introduction, in which he draws attention to the title borne by the former piece in the MSS. now used, "the Charter of Oleroun of the Judgments of the Sea," and traces, in other copies, first the introduction of the more common term "Rolls of Oleron," as an alternative to "charter," and then the omission of the latter term. Now, for English laws, the change of nomenclature from "charter" to "rolls" dates from the reign of John, when the practice of enrolment commenced; whence an inference arises that the laws of Oleron, which continued so long to be called a charter, were sanctioned for English use before that reign, and therefore probably, according to the common story, by Richard I. (p. xiv).

With regard to the *Consulate of the Sea*, not only is its Catalan origin fully established, but it is even proved that the extension of its use to the French and Italian ports must be attributed to the currency of the translations made from the early editions printed at Barcelona. This appears from the details in which it differs from the earlier laws of Marseilles (p. xxxiii), of which some MS. remains exist in the National Library at Paris; of Pisa (p. xxx), still existing in MS. there; and of Amalfi (p. lxvi).

We have only further to remark that the famous *Black Book of the Admiralty* itself has been found, since Sir T. Twiss published its contents from the copy of which the discovery was also due to the impetus given by him. It was among the private papers of the late Registrar of the Court of Admiralty, nor without reason, for "it was at the instance of Mr. Henry Cadogan Rothery, the present Registrar, supported by the recommendation of the late Judge of the High Court, the Right Hon. Dr. Lushington, that the Treasury consented to establish, for the first time, a public office, where the records of the High Court are now kept" (p. vii).

J. WESTLAKE.

History of Cleveland, Ancient and Modern.

By the Rev. J. C. Atkinson, Vicar of Danby in Cleveland. Vol. I. (Barrow-in-Furness: J. Richardson. London: Simpkin, Marshall & Co., 1875.)

ALTHOUGH the history of this portion of Yorkshire has already been written about at considerable length by the Rev. John Graves and Mr. J. W. Ord, we find this more modern attempt in the same direction in no respect superfluous. While so many other parts of the county, of much more importance in the general history of England, yet lack a chronicler, even of the humblest kind, Cleveland is very fortunate in the possession of three such able annalists as those just named and Mr. Atkinson.

Mr. Atkinson contrasts with the more old-fashioned county historians in the greater prominence which he gives to any matters throwing light on the prehistoric circumstances and condition of his district and its

inhabitants. In this portion of his subject, moreover, he is thoroughly at home, and no earthwork, burial mound, dwelling site or hut-pit within the limits of the "Land of Cliffs," seems to have escaped his careful and systematic investigation. Cleveland is singularly rich in such prehistoric remains, and a large proportion of them, from the wild, unreclaimed, and it may be said, unreclaimable nature of the parts of the country wherein they are situated, are less injured and defaced than is the case with many other like monuments of antiquity at the present day. The nature of these remains leads to the conclusion that the earliest dwellers here of whom traces can be found were a race of people living almost exclusively on the products of the earth, neither hunters nor herdsmen. That they should have selected bleak, exposed hill surfaces for the sites of their habitations, seems at first most remarkable, but the true explanation of this seems to be that down to the time of the Norman Conquest the dales were one continuous mass of forest and morass. In Roman relics the district is somewhat deficient: an inscribed stone supposed to record the formation of a portion of the road passing close by, or the erection of a building, "by some fifty soldiers of the sixth legion;" a part of a hand-mill, two or three incised stones, and a few coins (including a consecration piece of Vespasian, a Marcus Aurelius and an Empress Faustina) make up almost the entire list. The Anglian element, too, in Cleveland history, seems to be altogether a subsidiary one, a proof of which appears in the very small proportion of place names which can be traced to that source, upwards of 80 per cent. of such distinguishing marks being undoubtedly due to the Danish colonists who thronged into the country and settled down there before the close of the ninth century. Some interesting local evidence of the Danish occupation was brought to light very recently during the rebuilding of Kildale Church. In digging some of the foundations, and also in excavating along the mid-length of the nave, a number of skeletons in perfect preservation were unearthed, together with many iron weapons, swords, daggers, and a battle-axe, of unmistakeable origin, showing that the mediæval church, which was being removed, had been built on the site of a Danish cemetery. The most striking testimony to the abiding influence of these invaders is to be found in the dialect of the district, most of the objects and operations of common country life being described by Danish terms.

The archaeological and philological portions of this volume seem to us by much the most valuable. In biographical interest the history is altogether wanting. For this, however, the author is hardly to blame, for, if we except the denizens of Mulgrave Castle, it would be difficult to call to mind a single individual of eminence or prominence claiming his birthplace within the limits of those parishes in Cleveland to which this first volume relates. Still some few deficiencies in this respect may be glanced at. The account of the family of the Sheffield Earls of Mulgrave and Dukes of Buckingham (to whom belonged the royal residence

* See notices of the first and second volumes on January 17 and April 25, 1874.

still known as Buckingham Palace) is compressed within the compass of six lines in this volume, although ample material exists for a very full and entertaining history. The date at which Mulgrave Castle—after passing through the hands of the De Mauleys, Bigods, and Radcliffes—came into the possession of Lord Sheffield of Butterwick, President of the North, is fixed by Mr. Atkinson about the year 1625; Antony à Wood, however, in his notes on Dugdale, to be found in Harleian MS. 1056, writes that Edmund Sheffield “did in the reign of Elizabeth by the finesse of his wit get the Castle of Mulgrave from the possession of Radcliffe to whom it had descended from Bigod,” while Camden in his *Annals* makes an entry under date of October 1619 relating to the same transfer. John Sheffield, the third Earl, and first Duke, attained considerable prominence as a soldier and a statesman during the reigns of five successive monarchs. He sought for distinction as a man of letters as well, but his success in that way is doubtful. Dryden, indeed, characterised his thoughts as just, his numbers as harmonious, his words chosen, his expressions strong and manly, his verse flowing, and his turns happy and easy. Walpole, on the other hand, displays his powers of sarcasm on this “noble author” in the following manner:—

“The life of this peer takes up fourteen pages and a half, in folio, in the General Dictionary, where it has little pretensions to occupy a couple. But his pious relict was always purchasing places for him, herself, and their son, in every suburb of the temple of fame: a tenure against which, above all others, quo warrantos are sure to take place. The author of the article in the Dictionary calls the duke one of the most beautiful prose writers, and greatest poets of this age; which is also, he says, proved by the finest writers his contemporaries; certificates which have little weight, where the merit is not proved by the author's own works. It is certain, that his grace's compositions in prose have nothing extraordinary in them; his poetry is most indifferently; and the greatest part of both is already fallen into total neglect. It is said that he wrote in hopes of being confounded with his predecessor in the title; but he would more easily have been mistaken with the other Buckingham, if he had never written at all.”

The founder of the beautifully situated modern Mulgrave Castle was Lady Catherine Darnley—the illegitimate daughter of James II. and his mistress Catherine Sidley, Countess of Dorchester—who, after getting a divorce from James, third Earl of Anglesey, was married to the Duke of Buckingham whose literary merits have just passed under review. The picture-gallery there at the present day includes portraits of William Pitt by Hoppner, of Queen Henrietta Maria, James II., the above-named Catherine, Duchess of Buckingham, and paintings by Cuyp, Rubens, Paul Veronese, &c.

Among the proprietors of Skelton Castle, Mr. Atkinson mentions a certain John Hall Stevenson by name merely. It would have interested many of his readers had they been reminded that this gentleman was the original of Sterne's *Eugenius*, a man of wit, of diversified talents, and a great traveller. Sterne's friendship with him began in their college days, and lasted through life; and it was in the quaintly rich library of the old

castle—a curious tumble-down sort of structure, which Stevenson and his friends delighted in calling Crazy Castle—that Yorick studied those old writers whose learning is reproduced with such remarkable effect in the pages of *Tristram Shandy*. Stevenson himself published anonymously some *Crazy Tales*—in which decency was not a conspicuous element—which were hashed up and re-issued about fifty years ago by an enterprising bookseller as the effusions of the “late Right Honourable R. B. Sheridan.”

No notice of this interesting and learned work would be complete without a reference to the many beautifully executed engravings, of ancient pottery and other objects of antiquity, as well as of gentlemen's seats, &c., with which the volume is thickly embellished.

J. J. CARTWRIGHT.

The Better Self. By Hain Friswell. (London: H. S. King & Co., 1875.)

MR. HAIN FRISWELL is not a very easy person to criticise, because it is worse than impossible to read his productions. One dips into them cautiously, for a few minutes at a time, because there is something dangerous in even contemptuous familiarity with a style so limp, and with ideas so tame as the style and the ideas of Mr. Hain Friswell. The author of *The Gentle Life* now presents the world with a book which seems to aim at being an improvement on that work, namely, *The Better Self*. Mr. Friswell probably does but give us of his best, or at least of his better, and the imagination sinks paralysed from the effort to guess what may be his worse, or his worst. If an author translates even his very motto out of Gladstonese into bad grammar; if he speaks of his own book as volumes, whereas grateful criticism finds that it is only in one volume; if he writes about “this adulteration of the milk of human kindness by something which will atone for its miserable dilution by a rich smack”—then one knows what to think of his style. Again, if he quotes Mr. Carlyle to support a theory that all English manufactures are now scamped and worthless, and then, remembering for whom he writes, repents in a foot-note, and says that “true English work is always, in spite of grumblers, truly good,” one knows what to think of his consistent attitude of mind. Can anyone be surprised that Mr. Friswell represents Mr. Tupper as the innocent victim of wicked sneers, when he himself writes: “Of the mother in a house it is difficult to speak otherwise than of one (*sic*) worthy of the very highest and noblest esteem and affection.” Even poor Mr. Tupper would shrink from such flabby platitudes, while most lady novelists would think twice before calling a man “a Dissenter and a teetotaller, severely so as to both.” These gems of English diction are carefully selected from Mr. Friswell's title-page, preface, and first ten pages. They may suffice as proofs of our position, that it is dangerous, if not impossible, to wade very far into the dreary wastes of *The Better Self*. Evil communications corrupt good manners, and much reading of Mr.

Friswell might be seriously bad for a writer's style.

There is more safety in a general view of the method, and, as Mr. Arnold might say, “the secret” of Mr. Friswell. The secret is to choose some such subject as “sisters,” “home,” and so forth, to represent a contemporary's probable view of the topic, and then to pour forth a flood of washy benevolence as a proof that Mr. Friswell's self is better than the self of the *Saturday Review*. The matter in hand is illustrated by remarks which show a rare ignorance of Spanish history, and of the clan system of society among other things; and the whole essay shuffles along in the manner of a Montaigne *épîcure*.

Grocers may be a very intelligent class of the community, but if they were what French tradition holds them to be, and if they had a favourite writer, that author would be Mr. Friswell. “Bless the word,” says Mr. Friswell, with his admirable ease and lightness, “Bless the word! What kind of entertainment can a sensitive author get—and authors must be sensitive, quick, vivid, easily hurt and easily wounded, or they would not be authors—from a series of ridiculous imitations and savagely critical articles on his style?” Now savagely critical articles are not meant to entertain authors, who, if they are sensitive, have no other literary quality. They are meant, on the other hand, to instruct, and to teach a writer that he should not speak of “a Dissenter and teetotaller, severely so as to both.” Writing of that sort does not allure, does not tempt the reader to yield his mind up to Mr. Friswell's moralising. We may say of him what he has said of an author “who possesses a somewhat comic name,” that “he has certainly written nothing vicious, while he has written much that is incentive to good.” But this, after all, is faint praise to give a book called *The Better Self*.

It would be a pity to take leave of *The Better Self* without quoting a typical passage, on Babies. Babies are a strong point with Mr. Friswell, because this innocent class of our population has suffered a good deal from the sneers of the malignant.

“Whether in the palace or the wigwam, the baby is king; the homunculus rules the world. Although he comes after us, he is preferred before us; he shall sit in our seats, he shall look down upon us, and stand in our place of judgment. Strong as we are now, we shall be but weak dust before his feet. For the baby the world exists, and the heart of woman was created; to him it opens, and expands, and blossoms like the rose; even as the evening primrose shuts itself up before the strong morning or noonday sun, but opens to the weaker light of the stars, so woman yields her chief love, her watchfulness, her care, herself, to babies.”

A. LANG.

ALLEN'S HISTORY OF SCANDINAVIA FROM 1497 TO 1536.

De Tre Nordiske Riges Historie, under Kong Hans, Christian II., Frederick I., Gustav Vasa, &c., 1497-1536. Af C. F. Allen. (Kjøbenhavn, 1872.)

IN the work before us, which is incomplete, as its author died while he was still in the midst of his labours, we have an interesting

and by no means unsuccessful attempt on the part of a Danish writer to treat a page of his national history after the manner of Macaulay.

From the details with which he supplies us, we are enabled to reconstruct for ourselves the whole fabric of society in Scandinavia towards the close of the fifteenth century, when the Oldenburg princes had not long entered upon their four hundred years' tenure of the Danish throne. The insight which we thus obtain into the social, industrial, and political condition of the northern kingdoms generally, and of Denmark specially, is not calculated to raise our opinion of the abilities or principles of these German rulers. In the middle of the fifteenth century, when the Counts of Oldenburg first exchanged their coronet for a crown, Denmark, notwithstanding her many past troubles and humiliations, still enjoyed a higher degree of political freedom and material prosperity than she was destined to know for many ages afterwards. The free peasant, or bonder class, had not yet lost all those great privileges of freedom and equality which in olden times had given them a voice on every question of national interest. Danish towns, which in subsequent ages long lay buried in stagnant inactivity, were then possessed of sufficient vitality to stand forth boldly and successfully in defence of their municipal and commercial rights. Districts, such as the island of Bornholm, in which barren rocks or drifting sands have long formed the predominant features of the landscape, were at the beginning of the Oldenburg rule still clothed with verdure, and crowned with dense oak and beech woods, in which swarmed deer and other game, no longer to be found in the land, and which yielded abundant stores of timber for exportation, as well as home consumption. Fisheries, which were subsequently suffered to fall into decay, then employed, in the Sound alone, a fleet of eight thousand boats, carrying upwards of 40,000 men, and sent forth, year by year, cargoes of salted herrings to the Mediterranean ports. By degrees the towns decayed, the peasants lost even the semblance of freedom, industry was paralysed, the entire aspect of the country changed under the blighting touch of ceaseless war, and all the characteristic features of land and people became modified by the changed conditions of national and social life. The real power of the Danish State centered more and more completely in the nobles, who jealously thrust back from participation in their privileges all the classes below them, and arrogating to themselves the sole right of disposing of the Crown, leased it out—whenever it fell vacant—to the highest bidder among those who through birth and other qualifications were eligible for the throne. These conditions were in a very great measure due to the disastrous *régime* of the Oldenburg princes, in whom the untitled nobles of Denmark found pliant tools, and whose craving for crowns was so insatiable, that no sacrifice was too great, no degradation too low to check their ready compliance with any terms offered them for the attainment of their object. As soon, moreover, as they had secured possession of the throne of Denmark, at the cost

of every privilege of regal dignity and power, these princes invariably began to intrigue or fight for the crowns of Norway and Sweden. Thus the coronation of a new king in Denmark in the fifteenth and sixteenth centuries served as the constant prelude to a universal appeal to arms in Sweden and Norway. All Scandinavia was shaken to its centre in consequence of the insane striving of the earlier Oldenburg kings of Denmark to force upon the sister kingdoms the continuance of that union which it had required all the genius of its framer, Queen Margaret, to make even tolerable to the Swedes and Norwegians, and which under her feeble successors could only be maintained at the cost of bloodshed and national irritation.

Yet no opposition on the part of Swedes or Norwegians could teach these Danish kings to be content with one crown, or to see the policy of leaving their neighbours to choose their rulers in accordance with their own wishes. It cannot be denied, however, that the Danish nobles, in their selfish ambition to retain all the privileges of electing to the throne, which they claimed as the ancient prerogative of their order, had a full share in the miseries of the kingdom; and to them, as well as to their puppet kings, must be ascribed the responsibility of having sacrificed the material prosperity and the political rights of the Danes in the futile endeavour to bring the three Northern kingdoms under one sceptre.

The reigns of Hans (son and successor of Christian I., the founder of the house of Oldenburg), of Hans' son, Christian II., and his brother, Frederick I., present such striking and varied forms of the miserable results of this struggle for the supremacy of Danish power in Scandinavia, that we do not wonder they should have special interest for the author. His sympathies, it must be admitted, however, are not influenced solely by motives of general national importance, but rather by considerations arising from his own strongly manifested political convictions. To him, as a democrat, Christian II. is the one great figure of the drama, from whom other men and passing events derive their chief claim to notice; and it may be said that Herr Allen seems to have written the history of King Hans simply because it formed the indispensable introduction to the story of the brief but most momentous war which Christian II. waged against the monstrous assumptions and almost limitless powers of the aristocracy of Scandinavia. Thus, too, we feel that the author would not have entered upon the uncongenial task of treating of the life and times of Frederick I., if he had not wished to point a moral and teach a political lesson.

But the pen dropped from his hand at the moment when he was beginning to trace the dark outlines of that gloomy period of Denmark's history when, after the deposition of Christian II., the severance of Sweden from the Danish sceptre, and the complete annihilation of every power in the State but that of the aristocracy, the King was the servant of his nobles, the burghers had almost ceased to exist as a class, and the peasants were reduced to the condition of mere bondsmen.

Herr Allen in all questions involving the

special interests of Danes, Swedes, or Norwegians is almost always perfectly just, when considered from a national point of view, for even if he appears to have a leaning in favour of Denmark, it may generally be traced to some political ground. He hates not Swedes or Norwegians, but princes and nobles, and in the ardour of his democratic principles, which occasionally seem to outstrip, in theory at any rate, those of the fiercest Red Republican, he evidently feels that he has found a royal hero after his own heart in Christian II., who, forsaking the traditions of his family, the prejudices of his rank, and the tendencies of his early religious training, endeavoured summarily to trample aristocracy into the dust, to raise democracy to be the mainstay of royalty, and to annihilate the entire system of the Romish hierarchy.

There can be no question that Christian's proposed measures deserved the name of reforms, and were, for the most part, noble in spirit and far in advance of the age. But no considerations of expediency or enlightenment can possibly excuse the violent *coups d'état*, or rather *coups de main*, by which he attempted to carry out his schemes for the amelioration of the status of the burgher and peasant classes. It is precisely at this point that Herr Allen shows himself the least well able to act as a trustworthy guide to the right comprehension of the events and conditions of the times. From the position which he assumes of an uncompromising democrat, he can see no wrong in any act which has the subversion of aristocratic privileges for its aim. In his eyes, princes and nobles seem to have no rights that have not been usurped; and any means are justifiable, provided the ends be the humiliation of the higher, and the exaltation of the lower classes. He appears, indeed, scarcely able to condemn Christian II. when he employs cruelty, treachery, and murder in furtherance of his efforts to restore to the bonder the privileges of participating in the legislative councils of the State, which they had in ancient times shared with the nobles. But whenever a prince or a noble is guilty of any wrong to a burgher or a bonder, the author has no scruple in denouncing the act in terms of uncompromising and virtuous reprobation. This one-sided view of injustice detracts from the merits of the work, but those who are willing to accept the facts brought before them in its pages without allowing their judgment to be biassed, or their sense of right to be irritated, will find deep and many hitherto unopened sources of interest in Herr Allen's narrative, and most especially, we think, in his account of those terrible times in Sweden which preceded the final separation of the kingdom from Denmark, and which were happily closed by the inauguration of an independent rule under the Vasas. In the earlier volumes he, moreover, enables us clearly to understand the process by which Christian II.—who in childhood had been crowned joint king of Denmark and Norway with his father King Hans, and whose kinsmen all entertained the ordinary ideas of their rank and times as to the respective uses and rights of kings and people—should have been able to throw off all the traditions of

his family, and enact the part of a radical reformer before he reached man's estate. The seeming mystery is cleared away when we find that this prince grew up—not in his father's house, or in the society of young nobles, who would have felt themselves to be nearly his equals in rank, as many of them undoubtedly were his superiors in wealth and personal influence—but in the home of a Copenhagen burgomaster, with no companions but the sons of other citizens of a similar standing. Here he imbibed a deep sympathy with the tastes, wants, and feelings of the burgher class, and an inveterate hatred of the nobles, whose interests and pursuits were foreign to him, and for whose power in the State he early learnt to entertain the fiercest and most sensitive jealousy.

It is said that the singular arrangement by which the presumed heir to the three Northern crowns was exposed to influences, so alien to those belonging to his rank and position, was entirely due to the all-absorbing interest taken by King Hans and his Queen in the question of the succession to the thrones of Sweden and Norway. In their eager desire to obtain the Swedish and Norwegian crowns, they had no time or thoughts to spare for family responsibilities, and as the unsettled state of the sister kingdoms never left them much ground for security, they were always journeying from the one to the other, and leaving their patient, peaceful Danish subjects to take care of themselves. In their frequent absences from Denmark they found that their servants had, on more than one occasion, neglected the infant prince committed to their care. At length a report reached them that the sole heir to the triple crown for which they were struggling had, through the negligence of his attendants, been snatched out of his cradle by an ape, and carried to the highest part of the palace roof by the mischievous animal, from whose arms he was with difficulty rescued, and forthwith they consigned their son to the maternal care of a humble burgher-wife. With her and her husband he remained almost to the moment when, in 1501, at the age of twenty, he was sent by his father King Hans to quell a rebellion in Norway.

The manner in which he performed his task, striking down every noble whom his arm could reach, and choosing his friends and councillors exclusively among men of ignoble birth, clearly foreshadowed what his future policy would be, and betrayed to the world the bitter savour of the fruit yielded by his early culture, which was destined to prove alike fatal in its results to himself and to his people.

To all interested in tracing the course of events in Scandinavia at the dawn of Swedish independence, and the beginning of the decadence of Danish supremacy in the North, Herr Allen's work will prove of signal service; but in regard to the causes which led to those results, the reader will generally have to form his own opinion.

E. C. OTTÉ.

THE death is announced of M. Vidal, author of *Studies on Seneca and the Greek Tragedians*, *Studies on Juvenal*, *Scenes of Jewish Life in Alsace*, and other works.

NEW NOVELS.

Hereditary Bondsmen; or, Is it all in Vain?

By J. de Liefde. In Three Volumes. (London: Tinsley Brothers, 1875.)

Gentleman Verschoyle. By Laura M. Lane. In Three Volumes. (London: Sampson Low & Co., 1875.)

The Outcast. By Winwood Reade. (London: Chatto & Windus, 1875.)

We and Our Neighbours. By Harriet Beecher Stowe. (London: Sampson Low & Co., 1875.)

From My Youth Up. By Marion Harland. (London: George Routledge & Sons, 1875.)

Father Fabian. By Emma Jane Worboise. (London: James Clarke & Co., 1875.)

Iseulte. By the Author of "Vera," &c. (London: Smith & Elder, 1875.)

Hereditary Bondsmen is a novel with a purpose, intended by Mr. de Liefde as a political pamphlet on the Labour Laws, with two highly improbable and melodramatic plots to serve as the upper and lower strata of jam in which to administer the powder. The impression it creates is that the writer has read and assimilated *Sybil* and *Alton Locke*, and that this is the result. But there is little of the vigour and picturesqueness of either Mr. Disraeli or Canon Kingsley about his work. If he would write a terse pamphlet or magazine article, stating in clear and unexcited terms the grounds of objection which the artisan class now takes up against the Criminal Laws Amendment Act and the working of contracts, he might do the State some service; but even on his own showing, he has not made out a very good case for his clients. Quite the best part of his novel is the description of the polyglot gang of a stonemason's yard; but his ideal working-man hero, Warren Harrick, with all the personal refinement and culture that only habitual training of the best sort from childhood can confer, violates probability far too much to be accepted, and almost compels the reader to reject the part assigned to the character in the issue of the story. But he is at least an ideal, whereas the wicked Earl who, in true melodramatic fashion, is set against the poor and virtuous hero, is a very inartistic sketch indeed, and, as any physician will tell Mr. de Liefde, could not, as the victim of intermittent epilepsy, have been a leading intellect in guiding European politics.

Curiously enough, *Gentleman Verschoyle* has also a good deal to do with the labour question, although the author has looked at it from an entirely different point of view, and has made it a mere episode in her story. While Mr. de Liefde treats of the grievances of the men, Miss Lang speaks of the duties of employers, in the matter of fair wage, educational classes, and means of wholesome relaxation to compete with the public house. In one particular she is a marked exception to lady novelists. One is familiar enough with the High Tory variety, and also with the newer race of Irreconcilables; but here we have actually an Old Whig of the purest type, a survival scarcely to be looked for now outside the House of Lords. And though her workmen are not very lifelike, but do their roaring as gently as any suck-

ing dove, yet she has at any rate mastered one economical truth—that the equal wage demand of trades' unions means the encouragement of stupidity. There is a great deal too much digression and sermonising employed to pad the story, and although for matter of the sort it is fairly good, yet it makes the action drag, and so far weakens the book, which might have been cut down into a very effective one-volume novel, for Miss Lang has shown respectable powers for sketching character, and when she has learned not to make her company talk book, will probably be able to write conversation too.

From Miss Lang's tone of mind to that of Mr. Winwood Reade is a very long interval. *The Outcast*, published but a few days before its author's death, is a controversial story on behalf of a highly diluted form of Theism, which rejects the notions of a personal Deity and of a future state. The title of the book is meant to express the condition of a clergyman who has been convinced that the facts of geology are inconsistent with any hypothesis of Biblical inspiration which can be adduced, and who accordingly resigns his living and becomes a social pariah.

It will be seen that the motive of the book is the same as that of the *Nemesis of Faith*, but there is no likeness at all after that. The one book is written from the inside, and is true to the life; whereas the other is purely the wild guessing of an outsider as to the disintegrating processes of a class of minds with which he has never been in contact. It might be enough to say, in proof of this, that his hero mentions several times in the course of the narrative that he was a classical first at Oxford, and that he even edits an excellent edition of Thucydides, but that on one unhappy occasion he clinches the fact of his brilliant degree by stating that the words *primus classis* (*sic!*) were attached to his name by the examiners. But one or two other points merit a passing comment. On the one hand, Mr. Reade prefaces his book with a sketch professing to be the life and opinions of a maniac, wherein he seems to mean veiling opinions which even he may have thought a little too startling and plain-spoken to be avowed as his own. The gist of these is simply a homily on the same text as Mr. John Stuart Mill's posthumous essay on Nature, the pain and cruelty which everywhere meet our eyes, and the corollary hence that if there be a Creator, he must be either a feeble or a malignant being. Mr. Reade evidently believed this hypothesis to be quite the newest thing in advanced heterodoxy. Unfortunately, it is as old as the second century, and is just the Gnostic doctrine of the evil Demiurge, familiar to every scholar, and surviving even yet among the secret sects which hand on the Albigensian tradition. The other point is that, evidently never having heard that, so far back as the time of Augustine, the days of Genesis i. were recognised as indefinite periods, he insists on their being meant as calendar days of twenty-four hours. But the least intelligent savages are aware that day and night depend on the sun; whereas the sun does not come into existence till the fourth day of the *Mosaic*

cosmogony. If Mr. Reade fancied that the intellect able to conceive a scheme of creation so very much nearer the latest speculations of science than any other religious literature has ever produced, could not notice that discrepancy, he must have been more credulous than any housemaid who consults a gipsy, or than those eminent scientists of our own day, who, foremost in their own walks, are yet ardent devotees of Spiritualism.

From my Youth Up is one of those queer religious novelettes of American origin, of which Miss Wetherell's *Wide Wide World* was the first specimen naturalised in this country. It is, on the whole, dull; and it is impossible to acquiesce in the author's view that a parson is very badly treated by his congregation pressing him to resign, seeing that, in despite of his alleged abilities and learning, he clips and gabbles his sermons so as to make them unintelligible, and in despite of apostolic zeal, is too selfishly shy to visit his people. To the hard worldly intellect this is clear breach of contract, and deserves forfeiture. Here and there, there are some sparks of dry humour which slightly relieve the volume, and this is a tolerable specimen, describing a country neighbourhood: "I never saw people who were more averse to innovation, who were more willing to stand still and see the salvation of the Lord—provided they were not too fast asleep to look at it when it arrived."

We and our Neighbours belongs to Mrs. Stowe's later manner, that of which the best example is *Old Town Folks*, but it is merely the second volume of a former book, *My Wife and I*; or, *Harry Henderson's History*. That had a certain literary value, as describing very well and clearly the fashionable and commercial society of New York, but this new part is only interesting as carrying on the narrative of personages whom Mrs. Stowe has created, and is loth to part with; for she has not acted like Mr. Trollope in his Barchester series, by bringing fresh characters into the field, except one very mild clergyman, who is wanted for a flirtation and marriage. Those who have read and care about *My Wife and I* may as well get this book; for others it will have but slight attractions.

Father Fabian, like the *Outcast*, is a controversial story, but extremely dissimilar in tone and treatment. The author's mission is to expose the "Ritualistic Conspiracy" in all its treason and folly, and to exhibit the spiritual triumphs of Nonconformity over the Establishment and the Church of Rome. Given its premisses, the conclusion follows consistently enough, and as a story the book is cleverly put together. But the author has succeeded better when contented with domestic narrative; and we are afraid that some irreverent spirits may be moved to laughter by her polemics, and rather at her than with her.

Isulte is a book of a very different stamp from all the others here noticed. It is the work of a true artist, and is one of those excellent delineations of French society from English pens which have become frequent of late, and which make us marvel why no Frenchman, unless one situated like the late Comte de Jarnac, can write an English story

without incessant childish blunders in the commonest things. Here we have keen observation and delicate handling, and just enough of plot to give interest to the vivid descriptions of Auvergnat landscape and society, with a glimpse of the recent war.

R. F. LITTLEDALE.

MINOR HISTORICAL BOOKS.

Life and Times of Alexander I., Emperor of All the Russias. By C. Joyneville. (Tinsley Brothers.) This is a very puzzling book. It contains a great amount of information about the reign of Alexander I., and speaks with the utmost confidence about Russian affairs, but the author shows no signs of being personally acquainted with Russia, and is evidently unacquainted with Russian. Professing to be a biography of Alexander I., it is mainly devoted to an account of military proceedings about which much has already been written. A description from a Russian point of view of the campaigns of Austerlitz, Eylau, and Friedland, and of the French invasion of Russia in 1812, would have been valuable, but "C. Joyneville" has used for the most part only such histories and memoirs as have been written by foreigners, and have been ransacked before by all manner of writers on the subject. Two objects the writer has kept steadily in view throughout this long, and to our eyes tedious work. The first is the exaltation of the Emperor Alexander I., who is constantly represented as only a little lower than the angels; the other is the degradation of the Emperor Napoleon I., on whom abuse is lavished whenever an opportunity for speaking about him arises. The work is indeed a picture in black and white, the former colour being reserved for the French, and the latter for the Russian Emperor. To the merits of patience and industry the author may fairly lay claim, but few traces occur throughout his bulky work of anything like discrimination. Scarcely anything can be learnt from it of the actual state of Russia during the reign of Alexander I., of the changes which he introduced, of the state in which he left the country at his death. Nearly half of the first volume, almost the whole of the second, and a considerable part of the third, are devoted to those wars with Napoleon, and the political complications arising out of them, which have already been described at such length by Sir Archibald Alison. Dealing as it does with some of the most interesting scenes in the history of the world, it is impossible that "C. Joyneville's" work should be devoid of interest. But the virulent animosity which he displays whenever the first Napoleon appears on the stage will render many of its chapters distasteful to readers who are not rabid haters of that at all events somewhat remarkable personage. It is too bad to be told as an undoubted fact that "an imprisoned English officer, Captain Wright, was put to the torture, and it is believed privately murdered," by Napoleon, and then to be referred for the proof of the story to the *Secret History of Bonaparte*, by Lewis Goldsmith. It is a suspicious circumstance that one of the most important, and the most detestable of Alexander's favourites, the infamous Arakhtchieff, is frequently referred to throughout the latter portion of the work as a character familiar to the author, but his name is consistently misprinted Aratchaieff. But in spite of a few misprints, the present work ought to be gratefully received in Russia, for it is to some extent an eulogium upon that country during the reign of Alexander I. Even the horrible punishment of the knout finds in "C. Joyneville" a kindly critic, for we read that "twenty-five strokes with the knout (which was generally fatal) was the utmost given in cases of aggravated murder," and the victim "was attended beforehand, and accompanied to the place of execution, by a priest, who supported his failing courage and repeated prayers for his soul."

EXCEPT that it was necessary to fill up a sufficient number of pages to justify the dignity of a cloth binding, there seems no reason why in Mr. Kington Oliphant's *The Duke and the Scholar* (Macmillan) the lives of two recently deceased Frenchmen should lead to a translation of an extract from a chronicle by a friar of the thirteenth century, and to two not very striking essays on special points of English history. The lives themselves are interesting from their subject. The late Duke of Luynes was no mere patron of learning. He was himself a learned man, full of knowledge, and using his wealth to organise the learning of others. One of those whose patient accuracy he was able to utilise was M. Huillard Bréholles, to whose labours on the reign of the Emperor Frederick II. Mr. Kington Oliphant has acknowledged so deep a debt in his own history of that sovereign's reign. The picture of the two men working together without any sense of dependency on one side, or of superiority on the other, is very pleasant to contemplate, and the book may be especially commended to those who have plenty of money and who do not want to spend it all upon themselves.

In translating Michelet's *Summary of Modern History* (Macmillan), Mrs. Simpson has given to tolerably advanced students the early work of a writer who will always be read with pleasure, because he knew how to seize the salient points of an epoch or a scene, and to present them to the reader in the most attractive form. The title, indeed, is a misnomer. It should rather have been called a summary of French history, with occasional glimpses at the rest of Europe. Such a mode of handling the subject, though natural enough in a Frenchman, gives a turn to the story different from that which an English writer would have chosen; but as M. Michelet was most familiar with the history of his own country, no harm is done as soon as the reader is led to understand what he may expect to find. The text is enriched with a valuable series of the dates at which men of literary and scientific eminence died.

M. Michelet's own part of the book ends with 1789. The translator's continuation is decidedly prosaic. She is a bold woman to continue at all a writer of so imaginative a genius, and if she had studied the spirit of the book which she has attempted to complete, we should hardly have heard quite so much about successive English Ministers from Pitt and Peel to Gladstone and Disraeli, to say nothing of the final flourish about the Abyssinian and the Ashantee wars.

Saint Ewen: Bristol and the Welsh Border, 577-926. (Bristol: Thomas Kerslake & Co.) This is an interesting local pamphlet, evidently written by a person who has an intimate knowledge of the history of Wales and South-Western England. He has felt, as all of us must have done who have made the earlier history of Britain an object of study, that the lists of Saints as we now possess them, whether in collections of lives or in the calendars of the Church, are very imperfect, and for the more obscure among "the blessed" about as inaccurate as they can be. The following passage is worth attention, as presenting facts of which most people are ignorant, in a clear light:—

"It is well known that almost all the Welsh dedications were originally national; or even more frequently tribal, or strictly local. In many cases they are shrinal, or marking the spot under which the patron saint was buried. Indeed, scarcely any of them were saints in the official ecclesiastical sense. Very few of them have found their way into any Catholic calendar; and the *Lives*, by the Rev. Alban Butler, and even the great *Acta Sanctorum*, will be searched for most of them in vain. The dedications of the churches are the only authentic records of many of them. They were either reputed martyrs; or men or women distinguished by eminent or ascetic piety; or national patriots, or local benefactors; or even heroic but virtuous or religious princes;

canonised by the public opinion of their neighbours, or of their province, or nation."

These remarks, which the writer has confined to Wales, might fitly be extended to the whole of Scotland and to many parts of England.

THE very small number of people in England who take an interest in Swedish literature may be aware of the existence of a very laborious and very ponderous *History of Gustavus Adolphus*, by Cronholm. Dr. Helms has attempted to make that part of it which relates to the doings of the Swedish hero in Germany familiar to the European public through the medium of a German translation (Leipzig: Fues's Verlag). As he implies in the preface, he has been obliged to alter the text considerably in order to present it in a shape which would give it a chance of being read. It is not the fault of Dr. Helms if his efforts have not been completely successful. After all that he has done the book is one which the student of the history of the time will do well to consult, but which those who have no special reason for wading through masses of detail will probably agree to avoid. EDITOR.

NOTES AND NEWS.

WE understand that a new work by Mr. Tennyson is in the press, and will shortly be published by Messrs. Henry S. King and Co. It is entitled *Queen Mary: A Drama*, and embraces the life of Mary Tudor from her accession to her death, together with the prominent scenes in her reign. We cannot doubt that Mr. Tennyson's entrance on so new a field—with the single exception that he himself is wont to describe *Maud* as a monodrama—will excite great attention from his numerous admirers and critics.

THE first part of *Facsimiles of National Manuscripts of Ireland*, under the editorship of Mr. J. T. Gilbert, Secretary of the Irish Record Office, was issued last week. For the production and supervision of the photozincographic portion of this work, at the Ordnance Survey Office, Southampton, the public are indebted to Major-General Sir Henry James, R.E., and Mr. W. B. Sanders, already well known for their careful execution of similar works illustrating English and Scottish history. In our issues of March 7 and March 14 last year, we gave very full descriptions of some of the most remarkable manuscripts selected for representation in facsimile by Mr. Gilbert. We have nothing to add on the subject, except it be the expression of our opinion that, from an artistic point of view, this volume is by far the most beautiful of the series yet issued.

THE Report of the Progress of the Ordnance Survey during last year, which has just been published, contains, beside some index maps, a facsimile of an Anglo-Saxon charter, A.D. 974, a grant by King Edgar to his Thane or Duke Aelfhere of land in three mansas (i.e., plots of ground), at Nymed in Devonshire. The fine bold writing of this charter has been perfectly preserved up to the present time. Upwards of forty signatures are attached to this grant, among them being those of King Edgar, Queen Aelfthryth, and Archbishops Dunstan and Oswald. In pursuance of the original intention to publish a series of documents in facsimile, which would illustrate the changes in our writing and language from the earliest times of which we have authentic records, it is proposed, on the completion of the Irish series above noticed, to publish a volume of selected charters, each county of England to be represented by one or two specimens.

AN opportune book by the well-known French economist M. Victor Bonnet, just published at Paris under the title *Le Crédit et les Banques d'Emission*, discusses several questions of interest to economists and bankers in England as well as in France. M. Bonnet relates in it that Sir Robert Peel, conversing with an eminent French states-

man on the comparative wealth of France and England, observed: "In England one man in five spends his whole income, or all he makes in the year; in France hardly one in forty does so; the other thirty-nine save." Had Sir R. Peel included the agricultural labourers of the two countries, the comparison would have been far more unfavourable to England.

MESSRS. GERMER-BAILLIÈRE, who are to publish the *Revue Historique*, will likewise bring out on January 1 next, a *Revue Philosophique*, which will appear monthly, under the editorship of M. Ribot, and will be open to the expression of opinions of all schools. Contributions have already been promised by Messrs. Bain, Lewes, Herbert Spencer, Wundt, Janet, Caro, Luys, and other distinguished writers; and subscriptions for the new review may be sent at once to the publishers.

MESSRS. HURST AND BLACKETT will shortly publish a new work entitled *Cositas Españolas: or, Everyday Life in Spain*, by Mrs. Harvey of Ickwell Bury, author of *Turkish Harems and Circassian Homes*. The same firm have in the press *Eglantine*, a new novel by the author of *St. Olave's*.

WE are glad to hear that a "Bedfordshire Natural History Society and Field Club" has been formed in Bedford. Mr. Thomas Gwyn Elger, F.R.A.S., is the honorary secretary.

THE *Temps* announces that another batch of letters by Mérimée to a second "Inconnue" has been discovered, and will shortly be published.

THE *Journal des Débats* states that no complete edition of the works of Diderot has appeared since 1820. Some important additions derived from the MSS. preserved in Russia at the Hermitage library have been awaiting publication for the last twenty years. Messrs. Garnier Frères have now commissioned M. J. Assézat to superintend the publication of a new edition, which will comprise about fifteen volumes.

DR. OVERBECK, of Basle, has brought out the first part of *Studies on the History of the Ancient Church*, containing (1) his essay on the epistle to Diognetus, originally printed as an academical "programme"; (2) an investigation of the policy of the Roman Emperors, from Trajan to Marcus Aurelius, towards the Christians, and the representations of the Christian writers on this subject; (3) an essay on the relation of the early church to slavery in the Roman Empire. Dr. Overbeck has an inconvenient tendency to reopen questions supposed to be closed, as was notably shown in his treatment of the epistle to Diognetus. In the present volume he makes honourable mention of Dr. Donaldson, who had anticipated him in his reversal of the ordinary view. He also gives his reason for rejecting Dr. Donaldson's ascription of the letter to Stephens the printer. (Comp. ACADEMY, vol. iv. pp. 27, 130.)

In a paper on the remains of early ages in Brittany, read on the 10th inst. before the Society of Antiquaries at Edinburgh, Sir Henry Dryden pointed out that the chief non-military remains of early ages were religious, some being sepulchral, others only of worship, but doubtless many of both. Sir Henry had spent five summers in France in assisting Mr. Lukis to make plans of these remains, all apparently of a date earlier than the Roman invasion. In making plans of the same class of remains it was most important that the scale should be identical, and that the north should always be at the top. Of these remains there were five classes in Brittany: (1) Menhirs, or pillar stones; (2) Lines or rows of upright stones, generally in groups; (3) Circles of upright stones; (4) Dolmens, or chambers of stone, formed chiefly of slabs, and enclosed, or mounds of earth for the purposes of tombs; (5) Walls of barrows, most of which are boundaries of mounds including dolmens. Menhirs vary in height from 4 feet to 30 feet, the thickness being usually at least half the width,

most of them being of quarried stone. They were used as boundaries, monuments, &c. In the lines which are not strictly parallel the stones are usually larger at the wider end. The stones composing the lines are generally at least half as thick as they are wide. The stones of the circles are thin, wide, and not so tall as the tallest stones of the lines, averaging about 5 feet in height, and only a few inches thick, and are much nearer together than the stones of the lines. Sir Henry was acquainted with eleven groups of lines and six circles. The dolmens were of four forms:—(1) A chamber nearly square, with a passage to the south-east; (2) The same, with side chambers in addition; (3) A parallelogram placed north-east and south-west, with a passage leading south-east. This form was very rare in Brittany, and the best example has lately been destroyed, fortunately not till after it had been planned; (4) A circular chamber, with low side walls and a dome-shaped roof, the passage being as in the others. These were very rare.

THE German papers announce the death of Dr. K. W. Ch. von Schüz, Professor of Political Economy and Jurisprudence at the University of Tübingen, and author of numerous works, among the best known of which are his *Principles of National Economy*, and his treatise *On the Distribution and Subdivision of Patrimonial Property considered in its bearing on Individual and National Prosperity, and on Social Life generally*.

AT Leipzig the summer session has opened under favourable circumstances, the number of students being unusually large. Among these are several ladies, who have enrolled their names for attendance at the classes for philosophy and jurisprudence. The opening of the new Institute for Anatomy was formally celebrated at Leipzig on the 26th of last month, when the director, Professor Iltis, delivered the inaugural address, in which he recapitulated the prominent advances made during the last quarter of a century in anatomical science. At Strassburg the German authorities took special delight in commemorating on May 1 the third centennial jubilee of the University, when the rector, Dr. Schmoller, gave a comprehensive view of the social history, the intellectual condition, and the constitutional disturbances of the city of Strassburg in the fourteenth and fifteenth centuries. The attendance at the University is at present much larger than it has been since the beginning of the Franco-German war. At Vienna Dr. Weisz, former extra-professor of astronomy, has been promoted to the full rank of Professor Ordinarius in the University. At the newly founded University of Czernowitz the spirit of Pan Slavism has been asserting itself in a way which for the present threatens to frustrate the enlightened views of the Austro-Imperial government. The latter appears to have deeply wounded Slavonic susceptibilities by calling upon the wealthy clergy of Bukowina, in Galicia, to supply, from the enormous funds at their disposal for educational purposes, a sum of 160,000 florins towards the building of the Czernowitz University.

HALF of the January number of the *Romania* consists of an elaborate article, by M. Morel-Fatio, on the Old Spanish *Libro de Alexandre*, and the conclusion of M. Mussafia's Franco-Venetian text of *Berta de li gran pié* takes up a quarter of the rest. M. V. Smith gives some popular modern dialectal songs (French); M. Schuchardt a further note on Old French *oi* and *ui*; and M. G. Paris an account of the reduction of *ié* to *é* in Modern French. Beside several smaller articles, there is a searching and severe review, by M. P. Meyer, of the new edition of Bartsch's *Chrestomathie provençale*, and the usual valuable summary of the articles of other periodicals interesting to Romanic students.

WE are glad to see, from a circular issued with the last *Romania*, that the lately founded Société des Anciens Textes Français numbers over 200 members. That there are only about a dozen

English names in the list, we can account for only by supposing that the existence of the Society is hardly known here; the importance of careful editions of Old French texts (still mostly in MS.) for the history of our Middle Age language and literature must render its publications indispensable to a large number of literary and linguistic students in this country, while their inherent interest ought to attract many readers who do not require them for scientific work. We therefore mention again that the subscription is 1*l.* a year (or 10*l.* for life), and that names should be sent to M. P. Meyer, 99 Rue de la Tour, Passy, Paris.

MR. J. W. HALES is to deliver a course of five lectures to ladies on Shakspeare's Comedies at the Bedford College on successive Wednesday afternoons, beginning on the 12th instant.

We have received *The Dramatic Works of William Shakespeare*, with biographical Introduction by Henry Glassford Bell, vols. ii.-vi. (London and Glasgow: Collins); *The Life and Campaigns of General Lee*, by his nephew, Edward Lee Childre, trans. G. Litting (Chatto & Windus), see ACADEMY, vol. v. p. 66; *National Finance*, by John Noble (Longmans); *In the Beginning*, by R. H. Sandys (Pickering); *Die Prinzipien der Naturwissenschaft*, von Dr. W. Rosenkrantz (München: Ackermann); *Zur Kritik moderner Schöpfungslehren*, von J. Huber (ditto).

We get a passing glimpse of Eton nearly a century and a half ago in the following letter (transcribed from the original) addressed to the well-known Thomas, Duke of Newcastle, concerning the nephew who succeeded him in the title. It is endorsed "Mr. Hume," and runs thus:—

"May it please your Grace

I am to make my Lord Lincoln's excuses for not writing, which considering all things a'n't bad ones. He has twice as much book & desire to play as ever he had in his life & can't find a moments leisure; From construing & peering (*sic*) Greek he is gone to make verses & from verses to prose, & from prose to Greek again: what time for Letters? & what a change from Claremont? nevertheless y^e number of boys in y^e same case with himself makes y^e Pill go down tho' tis a very bitter one.

"He has been examined by y^e Doctor & is placed in y^e 4th Form, last remove, till further trial, tho I am of opinion 'tis better keep him there than to hurry him through the school too fast. He is perfectly well in health.

"I am &c.

"HUME.

"Eton July y^e 19, 1733."

AMONG the Hatton Papers recently added to the Manuscript Department of the British Museum is a long series of letters addressed by Sir Edmund King to Viscount Hatton at his seat at Kirby in Northamptonshire. The writer was a physician and chemist of some note in his day, and Charles II. whiled away many an hour in his laboratory; it is said, however, that the thousand pounds he was to receive for his attendance on that king during his last illness was never paid. The letters are upwards of 300 in number, ranging in date between 1677 and 1704, and are chiefly filled with prescriptions and advice regarding his lordship's health, which would disclose, to any one who cares to decipher the somewhat tortuous handwriting, many curious illustrations of the medical practice of that time. Some interesting scraps of political and social news occasionally crop up, the most important of which seems to be the following sketch of the state of affairs in London consequent on the flight of James II., dated "Thursday night Dec. 13 '88":—

"Every day brings new alarms or woonders, nay almost every hower. I intended to send w^t papers are out, but I find 2 or 3 of them in the Gazett w^{ch} cam not out till 7 this night; the rabble have been extremely insolent & ungovernable, yet are not suppressed. This day about 1 a clock we had news that the King was stopt by Fisher Boats and that he is now

at Feversham in Kent; I went to White Hall, and met my Lord Preston's Lady, who said it was true, & soe said Lady Peterboro' & many more, and this night the Duke of Grafton is com to Towne. I went to seeke him, but he was wth the Lords in consell to night, & I finde this news has choakt their meassurs for the present, but I beleve they must prosed. The Prince of O. is not com yet. Ld. Peterb. is taken too, & his L. beleiv's it. Sir Edw. Hayls is saide to be wth the K. and the Bis. of Chester (but I doubt y^t). We hear 24 preists taken in one vessell & all wish it true. I was in Cheapside wth the Chancellor [Jeffreys] was brought to my L^d Major, ther never was such joy, not a man sorrío y^t we could see, they long'd to have him out of the coach, had he not had a good guard. Dr Oates I am tolde is drest in all his D^r robes againe, & expects liberty quickly. We had a terrible alarm last night at 12 a clock in the (*sic*) night, cri'd 'Arm Arm Arm 7000 Irish was com from the Army disbanded but in a body & killing all they met.' We was all up in Arms till 5 in the morning. It arize from some disorder amongst them in Brainford, & was allayed by telling the Princes van-guard of Horse pursu'd & cutt them to peeces. It's a strange thing we have not the truth out yet, we doe not thinke we are safe till the Prince com's, all the Protestants long for him."

In two other letters we find the following incidents recorded:

"June 9, '87. Tho' it's near 11 at night and I fear the post is goeing, I cannot forbear to send you a peice of news odd as unusual. Ther was a rich Spanish ship coming from the west Indies y^t was sunck three score years agoe laden with gold and silver. Duke Albemarle Sr Jo. Harboro Sr James Hays and another gott a pattent from the late King on tearms to gett all the gold & silver they could from the bottom of the sea by any art w^eever, they have been 10 years a trying, & gott dyvers (men used to it) out of the west indies, & found this ship, & gott her up & safe into the River, worth two hundred and 50 thousand pounds in gold & silver. Duke Albemarle's share 2 eights is 40000 Sr James Hays as much 40000 & others proportionable; the King reserved a 10th for him selfe.

"Jan. 7 '92. Capt. Whitney the Great Highway-man is in Newgate, & I had a minde to se him and dsir'd Mr Richason to carrie me to him; he is a geiteel p^oper man about 30 years of age. I had some discourse wth him; I did not expect him soe much a Gent. as he seems to be. It's a thousand pitties he was not in a Better employ to exercise his courage."

NOTES OF TRAVEL.

ADMIRAL SHERARD OSBORN, C.B., whose sudden death on Thursday, the 6th instant, so startled his numerous friends and the public, was born in 1822, and entered the Royal Navy at the age of fifteen. Shortly after obtaining his commission as lieutenant, he volunteered and was selected for the Arctic Expedition, under the command of Captain Austin, sent in search of Sir John Franklin; and in this service, besides gaining experience which proved of great utility in later years, he displayed qualities and performed good work which earned for him promotion. He was made C.B. for his services during the Crimean War, and was also decorated with the Legion of Honour and the order of the Medjidie. In 1857 he was appointed to H.M.S. *Furious*, and took part in the capture of the Taku Forts, and assisted in opening up the free navigation of the Yang-tse-kiang. After taking part in the expeditionary force despatched to Mexico, he repaired to China at the Emperor's desire for a space of six months, to assume the command of a squadron to suppress the piracy which was, and is still, so rampant on the coast of China. The affair, however, fell through; and on Captain Osborn's return to England he was appointed to the command of the *Royal Sovereign*, with the object of reporting on the new turrets invented by Captain Cowper Coles, a system which gained his entire approval. For a few years he was agent of the Great Indian Peninsula Railway at Bombay, and after that he accepted the post of managing director

of the Telegraph Construction and Maintenance Company. Admiral Osborn was the author of several works descriptive of his experiences in the Arctic Regions and the Eastern Seas. He also read at various times papers before the Royal Geographical Society, advocating the resumption of Arctic Exploration, and it is almost entirely due to him and to two or three others that the despatch of the present expedition is due. As a staunch supporter of the Smith Sound route he was exposed to much adverse criticism from German geographers of the school of Petermann, Chavanne, &c., but the success of the American expedition under Hall vindicated his views triumphantly. He was appointed to the command of the *Hercules* in 1871 (a post, however, which he held but for a short time), and in 1873 was made a rear-admiral. A few months back he had volunteered for the English Arctic Expedition, and this act was thoroughly characteristic of his fearless English spirit which, combined with a most genial manner, gained for him the admiration and esteem of a large circle.

DURING last season Mr. Bond, an Indian surveyor, while at work in the Madras Presidency, to the south-west of the Palanei Hills, managed to catch a couple of the wild folk, who live in the hill jungles of the Western Ghats. These people sometimes bring honey, wax and sandalwood to exchange with the villagers for cloth, rice, tobacco and betel-nut, but they are very shy. The man was 4 feet 6 inches high; he had a round head, coarse black woolly hair and a dark brown skin. The forehead was low and slightly retreating, the lower part of the face projected like the muzzle of a monkey, and the mouth, which was small and oval, with thick lips, protruded about an inch beyond the nose; he had short bandy legs, a comparatively long body, and arms that extended almost to his knees, the back just above the buttocks was concave, making the stern appear to be much protruded. The hands and fingers were dumpy and always contracted, so that they could not be made to stretch out quite straight and flat; the palms and fingers were covered with thick skin (more especially the tips of the fingers), the nails were small and imperfect, and the feet broad and thick-skinned all over. The woman was the same height as the man, the colour of the skin was of a yellow tint, the hair black, long and straight, and the features well formed. This quaint folk occasionally eat flesh, but feed chiefly upon roots and honey. They have no fixed dwelling-places, but sleep on any convenient spot, generally between two rocks, or in caves near which they happen to be benighted. Worship is paid to certain local divinities of the forest. Although this race has been reduced to a few families, their existence was not unknown, but this is the first time that they have been described with any minuteness.

THE Governor of Algeria has resolved to institute periodical fairs in the principal oases of the Sahara lying south of his province, with the twofold object of opening up commercial relations with the natives of the Sudan and, by familiarising them with Europeans, paving the way for future explorers of that interesting part of Central Africa. The chief fair will be held in the oasis of Wargla, some distance to the south of the province of Constantine. It is anticipated that this oasis will form a mart for the caravans trading in ivory, salt, henna, honey, ostrich feathers, goat and camel skins, stuffs, and the quaint jewellery peculiar to Africa.

THE first general meeting of the French Alpine Club, which now numbers over 850 members, was held on the 30th ult., M. Cézanne in the Chair. Among other topics of discussion was the utility and practicability of organising school excursions, during the holidays to the French mountains. After the other business had been disposed of M. Georges Devin delivered an interesting lecture

illustrated by photographs, on his ascent of Monte Rosa.

It is officially announced that the Swedish expedition, under Professor Nordenfjöld, will early in June leave Tromsø, where they will be met by the twelve experienced Norwegian sailors who are to accompany them with the necessary boats and sledges. At this final point of departure for Novaja Semlja the Professor will be joined by Drs. Kjellman, Lundström, and Theel, who are to form part of his scientific staff.

WE have received Nos. 7, 8, 9, of that interesting periodical the *Cosmos* of Signor Cora. It opens with a very thoughtful article by Mr. Ney Elias on the movements of the Yellow River, which have been described by a French scientific writer as the most remarkable phenomena in the ancient or modern geography of China. Mr. Elias enters fully into the various natural causes which combine to make this river such a source of danger to the country through which it flows. Next to this article follow some valuable hydrographical notes on a recent cruise of the *Vittor Pisani* from Singapore to Yokohama. These notes are all based on the English Admiralty charts, and the information conveyed by them is at once valuable and easy of incorporation. We recommend them to the careful consideration of the authorities of the Hydrographical department. Captain Prshevalsky's travels in Eastern Mongolia, and M. Maklay's researches in New Guinea are duly chronicled. Among the remaining articles should be mentioned an account of Professor Hayden's recent Surveys in the Rocky Mountains, and a short notice of the additions to our knowledge of Borneo which have resulted from Italian exploration.

The *Geographical Magazine* presents us, among other papers, with an obituary notice of young Mr. Margary, who, it appears, besides being a promising member of the Chinese Consular Service, had gained distinction in another field, having been awarded the Royal Humane Society and Albert medals for saving, in conjunction with a Mr. John Dodd, the greater part of the crews of three European vessels, which in 1871 were wrecked off the coast of Formosa. The author, who writes apparently with circumstantial and local knowledge, does not hesitate to hint at the complicity of the Burmese authorities. He also makes the announcement that Mr. Margary's journals have been fortunately saved. Colonel Yule sends a curious note on a certain garden in China, where in the middle ages the disembodied souls were supposed to dwell in a number of apes who were tended by a Chinese monk. From the pen of Mr. Southworth, the Secretary to the American Geographical Society, we have an interesting description of the new State of Colorado, which he traversed on horseback in company with Dr. Hayden's Geological Survey. He states that the climate is wonderfully strengthening; that Colorado is emphatically the Land of Health alike for consumptives, for overtasked brains, abused stomachs, and morbid tendencies. The writer also gives an account of some of the rascality which is apparently inseparable from all mining transactions, and boldly affirms that nine-tenths of New York shareholders in mines have been "deliberately defrauded of their money." The reviews of geographical works and maps are quite up to the mark, and among the other contributions should be mentioned a vigorous protest against the appointment of chaplains for the Arctic Expedition to the exclusion of much-needed officers, and some useful hints as to the best appliances for blasting ice, both of which subjects are well worthy of the attention of the Admiralty authorities.

HEINRICH EWALD.

A GREAT scholar and, take him all in all, a noble man has passed away—Heinrich Ewald is no more (died May 4). As a pioneer in Semitic philology second to none, as a fruitful investigator of Biblical literature *facile princeps* among Christian scholars, his place in the history of criticism has long been marked, and the inferiority of his later work cannot appreciably affect it. As an advocate of political liberty in a low state of public opinion he will be remembered with honour by those who most deplore the vagaries of his old age. As one who scorned ease and money and the praise of men, he is entitled to a charitable judgment even from admirers of those whom he bespattered with his pen, Gesenius, Baur, and Delitzsch. His father was a weaver at Göttingen, where he was himself born November 18, 1803, and where he naturally enough became a student. Those were palmy days for the "Georgia Augusta," which, in 1823, numbered no fewer than 1,547 "academical citizens." That year is marked by two events in Ewald's life, his acceptance of a mastership in the Gymnasium at Wolfenbüttel, and the publication of his first work, *Die Composition der Genesis kritisch untersucht*, an acute attempt to account for the use of the two divine names in Genesis without recourse to the document-hypothesis. No doubt in after years he retracted it, but it remains a good and stimulative book, and it helped Ewald to recognition in the somewhat exclusive professorial world of Göttingen. With this book in his hand he won his first bride, a professor's daughter, and, at the same time, the honourable position of Repetent, or theological tutor. In 1827 he published the first edition of his (not yet *ausführliches*) Hebrew Grammar, and became extraordinary, and in 1831 ordinary professor at Göttingen. Ten years later was another of the turning-points of his life, when he joined six of his colleagues, "Herodotus" Dahlmann, "Shakspeare" Gervinus, the two Grimms, Weber (famous in electricity), and W. E. Albrecht, in a protest against the arbitrary revocation of the Constitution by King Ernst August—a great deed in the then relaxed condition of political morality, a vivid description of which will be found in Jacob Grimm's *Kleine Schriften*. After a visit to England, Ewald accepted a call to the Würtemberg University of Tübingen, where he soon gathered a band of enthusiastic disciples, and where he published his translation and commentary on the Prophets, and began the *History of the People of Israel*. But he had a constitutional difficulty in adapting himself to circumstances. He never felt himself at home at Tübingen (it was the period of Baur), and gladly accepted his recall to Göttingen in 1848. There he lived and worked for the last twenty-seven years of his life; and if his lecture-room was not now crowded as before, it is to be accounted for partly by the decrease in the number of students, partly from the growing hostility to liberalism on the part of the Lutheran church authorities. It is a privilege to have attended Ewald's lectures, before "the eye" of his reason "was dim, and his natural force abated," and I at least can testify that no teacher could be more stimulative and more lavish of his time than Ewald in the last semester of his professorial course. This remark refers to his Semitic lectures, not to his theological; for in these he was evidently lecturing down to the low level of the average "Theolog." On the annexation of Hanover in 1866, Ewald refused, on conscientious grounds, to take the oath to the King of Prussia. No notice was taken for a long time; but, after much provocation on Ewald's part, he was placed on the retired list, with the full amount of his salary for pension. He retained, however, the right (which in his last years he certainly did not exercise) of giving lectures. He might have done much good work; he might have been alive now; had not his friends ("amici quam parum amici," Cassaubon) formed the desperate resolution of sending him as the Guelphian representative of

Hanover to the German Reichstag. Let us draw a veil over the melancholy issue of that ill-advised step, but respect the sense of duty which refused "to brood over the languages of the dead when," as he thought, "forty millions of Germans were suffering oppression." Of his works, a mere catalogue of which would occupy nearly three pages, it is needless to say much, and scholars will pardon my presumption in saying anything. But a protest has become necessary against the uncritical laudation of which Ewald has in England become the subject. His chief merits, it may be observed to the student, are those of a pioneer. By his Hebrew Grammar he earned from Hitzig the title of "second founder of a science of Hebrew language," and Professor Pusey cordially admits the "philosophical acuteness, whereby, as he says, 'as a youth of nineteen'" (? 24), "he laid the foundation of the scientific treatment of Hebrew grammar." But the intense pride which has been the bane of his life has prevented him from making that impartial revision of this as of his other works which most authors after a certain lapse of time are able to give. The most permanent part of Ewald's Grammar is the syntax. Then, as for his *History of Israel*, a great part of which is now happily (but how late!) accessible in English, no doubt it made an era in the study of the Bible, comparable to that made by Niebuhr in the history of Rome. It put a summary end in Germany to the purely theological treatment of the Old Testament. It is not only full of brilliant hints and unlooked-for combinations—no amount of these would revolutionise criticism—but also for the first time recognizes the principle of development. The history of Israel unfolds itself as a grand whole, opening with the gifted personality of Moses, and culminating politically in David and Solomon, religiously in Christ. But the author's synthesis is premature. He is under the dominion of preconceived notions. There is much more feeling than criticism in Ewald's general view of the course of Israelitish history. In fact, theologically speaking, no one was less progressive than Ewald. The same nebulous haze which enwraps the opinions of Herder, blurs the outlines and mars the effect of Ewald's unfortunate attempt at a History of Christ. His last work, *Die Lehre der Bibel von Gott*, three volumes of which have appeared in rapid succession, suffers from the fundamental vice of a confusion between dogmatic theology and the history of doctrine. It contains brilliant suggestions, but I am not prepared to say that they will hold their ground. Those in England who read Ewald as an authority in Biblical criticism, or who judge of Biblical criticism by the standard of Ewald, are guilty of a gross anachronism. Let us thankfully accept the stimulus of a great and original mind, but be aware of his limitations.

T. K. CHEYNE.

MR. CARLYLE'S PORTRAIT OF JOHN KNOX.

A PAPER has just been read at the meeting of the Scotch Society of Antiquaries, on the 10th inst., by Mr. James Drummond, R.S.A., Principal Curator of the National Gallery of Scotland, entitled "Notes on some Scottish Historical Portraits—John Knox and George Buchanan," of which we have received the following abstract:—The author first called attention to a photograph from the portrait of John Knox called the Somerville picture, which had been recently presented to him. Below the impression from which it had been taken there had been written—"John Knox (the one portrait I ever believed to be a likeness of Knox.—T. Carlyle, February 7, 1874)." Accepting this as a mere expression of opinion on the part of Mr. Carlyle as to what his ideal of Knox was, which he had sent to some friend, Mr. Drummond thought no more of it, having (in common with every person who has paid attention to such matters) always regarded this picture as one of the many spurious portraits of historical characters

so commonly found in the houses of Scottish families, who seem to think it essential to possess representations of Sir William Wallace, Robert Bruce, Queen Mary, George Buchanan, John Knox, &c., all of which become genuine after a little of the smoke and dust of time have accumulated upon them, and are then pointed to as so many links in the various phases of family history. No one could find fault with Mr. Carlyle for the expression of his opinion that this was the one portrait of Knox which he could believe in—or, in other words, that the one given by Beza did not satisfy his mind, although this one somehow did, as his ideal of the great Reformer. But when he wishes us, as he does in *Fraser's Magazine*, to substantiate this myth as an historical reality in place of the portrait by Vaensoun, which was sent by King James VI. along with his own portrait, both of which were cut on wood for Beza's *Icones*, published at Geneva in 1580, it is too much. Moreover, the payment for these "two pictures" is duly entered in the treasurer's accounts, June, 1581; and the notion that this date, being a year after the publication, must have been for other two portraits, is too far-fetched, and only suggested to help him in his difficulty. There is no ground for such an idea, and there can be no reasonable doubt that the portraits in Beza are those sent by James and duly paid for in 1581, that being the date of payment, not the time when they were done. Mr. David Laing says, in his introduction to the Works of Knox, "I was very desirous of obtaining a portrait of the Reformer to accompany this volume. Hitherto, all my enquiries have failed to discover any undoubted original painting." But he has no doubt whatever that the portrait given by Beza is from the picture by Vaensoun, sent to him by King James VI.

Mr. Drummond then noticed Mr. Carlyle's arguments in this discussion, stating that the clerk whom he has condemned for ignorance in spelling the painter's name Vaensoun was right, and that it is quite certain that a painter of that name was in Scotland at that time, and that he painted the "two pictures" of King James and John Knox, which were sent to and used by Beza in his book in 1580, the one of John Knox being afterwards used by Verheiden in his *Praestantium Aliquot Theologorum*, &c., published at the Hague in 1602. Another of the arguments used against the Beza portrait is that in a French translation of the work by Goulart, another portrait was introduced by mistake as Knox, which Mr. Carlyle was willing to have accepted as Knox, but gave it up on being told by our best living authority that it was William Tyndale.

Mr. Drummond then adverted to Mr. Carlyle's rapturous admiration of "Goulart's accurately conscientious labour which everywhere else reproduces Beza as in a clear mirror." But though Goulart would no doubt submit this translation to Beza, there are absurd mistakes in the book which show that he could not have arranged the portraits, one likeness being made to do duty for two different individuals, which it attempted to justify by their "having a certain vagueness of similarity," so vague indeed that the man who made the mistake must have been very blind or very stupid, the more so that the portrait left out is that of Beza's early friend and teacher, Melchior Wolmar, to whom he dedicated his volume of poems. So many mistakes show this translation to have been one of the most carelessly edited books, as far as the illustrations are concerned, ever published, and yet it is quoted as the only evidence. Even in the new edition of 1673, the same stupid carelessness as to the portraits is continued, and the portrait of Tyndale still figures as Knox, whose real portrait is inserted as Beza, to whom it has no resemblance, and this in Beza's native city Geneva, where every one must have been familiar with his likeness, which with that of Knox had appeared in Verheiden's beautiful and authentic series of portraits, engraved by Hondius in 1602. It is satisfactory

to find that Mr. Carlyle has a word of admiration for the portrait of Knox, as engraved by Hondius in the Verheiden volume, for it is one of the grandest and most powerful heads in the book, and was most probably engraved by Hondius from the same original as that in the volume of Beza, who was still alive, and who alone could give it. This was the more probable, as Verheiden must have corresponded about Beza's own biography and the portrait to illustrate it, both of which, with the portrait of Knox, are in his book. If not from the same painting or drawing, then another must have been procured from Scotland; in either case it is strongly against the idea of another likeness, as twenty-two years after Beza's *Icones* had appeared, its genuineness had not been disputed. To throw discredit on Beza's portrait, Mr. Carlyle more than insinuates that Beza never had seen Knox, and therefore could have no idea of his personal appearance. This, like the authenticity of the portrait, has never before been called in question; and the two greatest authorities on this subject—the late Dr. McOrie and Mr. David Laing—have no doubt whatever that they must have been personally acquainted. It is difficult to understand how it possibly could have been otherwise at such a time, when meetings of the leaders in the Reformation must have been of very frequent occurrence at Geneva, where Knox had been officiating some years as a preacher, and during which time Beza was a well-known professor of Greek and preacher at Lausanne, which is but a few miles from Geneva, the head-quarters of the Calvinistic Reformation—in which Beza, like Knox, was one of the moving spirits; and of such mark that he succeeded Calvin, not only in his church, but as the leader of the party—a position to which he never could have risen had he not been well known in Geneva, both personally and by reputation. The affectionate correspondence between Knox and Beza is also suggestive. In the *Life of Knox* (London, 1650) the Hondius portrait is used; and in that extraordinary volume, *Theatrum Virorum Eruditione Clarorum*, by D. P. Freherus, and published at Nuremberg in 1687, the Beza portrait of Knox is used, showing again that up to that time no doubt existed as to the authenticity of this likeness, and no amount of mere abuse and attempts at turning it into ridicule would ever take the place of the fact that James VI. sent over two drawings or paintings to Beza which were used in his volume of portraits, nor would a mere personal opinion, however boldly asserted, ever replace a genuine portrait by a merely fanciful head. In Boissard's work (1598) there is a portrait of Knox, a front face with the long beard, but evidently from an indifferent picture, and unmistakably the same person as given by Beza and Verheiden, having just the little differences which two artists would give to the same head. In 1732, another portrait of Knox for the first time appears in the *History of the Reformation*; he is in a close-fitting cap and long white beard, but there is no artist's name. As to the Somerville portrait, it is supposed, for it is a mere conjecture, that it was bought about 1760; but whether it was acquired by Lord Somerville as a portrait of the Reformer, or was merely his ideal, and consequently so called, nobody can tell. The period was in one sense unfortunate. Walpole's example had initiated the fashion of collecting articles of *virtu* and in fact anything queer or out of the way. Lord Somerville, like his contemporary, the Earl of Buchan, seems to have been a collector, and among other things managed to get hold of the old city cross of Edinburgh, which he had erected in front of his new house at Drum, in which one of the greatest curiosities must have been his lordship's portrait of the Scottish Reformer. It was a time also rife in the manufacture of historical portraits, and we can imagine the old lord wandering from his own apartments in Holyrood to the great gallery of the palace, with its 120 portraits of kings, beginning 330 B.C., and ending with

his own royal master, George II., who died in 1760, pondering as he went on the necessity of a picture gallery at his house of Drum, then in course of erection. There was a John Knox at Holyrood, and why not at Drum; and so it came, and no doubt many others, as the necessary furnishing for the house of a lord of ancient lineage. The manufacture of portraits must have been a lively and no doubt a profitable one, and if we did not know something of this, we should be surprised where all the portraits of John Knox, Queen Mary, and others come from, which every now and then are cropping up at sales in Edinburgh and elsewhere. Among the most prolific and best known of these producers of old portraits was John Medina, who died at Edinburgh in 1796. He for a long series of years carried on an extensive practice of this sort. His specialty, however, seems to have been Queen Mary, his model for which he found among the royal portraits in the gallery at Holyrood. This school of manufacture was continued into this century, and Mr. Drummond had been informed by the late Mr. David Roberts, R.A., that when a boy he was frequently sent with messages by his master to an artist called Robertson, who lived by doing portraits of Queen Mary, Prince Charles, and such like, the first of which he varied by a red or black dress; sometimes a veil was thrown over the head, or a crucifix put into the hand, and if required a crown was introduced somewhere or other, a favourite inscription on the back being, "From the original in the King of France's closet," unless it was to be an original (!), into which it was easily converted by a little judicious smoking and varnishing.

The author next adverted to the statements of Mr. Robert Tait regarding the suspicious collar in the Somerville portrait, of which not one example occurs among the 495 engraved portraits of theologians before 1670, in the folio volume of Freherus. The nearest in shape, but only half the size, is of the date 1670. This collar suggests that the picture, if genuine, cannot be older than Cromwell's time. The theory of Mr. Boehm that this picture is an enlarged copy from a portrait by Porbus, because there happens to be a picture by that artist said to be George Buchanan, is a mere vague and uncertain speculation, for which there is not a shadow of authority. The first enquiry should have been as to the authenticity of the so-called Buchanan portrait, which was engraved by E. Scriven in 1836, for Mr. Charles Knight, from a picture belonging to the Royal Society; but being in that collection is no proof that it is a portrait of George Buchanan. Fortunately, an indisputable test is in existence by which to try portraits of George Buchanan, his skull being preserved in the Museum of the University of Edinburgh—a valued treasure. There is also a portrait which has been there probably from the foundation of the University by James VI. Again, there is a most characteristic engraved portrait in the *Icones Virorum Illustrium*, &c. (4 vols., 1607), by his contemporary, J. J. Boissard. Some forty years ago Sir William Hamilton compared various portraits of Buchanan by measurement with the skull, and these two only stood the test. The head in both is thoroughly Scottish in character, with a long and well-formed nose, well-defined cheek-bones, and a long upper lip as in the skull, not a round-headed, short-nosed individual with a short upper lip like the Royal Society portrait.

After a critical examination of the details of the Carlyle "ideal," Mr. Drummond felt compelled to pronounce against its authenticity. Neither could he agree with Mr. Carlyle in the high estimate he had formed of it as a "portrait." The upper part of the head is no doubt well formed, but with such a weak jaw and uncertain chin, the person whose portrait it is would have proved quite powerless and incapable in the position which Knox occupied as a leader of men, forming their opinions and directing their actions. Common observation has led us to judge of a

man's character by the shape of the lower part of the face, and we all practically understand what is meant by a jaw which is called weak. As to the mouth it is essentially gross and sensual. In short, the portrait does not represent a man who would have carried a two-handed sword to protect his friend Wishart, and still less a man over whom the Earl of Morton could have pronounced his now famous eulogium, "There lies the man who never feared the face of man."

NEW YORK LETTER.

New York: April 14, 1875.

There is a very remarkable and interesting collection of engravings, mezzotints, and etchings now being exhibited in Philadelphia for the benefit of the Academy of the Fine Arts. They are owned by Mr. James L. Claghorn, of that city, President of the Academy, and number some thousand prints illustrating the history of the art of engraving from its origin until the present day. The catalogue begins with Martin Schongauer, printer and engraver, who flourished between 1420 and 1428. Most of the prints are rare and valuable specimens of the work of their respective engravers. There are forty-four Albrecht Dürers exhibited, some of which are fine early impressions. The *Life of the Virgin*, including the complete set of twenty, is of this number. In this interesting collection are to be found specimens of the work of Lucas Cranach, Raimondi, Ravenna, Lucas van Leyden, Hendrick Goltzius, and other old masters of the graver. We cannot but admit that while modern engravers have gained in a certain sort of dexterity and finish they have lost in boldness of conception and religious feeling. Among the mezzotints the work of Mr. John Sartain, a Philadelphia artist, holds no mean rank. The collection of etchings is unusually choice, and includes specimens of Rembrandt, Daubigny, Rajon, Meissonier, Fortuny, Jacquemart, and Flameng.

Mr. Thomas Moran, who is best known as the painter of the *Cañon of the Yellowstone*, and *The Chasm of the Colorado*, which pictures now adorn the walls of the Capitol at Washington, and are, by the way, among the few good works of art owned by our Government, has just finished another important painting. The subject of this picture is the *Mountain of the Holy Cross*, situated in the Rocky Mountains of Colorado. The name was given it by the early Spanish missionaries, and was suggested by a cross-shaped crevasse near the top of the mountain which is filled with snow all the year round. This strange but not unique freak of Nature is visible from but a few points in the neighbourhood. The Holy Cross creek, which is seen in the foreground, is supplied entirely by the melting snow from the mountain. Mr. Moran visited this region in the summer of 1874 for the purpose of making the sketches from which the picture was painted. The artist has shown good taste in not making the cross too conspicuous an object in his picture. It is so far in the distance that the eye is not caught by it until the picturesque stream, broken by accumulated rocks, and the nearer mountain sides, have been admired. Mr. Moran has made a picture that the general public will find much more pleasing than the *Cañon* or the *Chasm*, and one that is certainly more picturesque than either.

It has recently been announced through the medium of a small and unpretending pamphlet that a gentleman of this city is about to give five million dollars for the purpose of founding an American College of Music. The name of this generous unknown is withheld for the present for personal reasons, but it is rumoured that he is a bachelor and upwards of eighty years of age. Dr. W. Elmer, a well-known physician of this city, acts as the medium of communication between the millionaire and the outside world. The charter has been drawn up, and is before the State Legislature at this writing. As soon as it

is passed, which will probably be in a few days, a Board of Trustees chosen from among our best known and most cultured citizens will be organised and the plan of the college work will be immediately decided upon. No money or pains will be spared to make it as thorough a school of music as any in the world, and the faculty will be selected from the very best talent both at home and abroad. Everything necessary to perfect the pupils in the art of music, both instrumental and vocal, will be taught, and all free of cost. The site for the college building has not yet been selected, but will probably be a block on Madison Avenue, near the centre of the city. The work of building will be commenced as soon as the architect's plans are decided upon. The building is to be complete in every particular, and will, with the ground, cost two million dollars. The gentleman to whose liberality we shall be indebted for this noble gift is not a musical man, and only moderately fond of music. Before he had decided upon this step he talked of founding a hospital for consumptives. But upon second thought he concluded that there were plenty to do this, and that the idea of a College of Music was new, and would certainly become popular. Since the announcement was first made, Dr. Elmer has been overwhelmed with letters from all over the world asking questions and offering advice. If the bill does not pass the Legislature at this session it will have to lie over until next year, and nothing can be done in the mean time.

Mr. J. W. Bouton, a book importer of this city, has recently sold a Bible, in the preparation of which Mr. James Gibbs, of London, passed the greater part of his lifetime. This remarkable book contains the entire text of three or four rare editions of the Bible, and consists of sixty volumes. The text is carefully inlaid and illustrated by the insertion of upwards of thirty thousand plates, original drawings in oil, water colour, and pencil, specimens of early printed, rare, or curious Bibles, etchings, engravings on steel and copper, and mezzotints. The book, which is a library in itself, was sold for ten thousand dollars to a private collector in this State. Mr. Bouton will soon publish an interesting book entitled *Monumental Christianity; or, the Art and Symbolism of the Primitive Church as Witnesses and Teachers of the one Catholic Faith and Practice*, by John P. Lundy, Presbyter. Not the least valuable part of the book will be the illustrations, which have been made from subjects in every known part of the world.

Mr. Edward King's *Great South* has been published by the American Publishing Company of Hartford as a subscription work, and will be republished in England under the title of *The Southern States of North America*. The contents of this volume appeared in a series of papers which ran through *Scribner's Monthly*. Mr. King has just left this city for Paris, where he will collect the material for the third volume in G. P. Putnam's Sons' series of "Brief Biographies," edited by T. W. Higginson. This volume will consist of the biographies of French statesmen and leaders. Mr. King has spent a number of years in Paris and is personally acquainted with many of the subjects of his book.

On this side of the water when speaking of critical essays we have a phrase like this: "These are the most important papers of literary criticism since Professor Lowell's last." I have heard this several times in regard to Mr. Stedman's *Victorian Poets*. These essays will be published by J. R. Osgood and Co. during the coming Fall. The volume will consist of the Essays which have appeared in *Scribner's Monthly* on Landor, Hood, Arnold, Proctor, the Brownings, Buchanan, Morris, Rossetti and Swinburne, with a new introductory chapter on the Victorian Period, the Study of Tennyson and Theocritus which attracted so much attention in the *Atlantic*, and two new and elaborate chapters on the minor Victorian poets. This book,

though it deals but little in excerpts, is intended to be in a great measure a handbook of the English poetry of the last forty years. I believe that no one has yet gone over this ground, and this volume will undoubtedly win attention as an impartial view of British poetry by an American poet whose critical ability has been already recognised on both sides of the water. The book will have a full index and copious side-notes, and will be, typographically, an admirable specimen of American book-making. It is said that Mr. Moncure D. Conway will edit the English edition of Mr. Stedman's book.

The report that Longfellow is translating the *Nibelungenlied* may be authoritatively contradicted, I am sorry to say.

Our Water-colour Exhibition, lately closed, was the most interesting and promising that we have yet had. Of the foreign work the most important features were Mrs. Spartali Stillman's three paintings, *Launcelot and Elaine*, *Tristram and Isolde*, and *In a Balcony*, and the etchings of Millet, Whistler, Seymour Haden, Fortuny, and Meissonier. Mrs. Stillman's work, of a kind with which our Academy walls are not familiar, attracted much attention, and gave great pleasure to the discriminating. Some flashy bits of continental colour near by served to enhance the quiet thoughtful charm of Mrs. Stillman's pictures. *In a Balcony* has found a purchaser, and I trust Mrs. Stillman's other pictures will not be suffered to leave the country. Mr. Francis Lathrop, a young American whose name will be remembered by London artists, was pleasantly represented in this exhibition.

A special effort has been made to enlist the sympathies of the ladies in the centennial movement by giving them charge of certain departments. To carry out their designs "Martha Washington tea parties" have been held in almost every city and village in the country. The two that were given in the Academy of Music in Philadelphia were the social events of the winter in that city. The ladies belonging to the best families took part in the entertainment dressed in the costumes of a hundred years ago. The cups out of which the tea is drunk at these parties bear facsimiles of the autographs of the signers of the Declaration of Independence, and are sold for an extravagant price, to be kept by the purchaser as a memento. New York did not hold its tea party until quite recently. The Academy of Music was secured, and was crowded as it never has been since the night of the ball given to the Prince of Wales. A number of the costumes were heirlooms, and were worn by the direct descendants of the families of revolutionary fame. An interesting collection of relics was lent for exhibition, among which was a punch bowl, presented by General Washington to the grandfather of the present owner; a harpsichord manufactured for Mrs. Washington in 1770, by Joseph Kirkman and Sons, of London; a cabinet table used by Washington; and a cane, once the property of John Hancock.

Mdme. Adelaide Ristori has been playing a "farewell" engagement in this city to crowded houses at the Lyceum Theatre. She did not act the whole of *Macbeth* in English, as was expected, but only gave the sleep-walking scene in that language. Mdme. Ristori has been the subject of a number of elaborate criticisms in the *Tribune* written by Miss Kate Field. Miss Field sees few, if any, faults in her favourite tragédienne, and what she has to say, while it is exceedingly eulogistic, is well worth reading. Mdme. Ristori might have stepped from a grand historic picture, so perfect is she in all the details of her art. Her posing is particularly picturesque, and all her movements are graceful. One is, however, never excited by her bursts of passion; she does not make the blood curdle in one's veins as does Salvini—as did Rachel.

Notwithstanding the cry of "hard times" our theatres have done exceptionally well this year.

The *Gilded Age*, a flimsy play, dramatised by Mark Twain from his book by that name, had a run of 127 nights owing to the great cleverness of Mr. John T. Raymond, who made himself famous in the rôle of Colonel Sellers. *The Shaughraun* ran over 130 nights at Wallack's, and the *Two Orphans* is approaching its 150th night at the Union Square Theatre. Mr. Rignold is drawing crowded houses to see him as Henry V., and *The Big Bonanza*, said to be an adaptation from the German, is making a success at the Fifth Avenue Theatre. At the Grand Opera House a new spectacular drama, written by Mrs. Julia E. Dunn, a California lady, has just entered upon a brilliant career. The name of this play is *Ahmed*, and it is adapted from the *Pilgrim of Love*, one of Irving's "Tales of the Alhambra." It is one of the most gorgeous spectacles ever seen upon a New York stage. The author is a woman of wealth who has a great admiration for the stage, and she has produced this drama principally to exhibit an invention she has perfected by way of scenic effect. The scene is painted on gauze, and is made to change without being raised or lowered by a simple alteration of the lights. It is a very pretty and ingenious device. English opera has been among the successful amusements, but Italian opera was a complete failure. The management claim to have lost 40,000 dols. by the season. Mr. Strakosch says that he will not bring opera over next year, and that we shall have to content ourselves with a concert troupe, of which Hans von Bülow and Anna de Belloc will be the principals.

CORRESPONDENCE.

THE ASSOCIATION TO PROTECT THE RIGHTS OF AUTHORS.

Clement's Inn: May 12, 1875.

I agree with the writer of the notice of my Report on Copyright that it is desirable that this association should explain the principles upon which they intend to act in the important matter of International Copyright between this country and the United States of America. The document, however, on which his remarks are based is simply, as therein stated, a "Report on Defects in

the Law of Copyright and Stage Right." The failure of our diplomatists up to the present time to bring about a convention for this purpose between the two countries is in no way connected with any defect in the law, and it would, therefore, have been out of place to include in the report anything on that subject beyond the passing mention bestowed upon it. The fact is, that under the General International Copyright Act the Executive Government of Great Britain for the time being is fully empowered to confer upon the authors of foreign countries rights not exceeding those enjoyed by the British author on the sole condition of reciprocity. It is not easy to see what more our Legislature can do in this direction, but it was one of the chief objects of the deputation of our Association which waited on Mr. Disraeli on Monday to point out the importance of including in the proposed enquiry by Royal Commission or Select Committee the question of the causes which have hitherto prevented an arrangement with the United States. Mr. Disraeli's courteous reception of that numerous and influential body of authors and authoresses, and indeed his direct expression of opinion that (to use his own words) "the burdens, vexations, and annoyances, that now exist" are ripe for legislation without further enquiry, render it doubtful whether any Committee or Royal Commission will be moved for; but the Association are ready to give evidence on the question of the causes which have hitherto hindered International Copyright between this country and America; and they are already preparing for an active campaign, with a view to a satisfactory settlement of that great question.

The present letter is written without any direct instructions from our Committee; but I believe I am authorised in saying that the principle on which the Association intend to be guided in this matter is that of treating it simply as a question of authors' rights and interests, which they believe are in the long run identical with the interests of readers. Hitherto all agitation on this question of a really practical kind has been confined to the publishers of both countries. Our Association is far from being in a hostile position towards those gentlemen, or even from lacking sympathy with their objects, but they believe that this movement may be conducted with more hope of success by separating the two subjects of copyright and commercial interests. If, for example, the publishers urge that when a book is published in either country in a shape to be suited to the tastes and requirements of both (a rarer case, by the way, than might be imagined, for our circulating library books in two, three, and four volumes are absolutely unsaleable in America, and *vice versa* American publishing fashions are not much esteemed here), we say that that is a demand, not only favourable to publishers' interests, but based on sound public policy. It is not well that there should be two sets of printers and binders employed where one would suffice; and the claim of any particular branch of industry to compel by law wasteful systems of that kind cannot be justified. At most the United States publisher is entitled to be protected by an import duty equal to the exceptional burdens under which he is placed by domestic taxes imposed on his particular trade. The fairness of these principles is undeniable; and I believe that there is not a member of our Association who would not wish to see—as it would be clearly the interest of authors to see—free trade in books established between the two countries, and substantial justice done to our publishers in this matter. But the question of copyright is a different question. English authors cannot afford to wait for the universal recognition of those free trade doctrines, which are yet new in the world, and in the United States have even now made but little progress. They see, moreover, very clearly that, even if the principles above laid down were fully recognised, their application in a mode satisfactory to con-

flicting trade interests must always be a matter of great difficulty. Any way they are not content to refuse copyright in the United States, because the Custom House regulations in that country continue to be illiberal towards the importing country and injurious to the interests of American readers. They hope that time and the progress of ideas will bring about a sounder commercial system, but they are well aware that international copyright pure and simple is a question far more ripe for settlement. American authors and English authors are, without any exception, agreed on this subject, and they have a right to be heard. It is a hardship on the American author that his writings should be pirated and mutilated at the will of a foreign publisher, and it is equally hard that his works, which could yield him no reward unless they were published at something above the cost of production, should come into competition with new works which the publishers get for nothing, or at most for a trifling sum paid for the favour of early sheets. I am aware that in the minds of many persons this is to place the pursuit of literature on a very low level. There was once a distinguished judge who, though he had not disdained to combine the practice of his own glorious profession with very substantial rewards indeed, nevertheless declared his opinion that literature should be its own reward, or should at all events rest content with the grudging privileges which in those days were all that the Legislature had accorded. But I do not know why learning and genius should hesitate to confess their preference for a system which secures to them, in common with the followers of other arts and callings however humble or however dignified, the fruits of their labour. Already this preference is practically confessed by every author who declines—as even Mr. Tennyson and Mr. Browning decline—to issue his works at the mere price of print and paper. It is one of the very few well-ascertained facts in the biography of Shakspeare that his literary life was greatly influenced by his desire to reap a pecuniary reward from his works. It has been well observed that the want of just laws for the protection of dramatic property is the sole reason why we have no authoritative text of the poet whose very name gives England a higher place among the nations; and it was by the mere chance of the singularly early decline in the money value of Shakspeare's works as plays for the stage that his text is not in the hopelessly corrupt condition of Beaumont and Fletcher. Their works—I am speaking, of course, without reference to the revived taste for Shakspeare in later times—having held the stage much longer were not given up to the stage pirates in the form of printed copies till nothing remained to print from but worn and tattered playhouse copies disfigured by the blunders of illiterate transcribers; and till not only the "twin-dramatists," but brother authors and players, who might have possessed even such authority as Heminge and Condell professed in the case of Shakspeare, had long passed away. But for accident, so might it have been with Shakspeare, to the infinite loss of mankind.

With these and many other examples before us, it would be idle to pretend that the public can safely allow literature to be "its own reward." After all, denying to any class the fruit of their exertions is but a fool's way of making productions either good or abundant; and the notion that literature is, with the exception of rare instances, beyond the range of this maxim cannot too soon be abandoned. It is on this principle at least that the "Association to Protect the Rights of Authors" intend to invite American authors to join hands with them on behalf of a measure of justice which they believe to be not more important to authors than conducive to the interest of the public on both sides of the Atlantic.

MOY THOMAS,
Hon. Secretary, Association to Protect
the Rights of Authors.

"PEPYS' DIARY."

1 Leicester Square : May 10, 1875.

Messrs. Bell and Sons are entirely wrong in stating that "any new edition of Pepys' Diary must necessarily be imperfect," as they certainly cannot claim any copyright in the original MS. in Magdalene College.

Our edition will not be a reprint of the 1828 edition, but will be printed from an entirely new transcript made by the Rev. Mynors Bright (President of the College), and will contain not only all that appears in Messrs. Bell's edition, but about a third additional matter of considerable interest, and perhaps more thoroughly characteristic of the author than any that has hitherto appeared.

The whole of his "Curtain Lectures" will now be included, and we are bound to state that Mr. Smith's transcript abounds in errors, which in our edition will be corrected. Most of the additional passages in the edition of 1854 are misplaced.

BICKERS AND SON.

23 Sussex Place, Regent's Park : May 12, 1875.

I am a Fellow of Magdalene College, Cambridge, and one of the Trustees of the Pepysian Library, which is in the custody of the Master and Fellows of the College.

The late Master employed Mr. Smith to decipher the MS. of Pepys' Diary for HIMSELF; he kept Mr. Smith's MS. in his own possession and considered it his own private property. It is now the property and in the possession of his son, Mr. Neville-Grenville.

The late Master lent Mr. Smith's MS. to his brother, Lord Braybrooke, to make extracts from for the original edition of the Diary in 1825. He lent it to him again to make additional extracts for the edition of 1848. I was then a Fellow of the College, but the matter was never brought before a College meeting; and there is not the slightest mention of it in the College Order Book.

Lord Braybrooke sold the copyright of the extracts which he had taken from Mr. Smith's MS.

He was quite at liberty to do so, but he had no power whatever to prevent any future Master or Fellow from deciphering afresh the original MS. in the Pepysian Library, and from publishing the whole or any part of it that he may choose.

MYNORS BRIGHT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 15,	3 p.m.	Royal Institution: Mr. W. Herries Pollock on "The Drama." I.
	"	Royal Albert Hall: Verdi's <i>Requiem</i> .
	"	Crystal Palace: First Summer Concert.
MONDAY, May 17,	3 p.m.	Royal Albert Hall: Afternoon Concert.
	8 p.m.	" " Evening Concert (Sims Reeves).
TUESDAY, May 18,	3 p.m.	Royal Institution: Professor Gladstone on "Chemical Force."
	8 p.m.	Civil Engineers. Pathological.
WEDNESDAY, May 19,	11 a.m.	Pharmaceutical: Anniversary.

SCIENCE.

THE SUPPOSED VARIABILITY OF THE SUN'S DIAMETER.

Studi intorno ai Diametri Solari. Del P. Paolo Rosa. (Roma, 1874.)

On the Possible Periodic Changes of the Sun's Apparent Diameter. By Simon Newcomb and Edward S. Holden. ("American Journal of Science," October, 1874.)

THERE is probably no astronomical quantity so difficult to determine as the apparent diameter of a heavenly body, the reason being that it can hardly be said to have a real existence since, through the effect of irradiation, whether from the eye or telescope, we never see the true edge of a luminous object. At the same time, as the only knowledge we possess of the real size of heavenly bodies is derived from estimates of their apparent diameters, the determination of the latter is a matter of considerable importance, though the question is beset with great difficulties, arising from peculiarities in the observer and in his telescope. The observation consists essentially in estimating the contact of a spider-line with the edge of the disc, whether referred to time in noting the transit, or to a graduated circle or micrometer screw; but simple as this operation seems, no two observers will agree in their mode of performing it, and the uncertainty arising from this cause is not easily got rid of. It is in vain to multiply observations where each is affected by the same systematic error. What is really wanted, as Le Verrier has pointed out, is the multiplication of observers and the determination of the differences between their modes of observing. In the case of the sun, the number of observations available is so great, that accidental errors would seem to be to a great extent eliminated, and we must therefore refer the discordances between the results obtained at different times either to changes in the sun itself, or to systematic errors affecting large masses of observations.

At the beginning of this century Lindemann called attention to variations in the sun's diameter which seemed to be shown by the Greenwich observations of the last century; but Bessel pointed out that these might readily be referred to instrumental changes, and the subject dropped until it was revived quite recently by P. Secchi and his assistant, P. Rosa, the latter of whom has now carefully discussed the series of Greenwich observations from 1750 to 1870, in continuation of his former memoir, in which, from an examination of observations made at Rome during one year, a connexion was sought to be established between changes in the size of the sun and outbreaks of spots on his surface. In this earlier discussion great stress was laid on the assertion that errors of two-tenths of a second of time were not to be expected in the mean of the times of

transit over twenty webs, but it is matter of every-day experience in regular observatories that such errors do occur, even when two stars are observed successively by the same observer, and although the transits over the individual webs may agree within a few hundredths of a second; the only explanation being that the observer has capriciously changed his habit of observing. That the discordances in the Rome observations were to be explained in some such way was clearly shown by Dr. Anwers by comparing them with observations made at eight other observatories during the period in question. As the result of this comparison, it appeared that the measures made at Rome frequently differed from the mean of corresponding observations at the other places by more than a tenth of a second of time in either direction, while no support could be obtained for the supposed changes in the sun itself.

Nothing daunted by this result, P. Rosa has now opened the larger question of changes, both secular and periodic, to be traced in the observations extending from 1750 to 1870; and as in the earlier half of this period, trustworthy measures were made exclusively at Greenwich, the comparison with corresponding observations made elsewhere, which proved so effective a test in the former case, is not applicable here. A consideration, however, of the series itself and the discordances it exhibits, and a careful examination of the arguments which P. Rosa brings forward, will, in our opinion, suffice to show that there are sources of error which will account for the irregularities in question without calling in the aid of his rather complicated hypothesis. Thus, it appears that, in order to reconcile the measures of horizontal and vertical diameters made by Bliss in 1763 and 1764, it is necessary to suppose that the intervals of the webs had been altered by a change in the focal adjustment, which is precisely the way in which Bessel explained away Lindemann's hypothesis; and though P. Rosa attempts to show that other years were unaffected by this error, our confidence is necessarily somewhat shaken.

That such sources of error may be easily overlooked is shown by the circumstance that the introduction of the chronograph for transits caused an apparent change of a tenth of a second in the time of passage of the sun's diameter, evidently due to personality in the observers, and that P. Rosa appears to be quite unaware of this important instrumental change. As another instance we may take the statement that the centres of figure and of gravity do not coincide in the case of the sun, or in other words, that the centre of the sun's disc does not describe a great circle in the heavens. This assertion is based on the fact that the sun's observed greatest distances north of the equator in summer, and south of it in winter, are not exactly equal; but unfortunately for the hypothesis, this discordance, which is very minute, changed its sign, at the same time as the coefficient of flexure, when a slight mechanical change in the Greenwich transit-circle was made by piercing its central cube, and was further considerably affected (as was indeed natural) by a slight change in the adopted value of

astronomical refraction, clearly showing it to be the result of systematic errors too small to be determined with certainty in the present state of our knowledge.

But though P. Rosa has, in our opinion, underrated the effect of such errors, he has not altogether overlooked it, and with a view of eliminating it has discussed the values of the moon's semi-diameter obtained with the same instruments. But on his own showing, there are discordances of 3" in the horizontal diameters, and of double that amount in the vertical, and the variations of both these measures agree remarkably with those observed in the sun for corresponding groups of years. This would appear to dispose of the so-called secular changes. With regard to the changes of shorter periods in the sun, it is sufficient to remark that they become smaller and smaller with the improvement of instruments and increase of the number of observers, and that this feature is more noticeable in the vertical diameter, the large errors to which these measures were liable in Bradley's days having been got rid of by the substitution of the modern divided circle for the old quadrant. There was much less room for improvement in the observation of a transit.

There is one disturbing element in the determination of diameters for which allowance may well be made, and that is irradiation, as dependent on the aperture of the telescope used. This is a quantity which may readily be computed from the theory of interference of light (varying inversely as the aperture), or may be determined practically by observing the closest double star which the telescope is capable of dividing into its two components. So far, however, is P. Rosa from allowing for this, that he does not even allude to the effect of the change of aperture from Troughton's transit to the present transit-circle at Greenwich, while he cites diameters of the sun determined from transits of Mercury as if they were comparable with those observed directly, though the well-known phenomenon of the black drop at internal contact is sufficient to show what an influence irradiation has in increasing the apparent diameter of the bright sun, and in decreasing that of the dark planet.

The same effect is shown in eclipses of the sun, the times of beginning and ending being found to depend on the telescope used to such an extent that these phenomena cannot be used for determining longitudes without great caution. From observations of the eclipse of 1870 made at Greenwich with the equatorial of thirteen inches aperture, and the altazimuth of four inches, it appears that the increase of the sun's diameter and decrease of the moon's, due to irradiation, were with the latter instrument each 4", while with the former they were only 0".5. That diameters obtained with these two instruments could not be combined into one series without applying a correction to one or other, is quite evident.

If now we pass from the question whether the apparent changes in the sun's diameter are instrumental or real, to that of their connexion with sun spots, we find the same difficulty in accepting P. Rosa's views. The conclusion he deduces is that there is

divergence between the curve representing the variations of the diameter and that representing the variations in the number of sun spots at the maximum of the latter, and convergence at the minimum; but a slight examination of the curves in question will show that this simply expresses the fact that the sun spots follow a marked curve, while the diameter does not.

Such a statement as P. Rosa's implies, if it means anything, that the solar diameter follows the inverse curve of sun spots, or the curve of rarity, and as he has not exhibited this latter curve we may assume, as is indeed sufficiently obvious from the forms of the curves given, that the same law of divergence at maximum from this curve would hold also, and that therefore there could be no connexion of the kind supposed. Having thus no reason for supposing the sun's diameter variable, and knowing that the determination is subject to sources of error which may very well account for the changes to which P. Rosa has called attention, we may fairly conclude that we are not called upon to accept the startling hypothesis that the sun is subject to enormous variations of size; but Messrs. Newcomb and Holden have gone further than this, and have clearly shown that we have strong evidence that no such changes can be taking place. This they have done by comparing corresponding observations taken at Washington and Greenwich from 1862 to 1870, and examining the number of cases in which a large diameter at Greenwich corresponds to a large diameter at Washington, and a small to a small. The result, while completely negating the idea of real changes, is rather curious, as there is a slight preponderance of cases in which a large observed diameter at Greenwich corresponds to a small one at Washington, and *vice versa*, a result which is almost certainly due to chance. If it represented any real change taking place in the sun, it could only arise from a tendency to fluctuation of short periods, probably not differing much from ten hours, the Washington observations being made about five hours after those at Greenwich. The conclusion is, that there is no sensible variability of which the period, regular or irregular, lies between one day and six months, which appears completely to dispose of Secchi's original hypothesis.

One of the results of these researches is, that some of the Greenwich observers systematically differ in their estimate of diameter to the extent of 5"; and another equally important conclusion is, that, as Wagner was the first to point out from the Pulkowa observations, the sun's apparent diameter varies with the state of the atmosphere, which gives rise to a periodicity in the monthly means, the state of the sky varying with the time of year.

As it appears, then, that even with all the refinements of modern observatories, comparatively large systematic errors still affect the determination of the sun's diameter, there seems to be no cause for surprise that discordances are found in the results obtained with the much ruder instruments of the last century. W. H. M. CHRISTIE.

THE EARLY HISTORY OF MAGIC.

La Magie chez les Chaldéens et les Origines Accadiennes. Par François Lenormant. (Paris: Maisonneuve et Cie.)

We always expect from M. Lenormant what is at once new, suggestive, and readable; and the volume before us forms no exception to the rule. Brilliant and learned, it presents the latest revelations of cuneiform decipherment in a shape that will commend itself to both the scholar and the general reader. For the first time the veil that has so long hung over the religion and culture, the origin and migrations, of the primitive inhabitants of Babylonia is lifted, and they come before us with all the beliefs and superstitions which still characterise the Samoyed or Siberian of to-day. The early literature of the Turanian Accadians, the inventors of the arrow-headed method of writing and the builders of the great cities of Elam, of Assyria, and of Chaldaea, discloses to us the beginnings and early development of beliefs which lay at the root of many of the great religious systems of the East. If it be true that a new chapter of history has been opened for the philologist and ethnologist, it is yet more true that a new record has been unrolled for the student of the science of religion.

M. Lenormant's book falls into two parts. The first of these deals with Chaldaean magic and its crystallisation into a religious system; the second with the language and ethnology of the Accadian population. The language is agglutinative, presenting remarkable resemblances to the Finnic group; and its antiquity and simplicity not only render it invaluable for the scientific study of the so-called Turanian family of speech, but also throw new light upon the problems of Comparative Philology. Ethnologically, the Accadians or "Highlanders," for such is the meaning of their name, were brethren of the Elamites and other Turanian tribes who had dispersed from their cradle in the mountainous country south-west of the Caspian, where rose "the mountain of the world" on which the ark of Tam-zi, the Chaldaean Noah, had rested. The fertile plains of Babylonia were already in the possession of a cognate people called the Sumerians; and Accad and Sumer, better known by its biblical name of Shinar, long continued to denote the southern and northern divisions of the country. But at an early date Shinar and its tetrapolis were seized by a Semitic population, who borrowed the civilisation of their predecessors, and, little by little, contrived to extirpate both them and their language. Between B.C. 2000 and 1500 the whole district watered by the Tigris and Euphrates passed into the hands of Semites, who adopted the traditions and mythology of Accad along with its astrology and science, though moulding and transforming them in the process. The old Accadian triad of the Sky, the Earth, and the Underworld became the Babylonian Trinity, and the solar heroes of the Accadian Kalevala occupied the background of Semitic history. At a later period a portion of the Aryan race also submitted to the influence of the Chaldaean faith. Aryans and Turanians met together in Media, Magism was amalga-

ated with Mazdaism; and the nature-worship of the Turanian forced its way into the system of Zoroaster under the guise of ravashis or Fervers.

The Accadian cult was analogous to what is now called Shamanism. Every object had its "spirit," the conception of which was material enough. The progress of culture introduced a hierarchy among these spirits; but the old idea could not be got rid of, and even the supreme gods were addressed each by their "spirit." Like the objects from which they were hardly separated in thought, the spirits were both good and evil; indeed, the evil ones were so numerous that life must have been passed in constant dread. There was hardly an act which did not risk demoniac possession; and the bulls which guarded the palaces of Assyria were supposed to prevent the entrance of malignant beings. Diseases were, of course, looked upon as evil spirits which had seized upon the body, and medicine was a system of charms and philters. Numerous were the magical formulae against the demon and its agent the sorcerer. A large collection of these in Accadian, with Assyrian translations annexed, is now in the British Museum, and is extensively quoted by M. Lenormant. The conception of magic which they contain differs essentially from that which underlay Egyptian magic; and M. Lenormant devotes a chapter to the comparison of the two. While the Egyptian knew nothing of elementary spirits, the Chaldaean knew equally nothing of a power of constraining the gods.

But Chaldaean magic, once worked up into a system, tended to become a highly finished theology; and the development of a solar worship gave rise to a rich mythology. This was further complicated by the absorption of astrology into the official religion and the consequent formation of an astro-theology. M. Lenormant has been the first to point out that the elaborate religion of Assyria and Babylonia with which we are acquainted was the result of "a great religious reform analogous to that of Brahmanism," in which the hostile religious conceptions of the Turanians of Accad and the Semites of Shinar were fused into one gigantic system. The hierarchy of the gods was settled, and room was found for the divinities of the ancient magic among the 300 spirits of heaven and the 600 spirits of earth. The various titles given to the same deity, especially to the sun, were crystallised into separate gods, the Semitic distinction between male and female was introduced into the pantheon, and the relations between the divine hierarchy and the stars were determined. We thus have three periods in the history of Western Asiatic religion, the first marked by the primitive fetichistic magic of the Turanians; the second also Accadian, but characterised by a more developed theological cult and the growth of a solar worship and mythopoeic age; while the third represents the combination of Semitic and Accadian belief, the material being Accadian and the form Semitic, together with the superinduction of an astro-theology.

Such is a brief outline of the main points brought out in this highly interesting book. But wherever we turn we find something to arrest our attention. Perhaps the most

important of these subsidiary notices is the note on p. 271, in which the author compares the Finnic tradition of the origin of the race from the Suomi and Akkar-ak in the mountains of the East with the actual division of the Chaldaeans into Sumeri and Accadi.

There is one point, however, in which, as it seems to me, M. Lenormant has gone wrong through too great an anxiety to mitigate the severity of M. Renan's disbelief in the civilising capacity of a Turanian people. He would attribute the astronomy and astrology which we associate with the name of Babylonia to the Semitic settlers in the country, and deny the Accadians any claim to it. But a study of the great astronomical work of Sargon of Agané, which was compiled before the sixteenth century B.C., leads to a different conclusion. The work was made by Semites for Semitic readers, and yet fully two-thirds of it consists of Accadian words. A large proportion of these, it is true, are ideographs, but others are phonetically spelled out. So technical a term as "conjunction," for instance, is written in Accadian syllabically and not ideographically; and if any conclusion is to be drawn from this fact, it would be that both the phenomenon and its name had been observed and invented by the original population of Chaldea. A. H. SAYCE.

SCIENCE NOTES.

Das Ausland (May 3) reports from *Wiener Abendpost* that Professor Schnetzer, of Lausanne, placed some eggs of the common frog last spring in colourless glass vessels, and in green ones, and found the tadpoles developed much more slowly in the latter, which he ascribed to a deficiency of ozone which was formed in the colourless glasses, but not in the green. These observations may be considered in connexion with the remarkable experiments lately exhibited before the Royal Society by Mr. Crookes, in which light repels the dark side of pith balls suspended in a vacuum, and the action is weakened when green or blue glass is interposed.

AMONG many important papers in the *Proceedings of the Boston Natural History Society*, vol. xvii., we find in Part II. an account of fishes and cray fish collected by Mr. F. W. Putnam in the Mammoth Cave, Kentucky, while acting as ichthyologist to the State Survey. The species were, *Amblyopsis spelaeus*, *Typhlichthys subterraneus*, *Chologaster Agassizii*, *Cambarus pellucidus* and *Cambarus Bartonii*. The two first, commonly known as big and little blind fishes, are without external eyes and colourless; *Chologaster* has eyes, and is of a beautiful brownish tint. *Cambarus pellucidus* is blind, but *C. Bartonii* has dark eyes, and is generally found in the cave of the same mottled brown as individuals living in the Green River.

In a cave on the opposite side of the Green River several miles below the Mammoth Cave, blind fishes and crayfish were found so near the entrance that artificial light was not required to see them. *Chologaster*, unlike the other blind fishes, which are surface swimmers, seldom leaves the bottom of the stream. Mr. Putnam said, "he had carefully seined the Green River and its tributaries without finding a *Chologaster* out of the cave," from which he concluded "that darkness did not bring about atrophy of the eyes, if the specimens were any test, for here we had fishes with eyes which had (for all we knew to the contrary) been in the cave as long as those species without them, and were an essentially subterra-

nean form, as far as our present knowledge goes." It may be said, on the other hand, that in the absence of information how long these *Chologasters* had been in the cave, we have no right to assume that continued deprivation of light does not lead to atrophy of the visual organs.

AN addition to our list of carnivorous plants is suggested by Mr. J. O. Druce in a letter to the *Pharmaceutical Journal*, in a little early spring flower found chiefly on the tops of walls, *Saxifraga tridactylites*, a plant not very distantly allied to the *Droseras*. Mr. Druce states that when examined under the microscope the leaves are seen to be covered with glands of a similar character which exude a viscid secretion, in which he found a midge was entrapped and held fast when placed on the leaf. On examining a number of leaves, he found in all of them the debris of insects which had apparently perished in this manner.

IN a paper entitled "Observations on the Phenomena of Plant Life," by Mr. W. S. Clark, president of the State Agricultural College of Massachusetts, we have a record of a most interesting series of experiments instituted to determine: 1. The structure, composition, and arrangement of the winter buds of hardy trees and shrubs; 2. The percentage of water to be found in the branches and roots of trees during their annual period of repose, as well as when in active growth; 3. The phenomena and cause of the flow of the sap from wounds in trees when denuded of their foliage, as well as the flow from the stumps of woody and herbaceous plants when cut near the ground in summer; 4. The structure and functions of the bark of exogenous trees, with special reference to the circulation of the sap, the formation of wood, and the effects of girdling; 5. The expansive force of growing vegetable tissue. A number of the officers and students of the college co-operated with Mr. Clark in conducting the investigations, and all the details of the work appear to have been observed and recorded in a most conscientious manner. The results, generally, bear out the theories held by the most eminent physiologists, but the marvellous vital forces revealed are surprising, even after all we previously knew of the lifting powers of plants. Possibly some of our readers may have their doubts respecting the accuracy of the data, and the means employed to register the forces. The experiments undertaken to measure the expansive force of growing vegetable tissue illustrated this phenomenon in a most remarkable and indisputable manner. The subject chosen for this purpose was the squash or mammoth pumpkin, *Cucurbita maxima*. In order to have the plant under perfect control a timber bed was constructed for it in a propagating house. The bed was fifty feet long, four feet wide, and about six inches in depth, and was built on stout supports above the floor. It was filled with a rich compost from a spent hot-bed, and the seeds were planted on July 1. Under very favourable conditions, the plant selected for experiment grew with extraordinary rapidity. A female flower on the twenty-first joint of the vine from the root was artificially impregnated on August 1. The young pumpkin immediately began to enlarge, and on the 17th it measured twenty-seven inches in circumference, at which date it was confined for the purpose of testing its expansive power. The apparatus consisted of a frame or bed, of seven inch boards, one foot long. These were arranged in a radial manner, like the spokes of the lower half of a wheel, their inner edges being turned towards the central axis. These pieces were held firmly in place by two end boards twelve inches square, to the lower half of which they were secured by nails and iron rods. A hemi-ellipsoidal cavity was cut from the inner edges of the boards to receive the pumpkin, its attachment to the stem being carefully guarded. Over the pumpkin was placed a semi-cylindrical harness, or basket, of strap-iron, firmly rivetted together, and on this, parallel with the axis of the

pumpkin, was fastened a bar of iron with a knife-edge to serve as the fulcrum of a lever to support the weights by which the expansive force was to be measured. It was necessary to replace the lever and fulcrum several times, according as the weight was increased, and finally the experiment came to an end from the breaking of the harness. The weight lifted increased from 60 pounds on August 21, to 500 pounds on August 31. By the end of September it raised 2,015 pounds, and on October 24 it was increased to 4,120 pounds. The last weight was 5,000 pounds, but this was not clearly raised, though it was carried ten days, on account of the failure of the harness irons. We have described pretty fully the *modus operandi*, to enable the reader to understand the experiment, but all the details of the whole series of experiments here recorded are most interesting. However, we can afford space only for a few of the more important facts. The root development of this pumpkin vine was something almost incredible. The earth was carefully washed away from the whole root-system, and the latter measured in all its ramifications. It was calculated that these were fifteen miles in length, and that 50,000 feet of roots must have been produced, at the rate of one thousand feet or more per day! A second plant of the pumpkin, in the same bed, was cut off close to the ground when eight weeks old, and attached to a mercurial gauge to measure the pressure of the sap. The maximum force attained was equal to a column of water 48.51 feet in height. It should be remembered that this represents the force exerted in the flow of the sap of an herbaceous plant. Several illustrations are given of the mechanical force exerted by the roots of trees growing in rocky ground, and the depth to which roots will penetrate in search of food. Dr. Bell Pettigrew's lectures on the "Physiology of the Circulation in Plants, in the Lower Animals, and in Man" are very severely criticised by Mr. Clark. In regard to the causes which induce the absorption of water and soluble substances by the roots of living plants, he says, it seems unfortunate that so much has been claimed for osmose. Some experiments on the absorption of water by trees lead Mr. Clark to ask whether imbibition is not the proper term for the force which carries up the crude sap. A half-inch tube, six feet long, was attached to a stopcock inserted into the trunk of an elm tree, and the tube filled with water. The absorption was so rapid that the fluid disappeared in thirty minutes; and this was repeated several times the same day. Similar observations were made upon the white oak, chestnut, and buttonwood trees. Experiments to ascertain the proportion of sap wood that could conduct the necessary supply of sap to the foliage of a growing tree, and whether the thick parenchymatous bark alone could furnish the requisite water to prevent the leaves of a tree from withering, showed that a very small portion of the sap-wood protected by wax is sufficient, and that the bark is quite unequal to the task. Hence Mr. Clark concludes that osmose is not the cause of the ascent of the sap. We will describe one more experiment similar to that made by Hales in this country in 1720. A vigorous plant of *Vitis aestivalis*, covering an elm about forty feet in height, was selected for the purpose. One of the main roots of the vine was uncovered, and followed from the stem towards its extremities, a distance of four feet, where it was cut off. To the large end of this detached root, the remainder of which was left undisturbed in the soil as it grew, was firmly fastened a piece of stout rubber hose, which was connected by means of a stopcock to the lead pipe of a mercurial gauge. This was on May day. The tissues of the root, which had not yet awakened from its winter sleep, at once began to absorb water from the gauge, and the next day there appeared a suction equal to -4.53 feet of water. This continued, though gradually diminishing, till it reached zero, on May 10. From this time pressure began

and increased, until, on the 29th of the month, it became sufficient to sustain a column of water 88.74 feet in height. We have gone into these experiments at some length, because it is desirable that they should be repeated, and we commend them to the notice of those who have the leisure and facilities for doing so.

PHILOLOGY.

DR. EUTING, whose name will be known to readers of the ACADEMY, has recently published a handsomely got-up pamphlet on *Sechs Phönikiische Inschriften* (Trübner), found at Idaliu in Cyprus. One of them forms a part of the famous bilingual inscription of King Melekyathan, which gave the clue to the Cypriote syllabary. Dr. Euting's interpretations and restorations are always happy, and our knowledge of Phoenician has been enriched by the new inscriptions in one or two important points. Ziv is shown to have been a Phoenician month, and Karar must be added to Marpe and Chiyyar already known as months of the Phoenician calendar. Three examples are also found of the "epenthetic Nun" before the suffixed pronouns of the third plural masculine, which seems to have been imitated and extended to another pronoun-suffix in Isaiah xxiii. 11.

DR. HYDE CLARKE has printed a paper read before the Anthropological Institute, and entitled *Researches in Prehistoric and Protohistoric Comparative Philology, Mythology, and Archaeology, in connexion with the Origin of Culture in America and the Accad or Sumerian Families* (Trübner). The length of the title is out of all proportion to that of the book, though the author states it to be the result of forty years of consistent study and labour. Short vocabularies rather than grammatical details are compared, but as the words classed together sometimes have not a letter in common, and Dr. Clarke never tells us what is the method of comparison that he has followed, it is difficult to test the value of his conclusions, or to understand why some languages should be declared "conformable" and others not. The difficulty is increased by our finding that the languages compared are often separated by half the globe from one another, besides belonging to widely removed periods of time or social development, while great use is made of that most fallacious of all arguments, the superficial resemblance of geographical names. We cannot help suspecting, too, that the words given by Dr. Clarke are not always right. Comparative Philology has hitherto been content to keep within the limits of the historic age; but Dr. Clarke believes that by his method he can get back to an epoch when the great races of the present world formed but one, and can distinguish between two periods—one prehistoric, of which Eskimo, Agaw and Basque are examples, and the other protohistoric, comprising Egyptian, Sumerian, Peruvian, Chinese, Tibetan and Dravidian. In the prehistoric period, it is laid down, "an idea was represented by three or four words, and again a word was represented by three or four ideas." Thus "Eye and Sun are permutable, because the Sun was called the Sky-eye." Traditions of a prehistoric knowledge of America and Australasia, which existed during the empire of the Sumerians, are supposed to have lingered among the nations of the old world. With the fall of the Sumerian power came confusion of peoples and tongues. We must not forget to add that the book contains a great mass of facts, ethnological as well as philological.

It is not an encouraging sign that Dr. Kaliach's *Hebrew Grammar with Exercises* (Part. I., Longmans & Co., 1875), should have taken ten years to get to a new edition, considering that no other grammar is so well adapted to the ordinary English student. At once full and clear, it is impossible to work through it without obtaining a thorough acquaintance with the facts of the language. It has evidently been carefully revised, especially in the earlier sections, with a view to

still greater clearness of expression. We have not noticed any alteration of arrangement, or any improvement in the somewhat deficient explanations of the forms, and theory of the tenses.

MEETINGS OF SOCIETIES.

SOCIETY OF ANTIQUARIES (Thursday, April 29).

MR. BRENT, of Canterbury, read a paper on "Antiquities found at Canterbury, the Kingfield at Faversham, and Reculver." Canterbury contained four Roman cemeteries, in one of which inhumation was practised, while cremation was more common at the others. Several fine specimens of enamelled brooches were found at these places, besides other objects of less interest. The most remarkable object exhibited by Mr. Brent was a bronze vase of most elegant form, the handle of which terminated at the top in two swans' heads, and at the bottom in a human face. Fragments of a race cup were also discovered, almost identical with one now in the British Museum. Some flint implements found at Reculver are of a specially high type.

MUSICAL ASSOCIATION (Monday, May 3).

MR. HULLAH in the Chair. After the preliminary business, Mr. Bosanquet read the second part of a paper on "Temperament, or the Division of the Octave," and exhibited a small enharmonic organ with his generalised key-board, and two stops containing different systems of tuning. The substance of the paper was as follows.

Systems other than the ordinary equal temperament may be divided into two principal classes: Positive, having both fifths and thirds approximately perfect, and fifths greater than equal temperament fifths; these form their thirds by eight fifths down. Negative, having flat fifths, less than equal temperament fifths, and perfect or approximately perfect thirds; these form their thirds by four fifths up.

Positive systems represent the methods in vogue up to the middle of the seventeenth century; up to that date we find but little mention of temperaments, except as curiosities; the pure consonances always formed the basis of treatment. About the middle of the eighteenth century we find, on the other hand, the well-known treatise of Smith, in which the discussion of scales is almost entirely confined to negative systems. And we know that at this time the old unequal temperament, which is the mean tone system (negative), was in universal use. It disappeared in Germany before Bach's exertions; in England it has not entirely disappeared yet.

The theory developed in this and the preceding paper makes the ordinary equal temperament a basis for the theoretical study of all systems consisting of uniform series of fifths. And the generalised keyboard admits of the control of all such systems, the characteristic of its application being, that passages have the same fingering in all keys.

The small enharmonic organ exhibited has a keyboard of three octaves, with forty-eight keys to each octave. One of its two stops is tuned to a positive system, commonly described as that of Helmholtz, which may be called the positive system of perfect thirds; and the other stop is tuned to the mean tone system, which is negative, and may be regarded as the old unequal temperament, without the "wolf."

In discussing positive systems, the opinion was expressed that, owing to the peculiarity of a number of rules to which the harmony of these systems is subject, they are to be regarded as rather offering new material to the composer than as being suitable vehicles for existing music.

Negative systems, on the contrary, are suitable for the performance of existing music. The manipulation of negative systems by means of the keyboard is also so facile, that it is possible that the application may prove of practical importance.

Examples were performed on the positive stop, and three of Bach's preludes on the negative (mean one) stop. The latter performance brought out a curious point about melodic sequences. The semi-one of the system proved offensive in its melodic effect to eminent musicians present. In fact, it is $1\frac{1}{2}$ nearly of the ordinary equal temperament semitone. Now, in Handel's time no organs in England, and very few on the Continent, were tuned to anything but this very system; and though the "wolf" of that application eventually led to its disuse, it was always conceded that the effect of the best parts of the system was excellent. Equal temperament education has, therefore, had the effect of changing the value of the melodic interval in common use for the semi-one.

After the conclusion of the paper, Mr. Ellis read some passages from Helmholtz, which had been referred to, from the proof copy of his forthcoming translation. Mr. Hullah indicated his doubts of the practical character of the results. Mr. Cummings observed that he readily detected, and found unpleasant, the large deviation of the perfect minor third from its equal temperament position. Mr. Bosanquet observed, in reply, that the interest of the investigation to musicians was, at present at all events, scientific rather than practical.

ENTOMOLOGICAL SOCIETY (Monday, May 3).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.—The President exhibited male specimens of *Stylops*, taken by himself in the pupa state on *Andrena atriceps*, at Hampstead Heath, on the 6th, 9th, and 17th April last. Mr. Enoch, who had been there on the 6th, at an earlier hour (between nine and ten o'clock) had been still more successful, having captured seventeen males; one of which, however, was taken after 2 p.m. The President drew attention to the remarkable difference observable in the cephalothorax of the females in these specimens, as compared with those met with on *Andrena convexiuscula*, and remarked on the importance of avoiding confounding the species obtained from different *Andrenae*: *Stylops Spencii* having been described from *A. atriceps*, while *S. Thwaitesii* had been described from *A. convexiuscula*. Mr. Smith believed that eventually a great many species would be found to inhabit this country, and that as many as a dozen different species would probably be found on the genus *Andrena* alone, independently of those on the genus *Halictus*.

Mr. McLachlan read an extract from a report made to the Royal Society on the natural history of Kerguelen's Island, by the Rev. A. E. Eaton, who was attached as naturalist to the Transit of Venus Expedition to the island. Nearly all the insects were remarkable for being either apterous or with greatly abbreviated wings. There were two Lepidoptera, one (only a larva) probably belonging to the Noctuidae, the other to the Tineinae. Of the Diptera, one species had neither wings nor halteres; another lived habitually on rocks covered by the tide at high water, and its larva fed upon a species of seaweed. All the larger Coleoptera seemed to have their elytra soldered together. Mr. McLachlan said that the theory as to the apterous condition of the insects was that the general high winds prevailing in those regions rendered the development of wings useless; and Mr. Jenner Weir remarked that the apterous condition was correlated with the fact that plants under similar circumstances were apetalous and self-fertilising; and hence it was supposed that the existence of winged insects was unnecessary.

Mr. C. O. Waterhouse exhibited a Chelifer which he had discovered under the elytra of a *Passalus* from Rio Janeiro.

Mr. C. O. Waterhouse also exhibited a drawing of a neuropterous insect of the family Ascalaphidae, from Swan River, presenting the peculiarity of having a large bifid hump on the basal segment of the abdomen, dorsally; each division of the

hump bearing a crest of hairs. He believed it to be the male of *Suphalasca magna*, McClachlan.

Mr. Wormald exhibited a collection of Coleoptera, Neuroptera, and Lepidoptera, sent by Mr. H. Pryer from Yokohama.

Professor Westwood communicated "Descriptions of some new species of short-tongued bees belonging to the genus *Nomia*, Latreille;" and also a paper "On the Species of Rutelidae inhabiting Eastern Asia and the Islands of the Eastern Archipelago."

Mr. C. O. Waterhouse communicated a description of a new species belonging to the Lucanidae (*Protopocoelus Wimberleyi*), by Major F. J. Sidney Parry; and also a description of the male of *Alcimus dilatatus*, by himself.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, May 4).

S. BIRCH, LL.D., F.S.A., President, in the Chair.—The following papers were read:—

I. "Commentary with Notes on the Deluge Tablet." By H. Fox Talbot, Esq.—The author refers to the recently published text, and compares the sacrifice of victims by seven at a time, and the deity smelling a sweet savour of the burnt offerings, with the Mosaic narrative. Other points of contact are noted, as that the ark had only one door and one window. The causes of the divine wrath, of the building of the ark, and of the warning are also noted. The sacrificer wore white linen. (Cf. Ezek. xlv. 15.) The peculiar illness of Izdubar is then explained from a kind of malaria (Isaiah x. 18; Job vii. 5), causing a cutaneous disorder, probably leprosy, which was to be purified by immersion in water. Mr. Talbot considered that Izdubar directed his return voyage by the "astrolabe." In conclusion the author generally agreed with Mr. Smith's translation of the narrative in its essential points, but not so in the unimportant sequel of Izdubar's illness and cure. Ubara-tu-tu leads to *Tutu* being the same as *Bel*, *Tutu* being the Accadian for parent or father. The Greek *Ardates* is *Arda-uttu*; *Otiartes* probably being the same as *Utu-arda*.

II. "On an Historical Inscription of the Tenth Expedition of Esarhaddon." By William Boscawen.—The translator stated that the inscription in question showed that the cause of the tenth warlike expedition of the king of Assyria was the revolt of Bahal, king of Tyre, in conjunction with the king of Egypt, whom he had previously subdued. Hastily gathering his army, Esarhaddon started from the city of Assur, B.C. 672, and crossing the Euphrates and Tigris marched to Apqu, the Biblical Aphek, a city at the northern extremity of Samaria. Detaching a portion of his army to blockade Tyre, he took a forced march of 200 miles to Raphia, a town on the borders of Egypt. Here the boundary river between Egypt and Assyria being dry, the kings of the Arabians supplied the Assyrians with water, and thus sustained the army till it arrived at the seat of war in Lower Egypt. Unfortunately the inscription breaks off at this point of interest, but from the annals of Assurbanipal, the son of Esarhaddon, we learn that the Egyptians were defeated, and order re-established, and the kingdom itself divided into twenty petty states, the chief of which was Memphis. Soon after this event Esarhaddon resigned the empire of Assyria to his son Assurbanipal, retaining that of Babylon for himself. He died not long afterwards, B.C. 668.

III. "On the LISHANA-SHEL-IMRANI, the modern Syriac or Targum dialect of the Jews in the vast territories of ancient Media and Assyria; with some account of the People by whom it is spoken." By the Rev. A. Löwy.—The author gave a short statistical account of the Jews of Kurdistan and adjacent districts. He drew attention to existing similarities and differences between the Nestorians and the Jews. He further pointed out the peculiarities of the important Jewish *Imrani* dialect, and produced the first written

specimen of this hitherto unrecorded member of the Semitic languages. The paper tended to show that philological investigation in this direction would probably throw much light on some of the most interesting questions in the history of language and of race.

LINNEAN SOCIETY (Thursday, May 6).

DR. G. J. ALLMAN, President in the Chair.—The following foreign members were elected:—Alexander Agassiz, H. E. Baillon, Ferdinand Cohn, M.D., A. de Quatrefages, and F. Parlatore. Papers were then read as follows:—1. "On the Anatomy of two Parasitic Forms of *Tetrarhynchidae*," by Mr. F. H. Welch. 2. "Notes on the Lepidoptera of the Family *Zygænidæ*, with Descriptions of new Genera and Species," by Mr. A. G. Butler, F.L.S. The main object of this paper was to rescue this section of Lepidoptera from the confusion into which it had been brought by the creation of new species and genera on insufficient grounds by Mr. F. Walker. Some very curious instances of mimetism were mentioned between parallel series of species of burnet moths and of Hymenoptera. 3. "On the Characteristic Colouring Matter of the Red Groups of Algae," by Mr. H. C. Sorby, F.R.S. Mr. Sorby gave an account of some of the leading characters of the various remarkable blue, purple, and red substances, soluble in water, characteristic of red Algae. The compound nature of the solutions obtained from the plants may be proved by the varying decomposing action of heat on the different colouring matters. He also showed that, though the *Oscillatoria* and *Floridea* both yield closely related coloured substances, their specific differences serve to separate those two groups of Algae quite as much as their general structure. Connecting links do indeed occur, and the further study of this question will probably yield interesting results. Specimens illustrating these facts were exhibited.

ZOOLOGICAL SOCIETY OF LONDON (Thursday, May 6).

THE fourth lecture of the session was delivered in the lecture-room at the Society's Gardens by Professor Garrod, who took for his subject "Deer and their Allies." After pointing out the general characters of the family, he described the development of the antlers, which he regarded as consisting primarily of a single or double *brow-antler* and a bifurcated *beam* or main-stem. Most of the deer might be divided into two groups, according to the modifications of this type. In the first or *Elaphine* series the anterior bifurcation of the beam is much the smallest (forming what is known as the *tray* or *bez-antler*), while the posterior is largely developed and usually either branched or palmated; these include the well-known stag, wapiti, fallow-deer, &c. In the second or *Rusine* series the anterior bifurcation is larger than the posterior, and is often divided into branches, as in the Barasingha and the Virginian deer, while in some, as the *Panolia* deer of India, the posterior portion is reduced to a small snag. The reindeer and the roe were more doubtfully referred to the *Rusine* section, and the elk or moose was regarded as quite peculiar in the formation of its antlers. A brief review was then given of the distribution and habits of the principal species, with a short description of the more remarkable forms. Professor Garrod will give the next two lectures, on "Sheep, Oxen and Antelopes" and on "Camels and Llamas," on Thursday the 13th and 27th inst., at 5 p.m.

PHILOLOGICAL SOCIETY (Friday, May 7).

REV. R. MORRIS, LL.D., President, in the Chair. Mr. Henry Nicol read the second part of his paper on "French Sounds in English." After giving an account of the Old French and Middle English vowels in the words borrowed by the latter language from the former, he drew attention to the

accuracy with which the Old French distinction of close and open long *e* (*éé* and *èè*) was reproduced by Middle English; the Old French *pér* (now spelt *pair* = *për*, Latin *parem*), and *bèste* (*bête* = *bèt*, *bestiam*), having exactly the same forms in Middle English, and being in the sixteenth century *piir* and *béest*, as testified by the present spellings *peer* (with *ee*) and *beast* (with *ea*)—the distinction of vowel, though lost, as in Modern French, in the English of London (*beast* being now *biist*), still existing in that of Ireland.

After this Professor W. D. Whitney, of Yale College, New Haven, Connecticut, U.S., read a paper on the "Theory of Roots in Language." He considered that separating the formative elements—themselves once roots—from the root, was only retracing the old steps by which the roots were built up into distinct words. By successive removals we reach something older and older, and the residuum is the root, whence the rest were evolved. The nucleus thus obtained is the historical germ. Language he considered to be a product of the exercise of the human faculties for advantage or pleasure, and that the true theory of its origin must be sought for in regarding it as an instrument, a wrought out means of human thought, and not as its natural expression. He could find no instinctive means of expressing intellectual processes, but only of feelings and emotions. Language begins where the attempt is made to communicate thought, and must begin with what is most easily signified, and this also brings us to the root.

ROYAL INSTITUTION (Friday, May 7).

PROFESSOR CORNU, of the Ecole Polytechnique, Paris, gave his promised lecture on the velocity of light, with especial reference to his own direct determinations of its value. The lecture was one of more than ordinary interest, and though M. Cornu spoke in French, it was evident that the majority of his hearers followed him throughout the whole of his remarks. After alluding to the belief of the old philosophers in the instantaneous propagation of light, M. Cornu passed on to the discoveries of the Danish astronomer Roemer, who noticed discrepancies between the computed and observed times of the eclipses of Jupiter's satellites. Roemer was led to ascribe these differences to the time necessary for the propagation of light, and concluded that light requires about eight minutes to come from the sun to the earth.

The astronomical determination of the velocity of light, deduced from the aberration of the stars discovered by the English astronomer Bradley, was next referred to, and the lecturer passed on to consider the *direct* determinations of this constant which have been made in recent years. The first solution of the problem was given in 1849 by M. Fizeau, who employed the method of the *toothed wheel*. The principle of the method is the following:—A beam of light passes through the interval between two teeth of a toothed wheel rotating about a horizontal axis; this beam is reflected by a mirror fixed at a distance of several miles from the wheel, returns in exactly the same line, and passes through the same interval. The observer can examine the beam as it returns by interposing obliquely in its path a piece of transparent glass, which reflects a considerable portion of it. When the wheel is rotated with a moderate velocity the luminous impression is continuous, for the light travels to the reflector and back again before the periphery of the wheel has passed through the interval between two teeth. But the angular velocity of the wheel can be so far increased that the light in returning meets with the obstruction of a solid tooth, and the observer no longer sees the reflected image of the spot of light. If the velocity of the wheel be doubled, the luminous point will appear again, because then the light passing out by one hollow returns by the next; with a triple velocity extinction will again take place.

The second solution of the problem of determining directly the velocity of light was brought before the French Academy simultaneously by M. Foucault and MM. Fizeau and Bréguet in 1850, and again by M. Foucault in 1865. The method employed was that of the revolving mirror. A beam of light reflected by a revolving mirror falls normally on a fixed concave mirror and returns by the same path. During the time of the propagation of light from the first mirror to the second and back again, the revolving mirror has suffered a small angular deviation; consequently the return beam after reflection from the revolving mirror is slightly deflected, and from this deflection the velocity of light can be computed. The latest experiments of M. Foucault gave as the result 298,000 kilometres per second.

Professor Cornu has improved the method of the toothed wheel, as well as that of the revolving mirror, and has employed both methods in his new determinations. His experiments with the toothed wheel were made first in 1872, between the Ecole Polytechnique in Paris and Mont Valérien (distant about 6½ miles). A new series of experiments made in the summer of 1874, between the Paris Observatory and the Tower of Montlhéry (distant about 14½ miles), gave the velocity as 300,400 kilometres per second. The probable error does not exceed one-thousandth. The chief practical difficulty to overcome was the exact measurement of the angular velocity of the wheel. It was impossible to give a uniform motion to the wheel, and hence it became necessary to devise some means by which a uniform motion should be unnecessary. This Professor Cornu effected by using an electrical registering apparatus, which registered the continuous increase of motion of the wheel, and enabled the observer by a peculiar electrical signal to note the instant at which the required velocity was obtained. A second improvement, introduced by M. Cornu, was the substitution of a pair of observations of the reflected beam for a single one; that is to say, instead of making the electrical signal at the instant of total extinction of the light, two signals were made, one just before and the other just after the instant of total extinction.

In his experiments by means of the revolving mirror, M. Cornu used five fixed concave mirrors instead of one, thus increasing fivefold the distance traversed by the beam of light between the times of leaving and returning to the revolving mirror.

The distinguished lecturer concluded his exposition by pointing out the importance of the direct determination of the velocity of light, not only to the astronomer, but also to the physicist. The experiments and theories of the British electricians have indicated that the velocity of light is a coefficient common to the undulatory waves and to the mode of motion which is called electricity. Several purely electrical determinations of that coefficient have been made in England, and the results agree very closely with the value obtained by M. Cornu.

ROYAL SOCIETY (Thursday, May 13).

THE Croonian lecture was delivered by Dr. Ferrier, the subject being "Experiments on the Brain of Monkeys."

FINE ART.

THE WATER-COLOUR SOCIETY.

THIS gallery opened to the public on April 26. If we call it a fair average exhibition we do it no injustice. Old exhibitors send new pictures, which will not be distinguished in reminiscence a few years hence from a miscellany of their antecedent works. The one which will decidedly be remembered, in virtue not only of its important subject and fine artistic quality, but also of its peculiar disposal, adapted to irregularly-shaped compartments of a room (the water-colour being evidently a preparation for a much larger work), is

The Tragedy of an Honest Wife, by Mr. Alma-Tadema—the story of Frédégonde and Galsuinthe, wives of Chilpéric. This striking picture has already been described in our pages. Quite as good as this, in its more restricted range of subject-matter and of size, is *The Architect of the Colosseum*, by the same distinguished master. The elderly man, in concentrated thought, his left hand up to his mouth, and a fillet round his thick and crisp grey hair, with plans of his immense creation thrust aside in his robe, holds in his right hand a measuring-rod, with which he lightly and vaguely scores the ground: details of the design are floating through his head, and require some sort of realisation to the eye. The grey flat tints of this painting are extremely agreeable. *Fishing* is another capital work by the same artist: he has inscribed in the corner, on one of the marble steps, his name "L. Alma-Tadema, Op. cxlix," and, with almost humorous fastidiousness of actuality, has painted the same words reflected and reversed in the calm water, which, at the opposite side, passes under a bridge. The architectural details are those of an ancient Roman house, with fluted columns of white marble. The drapery of the figure, a woman engaged in angling, is precisely and prettily handled: the middle distance of foliage, and the water-lilies on the stream, are treated with a slightness hardly characteristic of Mr. Tadema. Besides the Tadema triptych, however, there is one very noticeable picture in the exhibition, the *Winter's Walk* of Mr. R. W. Macbeth. This is large in size, and uncommonly large in manner, having almost the quality of a distemper-painting rather than an ordinary water-colour. The execution is remarkable for strength, and reminds one to some extent of a Millais. A young girl, with a nice, frank, healthy face that has just ceased to be childish, is sallying forth from the old-fashioned mansion, beside which runs a rivulet; in her left hand is a bunch of violets and primroses, and in her right a dog-whip. Her dog, as glad as herself to be abroad in the brisk keen air, scampers by her side. It is rather unfortunate that the line of the grass edging to the pathway comes exactly up to the point of the dog's collar, and thus looks as if it were projected out of that.

Of Sir John Gilbert's two works we prefer the smaller, named "*With ruffling Banners that do brave the Sky*:" mounted knights in plate armour ascending a knoll, sketched off with all the spirit and felicity which distinguish this painter. The larger picture—*King Francis I., the Queen of Navarre, Madame d'Etampes, and the Cardinal of Lorraine, in the Workshop of Benvenuto Cellini*—is a cross, not altogether successful, between the splendid and the picturesque; if either element of the composition were made to predominate a little more decidedly over the other, the impression would be more marked, and, we think, more satisfactory. Mr. Pinwell is understood to have been suffering in health of late, and this we can easily believe on looking at his leading picture, *Sweet Melancholy*. So capable and refined an artist would, we apprehend, under different circumstances either have made this a completer and more sightly performance, or else have withheld it from public display. Four other works from his hand are better. In No. 278,

"We fell out, my wife and I,
Oh we fell out, I know not why,"

there is much truth of expression, both in the faces and still more in the general set of the figures, dragging and constrained, neither of them knowing exactly how to take the first step, and laugh off the meaningless disagreement. Still more laudable in execution is *The Old Clock*, to which a quotation from some verses by Mr. Tom Taylor is appended, setting forth the indisputable truth that a clock may look undamaged when its owners are visibly in years. The aged man is moving the hands of the serviceable timepiece, while his aged wife aids and abets him in the

operation—or would do so were there anything particular for her to perform. This is excellently done, but (it may be hinted) a trifle uninteresting. Other domestic pictures of a high order of merit are contributed by Mr. Shields, Mrs. Allingham, and Mr. Walker. *Hide* is, in composition and the style of the figures and expressions, one of the most graceful works that Mr. Shields has produced. A little boy some six years of age, curly-headed and slim like a girl, is hunting after his sister, several years older, whom he knows pretty well where to find: she stands minimising her form in the doorway: an apple-tree is in lavish bloom close by, and the sun-shadows are blue upon the white wall. Both faces are smiling, but not with the same smile: the boy's is shifting and furtive, replete with *espèglerie*; the girl's broad and good-humoured. Mrs. Allingham's picture is entitled *Young Customers*: two small damsels, of five and four years old, in a village shop temptingly stocked with toys and sweetstuff, waited upon by the spectacled old woman of the establishment. Both the children are dressed uniformly, in little close bonnets and pink tipped frocks; one of them holds a doll, the other an imitation flat-iron. For motionless demureness, as they sit in the high chairs which the shop provides for adult customers, there is not a pin to choose between them. This is a work of great completeness in object-painting and colour: all is nicely and evenly finished. Mr. Walker's subject is *The Old Gate*, the same composition which he exhibited some years ago as a large oil-picture, here reappearing as a very elegantly-handled water-colour.

We shall return to this Gallery at a future opportunity.

THE ROYAL ACADEMY EXHIBITION.

(Second Notice.)

Historical Subjects (continued).—The Waterloo campaign has the luck, which can seldom have befallen it of late years, of furnishing three pictures to the collection; and able pictures they are—very able indeed. Miss Thompson, with the load of her last year's celebrity upon her, certainly shows on the present occasion even higher capacity than she then did; though maybe not higher capacity than a number of people, "as easily led by the nose as asses are," were all agog to ascribe to her, after hearing that the Prince of Wales (who may be presumed to know as much about art-matters as nineteen men out of twenty, and a good deal less than the twentieth) had paid her picture an after-dinner compliment. Her present subject is *The 28th Regiment at Quatre Bras*, and is described in the catalogue in terms which we slightly abbreviate:—

"This regiment played a conspicuous part in the Battle of Quatre Bras, June 16, 1815. Formed together with the Royals into square in a field of particularly tall rye, it was repeatedly assaulted by the enemy's cavalry, cuirassiers and Polish lancers; who closed a long series of unsuccessful attacks by a furious charge, simultaneously delivered against three faces of the square. The picture represents this last effort of the enemy at about 5 p.m. The failure of these attempts to break their formation was productive of much levity on the part of some of the younger soldiers."

The particular anecdote upon which, as we have been told, the picture is based, might also have found a place in the catalogue. It is said that, as another charge of the enemy was impending, and the order went round to the ranks, "Close up, close up," a sergeant, worthily representing the race which knows not when it is beaten, remarked, "What! are they going to try that nonsense on again?" Miss Thompson displays in this work a really extraordinary amount of force. Every action, of raging assailant and dogged defender, is forcible; every face—of deadly determination, of unsubduable resistance, of frantic jeering—is forcible; every foreshortening, of horse or musket or sword, of arm or leg, is

forcible; the brightness and the dimness of the contest, its play of metal and uniform, its volumes of smoke thickening and dispersing, converting many a stalwart fellow into a dim silhouette, are forcible. Three very youthful soldiers, recruits fighting their first battle, are especially hilarious and defiant. One of these, a central figure, is scarcely so successful in expression as some of the others. For difficulty of action well conquered, the French horseman to the left, on his ungovernably startled and rearing charger, might be cited. The handling generally is both free and definite. In testifying with all unreserve to the great merits of this picture—merits really surprising when we consider that the subject is a military and most energetic one, and the painter a woman—we would not be understood as implying that every sort of excellence is here exemplified. Miss Thompson appears to have less aptitude for the absolutely artistic than for some other elements of a good picture: she shows for instance no special gift for harmonious or beautiful colour. She has treated with fair ability that trying point—the red-coated uniform of the British soldiery; but she has not turned it exactly to the sort of account which a colourist would have managed—has not transmuted it out of a troublesome problem into a pictorial resource. With this fine work we may compare a cognate production by one of the best-reputed battle-painters of the time, M. Philippoteau—*La Charge des Cuirassiers Français à Waterloo*. That Miss Thompson should hold her own against the French master is high praise indeed, for he shows in this work all his well-known skill of combination and execution. He gives a larger field of action, more multitudinous combatants, more scenic fullness, and yet plenty of point in the individual groups and figures. A Highland regiment in front is receiving the onslaught of the French Cuirassiers; on the rising ground above, other Cuirassiers, galloping beyond the line of British cannon, with cannoneers dead at their posts, are coming to close quarters with an English regiment, which will know how to give an account of their gallant adversaries. The third picture in this series is the *Ligny* of Mr. Crofts; a capital performance, with more of a pictorial management of light and shade than in either of the others: the dark-blue uniforms are also in his favour, as regards the general massing of colour. Hard by a big windmill, Napoleon sits stoically on his white charger: one more detachment of the troops—one more lot of "food for powder"—is mounting the brow of the slope.

Another scene of fight and turmoil, though of a very different kind, has engaged Mr. F. W. W. Topham: *The Convent of San Francesco during the Sacking of the City of Assisi by the Perugians, 1442*. The spot is an arcaded passage in the convent, with stairs leading up and down. The condottieri or trained-bands of the Perugians are at length swarming up the steps. Two friars endeavour to stay the first of these ruffians: they seize both his hands, one of which grasps a rapier. One of the nobles of Assisi, an armed knight wounded in the knee, is taking, before he returns to prolong an unavailing resistance, a hurried farewell of his wife, hardly thinking ever to behold her alive, or undishonoured: she kneels on the pavement, beside columns blackened and perforated with shot. Two women, a mother and an adolescent daughter, crouch together in horrid silence and expectancy. There is a very fair amount of meaning in this picture, and of skill, though it is thinly painted. It does not strike one as particularly interesting as a whole; but points of individual significance come out not unimpressively as one pauses over them. Under the title *Ready*, Mr. P. Cockerell has painted the son of William Tell standing backed against a tree, with the apple on his head, ready to be shot at. This is a capable and solidly-painted work. The face has a genuinely courageous look, mingled as it should be with a certain nervous tension and

uneasiness; all well marked, although there is hardly any change from entire stillness of feature. Mr. Wallis may always be counted upon for something realised thoughtfully so far as his purpose is concerned, and vigorously as regards execution. His richly-coloured *Fugitives from Constantinople, 1453*, responds to both these demands. It has a meaning, intense look: the eye is satiated with opulence of hue, and the mind led onward and inward. Seated on one of the marble benches of the patriarchal church of St. Mark in Venice, we see a splendidly handsome man, some thirty years of age, with a crutch under one armpit, and a youth of sixteen dozing fitfully beside him. Beyond the arcade of the piazza, a great crowd of Venetians has assembled to witness some sight of public or national moment. The sun blazes; the marbles glow and shine with their magical variety of tint; the immemorial pigeons flutter and settle for a moment; the air rings with cries of acclaim. Those two, the Byzantine aliens and refugees, linger apart, in the scene and not of it. Sad memories and poignant thoughts ring them round with a personal solitude. Mr. Wallis's second contribution is also a Venetian subject—*On the Ponte della Paglia, going to the Council*; slighter in import, but also worthy of his hand. A senator and a procurator of St. Mark are crossing the bridge, close to that angle of the Ducal Palace which is sculptured with the Drunkenness of Noah. The younger man whispers to the elder, with a subtle uninterpretable smile: pleasant and companionable, the two magnates are yet enfolded in statecraft and secrecy closer than in their crimson robes. *Jacobites, 1745*, is the diploma-picture of Mr. Pettie, R.A., and is a very adequate specimen of his forthright, picturesque manner. Several Highland chieftains (their national costume managed with much effectiveness) are assembled in an unfrequented upper room of a mansion: the master of the house, an elderly and dignified gentleman in the ordinary dress of the time, is reading out to them the contents of a written paper, ominous of failure to their cause, and casting a gloom over the group. They are all armed, and claymores and targes lie secreted in a corner of the apartment, ready for use on occasion.

General Subjects.—Under this indefinite heading we shall deal with a number of figure-pictures which are neither sacred in theme, nor historical, nor domestic.

Mr. Millais sends a moderate-sized painting named *The Crown of Love*, being a modification of a design which appeared many years ago as a woodcut in *Once a Week*. The story is that of a "young lover of romance" who was required, as the condition for wedding "the fair Princess of France," to carry her in his arms up to the summit of a mountain: he achieved the feat, but died of exhaustion at the moment of success. This is one of Mr. Millais's slighter paintings, and yet its power is such as only a very able artist could evince: the face of the Princess, with her floating hair of pale yellow, her mouth open, large eyelids, and a hectic flush—mingling tenderness and anxiety—is the most interesting point. The black-haired youth, his countenance turned away from the spectator, mounts upward with stalwart naked legs, and with determined effort: a bird flies a long way below him; from the rocks, a river can be seen, and distant blue hills; the sky is of hard slaty grey, un pitying as the lifeless and death-giving crags. A detail to which we may object is the red velvet sleeve of the wooer, painted with a salient effect not in harmony with the general tone of colour. Mr. Poynter exhibits two narrow upright companion-pictures, *The Festival*, and *The Golden Age*. The former represents two young women engaged in the floral decoration of an Ionic temple. One of them is on a ladder, and stoops down to receive the rose-garland which the other, seated very low, and in a posture almost like kneeling, reaches up towards her; the faces

are finely drawn, especially the lower one, with its foreshortened turn, sideward and upward. Many more roses are in a basket and on the floor, along with a vase of antique varicoloured glass. This is a choice and accomplished work; though a certain charm which would be appropriate to it, compounded of spontaneity, freshness, and subtlety, is not among the gifts of Mr. Poynter. We like this better than its pendent, *The Golden Age*, which portrays two young men nearly naked, one of them handing down from a ladder a bunch of pears, to be added to the already well-filled basket which his companion attends to. Open-air health and fresh-blooded youth would be of the essence of this subject, but are counteracted by the almost leaden dullness of the flesh-hues. Mr. Albert Moore is a slightly provoking painter, even to those who sincerely admire him without falling—as some critics appear disposed to do—into absolute fatuity of praise. The resolute unintellectuality of his work, and its constant limitation with regard to tones of colour and of chiaroscuro, abate at last the pleasure which we feel in his sense of beauty and of grace, fineness of tint, and Greekish delicacy. Two of his minute contributions have already been reviewed in our pages; we shall therefore only specify the third, *A Palm Fan*, showing a girl distended on a sofa, with very visible contours through gauzy drapery, and pale-blue as the predominant colour. This is a covetable little piece of art, fully equal, on its restricted scale, to Mr. Moore's reputation. Mr. Pickersgill exhibits the strongest work we have seen from his hand this long while, quoting to it the verses of Tennyson's *Mariana in the South* where the deserted wife is represented as conning the old love-letters addressed to her, thus feeding the hunger of her affection and the embers of her resentment. The figure is of full life-size, and constitutes the entire subject, but for some well-found adjuncts of lilies and orange-tree, dense blue unvaried sky, and glimpses of blue lake. Mariana is dressed in deep full-tinted green, with dark plum-red sleeves; her yellow-brown hair trails untended; bitter retrospect, and rising indignation incapable of its object, are in her pale face—a face of solitary seclusion, to which no relief of confidence and companionship is vouchsafed. Mr. Poole's *Entrance to the Cave of Mammon* (from the *Faerie Queen*) has poetical unity of conception, and, like his sacred picture previously mentioned, ranks among his best works. It resembles that considerably in the general tone of colour. We feel some doubt as to what sort of lighting is intended; whether late twilight, or possibly moonlight; but, as the subject is one to which "the light that never was on sea or land" would be fitting enough, this is of the less consequence.

Of Mr. Frith's contributions in this section, the best is *La Belle Gabrielle*, holding a silver goblet on a salver of the same metal—for the refreshment, as we are to understand it, of Henri IV., who does not appear on the canvas. The face, in soft reflected light, with a little direct sunshine on the left brow, is skilfully treated in this respect. Mr. S. Lucas (a name we do not recollect) has three clever pictures: *Oxford*, 1650, a student in his chamber; *A Difference of Taste*, representing a cavalier of the same period looking at a portrait of a lady by Vandyck, while an elder man with an eyeglass is more attracted by a small seapee; and *By Hook or Crook*, 1745. Here we see a gentleman in a travelling-suit standing on some loppings of timber to talk to a young lady, who has mounted a ladder, and is giving him her hand; his portmanteau lies on the ground, with a rather slovenly man-servant beside it holding a whip; the roof of a Tudor mansion is to be seen behind. The general relation of the personages is clear enough—the gentleman is about to depart in clandestine haste, and is the lady's lover; but it may be questioned whether an elopement is pending, or whether (as the date 1745 might seem to intimate) we are to regard the man

as a Jacobite fugitive. Both here and in the other pictures, the workmanship is very efficient—broad and unlaboured. Mr. Hodgson pursues with increasing zest the line of Oriental or Tunisian paintings of a humorous character—increasing zest, and, it is to be feared, increasing indifference to beauty. *A Barber's Shop in Tunis* is decidedly unsightly; the colour husky, the manipulation ordinary, and some of the faces, wrinkled with laughter or under a small stream of water poured upon the hairless head, ugly beyond the permissible point. This is the sort of thing that passes in a sketchy caricature, not in a fully executed oil-picture. We like *The Talisman* better; also *A Cock-fight*, in which the expressions of the chagrined youth receding with his defeated chanticleer, and his conquering rival who holds out his own bird in triumph, proffering renewal of the combat, are extremely true, and the general treatment of the various figures is only moderately uncomely. Mr. Dobson's picture in the mild Oriental manner, *Children's Children are the Crown of Old Men*, might be designated as a booby and a baby, with some subordinate personages. Another Eastern subject, treated on a large scale and with a numerous array of figures, is *A Sheikh and his Son entering Cairo on their Return from a Pilgrimage to Mecca*, by Mr. Dowling. This is a meritorious effort in its way, but that way is at best third-rate: no element of the theme is managed pre-eminently well. Of the two principal Oriental pictures of the year, those by Mr. Leighton (Mr. Lewis does not contribute at all), mention has already been made in our columns: a third example, *Little Fatima*, a small girl of Damascus, is pretty, with the innocent quaintness of early childhood.

W. M. ROSSETTI.

ART SALES.

THE collection of furniture, faience, tissues and arms completed the Fortuny sale. Like all artists, he was a great collector, but of works solely relative to his paintings, and when he saw some rare specimen not to be acquired, he would make it himself. Thus, swords he would chase with a perfect knowledge of the style characteristic of each epoch. One which sold for 2,000 fr. was designed, forged and damascened by himself. It was of Moresque character, and of splendid workmanship. A connoisseur one day admired its rare beauty, and not doubting its authenticity from the matchless workmanship of the blade, offered to buy it. "Willingly," said Fortuny, smiling, "but wait till it is finished." A state helmet, of Italian work of the sixteenth century, sold for 12,000 fr.; Arabian bronze, 3,035 fr.; ivory casket, 4,000 fr.; portière of red velvet on gold ground, with border of various colours, 6,650 fr.; altar frontal of brocade, Spanish work of the sixteenth century, 10,200 fr. The piece most highly prized by Fortuny was a large Hispano-Moresque vase of metallic lustre, covered with gold arabesques, which he had found in a Moresque palace at Granada in 1871, and which he considered equal to the famed vase of the Alhambra. It sold for 30,000 fr. Another, with handles and neck wanting, 6,650 fr. The five days' sale of the pictures and works of art produced 800,384 fr. (32,015*l.*).

THE price of English china rises higher and higher, as the sale of Mr. J. Sanders's fine collection by Messrs. Christie, Manson, and Woods on the 4th and following days testifies. A Worcester teapot, blue scale ground, with large medallions of exotic birds, and the Dresden mark, 44 gs.; a pair of hexagonal vases, deep blue and turquoise borders, with medallions, 280 gs.; oval jardinière, same style of decoration, 87 gs.; the Nelson service, painted with his arms and crest and border of oak branch and gold, name inscribed, was sold in lots of a pair of dishes or plates, and ranged from 8*l.* 5*s.* to 8 gs. the pair; Bow, deep blue vase and cover, 12 in. high, with

pierced neck and subject medallions, 135 gs. figure of bishop in a mitre and robes, 29 gs. Chelsea, an oviform vase, deep blue, striped with gold, 125 gs.; one with exotic birds, 120 gs.; a magnificent group of two pastoral figures seated with lambs and dog, and mayflower ground, 16 in. high, mark R, modelled by Roubiliac—this group is similar to one sold in Mr. Lucy's collection (ACADEMY, May 8), only an inch taller and more highly finished. Mr. Lucy's specimen sold for 241 gs.; that of Mr. J. Sanders, after a spirited competition, fell to Lady Charlotte Schreiber at the enormous price of 330 gs. A pair of figures, Shepherd and Shepherdess, 100 gs.; another, 15½ in. high, 290 gs.; another, with lambs and dogs, 110 gs. Britannia, a figure of unusual size, 27½ in. high, 150 gs.; the Seasons, four allegorical figures of children, 100 gs.; pair of figures, mountebank and female, 79 gs.; *Quin as Falstaff*, 30 gs.; the Welsh Tailor and his Wife, 10 in. high, 100 gs.; tall beaker-shaped vase, deep blue, with medallions, 95 gs.; Bristol coffee cup and saucer, one of the service presented to Burke by Mr. and Mrs. Champion, 75 gs.; the companion, 50 gs.; Chelsea Derby statuette of Wilkes, 16½ gs.; and a pair of vases, with turquoise, white, and gold decoration on crimson ground, with subjects in medallions, 190 gs. Mr. Sanders's collection also contained fine specimens of European china of almost every manufacture—too many to enumerate. An oblong tobacco box and cover, formerly the property of Frederick the Great, sold for 132 gs.; and a set of fine vases, finely painted in Chinese subjects in medallion of the richest decoration and the A R mark, 140 gs. Nove, jardinière, from the Reynolds collection, 60 gs. The sale closed with a charming little collection of Chelsea *bonbonnières* and scent-bottles, ranging from 13 gs. to 20 gs. each; and a fan-shaped toilet-box, consisting of nine boxes, with beautifully painted cover, formerly the property of the Princess Elizabeth, 90 gs.

THE sale of Mr. Sanders's china was followed at Messrs. Christie, Manson, and Woods's by that of the pictures and water-colour drawings of the late Mr. Leaf, which occupied three days, there being above 500 lots:—Water-colour drawing, Hunt, *Boy Eating Porridge*, 130 gs.; *Dead Peacock and Still Life*, 305 gs.; *Head of a Mulatto Girl*, 300 gs.; *Interior at Hastings*, 205 gs.; Roberts, *Bridge of Irun*, 150 gs.; *Street Scene in Madrid*, 122 gs.; Stanfield, *The Drachenfels*, 130 gs.; Tayler, *The Poultry Yard*, 250 gs.; *Hawking Party*, 205 gs.; Turner, *Chepstow*, with pencil sketch, an early piece, 160 gs.; *Great Malvern Abbey*, 150 gs.; *Tivoli*, 390 gs.; *A River Scene*, a sketch, 60 gs.; Barret, *Walton Bridge*, *Sunset*, 315 gs.; Burton, *Yildiz*, 500 gs.; *Interior of Bamberg Cathedral*, *Franconian Peasants*, 775 gs.; Cattermole, *Baronial Hospitality*, 190 gs.; Haag, *A Rehearsal*, *Cairo*, 525 gs.; *Oath of Vargas*, 340 gs.; Sir John Gilbert, *Burial of Ophelia*, 160 gs.; *Joan of Arc entering Orleans*, 305 gs.; Harding, *Venice*, 305 gs.; Lewis, *Murillo painting the Holy Family for a Convent*, 350 gs.; and the companion, *Sacking a Convent*, 320 gs.; Read, *Interior of St. Stephen's*, *Vienna*, 300 gs.; Nesfield, *Fall of the Tummel*, 130 gs.; Lewis, *Courtyard of the House of the Coptic Patriarch*, *Cairo*, 1,850 gs.; Faed, *Baith Father and Mother*, 1,650 gs. The whole sale produced 32,357*l.*

NOTES AND NEWS.

MR. C. J. GALLOWAY, of Manchester, has bought Mr. Watts's picture of *Love and Death* for 1,300 guineas.

THE collection of ancient engraved gems belonging to the Duke of Marlborough, with which the public is by this time familiar from its exhibition at South Kensington and elsewhere, is to be sold at Christie and Manson's towards the end of June. About the half of the collection was

formed by George, third Duke of Marlborough. The other half consists of two previously celebrated collections, the one made by the Earl of Arundel in the time of Charles I., and the other by Lord Bessborough. It is seldom that a collection of this importance and magnitude comes into the open market, and doubtless the sale will attract great numbers of connoisseurs.

M. CHARLES W. DESCHAMPS, the successor of L. Durand Ruel, of 168 New Bond Street, announces that he hopes to be able to exhibit next winter the noble collection of drawings by the late Jean François Millet, now being shown in Paris.

SUBSCRIPTIONS are being raised for the restoration of a portion of the ancient church of Methley, one of the most picturesque ecclesiastical buildings in the neighbourhood of Leeds, and well worthy of notice in these columns. A small, weather-worn statue of St. Oswald, king and martyr, to whom the church is dedicated, figures in the gable of the porch. The Waterton chantry, founded there in 1424, contains fine alabaster figures representing Sir Robert Waterton and his wife. The large features and curling beard and moustache of the knight are very striking; an S.S. collar is round his neck, and a swelled girdle round his skirt, his head dressed in a turban-like cap ornamented with a rosette. Here too is a fine monument in memory of Sir Lionel, sixth Baron Welles—killed at the battle of Towton in 1461—a stalwart figure, with bold features, feet resting on a lion, head on a helmet, from which the crest has been broken, a chain about his neck, an embroidered belt, &c. The pieces of old glass in the east window, though not now in their original positions, are judged to be chiefly of the date of the reign of Edward IV. Below are figures of saints, representing, it is believed, Paulinus (who is said to have founded the church at Dewsbury, not many miles distant from Methley); Cuthbert holding in his hand the head of St. Oswald; Edmund, King of the East Angles, and others. One Anthony Elcocke, Minister at Methley before the Civil Wars, tells as piteous a story in his petition to Charles II. after the Restoration as any to be found in Walker's *Sufferings of the Clergy*. This petition for the living to be conferred on him, still preserved among the State Papers, recounts how Elcocke, "for his loyalty to our Father of ever blessed memory, and the Government of the Church hath oftentimes been imprisoned and Carried from place to place, and his house divers and sundry times plundered, four of his Brothers slain in the service of his late Majesty, and your petitioner driven to great want and necessity." He fears that unless he be reinstated, "himself, wife and children, after all their long sufferings are utterly ruined and undone." It is not quite clear that this petition was granted, but we meet with a sub-dean of York of that name in 1662, and "Dr. Anthony Elcocke" dies rector of Kirkheaton in 1670; so his sufferings and services went not unrequited. It is, perhaps, straying a little from our subject to add, as an instance of how these researches into personal and local history dovetail into matters of wider interest, that Elcocke's rectory was bought after and obtained, when he died, by his brother-in-law, William Shippen, rector of Stockport, the father of Pope's "downright Shippen," M.P. for Newton in Lancashire. Another noted rector of Methley was Gilbert Atkinson, a curious account of whose death has been preserved in a letter from one William Cookson to Ralph Thoresby, the antiquary, dated at Leeds, January 8, 1708-9. Cookson writes:—

"On Saturday last Parson Atkinson, of Methley, a man whom I know you and all that knew him valued for his general learning and accomplishments, was unfortunately slain in the following manner. He had been shooting, the forenoon, and about noon (it beginning to snow) gives his gun to a boy that attended him, and orders him to throw his coat cape over the cock to preserve it from wet, in doing which (the par-

son being turned with his face from him), the cock was moved and the piece went off and shot him into the thigh, broke the bone in pieces and pierced the fatal place which is commonly called the Pope's Eye; whereupon notwithstanding the pangs of death were very violent, he had the courage and presence of mind to fall upon the other knee (as I am told) and prayed with great fervour for his family, the church, and his neighbours; and told those present (which I suppose were two or three neighbours and his own son) that he was dying and that he felt his eyes fixed. The fatal step was betwixt the church and his own house (but near the church), from whence a bier was immediately fetched to convey him home; but his speech was taken away before he got home, and presently after his life."

Methley Hall and estate have been held, since the time of Elizabeth, by the Saviles, now Earls of Mexborough; the first holder of that name being Sir John, Baron of the Exchequer, brother of Sir Henry Savile, the learned Provost of Eton. Close by, at Oulton, was born another celebrated scholar, Richard Bentley.

A NEW archaeological discovery, writes the *Gazzetta di Venezia* of May 2, has been made in our Alps of an ancient chalice of massive silver, which was found some time back by a carpenter, a native of this alpine district, when climbing the highest of the calcareous, Jurassic rocks, in the valley of Rodena, between Castel-Tesino and S. Doria di Lamon, in order to cut down some old plants of larch and beech which had taken root round the mouth of a hollow opening; here, when scraping the tufaceous earth of the cavern, he found a silver chalice of ancient form, concealed with other ecclesiastical furniture. On descending this almost inaccessible peak, he carried his cup to Lamon, where it was soon purchased by the officials of the church of St. Peter, to be preserved as a work of art. This vase is of massive silver, covered externally with an ancient green glaze that is partly corroded by age. The cup is large, of the capacity of a litre and a half; it has a small, low foot, artistically worked, the weight of the whole 342 grammes. Round its upper margin is inscribed in round capital Roman letters the following legend: *De donis dei Sancto Petro et Sancto Paulo Ursus diaconus obtulit*. The form, roundness and impression of the characters are exactly similar to those in the basin of Gelimer (*ACADEMY*, February 6 and March 13), and they are probably of the same period. From the form of the chalice it may be inferred that it was used when both elements were administered to the laity. In the hollow under the pedestal is the ancient Roman letter D, which appears to belong to the sixth century. The inscription round the rim informs us that about the fifth century there was erected at Lamon the church dedicated to the apostles St. Peter and St. Paul, upon the ruins of an ancient Roman castle, of which there are still the remains in the calcareous rock, and that this church was administered by a deacon, Orso by name, who made the gift of the chalice to the same church as an oblation. How it came to repose in this obscure place is yet to be discovered. Later researches may show.

THE Union Centrale des Beaux Arts have transferred their residence to No. 3 Place des Vosges, and have resumed the series of their annual conferences, which take place every Thursday and are gratuitous. The programme is as follows: May 13, M. Albert Jacquemart, upon ceramics; 20th, M. de Montaignon, upon the taste of Brunelleschi in architecture; 27th, M. Lameire, upon the decoration of public works; June 3, M. Ph. Burty, upon Bernard Palissy; 10th, M. Sédille, upon architecture; 17th, M. Racinet, upon decoration.

LÉOPOLD FLAMENG, encouraged by the success of his two admirable Rembrandt reproductions—*The Hundred Guilder Piece* and *The Night Watch*—has now undertaken two new plates—*The Anatomy Lesson* and *The Syndics*. *The Anatomy Lesson*, in spite of its disagreeable

subject, is universally esteemed as one of the most powerful of Rembrandt's works; and *The Syndics*, painted in 1661, though less known, is equally remarkable for the wonderful life and individuality of the heads and its clear golden tones. Such works afford noble themes for the popular French engraver's admirable talent.

THE Municipal Committee of Archaeology has recently published the statistics of all the antique objects, sculptures, &c., discovered on the Esquiline Hill in the year 1874, but exclusively within the range over which the *scavi* ordered by the municipal authorities extend: 17 statues; 10 torsi; 47 busts and heads, more or less preserved; 5 sarcophagi and cinerary urns; 12 ex-votos and other objects for sacred purposes, i.e. offering in temples or to deities; 6 engraved gems or cameos; 11 basso-relievi in ivory or bone; 5 ornaments in gold and 6 in silver; 30 objects of similar character in bronze; 11 silver coins; 8,925 bronze medals and coins; 75 objects in terra cotta, of various kinds; 11 fragments of architectural ornament; 39 inscriptions, without including in the list a countless number of utensils for culinary, toilette and household uses.

THE sixth great annual exhibition of paintings at Vienna was formally opened last week. The number of works (460) seems extremely small, and of these 100 are by exhibitors from other cities, Munich supplying half these numbers. Paris, by the way, has not sent a single picture to testify to its artistic activity. The gem of the exhibition is, according to the verdict of the German papers, Hans Makart's *Cleopatra in her State Barge on the Nile*.

THE STAGE.

"THE GLADIATOR."

MEN of letters who are careful to stand well with posterity may with advantage consider the fate of the two writers who were leading the romantic school in France a few years before the accession of Louis Philippe. M. Alexandre Soumet and M. Guiraud were then held to be the greatest of Chateaubriand's disciples; their poems were read in the drawing-rooms, and won the applause of Talma and Benjamin Constant; their tragedies were performed on the boards of the Français and the Odéon; they were elected to the Academy with unusual readiness and unusual compliments; they had under them Victor Hugo, Alfred de Vigny, Emile Deschamps, Jacques Ancelot and Jules Lefèvre; and now their dramas and romances are left to the hawkers of the Quai Malaquais, to be bought for two sous a-piece by playwrights in search of a plot. Yet they had thought to be wise in their generation, and had withdrawn from the tumult of politics to illustrate, each in his way, their belief that the decline of the human race ended with the coming of Christ, and that its progress then began. This was the purpose of M. Guiraud's novel, called *Flavien*, which M. Soumet put on the stage with the title of *Le Gladiateur*. Seeking in the first place to show that social order could only be founded on liberty, and liberty on Christianity, and seeking in the second to carry out their maxim that historical truth should be observed in the minutest details, they here drew a striking picture of the Roman Empire in the reign of the last Gordian, when Rome was at the mercy of a licentious mob and the gods were esteemed as little as the government. A troop of soldiers could set up an emperor, a handful of fanatics could create a deity. Philosophers and Galileans, Cynics and Platonists, Gnostics and Ebionists, jostled one another in the schools. In the suburbs Thessalian witches were giving audience to the rich and reading their destiny in the entrails of newborn children. In the caverns under the Tiber were crouching the Christians, who practised their rites without temple or altar. From every street in the city between the Baths of Caracalla and the Mausoleum of Augustus poured the populace in holiday attire to see the

Christian maidens, who had blasphemed Serapis, mangled by the bulls and tigers and beheaded by the gladiators. And from the schools of the gladiators came the cries of desperate men who were beginning to arm themselves for the revolt that took place under Probus.

Without a just comprehension of the state of Rome in this third century of the Christian era, Signor Salvini's performance in the Italian version of M. Soumet's tragedy is liable to be misconstrued. Moreover there is a great gulf fixed between an actor of one country and a spectator of another; the conditions by which the actor's imagination has been restrained or enlarged are for the most part unknown to the spectator, and his shades of meaning lost, and scarce anything carried away but a general impression compounded of his tricks of manner and his broadest effects. Yet from this second work of the Italian actor's genius no one can fail to conclude that the vehemence with which he clothed the character of Othello is not essential to his style, but that in repressing his passions and concentrating them into an ominous stillness, he is as consummate an artist as in loosing the avalanche of his fury. Outwardly the gladiator is a cold and impassive man. He has been too long under the ban of slavery to have much room for feeling. His twitching fingers and the ceaselessly shifting expression of his face are the only signs that a storm is raging underneath. He comes to the catacombs to strike a bargain with the Christians, asking them to join their hate of the rulers to his and aid him in a projected revolt. He prays them to excuse him if his manner is boisterous: the lion's roar must have got into his voice that it should sound so harshly in the solitude: but the brand on his forehead will tell them his story. Fifteen years ago he had been the slave of Fausta, who was now the mother of Caesar, and had won his twenty victories in the amphitheatre: fifteen years ago he had for wife a fair-haired Gaul, whom Fausta slew in giving birth to a daughter, born under the same star as Fausta's son; and he then had fled with the child to Egypt, where the priests of Osiris stole her from him. For all this he would not rail at fortune, and yet was scarcely minded to believe in a God, whether the Christians' God or another. He had now returned to Rome with a few other slaves at his back, had found that the times were not ripe for revenge, and while waiting for their ripening was ready to place his sword at the service of his old mistress, and in humble gratitude do his best to rid her of the girl Neodamia, her rival in the affections of a valiant captain of Praetorian guards. But the people had heard of their favourite's return: the cells were full of Christians, the arms of the common executioners were growing weary, and their axes blunt: and therefore a tribune was sent with his lictors to bring the gladiator into the sovereign presence. For a moment the slave's heart failed him, and clinging to the statue of Jove he poured out passionate supplications. Then the old mood came back again. The god, after all, was a god of stone, and was daily crumbling to pieces: falling it might crush him, but standing it could not help him; and he accompanied the tribune with unflinching step. In this fever of changing moods Salvini's power is acknowledged: he uses his power with finest judgment, and avoids monotony by the most startling transitions of feeling that the English stage has seen. The dramatist's conception of the gladiator is pitched in too high a key, and the play is shrill with declamation: Salvini conceives him as a patient man of sensitive and not ignoble nature, cut to the quick by his sense of wrong, yet moved to publish it by nothing but the cruellest provocation, dallying with his revenge, ever putting it off till to-morrow and to-morrow, and in the end missing it.

In the circus he is on his own ground, and can afford to indulge his irony. He will do the bidding of the holiday folk, the kings of the amphitheatre,

who have honoured him with their applause; he loves the scent of any sort of blood, provided that part of it be his; he will mow down some score of Sarmatian or German slaves, nor shall the holy gods of the people be insulted by a Christian rabble while the gladiator holds a knife. And he sharpens his weapons with the air of a butcher. The sound of a woman's voice softens him. He was not prepared for this: he had thought to hack to death a band of sturdy heretics, to do battle with a leopard, or perhaps a hyena; but a girl of fifteen, a child in white martyr's robe and fillet, with pure upturned face and long streaming hair—this was a tougher job. Yet he seized her, and hastily tearing away the veil and raising the hair, found a long jagged scar on her neck, and knew that the martyr Neodamia was his daughter. At this point the actor's art momentarily deserts him; he falls into the convulsions of melodramatic ecstasy, and wastes the fine opportunity for original expression that M. Regnier may be remembered to have seized in *La Joie fait peur*, and Mr. Boucicault to have used with excellent effect in performing his English version of the same play. Then the gladiator grows calm, and turns to the people; he will fight in the ring for twenty years against all comers if they will give the girl to him. But the people are unmoved. Fausta, remembering that her son's life is bound up by destiny with the life of Neodamia, tries in vain to save her. So the gladiator slays her with his own hand, and offers her blood to the "poor and naked god of the Christians," praying that the deed might "flash in the eyes of tyrants and cry to a new age that the reign of force was ended and the reign of liberty begun." In the delivery of this prayer, which ends the play, Signor Salvini touches the highest point of histrionic art; he speaks it with rapid forced utterance, lest the clamouring populace break in and choke his speech. His scheme of vengeance has been abandoned, and, with his daughter, he has lost every hope in life: yet he will not fall a-cursing like a drab, nor declaim like an inspired prophet; he addresses a hurried phrase, like a mumbled formula, to an unknown God, wildly hoping that the slaves might yet find favour in heaven, though the gods of Olympus had deserted them. But from one end of the performance to the other Signor Salvini showed his purpose of breaking with tradition. The hot frenzy of Othello is exchanged for the chilling sarcasm of the gladiator. The uncontrolled jealousy of a man in high place is set against the long-suffering of an outcast. Instead of the explosion of animal instincts we have here an Oriental submission to fate. The second impersonation is the supplement of the first, and an impartial judgment on the actor's abilities can only be grounded on a careful consideration of them both.

WALTER MACLEANE.

MR. BYRON's new comedy at the Strand Theatre is called *Weak Woman*. It will be remembered that in Roman law the right of taking under a will was denied to women *propter sexus levitatem* in common with the deaf and dumb, prodigals and idiots. The father of Mr. Byron's latest heroine was so far convinced of the wisdom of this provision that he disinherited his daughters, less on account, however, of the levity of their sex than of the mercenary greed of their suitors. And many complications ensued from the fact that the intentions of the testator were unknown to his heirs. This is the shell of one of Mr. Byron's usual comedies, which resemble nothing so much as the contrivances called detonating fireworks, which explode at an early stage of their flight, and discharge a thousand coloured lights before they reach the end of it.

THE revival of M. Hervé's *Chilpéric* at the Alhambra Theatre supplies the denizens of Leicester Square with a very dazzling spectacle.

TO-NIGHT Mr. Herman's romantic play, *Jeanne*

Dubarry, and Mr. Clay's comic opera, *Cattarin* are to be produced at the Charing Cross Theatre and Mr. Hollingshead opens his campaign comic opera at the Gaiety Theatre with *Les Mousquetaires de la Reine*, by Halévy. Halévy is standing proof of the eclectic spirit in which England appreciates musical art. He was a composer of the supplest talent, turning with ease from the sublimities of *La Juive* to the graceful frivolities of *L'Eclair* and *Les Mousquetaires*. A French musician had a greater command of orchestral resources, a richer fund of harmony, or sweeter flow of melody; and yet he is less known in England than his relation of the same name who wrote *La Grande Duchesse*.

WHEN *La Boule* has ceased to be played at the Opéra Comique, Mdlle. Hélène Petit will appear in M. Sardou's play, *Andréa*.

MR. ALBERRY's comedy at the Olympic Theatre will be produced on Monday, the 24th inst.

MR. WALTER POLLOCK is to deliver two lectures on the Drama at the Royal Institution. The first will be delivered to-day (Saturday), at three in the afternoon.

THEATRICAL affairs in Paris are very dull; but M. Francisque Sarcey, of the *Temps*, announces that he has at hand a new theory of dramatic art which will carry him safely through the hot weather, and form one of the chapters of the volume he is meditating on the aesthetics of the stage. Meanwhile M. Sarcey and the other French critics are reduced to reviewing, with great care, a little act by MM. Meilhac and Halévy, *Le Passage de Vénus*, produced at the Théâtre des Variétés, and a comedy by M. Emile de Najac, *La Dernière Poupée*, played at the Théâtre du Gymnase. The first treats of a kind of Gresham lecture delivered by a learned astronomer to an audience composed of the porter and a young man who had retired to the solitude of the lecture-room for the purpose of writing a love-letter; and the second handles the old subject of a young girl's love for her stepfather with a delicacy that speaks well for the future of its author.

As to coming events of the French stage, even the *Figaro* confesses its remarkable powers of vaticination to be at fault. It has even refused to print some of the thousand communications respecting the productions of the future which it daily receives from the authors of these productions. It argues with justice that these letters will soon assume some such form as this:—"Des Sir,—You will oblige me infinitely by informing your readers that I have just bought the paper on which I propose to write a drama in five acts and in verse for the Théâtre Français. Yours, etc., the author of the *Broken Brace*." This touches a amiable weakness of English journalism pretty closely.

MUSIC.

ROYAL ITALIAN OPERA—"LOHENGRIN."

LAST Saturday the long-promised and often deferred production of *Lohengrin* at Covent Garden took place before a crowded audience; in fact, for more than a week before the performance there was not a ticket to be had. It is long since an event in connexion with the opera in this country has aroused so much curiosity; nor are the reasons far to seek. The interest so generally felt on the subject of Wagner's music is largely due to the efforts of Mr. Dannreuther during the last few years as conductor of the concerts of the Wagner Society; partly, also, no doubt, to the reports of the success of *Lohengrin*, first in Italy, and more recently in America. Though, as has before been said in these columns, any mere excerpts from the composer's operas given as concert pieces furnish most inadequate idea of his genius, the selective given by the Wagner Society, especially that from the present work, gave evidence of a power

which naturally excited a desire to make further acquaintance with the opera. Besides this, Wagner enjoys the distinction of being in all probability the best abused man in Europe—for which, by the way, he has largely to thank his own combative disposition; and the pros and cons of the "Wagner question" have been debated at more or less length in nearly every musical and literary paper in the country. To this must be added the fact that until last Saturday no really representative work of the master had found its way on to the stage at either of our opera houses. The *Fliegende Holländer*, it is true, was produced at Drury Lane by Mr. Wood in 1870; but this piece, full of beauties and often characteristic of its author as it is, was written before Wagner had cast off the conventional operatic forms, and in no degree illustrates the new views of the musical drama which he propounds and which he carries out in the construction of his later works. For a summary of these views, our readers may be referred to the article on the subject which appeared in the *ACADEMY* last year (February 14, 1874). *Lohengrin* is the first of Wagner's operas in which they are completely developed.

Before proceeding to speak of the performance, it is necessary to give some account of the opera itself. Like all Wagner's later works, with the exception of the *Meistersinger*, the period of action of *Lohengrin* is laid in the ages of romance, and the supernatural plays an important part in it. After the orchestral prelude, which is well known to our concert frequenters, the curtain rises and discovers a meadow on the banks of the Scheldt near Antwerp. Henry the Fowler, King of Germany, has come to Antwerp to summon his lieges against the Hungarians. He finds the people in a state of anarchy, and calls upon Frederick, Count of Telramund, to account for this. Telramund explains that the late duke of Brabant had died and left two children—a son Gottfried, and a daughter Elsa, both of whom were committed to his charge as guardian. The boy had mysteriously disappeared, and he accuses Elsa of the murder of her brother. The king summons Elsa to appear and answer the charge. She comes forward, and in reply to the accusation relates, as if in a trance, a vision she has had of a knight in white armour, who, she says, shall be her champion. Her manner makes a visible impression upon the King and the nobles present. Telramund answers that he is not misled by her apparent innocence, and that he has good proof of his accusations, but that it would ill beseem his dignity to bring forward witnesses, and that he is prepared to justify his charges with his sword. The King asks Elsa if she will abide by the issue of battle, and she replies by naming her mysterious knight as her champion. The herald summons the champion with trumpet-call to appear, and after considerable delay, a boat is seen on the river, drawn by a swan, in which stands a knight in white armour, exactly answering to Elsa's description. The music here is wonderfully truthful in dramatic expression, and works up to an almost overpowering climax at the arrival of Lohengrin. The knight steps forward, accuses Telramund of falsehood, and declares himself Elsa's champion. Before he will fight for her, however, he asks her if she will be his wife, should he prove victorious. She assents, and he then says, if he is to protect her, and if nothing is to separate them, she must promise never to ask him whence he came, nor his name nor rank. She gives the promise, and he engages in combat with Telramund, whom he overcomes, and the curtain falls on the songs of victory.

The second act takes place in the City of Antwerp. It is night. On the right of the stage we see the entrance to the cathedral, on the left is the Kemenate (the ladies' dwelling), and in the background the palace. On the steps of the cathedral are seated Telramund and his wife Ortrud. The former is in deep dejection, and upbraids his wife violently as the cause of his

disgrace, for we learn that it was she who had told him that she had herself seen Elsa drown her brother. Ortrud replies that she had only spoken the truth, and that the victory of the knight was the result of magic; that were he forced to disclose his name he would at once lose all his supernatural power; but that no one but Elsa had the power to force an answer from him, and hence his strict injunction to her to make no enquiries. She undertakes to instil suspicion into Elsa's mind, while Telramund is, before the King, to accuse the Knight of magic. Elsa appears at the balcony. Ortrud appeals to her pity, and induces her to take her into the house. The day breaks gradually, and the citizens come forth to their work. The King's herald proclaims the banishment of Frederick von Telramund, and announces that the strange knight, who assumes the title of "Guardian of Brabant," is to be married on that day, and on the morrow will lead the forces against the enemy. Elsa, and a procession of her ladies, among whom is Ortrud, come forth from the Kemenate to go to the cathedral; as the former ascends the first step, Ortrud advances, and claims precedence. "Wilt thou," says Elsa, "go before me? thou, the wife of one whom God hath judged by ordeal of combat?" "At least," replies Ortrud, "my husband's was a highly honoured name. What of thine? thou canst not even say who he is!" While the dispute is at its height, the King and Lohengrin enter; Elsa appeals to the latter for protection against Ortrud, and all are about to enter the cathedral when Telramund advances and charges the strange knight with magic arts, alleging in proof his mysterious appearance, drawn by a swan, and demanding who he is. Lohengrin replies that none but Elsa has the power to ask that question. He turns to her—"Elsa, wilt thou put the question to me?" She is in a tumult of emotion and doubt, but at present trust prevails, and she replies, "My love shall stand far above all doubt." As they go into the cathedral, the curtain falls.

Act the third opens with a brilliant orchestral prelude, familiar to many from its frequent performance at the Wagner Society's concerts, where it was one of the stock pieces. The curtain rises on the bridal chamber, to which Lohengrin and Elsa are conducted in state by a procession of knights and ladies to the music of the well-known bridal chorus. When they have retired a long scene follows, in which the doubts which Ortrud has insinuated into Elsa's mind gradually increase in power, and at length force from her the fatal question to her husband, who he is, and whence he comes. Just as the question is asked, Telramund and four retainers burst into the room with the intention of assassinating Lohengrin, who, with one thrust of his sword, strikes Frederick dead; his vassals submit. Lohengrin orders them to carry the corpse before the king, and summons two bridesmaids to conduct Elsa also to the royal presence, where, he says, he will answer her enquiry. The scene changes to the banks of the Scheldt, as in the first act, and after some gorgeous procession music, to which various knights and their vassals arrive on the scene, ready to depart for the frontier, the King appears. Telramund's retainers bring in his corpse. Elsa enters, heart-broken, and last of all Lohengrin comes forward, and, after explaining the death of Telramund, charges Elsa with having broken her promise, and thus destroyed her happiness and his own. He explains that he is a Knight of the Holy Grail, gifted with supernatural powers in defence of innocence; but that such is the sacred mystery of the Grail that it must not be revealed to the public, and if once it is known its knight must immediately depart. This was the reason why he forbade Elsa to ask who or whence he was; now that he had been forced to declare it he must return. The entreaties of the King, Elsa, and the people fail to move him, and the swan is seen approaching on the river to carry him away.

As he is about to enter the boat, Ortrud comes forward, scoffs at Elsa, and tells her that the swan is no other than her brother Gottfried whom she (Ortrud) had enchanted, and that if Elsa had not asked the question, Lohengrin would have had the power to restore him to a human shape. The Knight of the Grail hears her, and kneels by the side of the boat in silent prayer. A white dove appears hovering over the boat; Lohengrin understands the sign, and gladly loosens the chain by which the swan is fastened. The swan sinks below the water, and in its stead arises Gottfried, whom Elsa joyfully recognises, and the people of Brabant acknowledge as their ruler. Lohengrin chains the dove to the boat and departs. Elsa, with one agonising cry of "My husband! My husband!" sinks lifeless in her brother's arms.

It will be seen from the above abstract that the libretto of *Lohengrin* is no ordinary opera book. It abounds in forcible situations, and the poetry, as in all Wagner's libretti, is of very considerable literary merit. With regard to the music, it may be frankly confessed that it is certainly not of a kind calculated to attract the *habitués* of the Italian Opera. It overflows with melody; but it is not the sort of melody which catches the ear at once and haunts the memory afterwards. There is no fear that *Lohengrin* will ever be heard on the barrel-organs in company with *Madame Angot*! There are no detached songs or choruses; one piece follows another without the slightest break, so that the audience, even when most excited, had hardly a chance, so to speak, to get a clap in edgeways. It was very curious to see how the tendency to applause kept on breaking out, and was as constantly hushed down by those who knew the music. In one case it broke all bounds. The grand scene of Lohengrin's arrival in the first act roused an enthusiasm which there was no resisting. The audience positively refused to allow the performance to continue until it had been repeated—a decided error of judgment, though a most intelligible one; at the second performance the chorus, not having been led up to by the previous music, failed to produce anything like the impression it did the first time.

This brings us naturally to notice the distinctive characteristic of the Wagner opera—its dramatic unity. To record a personal impression, I may say that never in my life have I been so overpowered with any operatic performance as with *Lohengrin*. And the force of the impression produced arises not merely, nor even chiefly, from the music *per se*, but from the entire combination of music, drama, action, and *mise-en-scène*. There are many pages of the music which heard in the concert-room would be simply insufferable, but which on the stage produce the deepest impression. Such is especially the case with the long and gloomy scene between Frederick and Ortrud which opens the second act. There is hardly a phrase of melody that one can recall after a single hearing; yet the dramatic truth and power of the whole scene are unmistakable. It has often been said that Wagner's music can only be heard and judged on the stage; and this statement was to the fullest extent justified on Saturday evening. Those who would appreciate the work, however, must lay aside all their preconceived ideas of opera, and be prepared to accept dramatic truth instead of pretty eight-bar phrases. Moreover, to understand the music fully, intimate acquaintance with it is needed, as otherwise much of the significance of the introduction of the chief subjects ("Leitmotive," as they are termed) will be lost altogether, though the general impression of power and beauty cannot fail to strike the unprejudiced hearer, even if he have no previous knowledge of the work whatever.

The performance of the opera was, with one exception (of which presently), extremely good, in many respects even admirable. It is not too much to say that there is no work in the *répertoire* of the Royal Italian Opera which in

point of difficulty for soloists, chorus, and orchestra, even approaches *Lohengrin*. The amount of labour involved in the preparation of the work must have been enormous, and the first word of praise is certainly due to Signor Vianesi, who conducted with a steadiness and decision to which the success of the performance must largely be attributed. The part of Elsa was sung and acted by Mdle. Albani in a truly ideal manner. Not only did she look the character to perfection, but her conception of the romantic and dreamy maiden was admirably carried out, and never exaggerated. Her acting in the great scene with Lohengrin in the third act can hardly be overpraised, while her rendering of the music was not only technically faultless, but in the highest degree artistic. No less praise is due to Mdle. d'Angeri for her performance of the very thankless part of the venomous Ortrud. With the exception, probably, of Wagner's *Tristan und Isolde*, no more trying part exists in operatic music than that of Ortrud; and Mdle. d'Angeri attacked it with a boldness and spirit, and sustained it with a power of endurance which deserve all recognition. Her acting, too, was extremely good, and showed a thorough comprehension of the character. Signor Nicolini's Lohengrin and M. Maurel's Telramund were also most excellent, and Signor Capponi declaimed the part of the herald, which, though important, consists entirely of recitatives, in a very effective manner. The one failure in the performance was in the part of King Henry, which was represented by Herr Seideman, a new comer, who made his first appearance in England on this occasion. Every allowance should of course be made for a *débutant*; but unfortunately Herr Seideman's voice is not sufficient, either in volume or compass, for the important part which he undertook. The chorus, which in the opera has much more than the ordinary proportion of work, sang the very difficult music (in spite of some shortcomings) with a general accuracy and spirit which were the more praiseworthy as the choral portion differs so utterly in character from that to which our operatic singers are accustomed; and the splendid band of Covent Garden played the orchestral accompaniments with the utmost finish, a special word of mention being due to the brass instruments for the discretion which they showed in their performance. Wagner employs the brass so freely that without great care on the part of the players the balance of tone will be destroyed. Nothing could have been finer than the rendering of these parts on Saturday evening.

The *mise-en-scène* of the opera was without doubt one of the most magnificent ever seen at Covent Garden. In each act the opera affords great opportunity for spectacular display, and the scene on the banks of the Scheldt in the first act, the bridal procession of the second, and the mustering of the knights in the third, have probably never been surpassed for brilliance on any stage. The scenery too, particularly that of the cathedral in the second act, was admirable; while special mention ought to be made of the mechanical swan, which plays so important a part in the action, and which if badly contrived would easily excite laughter, but which was admirably devised, its motions being most natural.

The reception of the work by a densely crowded house was most enthusiastic, all the principals being recalled again and again after each act. The temper of the audience may be judged from the fact that they insisted upon encores the introduction to the third act, though it was then within a few minutes of midnight. Owing to the long pauses between the acts, the opera did not conclude until about a quarter to one, but notwithstanding the lateness of the hour a very small proportion of the audience left their seats until the final fall of the curtain.

How far *Lohengrin* is likely to take a permanent place here it would be hazardous to conjecture. Whether it will ever become really popular with the

class who mostly support the opera is very doubtful. Curiosity had certainly much to do with the large attendance at the first performance, and it was significant that the warmest applause came from the upper part of the house. Musicians, both professional and amateur, will gladly welcome frequent opportunities of hearing the work; but it is not upon musicians that Mr. Gye depends for his subscription-list. By the time that six performances of the opera have been given we shall be better able to estimate the chances of Wagner's future position here; meanwhile it is well that recognition has at last been given to the genius of one of the most remarkable musicians of the present century. EBENEZER PROUT.

OWING to the length to which our notice of *Lohengrin* has necessarily extended, we are unable to do more than record the chief features of the fourth Philharmonic concert, which took place at St. James's Hall last Monday. The programme was excellent, but far too long, including two symphonies, one of which was the "Choral," a pianoforte concerto, and three vocal numbers. Mozart's lovely symphony in D (the one known as the "Haffner" symphony) was the opening piece, but the specialty of the first part was the performance by Signor (query "Herr"?) Ludovico Breitner of Liszt's piano concerto in E flat. The player made on this occasion his first appearance in England, and by the excellence of his rendering of the very exacting work produced a marked impression. The second part of the concert was occupied by Beethoven's Ninth (Choral) Symphony, which was first performed at the Philharmonic concerts just fifty years ago, in the season of 1825.

At the New Philharmonic concert last Saturday a very remarkable *début* was made by a new pianist, Mrs. Beesley, a pupil of Dr. Bülow. The lady joined her master in Bach's concerto for two pianos in C minor, and in Schumann's Variations, Op. 46, but besides this, played Liszt's Concerto in E flat in such masterly style (if the term may appropriately be applied to a lady's playing) as at once to establish her reputation. The concerto was conducted by Dr. Bülow. Mrs. Beesley's performance was received with the applause it so richly deserved; and her further appearances will be looked for with interest.

MISS FLORENCE MAY gave a pianoforte recital at Willis's Rooms last Saturday afternoon, assisted by Signor Papini as violinist, and Miss Sophie Löwe as vocalist. The very excellent programme comprised two Preludes and Fugues by Bach, Schumann's "Faschingschwank aus Wien," Beethoven's "Kreutzer" Sonata, piano solos by Scarlatti and Bennett, a violin solo composed and played by Signor Papini, and songs by Schumann, Brahms and Sullivan.

MDME. MARIE ANGELO gave a piano recital at St. James's Hall on Wednesday afternoon, assisted by Miss Edith Wynne and Mr. Santley. The programme included, besides pieces by Beethoven, Weber, Mendelssohn, &c., two numbers for the left hand alone. However useful as exercises such things may be, they are certainly out of place at a public performance, as they serve simply to show the skill of the player, and can, from their very nature, have no artistic value. If we are provided with two hands, why use only one?

A SERIES of six Summer Concerts is announced at the Crystal Palace, the first of which takes place this afternoon. Among the works promised are Beethoven's Choral Symphony, a selection from Gade's *Erl-King's Daughter*, the first movement of Beethoven's violin concerto (why only the first movement?) to be played by Herr Wilhelmj, and as a very interesting novelty, a concerto in G minor by Handel for oboe and orchestra, the oboe part being played by that admirable artist M. Dubrucq. The chief features of to-day's concert are Beethoven's "Choral Fantasia" (piano, Mr.

Charles Hallé) and Schubert's unfinished symphony in B minor.

THIS afternoon one of the chief events of the musical season takes place at the Albert Hall in the first performance of Verdi's "Requiem," under the direction of the illustrious composer. The work will be repeated on Wednesday evening next at the same place. The solo parts will on each occasion be sung by the four artists who have taken part in the work at the recent performances in Paris—Mesdames Stolz and Waldmann, and Signori Masini and Medini. We shall notice the work in detail next week; at present we will only say that having been present at the full rehearsal on Wednesday, we can confidently promise those who attend the performances a treat of a very high order.

MESSRS. JOSEF LUDWIG AND H. DAUBERT have commenced a series of chamber concerts at the New Gallery, Argyll Street, Oxford Circus, the first of which took place last Wednesday. The programme included Brahms's pianoforte quartett in A, played by Miss Agnes Zimmermann and Messrs Ludwig, Bernhard, and Daubert; Chopin's Introduction and Polonaise in C (Miss Zimmermann and Herr Daubert), Mozart's Divertimento in E flat for violin, viola, and violoncello; violin solos by Herr Ludwig, and songs by Miss Sophie Löwe. The second concert is fixed for Wednesday week.

M. J. WILD, the head of the music-publishing firm of Schonenberger, died at Paris on the 6th inst., at the age of 82.

At the Carltheater, Leipzig, Verdi's *Aida* was announced for performance on the 28th ult. by the opera company from Chemnitz. A well-filled house was awaiting the rise of the curtain, when an announcement was made from the stage that an injunction had been obtained against the performance, and that the money would be returned. It is said that Messrs. Bote and Bock, the publishers of the music, had obtained the injunction on the ground that the director of the operatic company had only received permission to perform the work "in Chemnitz and the neighbourhood."

SATURDAY, MAY 22, 1875.

No. 159, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Poems. By William Bell Scott. Illustrated by the Author and L. Alma Tadema. (London: Longmans & Co., 1875.)

THIS dainty volume is in many respects a work of peculiar and unusual interest. It is one of a class whose members are very much less numerous than they should be. The work of a man who is not and does not claim to be a professional poet, it contains the carefully-garnered poetical produce which has now and again been as a by-work produced in a life mainly devoted to other branches of culture and art. Such by-works have always a great and peculiar attraction, as Mr. Browning, in lines which everyone knows, has pointed out. But it so happens that when such work takes the form of poetry, its value and consequently its interest is peculiarly great. For poetry, standing in this respect alone of the arts, and drawing an additional dignity from this solitude, is to a certain extent independent of professional study, of mere acquirement and knack. The amplest and most appreciative contemplation of paintings will not make a man a painter, the devoutest and most constant attention to performed music will not make a man a musician. But it is the glory of poetry that every one who can appreciate poetry is potentially a poet, and that the potentiality needs neither instruction nor practice to develop it. A sufficient study of good models, and an occasional heat of mood sufficient to accomplish the poetical projection, are the only conditions necessary to enable a cultured or culturable nature to produce a poem which shall be a poem, and not a copy of verses. Allow for the greater or lesser frequency with which this heat of mood occurs, and for the steadiness with which it is sustained, and you have the difference—a difference much more of degree than of kind—between what is generally called a great and what is generally called a minor poet. But it must be acknowledged that but few men make a right use of the poetical possibilities which lie in them. Sometimes circumstances, or indolence, or the half-indolent fastidiousness which so frequently accompanies culture prevent a man from indulging his genius at all. Sometimes the poems are written and remain in the desk till the dismal act of faith which a man's friends usually celebrate after his death commits them unread to the flames. Sometimes, more usually and less tolerably, the casual impulse is mistaken for a vocation, and the man assumes the enviable

position of a professed and acknowledged minor poet.

Mr. Scott has done none of these things. He has not neglected his poetical impulses; he has not left them to the tender mercies of his executors. Neither has he cared at stated intervals to squeeze out a volume of scannell verses wherewith to pad a few happy lines. He has evidently written when and only when he was in the vein, and has thus been able, at a time of life when most poetical workers are usually endeavouring to impair what reputation they have gained, to come forward with a goodly and almost a virgin offering of poetry wherewith to make good his title to the name of poet.

The matter contained in this volume divides itself pretty naturally under the three heads of ballads, sonnets, and miscellaneous poems. The ballads are of various patterns, from the simple common measure unnumbered or unadorned with refrains, to the more ambitious structures of which the following is a specimen stanza:—

"On the carved bed in the lighted bower
Turned lady Janet, May Jean,
Waiting it seemed to her hour on hour
Hearing the wind creak the vane on the tower.
The tide-wave breathes by sink and swell.
Why is she watching with eye and ear,
Shadowed and restless in fever and fear,
When the bolt is drawn and no one near?
Spees she or hears she anything
Except the lamp's flame and the moth's wing?
Sea foam seethes the empty shell."

No one, we suppose, will deny that this is a finely-wrought stanza, and a picture well presented, and the same may be said of the whole poem (the first in the book) in which it occurs. Perhaps its fault, if it have a fault, is that it is a little too elaborate, the poetical effect being somewhat sacrificed to the pictorial, and the doubly varied burthen in every stanza contributing to produce a distraction of the attention to the details from the whole. No such charge can be brought against "Kriemhild's Tryste," which is a very spirited version of the Lorelei story. "The Witch's Ballad," though its dialect strikes us as a little patchy, is also very good.

We are not sure that Mr. Scott's sonnets please us so well. There is a very general opinion, an opinion which probably considers itself safe under the shadow of Wordsworth's patronage, that the special function of the sonnet is to serve as a vehicle for the conveyance of any tolerably single and serious thought which may occur to a man, and which may seem to him to deserve or to be in any way capable of poetical expression. "When found—make a sonnet of" is the unspoken motto of the poetical Captain Cuttles who take this view. We would by no means insinuate that Mr. Scott is of this opinion, we are quite sure that he is not; but his practice might occasionally give some colour to an insinuation of the kind. For instance, there are here three sonnets on Wordsworth himself; the criticism they contain is absolutely just and fair, nor would it be possible to put the truth about Wordsworth better. But what on earth is the meaning of criticism in verse, and if we allow it where is our tolerance to stop? Why should we not have

the "Loves of the Triangles" or the savoury treatise of the Abbé Robbé at once? How well Mr. Scott can write in this form when he is better advised, the following will show:—

"Young men and maidens, darkling, pair by pair,
Travelled a road cut through an ancient wood:
It was a twilight in a warm land, good
To dwell in; the path rose up like a stair,
And yet they never ceased nor sat down there;
Above them shone brief glimpses of blue sky,
Between the black boughs plumed funereally
Before them was a faint light, faint but fair.

Onward they walked, onward I with them went
Expecting some thrice-welcome home would show
A hospitable board and baths and rest;
But still we looked in vain, all hopes were spent,
No home appeared; and still they onward go,
I too, footweary traveller, toward the West."

But it is neither among the sonnets nor among the ballads contained in this volume that the clearest evidences of Mr. Scott's poetical power are to be sought. His particular forte is in the management of the loose and irregular, but most effective and peculiarly English metre whose base is the catalectic dimeter trochaic. There are in this volume some half-dozen poems in this metre, and we wish there were more, for Mr. Scott manages it with rare skill. Of all metres it is the aptest to degenerate into doggerel, or to stiffen into prose, and here there is no trace of either. The first poem in which it is used, "Anthony," is a very remarkable piece of *diablerie*, and shows unusual powers in that style. Memories of Félicien Rops' frontispiece to *Gaspard de la Nuit*, and of Henri de Brés' strange little piece in the Brussels Musée float before us as we read these lines:—

"Then came a sound,
The regular chaunt of a litany—
Doubtless to Hecat or Venus—and they
Who chaunted it were seen nowhere,
Neither on ground nor in the air;
Nor was there green field or blue sky,
Or tree, or stream; but all was brown,
And flames like lamps leapt up and down:
Nor saw I aught living in doublet or gown,
Till we came to the market-place, where stood
Instead of a cross, an image of wood,
A huge-faced image, with ass's ears,
And horns and a tongue and eyes full of leers,
Bodyless, only a block, whence grew
Lopped arms and shameless parts; before
The image flickered a flame dark blue,
And round it, hand in hand, a score
Of dark brown men and women ran,
Naked as devils."

Mr. Scott's double vocation has here stood him in good stead. The composition is admirable; you have only to shut your eyes and the nightmare is realisable at once, while at the same time the details are not insisted upon too much. The whole poem (which we believe appeared, though composed many years ago, in the *Fortnightly* not long since), is worth quotation, and so, in hardly a lesser degree, is "Midnight." Two other poems of very different subjects, but cast in a similar form and of similarly successful execution, are "The Venerable Bede in the Nineteenth Century," and "The Music of the Spheres." And lastly, it is in this metre that the "Fable," which worthily closes the volume, is written. Four lines from this fable quoted by Mr. Swinburne first attracted the writer's attention to Mr. Scott's poems, and set him years ago on a fruitless quest for them among the book-

shops. Indeed, the whole passage with which these lines open is worth extracting:—

"He had seen the moon's eclipse
Through the fire from Etna's lips,
With Orion had he spoken,
His fast with honey-dew had broken,
Seen the nether world unveiled,
Nor had fainted nor had quailed;
And here he stands amidst the throng,
On his tongue a wise sweet song.
In his hand a laurel fair,
An opal rainbow round his hair,
Truth reigning from his great mild eye,
And in his heart humility."

One small thing (and yet nothing of the kind is really small) we have against Mr. Scott, and to introduce it we may quote his "Dedicatio Postica" to the three poets whose names will go down to posterity as the poets of this generation:—

"Not many years ago in life's midday
I laid the pen aside and rested still
Like one barefooted on a shingly hill.
Three poets then came past, each young as May,
Year after year, upon their upward way,
And each one reached his hand out as he passed,
And over me his friendship's mantle cast,
And went on singing every one his lay.
Which was the earliest? methinks 'twas he
Who from the Southern laurels fresh leaves brought,
Then he who from the North learned Scaldic power,
And last the youngest, with the rainbow wrought
About his head; a symbol and a dower—
But I can't choose between these brethren three."

Everyone will allow that this is a very beautiful and graceful tribute; but every one must see that its beauty is sadly marred by the ugly word "can't" in the last line. These purely colloquial contractions are in most cases fatal to poetry, and Mr. Scott uses them rather too often for our comfort.

We have not yet spoken of the designs with which the book is embellished. They are, it is hardly necessary to say, very different from the smooth inanities which usually do duty as book illustrations, and which bear "made to order" in legible characters on their faces. We must confess, however, that Mr. Alma Tadema's contributions are, with the exception of "Eric and the Water-Witch," somewhat disappointing. In the first, "Janet," the counterpane is pleasing, but we defy the acutest interpreter to identify the face on the pillow as a woman's. In the last, the "Sphinx," the smug contentment of the countenance could not be more unsphinxlike. Many of Mr. Scott's own illustrations are very satisfactory. "Recreating Genii" we like particularly, as also "A Study from Nature," and the two etchings which illustrate the series of sonnets called "The Old Scotch House." Not only these, but most of the others, are correctly described by Mr. Scott as "rather pictorial analogues to the sentiment and meaning of the poems than direct representations." And, undoubtedly, this is exactly what illustrations to poems should be.

Altogether the book is satisfactory both as a production and a possession. It is a worthy effort to help on the golden age when for every moment of a man's life there shall be a song to read, a picture to see, a movement of music to hear and to enjoy. To the furniture of not a few such moments Mr. Scott's volume will contribute.

GEORGE SAINTSBURY.

On the Class of Rude Stone Monuments which are commonly called in England Cromlechs, and in France Dolmens. By W. C. Lukis, M.A., F.S.A. (Ripon: Printed for the Author by Johnson & Co. London: Simpkin, Marshall & Co., 1875.)

A FEW years ago died in Guernsey an old man who retained his faculties in a wonderful degree to the last, whose extent of information was surprising, but not greater than his energy in collecting information on all antiquarian and scientific subjects, or his accuracy of observation, or his willingness to impart his knowledge to others.

He had formed a valuable and extensive collection of antiquities, of plans and drawings of ancient remains in Great Britain, the Channel Islands, and France. His sons inherited his tastes, and were from boyhood taught to observe accurately, to delineate faithfully, and to conclude logically. One of these sons is the author of the pamphlet named above. Notwithstanding professional labours he has contributed various papers to antiquarian societies, and no one could be more fit to examine the prehistoric remains which, spread over the world, abound most in the north-west of France.

Having the intention of writing an account of the French monuments, Mr. Lukis has thought fit first to dispel certain "notions" relating to one class of them, which he deems erroneous.

"It is my object to give, in as concise a form as the importance of my subject will permit, the result of my enquiries into the nature and origin of those rude stone monuments, commonly called cromlechs or dolmens, which are now existent, or of which we have trustworthy record."

Clearly the first thing to be done in such a study is to make, or obtain, accurate plans of the various structures; and, in the case of the dolmens, to obtain the most accurate account possible of their contents.

"The investigator must have long acquaintance with the monuments, sufficient dexterity in drawing and surveying to make accurate plans, sections, and elevations, be a close and unbiassed observer, and then have leisure to devote his intelligence to the scrutiny."

Those of our readers who have taken the trouble to examine printed plans and delineations, and to compare them with the monuments themselves, are aware how seldom the plans and delineations can be relied on. Mr. Lukis has not only collected all the available information on the subject, but has gone through much manual labour in excavating and examining minutely the contents of many dolmens. He has with assistance planned numbers of lines and dolmens and cromlechs, and has examined the moveable remains contained in the various museums which he has been able to visit.

There will remain to the end of time men who cannot be made to understand that two sides of a triangle are greater than the third, and to those persons we cannot recommend Mr. Lukis or his pamphlet. They would not be persuaded in opposition to their erroneous notions. Mr. Fergusson, in publishing his well-known work on *Rude Stone Monuments in all Countries*, attempted that which no one had attempted before,

and he was aware that such a first attempt was sure to contain many errors. He was compelled to take a great part, probably the greater part, of his evidence second-hand, and was unable in most instances to obtain plans of accuracy enough to warrant his trusting to them. Why, then, did he erect a superstructure of his own on such foundation, and detract from the value of his work by drawing conclusions from evidence which turns out to be unsound? Mr. Lukis quotes Mr. Fergusson's work, not because Mr. Fergusson alone holds erroneous views, but because the errors complained of are collected in that work and are therein available to the student.

"I venture to say that in the foregoing articles, none of my criticisms of the examples of the three ideal classes have been strained. The greater number I have personally examined and planned, and I am therefore able to speak of them with confidence."

No one who takes an interest in the subject of early sepulture must neglect to give patient attention to Mr. Lukis's pamphlet.

H. DRYDEN.

Rough Notes of Journeys made in the Years 1868, '69, '70, '71, '72, and '73; in Syria, down the Tigris, Kashmir, Ceylon, Japan, Mongolia, Siberia, the United States, the Sandwich Islands, and Australia. In One Volume. (London: Trübner & Co., 1875.)

A PERSISTENT diary, interspersed with intelligent remarks, not so much profound or speculative as prosaic and utilitarian, necessarily egotistical—here and there, perhaps, unpleasantly so—prolonged through more than six hundred octavo pages of small close print—such is a brief description of the volume we have to consider. The anonymous author is an unmistakable traveller. Less than five years is found a sufficient period for him to accomplish three journeys, each of which has in its favour the charm of interest, the warrant of distance, and the pungency of adventure. In the first of these he starts from London, and crossing Mont Cenis, embarks at Brindisi for Alexandria, whence, after a pleasant *détour* to Jaffa and Jerusalem, he steams through the Suez Canal down the Red Sea to Bombay. Traversing India, *viâ* Delhi, Cawnpore, and Lucknow, to Calcutta, he embarks for Rangoon, Maulmain, and the Straits of Malacca; re-embarking at Singapore, to visit Hong Kong, Saigon, Canton, Shanghai, Japan, and Tientsin—from which latter place he hires a cart for Peking. From Peking the journey is made to St. Petersburg by Kiachta. The second tour commences at Halifax, whence the reader is led, through the Mammoth Caves of Kentucky, Chicago, and the Salt Lake City, to San Francisco. From this point he is taken, *viâ* the Sandwich Islands, New Zealand, Australia, and Tasmania, to Ceylon, completing the long ocean circuit in the Gulf of Suez. Revisiting Jerusalem, the author returns to England by Alexandria and Marseilles. Palestine is reintroduced at the opening of the third book. Hence the panorama is made to represent successively Aleppo, Diarbekir, Mosul, Baghdad, Babylon and Karachi.

Scenes from Sind and the Panjáb follow; more also from India generally, from China, Japan, Ceylon, and Australia. Finally, we have again Alexandria and Port Said, with a homeward route "by Brindisi, Venice, and Vienna."

This is *bonâ fide* travelling, though for the most part in regions often before described, or over an ocean indescribable in detail. Not the least interesting of the land journeys recorded is that from Pekin to Kiachta and Tobolsk—thrown into the shade, it is true, in comparison with the more remarkable routes of Mr. Ney Elias; and less extraordinary than the elaborated explorations of Colonel Prijevalsky. But the first is a gold medalist of the Royal Geographical Society, and the second has yet to be rendered intelligible in an English dress. Our present traveller proceeded by a tolerably direct road to Urga, through Kalgan, past the finger or 1,000 *le* milestone, near the Salt Lake Iren, and across the desert plain of Hagan Tugarick. From Urga to Kiachta he makes the distance 176 miles. At Troitsarsk, the telegraph station of Kiachta, we are told that the electric wire holds communication with St. Petersburg, a distance of 6,200 versts, or about 4,150 miles. The mode of discovering a Lama king, when required, is thus related in the diary kept at Kiachta:—

"The Kutuchtu, or Lama King of the Mongols, who, when he is in the flesh, resides at the Lamasary at Urga, died some time this year. He was a young man, not much over twenty, and was said he had been poisoned. Soon after his death a deputation of Lamas visited Pekin, to inform from the Emperor in what direction they are to proceed in order to find the living being to whose body had passed the immortal part of our deceased Kutuchtu. The Emperor instructed him that they must proceed to Thibet, the home of the head of the Buddhists, the Dalai-Lama, and there they would find the child into whose body the soul of the Kutuchtu had found its way. The journey to Thibet is a long one, and not without difficulties, if not with some dangers, and this has induced the authorities at the Lamasaries at Urga to consult Mr. Grant as to the best mode of proceeding, and as to the probable cost of the journey; and they would fain have Mr. Grant with them, at any rate up to the borders of Thibet. As we passed through Urga, two Lamas from the Lamasary came to consult Mr. Grant on the subject. It is proposed that a party of some ten or eight lamas shall proceed at once to Thibet, learn the whereabouts of the young child, the incarnation of their Kutuchtu, and prepare the way for the advance of some 500 lamas—number thought adequate to accompany the Kutuchtu from Thibet to his future home at Urga. I don't know how they manage at Urga during the interregnum between the departure and return of their Kutuchtu; but I do not hear that anything has taken place to interfere with or disturb the good order and quiet of that Buddhist establishment" (pp. 120-21).

Omsk, the capital of Western Siberia, a city of 20,000 inhabitants and 4,000 public-houses, is famous for its bees, of which 10,000 hives are sometimes kept on one farm, producing some 60,000 lb. of honey one season" (p. 139). The boundary dividing Europe from Asia is situated within a stone's throw of the road" over the Ural mountains, 1,600 feet from the level, between the postal stations of Yekaterinburg and Behmbrukia (pp. 158-59).

Very correct is the picture of the Russians of the Kama and Volga:—

"They seem never to thin their hair; it is cut or clipped round, and looks as if the operator had placed a bowl on the victim's head to guide him in his work. If a man's waistcoat is buttoned over his shirt, the tail of his shirt is always left sticking outside his trousers, and perhaps over all. Though the thermometer may be at 80°, he wears a great-coat. Boots he almost always wears. Out of a hundred or more passengers now on board, there is only one of either sex whose legs are not encased in a pair of jack-boots, and that fellow can afford nothing better than a pair of bark shoes" (p. 102).

It might have been added that the shirt is commonly of a rose or brick colour, and that the hat, like an inverted flower-pot, is a fit accompaniment to the rest of the attire.

The author is hard upon Persia (p. 374), and we will not dispute his estimate of its poor condition, though his knowledge of the country is limited to the seaports of Bushahr, Lingah, and Bandar Abbas. But when he says: "Were it not that we think it politic to bolster it up against what we seem to consider our natural Eastern enemy, but which many people consider merely in the light of a bugbear—Russia—it would not be long in crumbling to pieces;" we think his criticism at fault. It is, perhaps, not so much to the fact of "bolstering up," as to the mode of applying the bolsters, that exception should be taken.

In alluding to the startling query (p. 34) whether conversion to Christianity should be carried on in a land where the greater liberty allowed to converts necessarily increases their household expenditure, we do so merely to remark that any satire therein contemplated fails in its object by the association of Musalmán and Hindú to illustrate the argument. The former, it need scarcely be said, is already one of a "flesh-eating people," and enjoys his butcher's meat under the laws of Islam.

There is an occasional tone of censoriousness in the book which can hardly add to its popularity. Folly as it flies is fair game to the traveller as to the indoor philosopher; but the sport should be carried on under certain restrictions. The conduct of "young Indian officers" and "youngsters in European regiments" is, doubtless, often amenable to censure; but when, reading of the individuals taken to task for serious offences in the later chapters of this volume (p. 474), we recall the type so rudely handled for mere boyish prattle at the very outset (p. 18), we must be pardoned for withholding judgment on the data given. Nor do we subscribe to the conclusions drawn by the author (p. 476), that the heroism of the past is not sure of repetition in future emergencies. Whatever injury may have been done to the native army of India by stripping its regiments of that corporate character which, when turned to good account, was a warrant of distinction, the spirit which animated its bygone heroes has no more become extinct than has the objectionable treatment of natives become the practice of every subaltern of the present day. We maintain that the Indian officer—if the term can be applied, under existing circumstances, to the military man launched

in an Indian career—is true as ever to his calling; and, however sensible to slights, real or imaginary, will not fail to prove his professional worth, if occasion offer. At the same time we are quite ready to recognise much common sense and truth in the opinions expressed on the relative positions of European and native in India in other passages of the diary (pp. 394-5); and to admit the necessity of reform.

Revision of the text might have been beneficially exercised, to avoid reiterations of facts and sentiments; at times, repetitions of the language in which these are expressed. Thus, at page 193, in an interesting account of the forest of Calaveras, the writer states: "One hardly realises the full size of these big trees while they are standing; it is only when stretched upon the ground that we become impressed by their monstrous dimensions." A page and a half further on he says: "It is not until a tree is down, stretched on the ground, that you become sensible of its dimensions." Again, at page 337, we are informed, in a description of Diarbekir: "the population of this place is variously stated as being between 25,000 and 50,000 souls;" and two pages further, "this Diarbekir should be a place of some consequence, seeing it contains from 25,000 to 50,000 souls." The accurate spelling of native proper names is yet a *vezata quaestio*, and advantage is here taken of the controversy: but this does not authorise the change of "Bishop Milman" into "Bishop Milner," as effected in page 26.

F. J. GOLDSMID.

Social Life at the English Universities in the Eighteenth Century. Compiled by Christopher Wordsworth, M.A. (Cambridge: Deighton, Bell & Co. London: George Bell & Sons, 1874.)

MR. WORDSWORTH deserves the thanks of both Universities for this valuable and amusing, carefully edited and beautifully printed book. A volume of upwards of 700 pages, designed to illustrate simply the social aspects of English academic life, and that too as this life presents itself during a comparatively limited period, would, perhaps, at first sight suggest that a process of condensation or selection might have been advantageously employed; but an examination of the contents will show that these pages very rarely offer us anything which has not a definite value in relation to the subject. We have here a little museum, as it were, of curiosities and relics, showing us what were the habits and customs of Oxford and Cambridge at a time when, notwithstanding the tenacity with which academic traditions have held their own, the points of contrast to the present day are perhaps quite as numerous as those which present themselves on a comparison of the aspects of ordinary life at the same period. "A singular condition," says Mr. Carlyle, in his *Life of Sterling*, "of schools which have come down, in their strange old clothes and 'courses of study,' from the monkish ages into this highly unmonkish one—tragical condition, at which the intelligent observer makes deep pause." By Mr. Wordsworth's assistance every reader

will be enabled to exchange any such feeling of innocent astonishment for one of more satisfactory comprehension. An excellent Table of Contents and Index make the volume easy of reference, notwithstanding its multifarious character; and it is precisely the kind of book which every student on the banks of the Isis or the Cam who wishes to enter into the significance of the features peculiar to such an experience, will gladly place on his shelf side by side with the University Calendar. He will here find an explanation of the process by which a three-legged stool came to transmit its name to the final honour examinations at Cambridge. He will be enlightened as to the academic origin of phrases like "Hobson's Choice" and "Neck or Nothing." Or he may trace and compare, step by step, the career of an eighteenth-century undergraduate with his own; and chuckle over an age when the coach from London to Oxford lumbered in after a two days' journey; when "hall" was at twelve o'clock, and attendance there in white stockings and low shoes was *de rigueur*; when battledore and shuttlecock, leap-frog, skittles, and bell-ringing were recognised amusements, and men, if they rowed at all, did so in enormous "tubs" and in square caps; when the college barber went round to call the men for chapel and shave them—the lazy ones as they lay in bed; when private tutors examined their own pupils for University honours, and were, notoriously, not oblivious of their ancient intimacy; when the university sub-librarian received only 10*l.* per annum, and was consequently found by visitors, as Uffenbach found Hearn, "very eager for his fee;" and when the *Terrae Filius* at Oxford and the "Tripos" at Cambridge publicly satirised the authorities in compositions the scurrility of which seems but very imperfectly redeemed by their wit.

But while the volume abounds with anecdote, *facetiæ*, and details of obsolete and amusing customs, it also contains much that serves to illustrate the less superficial characteristics of the century. In the first eighty pages Mr. Wordsworth points out to what an extent party politics then prevailed, and with what effects. To professors who think it within the province of the academic chair to discuss contemporary politics, and to politicians who see no sufficient reason for withholding the borough franchise from undergraduates, we may commend the symptoms of a period when regulations concerning gowns and the closing of taverns produced a lively ferment, solely, it would seem, because they had been recommended by a Whig chancellor and enforced by a Whig proctor. In his next volume, for which Mr. Wordsworth encourages us to look, we shall be better able to understand the causes that led to the low state of the intellectual life at this time, and of those studies which constitute the real *raison d'être* of such communities. He gives us here, however (pp. 83–87), a glimpse into the condition of affairs with respect to the professorial body. In the eighteenth century it was not often that the professors descended to lecture at all; though Dr. Parr, in his famous Spital sermon, seems to have held that he had sufficiently vindicated their

reputation—so far at least as Cambridge was concerned—when he pointed out that there were really not many instances in which they had "disgraced" their chairs "by notorious incapacity or criminal negligence."

Simultaneously with the growth of political feeling and the decay of learning, Mr. Wordsworth notes the first appearance of that peculiar product of university life known as "donnishness." The later age at which students then began to be admitted and "the violence and suspicion" resulting from party struggles, were, he considers, in some measure, the cause of this phenomenon; but there can be little doubt that it was mainly the outcome of a selfish disregard for the true uses of college foundations. The founders of our colleges designed, with scarcely an exception, that these societies should support only those who were either really learners or really teachers. The original seven years training in the subjects of the *Trivium* and *Quadrivium*, followed by another seven years of theological studies, during which the Fellow would probably be called upon successively to act as "cursory reader," "regent," or "ordinary reader," in the Schools, represented one continuous course of study in nearly every recognised branch of learning, combined at regular intervals with the office of instructing others. A youthful bachelor on the foundation of Merton or Peterhouse in the fifteenth century, who, after the requisite training in grammar, logic, and rhetoric, and keeping his "acts" with credit, had thought fit to declare his intention of reposing on his laurels, and leading thenceforth a purely contemplative existence, would have been very summarily reminded by the authorities that colleges were not meant for monks. But as, by degrees, the subjects both of the *Trivium* and *Quadrivium* were compressed within a three years' course, while the titles of B.D. and D.D. came to represent little more than a certain academic standing, the resident Fellow, unless engaged in teaching, found himself under no obligation or stimulus to study. Even his duties as a teacher were often almost wholly neglected, although the restrictions imposed in many colleges, with regard to the number of pupils whom each Fellow was permitted to take, for a long time led to the majority of the Fellows in residence having at least nominal duties to perform—duties, it is to be observed, partly representing those which the university professors had contrived to shirk. Then came a time when men of teaching power and sympathetic minds—like Whichcote and Tuckney at Emmanuel in the seventeenth century, and Richard Laughton, of Clare Hall, in the eighteenth (Mr. Wordsworth's research supplies us with no equally eminent examples at Oxford)—drew around them large numbers of pupils, and, the former restrictions being removed, less popular tutors found their occupations gone; then gradually the function of "tutor" lapsed into one or two hands at each college, while the office became entirely dissociated from that of the "coach" or instructor. Systematic intercourse between the majority of the Fellows and the undergraduate body was thus reduced to a minimum; and whenever the former were willing to find companions

among the latter, they too often preferred the wealthier and idler members. This was found prejudicial to discipline and was consequently discouraged; and then "donnishness" became conspicuous. A formal etiquette, none the less scrupulously observed because it was a *lex non scripta*, divided the learners from those whom the founder had intended to be their teachers. It was thus that, when the offices of dean, tutors, and bursar had been assigned, the remaining Fellows found themselves entirely without occupation. It was open to them to accept a mastership in some grammar school in the country, but such a position was scarcely regarded with more favour in the last century than in the time of Erasmus. In default, therefore, of influence and connexion, there was little to be done but to take occasional clerical duty and wait patiently for a college living. And hence at every college there was a larger or smaller number of Fellows of whose life a Oxford professor has left us both the sombre and the brighter picture in his well-known "Progress of Discontent."

The qualifications which Mr. Wordsworth has brought to his task are of so high an order that we cannot but hope they may some day be bestowed on the investigation of the more difficult questions that beset the enquirer at the earlier periods of university history. Occasionally he traces his subject to these times; as, for instance, where he quotes the opinion of Anthony Wood that the dress of the scholars was supposed to have been in imitation of that of the Benedictines. We should be glad if Mr. Planché, in his *Cyclopaedia of Costume*, could throw any light on the question. The notable decree of the Council at Aachen, in the year 817, which drew for the first time, a broad line between the secular scholars and the *oblats* and monks, would seem rather to render it probable that an attempt would be made to distinguish the first from the latter by some difference of dress. But however this may have been, it seems most probable that the fashion of the English academic garment, like so many of our early university statutes, and even the rules of our university libraries, was borrowed from Paris. And if we adopt Anthony Wood's theory, it is worthy of note how much more closely the gown, whether of Oxford or Cambridge, resembles that of a Benedictine of St. Denis, as represented in Helyot, than that of an English Benedictine as given in Dugdale's *Monasticon*.

We shall look with much interest for the result of Mr. Wordsworth's research in connexion with the Individual Studies of Religious Life of our universities (on which he is still engaged) during the same period as that whose lighter characteristics he has so successfully investigated.

J. BASS MULLINGER.

The Annals of a Fortress. By Viollet le Duc. Translated by Benjamin Bucknall. (London: Sampson Low & Co., 1875.)

It is now a good many years since *The Military Architecture of the Middle Ages* was given to the English public. Its author, Viollet le Duc, was previously known as

distinguished architect; that book stamped him as an eminent antiquary. We well remember the pleasure we had in learning from its pages that the hero of our childhood, Richard Cœur de Lion, was more than a good man-at-arms, or a minstrel singer. We there learned that

"the Chateau Gaillard des Andelys reveals one portion of the talents of Richard. There is too general a disposition to believe that this illustrious Prince was nothing more than a fighter, brave to rashness; but it is not merely by possessing the qualities of a good soldier, however fearless or intrepid, that a monarch acquires so large a place in history. To the men of his time Richard was a hero whose valour shone conspicuous in a valiant age; but he was also an able captain, an engineer full of resources, experienced; a master of the practice of his art, capable of things in advance of his age, and who never allowed himself to be the slave of routine."

Curiously enough, in the pages of this book is to be found the drawing of a loophole in use in the fourteenth century, which a fortunate individual was rewarded for inventing in the nineteenth. Since the book we allude to was written, France has passed through strange vicissitudes, unsurpassed even in her eventful history. Viollet le Duc has been an active worker in recent stormy events.

The man who described the fortifications of Paris as made by Philippe Augustus, Charles V., and Louis XIII., and subsequently shared largely in the defence of M. Thiers' bastioned enceinte and detached forts—the able architect and the accomplished antiquary, called from his studies to command the "Légion auxiliaire du Génie" at the siege of Paris, has, since the peace, not been idle. The best account of the great siege we have is from his pen, and we trace many of its lessons in his present work, the *Annals of a Fortress*. Viollet le Duc traces the history of a stronghold from the first time it was used as a safe retreat for savage tribes, through the various phases of a Druidic fortress, a Gallic town, a Roman fortification, a Frankish city, and a feudal castle, until its defences were modified to resist artillery, were improved by Errard, and finally completed by Vanban. In each case a siege of the fortress, with all its incidents, is given, minute not only in the military details, but conveying an interesting picture of the manners and customs of the inhabitants at each period of history selected for illustration.

The way in which the first growth of a warrior class is described—

"a class who came to regard the privileges accorded to their ancestors as a birthright; while the tillers of the soil, and the shepherds, and craftsmen of the vale became accustomed to submission, and finally adopted the conviction that they had come into the world to serve and support the men who inhabited the oppidum,"

—is very felicitous.

The characters of Lady Eleanor, Colonel Dubois, and Captain Allaud, the one-armed Engineer officer, are admirably given. But it is not as a piece of word-painting that the book is valuable; its object is far higher. It seeks to discover the true principles of fortification at the present day, by going back to its origin, and following its gradual development over a lengthened period, to

determine the causes that have produced alterations, and whither the action of those causes is now leading us.

As arms were improved so the men-at-arms thickened their armour. When fire-arms were first employed, the armour got so heavy that men could not carry it. Precisely so as regards naval warfare: guns are made that pierce wooden vessels, iron-clads are introduced, but each year sees the old iron-clad obsolete, the new gun all powerful. As the men-at-arms learned that rapidity of motion, not armour, enabled them to avoid bullets, so it is beginning to be now understood that rapidity of movement and facility in manoeuvring at sea tend more to victory than an increased thickness of iron. Fortification is no exception to this rule.

"It will be objected that a vessel or a horseman can move about, but that a fortress is immovable, and that consequently passive force cannot here be replaced by active force or agility. This is a mistake. Though a fortress cannot be moved, the defensive system of a district can and ought to be studied, in view of various contingencies. In future warfare the plan of temporary fortification ought to play a principal part, and may be made to do so. In other terms, an army ought to be able to fortify itself everywhere, and take advantage of every position. Still, the most reliable fortress for a country is a good and well-commanded army, and a brave, well-educated and intelligent population, resolved to make every sacrifice rather than undergo the humiliation of a foreign occupation."

That the branch of war least understood, and least applied, is field fortification, few practical soldiers will deny; and there are few who have studied the subject but will confess that the judicious application of fortification to tactics appears to offer the widest field for improvement in the art of war. The following words are pregnant with truth:—

"War is, therefore, a game which tends to become more and more costly, and especially siege warfare: are we then to conclude that nations will become disgusted with warfare on account of the frightful expense it involves? This is not probable. At the present day, as in times past, that which costs most is defeat. Parsimony in military preparation in times of serious change such as ours is ruinous."

The translation is fair, but hardly does justice to the original, which is remarkable for accuracy of detail and clearness.

A translator has always a difficult task. He must understand his author in one language, and be able to express his meaning in another. This is especially requisite if the book be technical. It is to be regretted that more attention was not paid to the rendering of French military terms into their English equivalents. The following are a few examples of faults of this class. The same work is indifferently styled an "outpost," an "outwork," and an "advanced work:" these words mean different things. "breach battery" and "trench shelter" are literal translations, but the English terms are "breaching battery" and "shelter trench." "Garde du Génie" is not "a guard of the Engineers;" it means an engineer foreman of works. These and other similar inaccuracies, without vitiating the sense, are blemishes which spoil a well got-up book. The illustrations are in their

way perfect. They are the work, not only of a mathematical draughtsman, but of a skilful artist.

Taking it altogether, the *Annals of a Fortress* is interesting and instructive to the general reader; and it contains many important truths which the military engineer should ponder over deeply.

ROBERT HOME.

The Vikings of the Baltic. A Tale of the North in the Tenth Century. By G. W. Dasent, D.C.L. (London: Chapman & Hall, 1875.)

SEEING that the Jomsvikings have scarcely been mentioned in English books before now except in an entirely cursory manner, it is not a little curious that two distinguished English writers should unanimously publish works in which they play a very prominent part indeed. It is amusing to contrast Mr. Carlyle's estimate of their character, as found in the earlier part of his new book on the Kings of Norway, with Dr. Dasent's in the half-history, half-romance that lies before us. The latter, troubled by no awkward antitheses of Cosmos and Chaos, dilates on the deeds of these "bold spirits and dashing blades of the time" with genuine gusto, while the elder historian finds nothing better to call them than "a Sea Robbery Association (Limited)," and rails at them for their contempt of the divine right of kings. Mr. Carlyle is very brilliant, but Dr. Dasent is very learned, and those who wish to gain a really accurate notion of how men lived in Scandinavia nine hundred years ago, will do well to study the *Vikings of the Baltic*, where their souls will be neither stimulated nor irritated by hero-worshipping invectives against modern liberalism.

The scene is laid at Jomsborg, the curious stronghold of celibate warriors, monastic republic, or city of masculine isolation, that existed for a short time on the south shore of the Baltic. It seems to have been at the mouth of the Oder, on one of the islands that form the delta of that river, and on the same side as the present town of Wollin. As early as the battle of Bravalla we hear of it; there was a certain Toke from Jom there on Harald Hildetand's side. The Danes built a castle on the spot in the reign of Harald Blaatand. The first great chief of Jomsborg that we hear of was Styrbjörn, who made deliberate war upon Denmark, and fell in the great battle of Fyrisvellir, about 983, some dozen years or more before Dr. Dasent's story begins. After Styrbjörn, there reigned at Jomsborg Palnatoke, the hero of Oehlenschläger's famous tragedy, the one only play without female characters, probably, ever successfully brought out on any stage. Under Palnatoke Jomsborg began a new lease of existence; he entered into a sort of treaty with Boleslaw, or Burislaw, King of the Wends, and set about making a great nursery for heroes (*Plante-skole*, as Petersen says) at the castle. He enlarged the harbour so that it could contain 300 long ships, all shut in at one time by the sea-gates. How he managed to do it is puzzling enough, nowadays. The Prussian govern-

ment would find it difficult to do the same at any point in Usedom or Wollin, especially if, as some think, the castle was on the north or outer side of the island. Doubtless the most astonishing changes in the topography of the Pomeranian coast have been effected since the tenth century. At any rate the castle must have been a stupendous triumph of engineering and naval architecture for the age in which it was built, and a stronghold, when completed, that might well consider itself impregnable. When the structure was finished, Palnatoke gathered his Vikings together and proclaimed a stringent code of laws, under which thenceforward he ruled the commonwealth. No one was allowed to join the company who was under the age of eighteen, no one who was over the age of thirty, no one who had budged before a man as well armed as himself. The bond of foster-brotherhood, entailing revenge in case of murder, which existed all through Scandinavia, was enlarged to include the whole band. No one must be more than three days absent from the castle without Palnatoke's permission. All booty was to be divided equally, no individual was to form any connexions with foreign bodies without consultation with the rest. Finally, no woman was ever to pass under the low arch at the gate of the town. Very soon these warrior-monks became the most dreaded Vikings in the whole of the North of Europe. Their raids were extended to England on the one hand, to Russia, and even to Constantinople, on the other.

When Dr. Dasent's story begins, Palnatoke was dead, and Sigvald, the son of Strudharald, was Captain of Jomsborg as his successor. The rule of the young Sigvald in the place of the old hero, whose best days were over before he sought a kind of cyrie for himself in Jomsborg, was soon marked by a relaxation in the laws of the town. Men began to stay away longer than the regulated three days and three nights, quarrels broke out among the warriors, and certain men even found their bane at their fellows' hands inside the castle walls. Worst of all, women began to be seen in the huts that had hitherto preserved such a monastic seclusion. Dr. Dasent, however, for poetic purposes, chooses to consider that the real reason why the rigour of the law relaxed in this point was the laudable desire of Sigvald himself to have a son and heir. "Dear, you know you had a father, let your son say so," we imagine Thorkel the Tall saying to his wise brother Sigvald, and Dr. Dasent has a stirring scene, in which he makes the Captain propose to erase the misogynic law in his own favour, that he may go a wooing to the Court of King Burislav, ready to marry the wisest and loveliest of his three daughters. In process of time Sigvald goes to the King of the Wends, and falls in love with his daughter Astrid. The stipulation is made that he shall have her to wife if he can manage to bring Svend Treskjaeg or Fork-beard, King of Denmark, to the Court of Burislav, as a prisoner. This seems impossible, but Sigvald undertakes it. He goes back to Jomsborg, fits out three ships, and sails away to Denmark. He found Svend at Grönsund, feasting near the shore. Arrived at the place, Sigvald got into bed

on board the outermost ship, and sent a message to King Svend that he was dying and had a last word to say to him. Up from table rises the unsuspecting Fork-beard, crosses two ships, goes down into the third. Poor dying Sigvald's voice is so weak that he must bend his ear low down to hear him whisper. Suddenly two such brawny arms are round his throat as death-beds rarely contain, and while he gurgles, half-throttled and too much startled to cry out, the rowers bend to their oars, and King Svend is a prisoner. How he was taken with great pomp to Jomsborg, and thence to the Court of King Burislav, how he regained his liberty and a Wendish wife, and how Burislav and Sigvald between them treated him as Laban treated Jacob, for all this we must refer the reader to Dr. Dasent's stirring pages.

The picturesque story of Svend's capture rests on the authority of the *Jömsvikingsaga*. Other accounts make it Palnatoke who takes him prisoner, not Sigvald. Indeed, according to Adam of Bremen, Svend was twice captured and brought to Jomsborg. Credulous old Saxo, in his confused way, expands it to three times. The Icelandic account, which our author has followed, seems after all the most rational. One hardly believes it possible that the shrewd Svend should have allowed himself more than once to fall into the trap of the unscrupulous Jömsvikings. It will also be remembered that Svend was a heathen and one of the last Danish kings unbaptised, and that, therefore, the monkish chroniclers are not above the suspicion of having been glad to make a fool of so resolute a pagan. The Jömsvikings themselves were strongly opposed to Christianity, their founder, Palnatoke, having been a most determined stickler for the old rites. In Sigvald's days, as Dr. Dasent says, the Vikings did not trouble themselves, in all probability, with religion at all, and were as indifferent to Odin as to the mysterious White God, whose peaceful worship was to render such a course of life as theirs impossible.

While speaking on this subject we may perhaps draw the author's attention to an anachronism which he has allowed himself to fall into, which does not indeed militate at all against the general interest of his story, but which is surprising in a writer so careful as Dr. Dasent. Towards the end of the first volume, in a beautiful passage describing the burial of the slain Vikings, he makes Beorn and Vagn wander through a wood, where they find a boy, Grim, who promised to show them the temple, which they wish to plunder. He brings them out into a clearing, where a little wooden church, containing nothing of any value, stands, and out of it comes a train of white-robed priests headed by Anschar. It is a very pretty idea to bring the Apostle of the North into the saga in this way, but unfortunately history is inexorable in refusing to admit it as a possibility. Nothing can well be more certain than that Anschar died at Bremen on February 3, 865, at least 130 years before the date of this story. If Beorn and Vagu came across any reverend prelate, it must have been Libentius, a prudent and good man, but with none of the vigour and genius

of Anschar. The period of the supremacy of Jomsborg was one of great depression for the Church. During the reign of Sven Christianity was persecuted almost to extinction. No archbishop ventured into the Danish dominions; the number of martyrs in Denmark and Viinland was countless, according to Adam of Bremen; and the flourishing bishopric of Aarhus, in Jutland, ceased to exist. Before Svend's death a reaction came, but during the period of Dr. Dasent's story the Christians were being persecuted on all sides, the Jömsvikings alone perhaps showing them the toleration of indifference.

We have not space to follow out the story in detail. It proceeds to tell how Sigvald became earl at his father's death; how Svend, hating him, sent for him to drink the funeral ale; how, hoping the expedition would be his last, he sent him against Hakon, Earl of Norway; and how at first the Vikings fared well, destroying the chief town of Norway, Tonsberg, and meeting Hakon in battle in the Voe of Hjorring. The account of this terrible action, in which all the flower of Jomsborg fell, and in which it was said that the Valkyriur themselves fought in lightning against the Vikings, occupies nearly the whole of the third volume. It is told in the most vivid and spirited manner possible. After this signal defeat, Jomsborg ceased to be a great power in the North of Europe. Sigvald's last important deed was assisting at the death of Olaf Tryggveson. The Jomsborg company broke up entirely before Sigvald's death, most of them coming over to England, where all who did not fall in the massacre of St. Brice's day formed a body guard for the kings in London till the reign of Edward the Confessor. The church of St. Clement's Danes is understood to mark the spot where they had their camp.

For all who are interested in the manner and customs of Scandinavia in early times *The Vikings in the Baltic* will be invaluable. The story itself is rather too bloody for any but those who can say, with Einar the Skald,

"Red wounds are lovelier than the rose,
Or rosy lips, to me ;"

but everyone must be fascinated by the minute and yet not pedantic descriptions of the curious ceremonies and traditions of the last of the heathen Norsemen.

EDMUND W. GOSSE.

ANCIENT ATHENS.

Die Stadt Athen im Alterthum. Von Carl Wachsmuth. Vol. I. (Leipzig: Teubner 1874.)

THIS is, so far as I know, the first large work from the present Professor of Ancient History in Göttingen. His brilliant lectures and conversation, as well as his acute monograph in the *Rhein. Museum*, have already impressed scholars with the hope of a rich harvest from his labours, and the present instalment so far justifies their expectations. But the very cautious and sceptical tone of his mind makes the negative results of his book more important than the positive. Thus his book is naturally dry and hard to read, so that none but thorough scholars will be interested

in such unflinching criticism; and this has told upon his style, which labours under the usual defects of German prose, and is often obscure through its unwieldy constructions.

The immense number of footnotes are also somewhat bewildering to the reader, but they give full information as to all the author's sources, and show the wonderful mastery he has attained over the enormous literature of his subject. Here we constantly feel the want of a full index, which, indeed, he has promised at the close of his second volume.

But I will not for one moment deny that the matter of the book compensates for these defects. It is the last and best book on the topography of Athens, and, not confining itself to topography, throws much new light especially on the oldest and latest history of the city. Many a good English scholar, who has not paid attention to this side of Greek philology, will find here facts which he ought to have known, but which may nevertheless be new to him, and solve many of his difficulties.

Thus he will find (p. 170) that there were at Athens two *orchestras*, one that of the theatre on the south side of the Acropolis, the other a platform rising above the *ἀγορά* on the west side.

Again, there were two places called *Kolonos* (p. 177), one the suburban *Kolonos*, the deme celebrated by Sophocles, without the city; and the other the *Kolonos agoraios*, close beside the market-place, and in the deme of Melite. For the demes reached up to the Acropolis, and thus, as the city spread, these demes, especially *Collytus*, *Melite* and *Kerameikos*, were partly within the city. The last name is a third instance of a term used ambiguously, for owing to the chief market-place being within the deme, the expression "to go to *Kerameikos*" may either mean to go to the *ἐλλιστον προαστειον*, as Thucydides calls it, the street of tombs west of the city; or else simply to go to the market or place of assembly.

Such points as the following are to be found scattered all through the book.

Gassendi's famous conjecture on Cic. *ad Att.* v. 19, 3, *quae de parietinis in Melita* (for the *militia* of the MSS.) *laboravi*, is not merely confirmed, but proved to apply to the house of Epicurus, which was separated from his celebrated gardens or park, laid out within the city, but near the *Dipylon* in *Kerameikos* (pp. 265, 618, 685).

The *Hermes πρὸς τῇ πυλίδι* of Philochorus is shown (p. 208), by acutely emending *Harpocration* (*Ἀκταίων* for *Ἀττικόν*, p. 211), to have been a statue not identical with the *Hermes ἀγοραῖος*, but situate at the little door in the wall of the *Peiraeus*, probably that through which *Leocrates*, according to *Lycurgus*, made his escape.

But, apart from isolated points, the light thrown on some periods of Attic history by the present volume is very great indeed. The whole discussion concerning the original *συνοικισμός* or settlement of Athens by various races (pp. 385, *sqq.*) is very good, and based upon the sound principle that separate groups of temples or shrines, belonging to the favourite deities of separate nations, indicate distinct though associated settlements of these separate nations. The

evidence for a Phoenician settlement in *Melite* (probably the same word as *Malta*) coming from *Salamis*, and bringing with them the famous olive-plant, is as convincing as can be expected on such a question. It is refreshing also to see the authority of the almighty *Thucydides* set aside, even on an antiquarian question. But Professor *Wachsmuth* has a much clearer political insight than *E. Curtius*. Thus he accuses *Demosthenes* of maligning the policy of *Eubulus* (p. 592), and inclines to the belief that this policy, as it was financially, so it was politically, not despicable. This is very superior to the twaddle talked by *Curtius* about the personal character of *Demosthenes* being the key to the history of the period. Indeed, all the details of the revivals of Athens (architecturally) under *Lycurgus*, from this side its second *Pericles*, and under *Hadrian* and *Atticus Herodes*, its last great benefactors, are brought together with skill and care. So are also (in the beginning of the book) the scanty notices of Athens in the fifteenth, sixteenth, and seventeenth centuries, those before 1678 being particularly valuable, owing to the sad catastrophe which resulted from the siege of the Acropolis in that year.

The modern literature is very fully discussed. With the exception of Colonel *Mure's Travels*, which are not mentioned, the author seems familiar with all the works of English travellers in Greece.

An analysis of the climate of Athens, based on the meteorological observations of the resident astronomer, is also given (pp. 93, *sqq.*), and is compared with the lavish praises of the ancients, who, I think, attributed far more influence on national character to this cause than is reasonable. Whatever effects climate may produce in some thousands of years, it seems to me that in a few centuries it has little power to change any race of men. No one will deny in the Irish people the existence of a sparkling and lively temperament. Has not this social gift withstood for ages a climate of fogs and bogs, not to mention the heavy hand of the ruling, and still heavier wit of the immigrating, Anglo-Saxon?

I prefer to notice some points in Professor *Wachsmuth's* analysis of the description of *Pausanias* (pp. 130-285). The most perplexing difficulty is his mention of the fountain *Enneakrounos* or *Kallirrhoe* totally out of its place, when he has just been describing the north-west side of the Acropolis. *Pausanias* also inaccurately says that it was the only fountain in Athens. This is inconsistent with the existence of the *Klepsydra* on the west side of the Acropolis, so much so that Mr. *Dyer*, first in the *Journal of Philology* (iii. 81), and more recently (I believe) in his book on Athens, has identified the *Enneakrounos* with the *Klepsydra*, and separated it from the *Kallirrhoe* which lies on the east side, beside the *Ilissus*. How any man able to estimate evidence, can do this in the face of *Thucydides'* remark (ii. 15), *τῇ κρηνῇ τῇ νῦν μὲν τῶν τυράννων οὕτω σκευασάντων Ἐννεακρούνη καλουμένη, τὸ δὲ πάλαι φανερών τῶν πηγῶν οὐσῶν Καλλιρρόη ὠνομασμένη*, I am at a loss to understand. The interesting question to determine is the occurrence of the descrip-

tion in this part of *Pausanias'* account. On the whole, the suggestion of *C. Müller* (cited p. 285) seems the most reasonable, that there was a page misplaced in the archetype of our MSS.; but we miss some account of the details which justify the suggestion.

If Professor *Wachsmuth* has the advantage of Mr. *Dyer* here, it is not so in another interesting debate (p. 249), as to whether the grotto of *Apollo* and of *Pan* on the north side of the Acropolis were different or identical. *Pausanias* goes on to speak of the *Paneion* just after he has described the grotto of *Apollo*, and they were therefore formerly considered identical. But the Germans now assert that a gap in the text has been overlooked, and that in this *Pausanias* must have mentioned a second cave. This view *Wachsmuth* supports (1) by the *a priori* argument that two gods could not have occupied one grotto, which I pass by as of no weight, and (2) by his positive argument, that an absolutely trustworthy authority, *Euripides*, implies in his *Ion* two grottos. But here the author's acuteness seems to have deserted him. His argument is this—*Kreusa* was ravished in *Apollo's* grotto. This he infers from *Pausanias'* explicit statement. He then quotes v. 938 of the *Ion*, which I will quote with its context (vv. 937-9):—

Κρ. ἄκουε τοινῦν, οἴσθα Κεκροπίας πέτρας;
Πα. οἶδ', ἐνθα Πανὸς ἄδνα καὶ βωμοὶ πέλας.
Κρ. ἐνταυθ' ἀγῶνα δεινὸν ἡγωνίσμεθα.

From the second of these lines he picks out the word *πέλας*, and says that it states the *Paneion* to have been near *Apollo's* grotto, and therefore not identical with it. This argument breaks down at every step. In the first place, *Euripides* has not mentioned *Apollo's* grotto, but merely the *Kekropian* rocks, and it is either near them, or near the shrine of *Pan*, that the altars are asserted to be. The passage, therefore, cannot bear out *Wachsmuth's* theory. But in connexion with another passage of the same play, it actually proves the case against him. For *Kreusa* goes on to say that she brought forth a child, and when asked where and how, answers (v. 949) *μόνη κατ' ἄντρον οὐπὲρ ἐξέτυχον γάμοις*. It is further implied (v. 958) that her child was abandoned in the same cave. Let us now turn back to an earlier chorus, which Professor *Wachsmuth* has also partially quoted, and we find (vv. 500, *sqq.*): *ὅταν αὐλίοις συρίζῃς, ὦ Παν, τοῖσι σοῖς ἐν ἄντροις, ἵνα τεκοῦσά τις παρθένος, ὦ μελέα, βρόφος Φοῖβω, πτανοῖς ἐξώριζεν θοῖαν, &c.* Nothing can be clearer. *Euripides* identifies the grottos of *Apollo* and *Pan*; or rather, as he never, I believe, speaks of the oft-mentioned grotto as *Apollo's* at all, and as the evidence for such a place is very slight indeed (cf. p. 249), I take the single grotto to have been *Pan's*, where, perhaps in connexion with this very legend, a sanctuary was erected at some later period to *Apollo*.

I will conclude with a few words about the *barathrum*, which is often alluded to in the book, but not adequately discussed (cf. pp. 164, 190, 346, 350, 439). The site of this *barathrum* is determined by *Plato* (*Rep.* 439 E) to have been near one of the roads to the *Peiraeus*. It is called by *Thucydides* *φάραγγες* (ii. 67). It is said by *Plutarch* to be in the deme *Melite*, by the *anonym.*

in Bekker's *Anecdota* to be in *Keiriadae*. These latter indications Professor Wachsmuth cites within a few pages, apparently accepting both, and not noting the discrepancy. As there is actually on the west side of the Hill of the Nymphs a ravine in the required position, with precipitous rocky sides, about 60 feet high, and as this place was still used by the Turks as a place of execution, there can be no doubt as to the locality. I think it likely that this ravine formed the boundary between the domes Melite and Keiriadae, and that hence arose the discrepancy on this point, one side (east) of the ravine being in Melite, the other (west) in Keiriadae. Wachsmuth very justly supposes that the once cited *ἐν τῇ πύλῃ* was the "accursed gate" or doorway through which the executioners and their victims passed from the prison to the barathrum. We must therefore reject, with our author, the story quoted from Photius and Suidas (p. 164) that it was filled up, and we must not interpret strictly the term *τὸ ὄρυγμα*, which Wachsmuth should have noted as of constant use for the barathrum in the orators.

But in connexion with the practice of executing *φάρμακοι* as state sin-offerings, Wachsmuth implies, in rejecting the notion that they were thrown living into the barathrum, that such was the practice with other culprits. This is indeed the usual theory. Until I am confuted by evidence, I am disposed to hold that "casting into the barathrum" was always done *after death*, and was the mere aggravation of refusing burial rites to those whose crimes seemed inadequately punished by death. I think all the authorities cited in Wachsmuth's notes are consistent with this theory only, on which I have elsewhere remarked (*Social Greece*, p. 251). The executioner lived there, and bodies, ropes, and implements of death could be seen there; but executions were always, I believe, conducted in prison, and then, if the relatives did not recover the body, it was carried out to the barathrum.

As to the institution of *φάρμακοι*, which Wachsmuth thinks hardly Athenian, or if so only symbolically carried out, I am disposed to hesitate. He evidently underrates the cruelty of the Athenians, which can be proved very clearly (*op. cit.* p. 220, *sqq.*), and has not observed the well-known line 732 in the *Ranae* of Aristophanes, (*πονηροί*) οἷσιν ἢ πόλις πρὸ τοῦ οὐδὲ φάρμακοῖσιν εἰκὴ ραδίως ἐχρήσται' ἄν. This proves the lowest possible subjects to have been selected, and this again makes me believe that they were really executed, and that it was not merely a "Reinigungs- und Sühnungsprocession" (p. 439, note). Possibly, however, they were merely cast in alive (unlike condemned criminals), and allowed to devise means for escaping, if they could, without the cognisance of the law.

If the antiquarian sequel is carried out with the research, the acuteness, and the originality of the present volume, there can be no doubt that Professor Wachsmuth's *Athen* will take its place among the very best books of its kind, and become quite indispensable to all earnest students of Greek life and literature. J. P. MAHAFFY.

CURRENT LITERATURE.

Summer Days in Auvergne.—By H. de K. (Bentley). So few travellers on their way to Switzerland or Italy care to diverge from the main line of route that a peep into one of the few picturesque districts of Lander's "pale dull France" offered some hope of beauties near at hand yet overlooked. The descriptions in the present volume have somewhat disappointed us. Not that the author keeps his or her eyes shut. The track of a steamer in the pathless waters of Folkestone, the mud of Boulogne at low-water, the gastronomic display at Chevet's and the café at the Buttes Chaumont, are all duly noted; though our brain becomes rather confused between dances, thirty thousand balls, and people who seem to have been singing and enjoying themselves while the said projectiles fell among them. Let us, by the way, console the writer by our assurance that the East End possesses Victoria Park, whose unsurpassed "subtropical" gardening, lake, and cricket grounds are fully as adequate to our needs as the clever theatricalities of the Buttes Chaumont are to those of our neighbours. The account of the Auvergne scenery, aided as it is by some good woodcuts, revives pleasant memories, and the enumeration of the many methods by which the patient's regimen of *aqua pumpi* is varied, is worthy of "the land which has taught us six hundred and eighty-five ways to dress eggs." But we must demur to being consigned to Murray's red books and to Poulett (not Powlett) Scrope for some details of the noble Chaine des Puys (twelve miles in length and containing some fifty gaping craters) which are easily accessible from Clermont Ferrand. Also, however gladly one welcomes allusions to Father Tiber in connexion with the remains of Roman luxury on the Puy de Dôme, we think it unfair to us stay-at-home travellers to be called upon to form an idea of the village of Royat by the Titanic labour of piling Cintra upon Torre del Greco. Several interesting bits of conversation show us the feelings of ill-concealed, or rather openly avowed thirst for vengeance, pervading the sufferers in the latest, but not last struggle between the Gaulish and Teutonic races. We are right glad to renew in these pages reminiscences of the glorious cathedral of Bourges, with its grand five aisles unbroken by transepts; but should have expected so distant a roamer to have known that the legend of the Tour de Beurre is told of many another cathedral, as also that the fires of St. John's day are to be found in all parts of Europe, and claim a patron far anterior to the Baptist.

Rotomahana and the Boiling Springs of New Zealand. (Low & Co.) The northern island of the New Zealand group, known under the name of New Ulster, is of volcanic origin, a fact to which the traditional native name, signifying "risen from the sea," seems to point. This subterranean agency breaks out in a variety of forms, such as hot water springs and boiling lakes, hot mud springs, geysers and volcanoes. A very interesting series of photographic views of Rotomahana, the wonderland in which these phenomena lie thickest, is to be found in the present volume, appropriate descriptive notes to each view being furnished by Dr. Ferdinand von Hochstetter, of Vienna, the views themselves having been taken by Mr. D. L. Mundy. The most remarkable of these is certainly a view of the Pink Terrace Geyser, a succession of natural terraces, which have been formed by the highly encrusting quality of the water flowing over it into the Rotomahana lake. The colour of the terrace varies from a light flush to a bright pink and orange chrome or salmon colour running in streaks down their entire depth, giving it the appearance of a lovely bank of variegated coral. Underneath hang innumerable stalactites, which may be detached with the blow of an axe, and which have the appearance of white china. Alto-

gether these photographs and letterpress combine to give one a very charming notion of scenes which from their remoteness must be rarely visited even by those resident in New Zealand. The book itself is well adapted for the drawing-room table.

Winter at the Italian Lakes. (Low & Co.) This well-intentioned little book, apparently the work of a very young writer, possesses no literary merit, and shows a lamentable ignorance of the rules of English grammar. People who travel for a short time along well-trodden paths are not likely to encounter anything very original, or to have leisure to investigate what is well known sufficiently to throw any new light upon the subject; and much may interest personal friends, and yet possess no charm for the general public. Our counsel, therefore, to the writers of journals has always been to consider, ere they rush into print, whether their experiences possess any interest beyond what is personal and egotistical. This little book—a guide-book diluted, and containing many excellent moral reflections, while giving a simple account of the way hence to North Italy—may, however, be commended to the managers of village lending libraries as capable of instructing those whom a page of Murray would not allure.

A Walk in the Grisons; being a Third Month in Switzerland. By F. Barham Zincke. (Smith, Elder & Co.) The title *A Walk in the Grisons* may at first excite in the mind of the necessary companion of that walk little more than a pious thankfulness that the journey is not to lie among the sadly over-trodden paths of Grindelwald and Chamonix. The name of the author, however, reassures us; and the recollection of his two former volumes renders a month's ramble in Mr. Barham Zincke's company by no means a depressing prospect. Nor are we disappointed. Starting for the long walk up the Susten Pass, perhaps the steepest pine-clad wall in Switzerland, we are carried from speculations upon the fate of caterpillars to sanitary improvements, no longer looked upon as impious thwartings of Providence, and reach Andermatt with a pleased surprise that the journey is over. Readers will share Mr. Zincke's dismay at finding a specially selected guide meet him in the picturesque old city of the British Saint and King Lucius in an elaborate Palais Royal costume, and can scarcely fail to be amused at the good-humoured but effective schemes by which his employer contrived to get something like a fair day's work out of the decidedly bad bargain he had made. Throughout the whole work serious facts press themselves upon the traveller's mind as to the never-ceasing labour needful to enable the peasantry in these high altitudes to obtain the indispensable requisites of life, nor does our author fail to enquire how much of the patience and skill without which life in these regions would be simply impossible is due to the energy born of the sense of proprietorship. Not that our author wishes unfairly to thrust upon an unwilling recipient a dose of political economy sugared over with Alpine snow and bedecked with flowers of the *edelweiss*; but simply that in every page we feel the tendency of his mind to trace phenomena, whether moral or physical, to their causes. A striking instance may be found, where from the everlasting pavement of the old Roman road over the Septimer he evolves the train of Etruscan traders who, long before Caesar's time, traversed the Channel, trod the streets of London, and carried civilisation among the tin mines of Cornwall. Nor is the future of Switzerland overlooked. The large houses in the Grison valleys which grow out of the penny ices of London, New York, and Sydney, and the monster hotels which every year renders more numerous, figure equally in these agreeable pages, which we can safely commend to our readers.

Over Land and Sea. By A. G. Guillemard. (Tinsley Brothers). We cannot help admiring the ingenuity displayed in the selection of fresh titles for books of travel round the globe, but if

they go on multiplying at their present rate there is a great probability of the stock of possible titles being exhausted. Already signs of embarrassment are apparent. The work now before us differs from many others of the same class in that the author deviated from the usual track by visiting Australia and Van Diemen's Land. To us this forms the most interesting part of his narrative. His remarks on the prospects of the different colonies of Victoria, Tasmania, and New South Wales are both interesting and of value, and he adds very emphatic testimony as to the loyalty of the colonists to the mother country. After Australia the author visits Fiji, Hawaii, and thence proceeds to San Francisco, and by the Central Pacific Railway across the American continent. This is well-trodden ground, and calls for no remark except that the grandeurs of the Yosemite Valley here related are such that they will bear being twice told, while some astonishing statistics respecting the height and age of some Californian big trees are well worth perusal, one specimen of the *Sequoia gigantea* being reckoned to have been 450 feet in height, and 2,500 years old at the time of its decease. Viewed as a whole, *Over Land and Sea* may be safely pronounced to convey a comprehensive, entertaining, and not uninteresting picture of the various regions with which it deals.

Grand Transformation Scenes in the United States; or, Glimpses of Home after Thirteen Years Abroad. By H. Fuller, editor of the *Cosmopolitan*. (New York: G. W. Carleton & Co.) The amount of padding required to fill out to seemingly dimensions certain periodicals which are in this light way floated into circulation, might, taken as example, possibly justify the printing of the matter composing this book, in its original shape; but that any kind of justification exists for reprinting it in book form is utterly inadmissible.

America not discovered by Columbus. Under this title, Mr. R. B. Anderson, A.M., of the University of Wisconsin, publishes at Chicago a small volume, which he characterises as "An Historical Sketch of the Discovery of America by the Norsemen in the Tenth Century," and to which he adds an "Appendix on the Historical, Linguistic, Literary, and Scientific Value of the Scandinavian Languages." He gives in his preface the list of the authors from whom he has derived his materials, which includes such names as Rafn, Gravier, Munch, William and Mary Howitt, &c.; and we cannot help feeling that the different weight which attaches to the statements of these writers when considered in reference to the subjects under discussion, is a very fair gauge of the character of the work itself. It deals largely with questions of which the author has obviously no clear knowledge himself, and hence he is incapable of estimating at their right value the various authorities which he brings forward with ostentatious impartiality. To persons in the far West the subject may be new, and the manner in which the author treats it may appear strictly in accordance with the nature of the questions discussed, but for us the book can have no possible interest, while it certainly possesses no characteristic merits of its own.

As a sample of the literary style of the work, we need only quote a passage like the following, to which many similarly constructed might be instanced:—"We can show mounds, monuments, and inscriptions that point to periods, the contemplation of which would make Chronos himself grow giddy." The author's reason for expecting that his book will find an extensive class of readers in America, which is set in a similarly high-worded key, informs us that "those who are born and brought up on the fertile soil of Columbia, under the shady branches of the noble tree of American liberty, where the banner of progress and education is unfurled to the breeze, must naturally feel a deep interest in whatever facts may be presented in relation to the first discovery and early settlement of this their native land."

Mr. Anderson further deems it necessary to acquaint us that his qualification for following the course of the Norsemen westward is that he has "crossed the briny deep four times himself, and has consequently seen something of what is required in order to venture with safety on so long watery journeys." He has also looked at "one of the old Norse Viking ships, which is preserved at the University of Norway," and he considers it to be "an excellent one both in respect to form and size."

After this exposition of Mr. Anderson's claims to be considered as a fitting chronicler of the daring adventures of the Scandinavian discoveries of America nearly a thousand years ago, we need only record the one novel fact that we have met with in the work—viz., that a "step towards the vindication of the claims of the Norsemen . . . has been made, and a movement inaugurated for the erection of a monument in memory of the Norse navigator, Leif Erikson, who visited and explored America in the year 1000. For the realisation of this object Ole Bull has contributed his eminent services . . . and Norway's famous poet and orator, Bjørnstjerne Bjørnson has promised to write for the dedication of the monument a cantata, to which the eminent Norse composer, Eduard Grieg, will write the music. Bjørnson has also promised to come to America in person and deliver the dedication oration." We rather doubt the last assertion; but as we have no valid grounds for questioning the statement, we in no way wish to discourage those who may be tempted by the programme of a ceremonial in which an Ole Bull and a Bjørnstjerne Bjørnson will in person represent the Vikingar of old, to cross the Atlantic and to take part in the American Leif Erikson Commemoration of 1875.

Drei Monate im Orient (Three Months in the East). By H. Loehnis. (London: Siegle.) This book is a curious medley, consisting of what may be called a nucleus devoted to desultory remarks on the science of religion, with an introduction of thirty-eight pages, and a long chronological appendix of very doubtful value. The introduction is a somewhat cut and dry diary of a three months' excursion along the beaten track to Egypt, Palestine, and Smyrna. Had it been longer it might have been interesting; as it is, it is little better than an itinerary. It serves, however, as a text for the main portion of the volume, the chief places of interest visited by the author—Sais, Jerusalem, Rome, &c.—suggesting remarks on the religious systems which may be grouped around them. The idea is a good one; but the execution is poor. Herr Loehnis has approached his task with insufficient preparation; he adds nothing of his own, and simply gives us extracts from Max Müller, Bunsen, Laurent, and some other writers, which he spoils in the process. Of modern Assyrian discovery he is altogether ignorant, so that we are not surprised at finding him placing Ur Casdim in the "Chaldean mountains," wherever these may be, or filling page after page of his chronological tables with the "years of the Ninyades" and the exploits of the mythical Semiramis. But we begin to doubt his knowledge of Greek when he spells Berosus Berosis, twice writes Xisuthros Xisurthos, and changes the Phoenician Zophasemim into Zosaphemim. Egyptologists, again, will hardly allow that Pharaoh signified "Son of Ra," nor will the theologian be pleased with his treatment of Mosaic history. Two courses are open to the student of Jewish religion: either he may accept the traditional hypothesis, or he may abide by the decisions of criticism; the third course of accepting the authenticity of the documents and the facts they relate, while rejecting all that is supernatural in them, though adopted by Herr Loehnis, as it was by the "rationalistic" school before him, is in the present day an anachronism. The reproduction of Bunsen's Egyptian chronology is similarly out of date. Still, the

book is not wholly worthless; a careful reader will find several passages of interest, such as those in which the relations of Christianity to the philosophies of Greek and Rome are described, and several apt quotations; but had the author been content to wait awhile, and then express his thoughts on Comparative Religion in a quarter of the compass of the present volume, he would have produced a book and not a farrago.

Handbook for Australia and New Zealand. Second Edition. (S. W. Silver & Co.) This new edition of Messrs. Silver's Handbook may be safely recommended to intending emigrants as the best and most useful guide to our colonies in the South Pacific. The information appears to be brought down to the very latest period, and to be drawn from the most trustworthy sources. The advantages of each colony are fairly set forth. As an instance of the enterprise of the compilers of this little book, we may note that there is a chapter devoted to our newest acquisition, the Fijis, which contains a good deal of information hitherto buried in blue-books.

Colonial Experiences; or, Sketches of People and Places in the Province of Otago, New Zealand. By Alexander Bathgate. (Glasgow: Maclehose.) Colonial experiences are apt to be a little monotonous, as life in one new country is very like life in another. The Province of Otago, as one of the most successful of our experiments in planting, has however a certain special interest of its own, in which the reader of Mr. Bathgate's unpretending and agreeable work will share. EDITOR.

NOTES AND NEWS.

EARL CADOGAN has lately presented to the British Museum two manuscript volumes filled with curious medical recipes, and recipes for preserves and pastry, collected by Elizabeth, wife of Sir Hans Sloane, at the beginning of the last century.

THE Additional Manuscripts in the British Museum have been increased by an Index to the Engravings, Drawings, &c., illustrating the topography of Norfolk, formerly belonging to Mr. Dawson Turner; some collections relating to Church Rubrics, by the Rev. M. E. O. Walcott; Notes on Justin's Epitome of Trogon Pompeius; R. Gough's printed Account of the Missal [Hours] executed for the Duke of Bedford, temp. Henry VI., with MS. Notes by the Rev. J. Tobin, &c. &c.

SOME valuable manuscript materials for a vocabulary, grammar and dictionary of the Assyrian language, brought together by the late Edwin Norris, Ph.D., have been added to the Egerton Library of the British Museum.

SOME manuscripts of value for the history of music and its professors have recently been added to the stores of the British Museum. These include—Quartets, sonatas, &c., by Jos. Haydn, written by an amanuensis and corrected by himself between the years 1784 and 1817, and some letters of Jos. Haydn to W. Forster, music printer, in 1787 and 1788, a bill of lawyers' costs in business connected with transactions of Haydn with Forster, 1781–1788, &c.; a Greek Stichæarion of the seventeenth century, for the services of the year, with musical notes; Greek Hymns of the same date, with musical notes, for services from February to the octave of Whitsuntide; Greek Liturgies and ordination services, A.D. 1664, with miniatures, in the old binding of velvet; and some seventeenth century hymn tunes of the Greek Church.

A SINGULAR story is told of the "Book of Lismore," an Irish chronicle of the fourteenth century, belonging to the Duke of Devonshire, and recently lent by his Grace to the Ordnance Survey Office authorities at Southampton, for reproduction in facsimile by the process of photo-

zincography. This manuscript was discovered in the year 1814 enclosed in a wooden box, together with a fine old crozier, built into the masonry of a closed-up doorway, which was re-opened while the old castle of Lismore underwent repair. Great interest was naturally excited among antiquaries of the time, and among them was a certain Mr. Dennis O'Flinn, of Shandon Street, Cork, a "professed" Irish scholar, but, as O'Curry said of him, "a very indifferent" one. O'Flinn, however, on the strength of such reputation, induced the Duke's agent to lend the manuscript to him. It was detained for a year, and during part of that time, according to the borrower's account, was in the hands of a copyist. From the time of its return until 1839, the precious volume remained locked up and unexamined; it was then lent by its noble owner to the Royal Irish Academy to be copied by O'Curry. The discovery was now made that the book had been mutilated, and that in such a way as to render what remained of the original almost valueless. Every search was made, but no trustworthy clue was got until the manuscripts of Sir William Betham, bought for the library of the Royal Irish Academy, were found to include copies of the missing portions. By means of a note attached to these copies, the holders of the originals were traced, and were induced to part with their somewhat doubtfully acquired property for the sum of fifty pounds. The whole volume has since been excellently repaired and handsomely bound by the present Duke of Devonshire. The contents of it include—ancient lives of Irish saints, written in very pure Gaelic; the conquests of Charlemagne, translated from Archbishop Turpin's celebrated romance of the eighth century; the story of St. Peter's daughter Petronilla, and the discovery of the Sibylline Oracle; an account of St. Gregory the Great; the Empress Justina's heresy; accounts of Charlemagne's successors, and of the correspondence between Lanfranc and the clergy of Rome; extracts from Marco Polo's travels; accounts of Irish battles and sieges; and a dialogue between St. Patrick, Caoilte, MacRonnain, and Oisín, the son of Fionn MacCumhaill, in which many hills, rivers, caverns, &c. in Ireland are described, and the etymology of their names recorded.

THE work on English Gipsy Ballads by Mr. C. G. Leland, Professor Palmer and Miss Tuckey, which was announced some time back, is now completed and will appear in a few days. Messrs. Trübner and Co. are the publishers.

MR. EIRIKR MAGNÚSSON and Professor E. H. Palmer, of Cambridge, are engaged upon a metrical translation of the lyrics of Runeberg, the celebrated Swedish poet.

MR. J. E. BAILEY, whose recent *Life of Dr. Thomas Fuller* shows him to be best qualified for the task, has undertaken the congenial labour of collecting the sermons of the witty and wise divine. They are now difficult to obtain—some excessively rare—and no library can boast of having a complete set of them. Mr. Bailey proposes to print them in two volumes to range with the Oxford edition of the Church History. The work will comprise the "Prayer before Sermon," thirty separate sermons, six larger treatises on the Lord's Supper, Paedo-Baptism, and other theological subjects, all accompanied by introductions, notes, and indexes, and illustrated by drawings of churches, &c., from inedited originals by Hollar and other artists. The important discourse, "Jacob's Vow," preached at Oxford, May 10, 1644, before Charles I., in reference to his own vow, will be printed from the unique original now in the possession of Edward Riggall, Esq. We are glad that, after two centuries of delay, the task of editing Fuller's Sermons has fallen to Mr. Bailey. In this respect we can heartily endorse the words of Mr. James Crossley, F.S.A. (one of the best of English bibliographers), who writes:—

"The delay, long as it has been, in accomplishing

the point has, however, been attended by this advantage, that the work has now devolved upon an editor who can be thoroughly trusted with the duties of this undertaking, in whom nothing will be wanting which perfect knowledge of his author, unceasing research, and watchful care of superintendence can possibly supply."

Mr. Bailey is printing the very interesting sermon on Reformation as a specimen of the proposed edition.

A SUNDAY Shakspeare Society has been formed in union with the New Shakspeare Society, to meet at the rooms of the National Sunday League. The subscription is five shillings per annum, and the Treasurer is Mr. W. Stafford, 83 Southwark Bridge Road, S.E.

THE new school of Economists in Italy has established a monthly periodical at Padua as its organ, with the title *Giornale degli Economisti*, of which the first two numbers for April and May have been published, containing several remarkable articles. The well-known German economist, Wilhelm Roscher, is the writer of a most interesting essay in the May number, on "The Economic Position of the Jews in the Middle Ages." Among the chief Italian contributors are Professor Luzzatti, Senator Lampertico, Signors Eugenio Forti and G. Boccardo. They treat political economy as a science of observation, which has a wide field of enquiry and study before it in history and actual life; and they reject the notion that it consists simply of deductions from the principle of individual interest.

WE are glad to hear that the Société des anciens Textes Français has now over 300 members. Its first text is to be a collection of fifteenth century popular songs, which is considered a gem, and will be edited by M. Gaston Paris.

MESSRS. CASSELL, PETER AND GALPIN will shortly publish a Course of Sepia Painting, with plates from designs by Mr. R. P. Leitch. A new edition of *Sketching from Nature in Water-Colours*, by Aaron Penley, will be shortly issued by the same publishers.

MR. M. H. IRVING, late Classical Professor of the University of Melbourne, has been nominated to a seat in the Council. The formal election had not been completed when the mail left, but as no other candidate was nominated, only one result is possible. Mr. Charles Pearson had been placed on the Council a few weeks previously.

MR. D. ELLIS COLNAGHI, our Consul at Florence, in an appendix to his annual commercial report from thence, gives an interesting little history of the art of engraving in Parma, which concludes with an account of the great work of engraving Correggio's frescoes, which was first undertaken by Paolo Toschi, of Parma. This artist returned to his country about 1819, after a long residence in Paris, where Bervic had taught him engraving, and Oortman etching. Although but thirty years of age, Toschi was well known in his profession, and soon received commissions to engrave classical works, which required not only the help of his friend and colleague, Antonio Isac, who died young, but the assistance of pupils who crowded his studio, during the whole period of his teaching, to the number of sixty-five. In a few years' time, surrounded by talented scholars and assistants, the master was able to carry out his conception above mentioned—to engrave Correggio's frescoes—before time and neglect should have completely destroyed them. The difficulties of this enterprise—owing to the vastness of the compositions, the curved surfaces on which the frescoes were generally painted, the want of light, &c.—would have checked the ardour of less persevering artists than Toschi and his associates. State assistance was needed, however, to carry out the project; and at length Toschi, as Director of the Academy of Fine Arts, was commissioned by the government of Maria Louisa to copy the frescoes in water-colours. He began the work

with Professor G. B. Callegari, C. Raimondi, and others; and for several years the artists patiently ascended the lofty scaffoldings placed under the cupolas of the duomo and the church of S. Giovanni until the drawings were completed. In 1844 the circular announcing the intended engraving of the frescoes was issued. For ten years Toschi and his assistants, at one time eighteen in number, worked incessantly. In 1854, when twenty-two plates had been published, the master died very suddenly. The work now languished somewhat, until the establishment, by decree of 1860, of a superior school of engraving at Parma, under Professor Carlo Raimondi, the Cavaliere Bigola (now professor at the Accademia Albertina of Turin), and Professor Dalco. The total number of plates in the series will be forty-eight; of these hardly forty had been completed last year.

OVERLAERER JAKOB LÖKKE, of Christiania, the author of several valuable linguistic works, has just published a handsome volume, *Engelske Forfatter i Udvvalg* (Copenhagen: Hegel), being selections from the most prominent English authors, with biographical and critical annotations. The series begins with Shakspeare, from whom is quoted the whole of the *Merchant of Venice*, and closes with Dickens. The work is characterised by extreme care and accuracy, and is the result of the labour of years.

It is announced from Grätz that the authorities have dissolved the greater number of the University clubs, societies, and other Academic associations, not excepting those which were generally assumed to have a purely literary character, as for instance the student-unions "Vendija" and "Sloga;" while all the more specially national societies have been summarily dealt with. Thus there is an end, for the present at all events, of the Carinthian student-associations "Alomania," and "Joannea," the Croatian "Hrovatski Adriatyk," the Serbian "Soko," and the Hungarian "Magyar Egylet."

AT the voting for the chair in the French Academy vacant by the death of M. Jules Janin, M. John Lemoine was elected with eighteen votes, M. G. Boissier obtaining fourteen, and M. Charles Blanc three votes. There was no election to the chair of M. Guizot, as no candidate obtained an absolute majority. M. Dumas, of the Academy of Sciences, was first on the list of candidates with seventeen votes, sixteen being given to M. Jules Simon, and two to M. Laugel. The election was accordingly postponed for six months. M. Guizot's place in the Academy of Moral and Political Sciences has been filled by the election of M. Fustel de Coulanges.

DON GASPAR MUÑOZ has commenced in the *Revista de España* a biographical sketch of Ana de Mendoza, the wife of Ruy Gomez de Silva, afterwards Principe de Éboli. The first instalment comes down to the period of her intimacy with Antonio Perez, and the sorrows and misfortunes of her later life have still to be related.

PROFESSOR DE GUBERNATIS in an article in the *Revista Europea* reviews the present condition of the study of Comparative Mythology, accepting and amplifying the method of Professor Max Müller, and promises to devote the next years of his life to carrying still further the meteorological explanation of myths. Signor Paolo Tedeschi contributes the first of a series of articles intended to defend the authenticity of Dino Compagni's chronicle against the attacks of Dr. Scheffer Boichorst and other critics who maintain that the chronicle is a forgery of much later date.

SIGNOR CESARE CANTÙ has brought out a work on the late history of Italy, which he calls *Dell'Indipendenza Italiana, Cronistoria* (Torino). The book is divided into three parts. The first begins with the invasion of Giacobini, and contains an account of the struggle between Beauharnais and Murat. The second comprises the Austrian period, and takes the history to the surrender of Rome

and Venice. The third, which is to be called the National Period, is still to appear.

STUDENTS of the Wallon dialect will learn with pleasure that M. Auguste Hock has published a fourth volume of his *Oeuvres Complètes*. His sketches are interesting not only from the dialectal point of view, but also as literary works. He records with a skilful hand not only the quaint phrases of the folk speech, but the lingering folklore, and many interesting social conditions, either disappearing or which have already disappeared from the Pays de Liège. The first volume, published in 1872, contained the Poésies; the second, Mœurs et Coutumes bourgeoises; the third, Croyanances et Remèdes Populaires; the fourth, La Famille Mathat, which will probably have a sequel.

THE following Parliamentary Papers have lately been published:—Report of the Commission appointed to enquire into the Administration of the Baroda State (price 3s. 9d.); Correspondence respecting the Canadian Pacific Railway Act, so far as regards British Columbia (price 1s. 1d.); Reports by H.M. Secretaries of Embassy and Legation on Manufactures, Commerce, &c., Part II. (price 5d.); Twentieth Annual Report of Registrar-General on Births, Deaths, and Marriages in Scotland (price 6d.); Reports of Inspectors on Railway Accidents during February, with Plate (2s. 4d.); Report of the Progress of the Ordnance Survey to December 31, 1874; with index maps, facsimile, &c. (price 3s. 6d.); Reports from Select Committee on New Forest Deer Removal, &c., Bill (1861); Annual Report on Loan Fund Board of Ireland (price 2s. 4d.); Accounts relating to Trade and Navigation of United Kingdom; Further Papers relating to the Laws, &c., of Monastic and Conventual Institutions in various Foreign Countries (price 1d.); Correspondence respecting the Macao Coolie Trade, 1874-75 (price 4d.); Copy of Mr. J. R. Wigham's Letter in reference to Mr. Douglass's Report on Signal Lights used on the Clock Tower of the Houses of Parliament; Reports of H.M. Consuls on Manufactures, Commerce, &c., Part III. (price 1s. 4d.).

THE correspondence of Orazio Lavezari, the last Venetian Secretary but one resident in England, contains, as may naturally be supposed, some interesting references to public affairs at the close of the last century. In turning over the copies of it sent to the Record Office by Mr. Rawdon Brown, the following items seemed more especially worthy of notice: A letter dated May 16, 1794, which reports the message from the King to the House of Commons about the eight members of the "Corresponding Society," and the Society "for constitutional information," does not allude to John Horne Tooke's having been originally in holy orders, but merely says he was "a coal merchant, a turbulent man, possessed of talents and of some fortune," and that his fellow prisoner, the Rev. Jeremiah Joyce, was the chaplain of Earl Stanhope, "an opposition Peer and ferocious protector of French Jacobinism." On June 13, Lavezari sent a minute account of Lord Howe's victory on the 1st, and under the same date says the Americans were claiming damages from England to the amount of a million and a half of pounds sterling, on account of prizes, and they also complained of support given by the English authorities in America to the wild Indians in their attacks on the United States. In July we hear of the arrival of Jay, the minister extraordinary from America, to enforce these claims; while Sweden and Denmark were preparing to protect their own trade with a combined fleet of sixteen ships of the line, and a like number of frigates. On August 15, the Venetian Secretary informs the Senate that his illumination for the Prince of Wales's birthday cost him twenty guineas and nineteen shillings; and on the 22nd he tells of the death of Robespierre. In September he lodges a complaint with the Under-Secretary for Foreign Affairs in London, and with Lord Gessville at Dropmore, about the seizure of Vene-

tian vessels by the "Anglo-Corsican" or "Paolist" privateers; and after communicating this proceeding to his chiefs, he gives some particulars of the Prince of Wales's debts, and his proposed marriage to the daughter of the Duke of Brunswick, necessitating a demand to Parliament for pecuniary help. On October 3, an account is sent of the conspiracy ridiculed by the Opposition under the name of "The Pop-gun Plot;" but Lavezari was of opinion that the two apprentices of the watchmaker and the chemist had very serious intentions of murdering the King with a poisoned arrow, to be shot at him from a tube when seated in his box at the theatre. On the public announcement of the Prince's marriage all London was illuminated, and in honour of the occasion the Venetian Secretary was again lavish in his expenditure, the cost of illumination this time reaching twenty-nine guineas and nineteen shillings. The trial of the shoemaker Hardy is the subject of his first letter in November; of this prisoner's counsel he writes, "Il Sig^r Erskine si distinse in grado eminente."

Lavezari acquaints the Senate on December 26 with Lord Grenville's reply to the announcement of the reception given by the Government at Venice to Lallemand, the envoy from the French Republic; and we also learn that the cost of the journey from London to Venice of the courier who brought the news was 80l. Anticipations that Fox in the Commons, and Lord Stanhope and the Duke of Bedford in the Lords, would clamour for peace form the subject of the first letter for 1795. In February, when noticing Pitt's reply to the Opposition about the loan for the use of the Court of Vienna, and the ministerial majority of eighty-eight, the Secretary wrote that the eloquence of this remarkable man was never susceptible of a summary from the inexhaustible rapidity of his ideas and arguments. His May letters announce the acquittal of Warren Hastings, after a seven years' trial which had cost the country 150,000 guineas; and assure the Senate that England is quite firm in her resolve to continue the war.

NOTES OF TRAVEL.

A ROUMANIAN Geographical Society has lately been founded, and is to be represented at the coming Geographical Congress in Paris.

THOSE desirous of following on the map the projected route of our Arctic vessels cannot do much better than consult the new circumpolar map issued by Messrs. Stanford and Co., of Charing Cross. It is based on the Admiralty chart, but there are numerous and useful additions. The names of "Arctic worthies" are inserted in conspicuous type in the places with which their names are most intimately associated. The list of these has been very carefully drawn up on the whole, but we miss the names of Sir Hugh Willoughby and Richard Chancellor, whose voyages to Northern Russia have lent so much historic interest to the bleak coasts of Lapland and Archangel. Old Hackluyt, as our readers may remember, compares their discovery of "a sea beyond the North Cape and of a convenient passage into the huge Empire of Russia by the Bay of St. Nicholas and the river of Dwina," in point of importance with the discoveries of the Cape of Good Hope by the Portuguese, and of America by the Spaniards. We also miss the name of Baffin. On the other hand, we observe with satisfaction that the proper name of Wiche's Land (misprinted Winhe's Land) is given to the island east of Spitzbergen; the lame attempt to claim its discovery as due to Messrs. Heuglin and Zeil and to the Norwegians Altmann and Nilsen having now been quite exposed. The map is altogether a useful one, and the best one of those we have seen which profess to illustrate the regions lying around the North Pole.

ARRANGEMENTS have been made by the Superintendent of the Great Trigonometrical Survey of

India, in concert with the Surveyor-General of Ceylon, to unite the triangulations of the two countries. It had first been proposed to let the connecting triangles run across by way of Adam's Bridge, where the Straits of Manar are narrowest, but this idea was given up, as the islets composing the "Bridge" proved to be mere sand hillocks, often covered at high water, and altogether unsuited for stations for observations. The linking stations will accordingly probably be erected on Kachi-tivu, an island of coral and sandstone, about a mile in diameter, to the north of Adam's Bridge. Very acute angles will thus be necessitated, which will be measured by instruments belonging to the Indian Survey, as these are extremely accurate, and superior to those of Ceylon.

FROM the last Proceedings (January 2) of the Berlin Geographical Society we observe that it now numbers 496 ordinary members, 31 extraordinary foreign, and 144 corresponding and honorary members. Baron F. von Richthofen is again President, and this is certainly a matter of congratulation to outsiders, as apart from the worthy baron's scientific qualifications and fame as a traveller, he has carried out a most useful reform in the prompt publication of the Society's Proceedings. Among the articles is a resolution passed by the President and Council on a communication received from the German Arctic Exploration Society in Bremen, asking for their co-operation in a renewal of Polar research. The Berlin Society are of opinion it would be best to wait till the Swedish and English expeditions shall have achieved some discoveries and then step in and complete these with the renewed vigour of a fresh enterprise. They also suggest that in order to ensure national support, the scheme will require guarantees that the route and plan of operations are approved by the best scientific authorities, and that the leadership is in competent hands. When matters are in a more forward stage, the Royal Academy of Sciences and the Imperial Admiralty will be asked to lend their aid. In the same number of the Proceedings there occurs a paper by Herr Neumayer on "Recent Exploring Doings in Australia," in which the author notices the journeys of Warburton, Gosse, Giles, Ross, and Forrest, and recommends the erection of stations at intervals along a line advancing into the interior, as the best plan for a systematic exploration of the unknown parts of the continent. Herr Neumayer also gives an explanation of the great difficulties under which his survey of Heard and McDonald Islands in the Indian Ocean was carried out in 1857, and defends himself from an attack made upon him by Dr. Petermann in his *Mittheilungen* (No. XII. of 1874), on this subject. Baron von Richthofen also contributes a "personal explanation," but of a more important character than those with which English readers of Parliamentary debates have been so familiar during the present session. The Abbé Armand David had expressed his opinion that the population of China amounted to about 300,000,000, and in communicating his views to the Paris Geographical Society took occasion to contest Von Richthofen's views that the population could not possibly exceed 100,000,000. The Baron now explains that this statement of his views is founded on a misconception, and after entering fully into the pros and cons of the question, arrives at the conclusion that the present numbers must amount to about 420,000,000. The fact of Von Richthofen's being one of the foremost Chinese travellers of the present day is enough to constitute him a standard authority on such a point. The last article of note is a memorandum by Herr Odebrecht on the Upper Itajahy in Brazil.

PARIS LETTER.

Paris: May 14, 1875.

The Chamber recess is always a happy time for the friends of literature. Then the endless discus-

sions on the Septennate, the Republic, the two Chambers and union of the Centres, are put aside for a while, and public attention is again directed to art, poetry, and science. But the fresh impetus given to the intellectual interests of the public is not only due to the recess, but partly also to the establishment of the Republic and the fact of there being a settled if not a definitive form of government. Since the beginning of the war the daily papers have entirely given up literature for politics, now they are gradually taking it up again. It was a real pleasure to see M. Schérer, who is the shrewdest and most profound literary critic France has possessed since the death of Ste. Beuve, resuming his *Articles du Lundi* in *Le Temps*, articles to which he owes a reputation as great as it is well-deserved. In the articles on the third and fourth volumes of the Correspondence of Lamartine, which bring us to the time when the great poet became a political character, his brilliant talent comes out more conspicuously than ever. Nothing can be more instructive than the correspondence of the remarkable men of any one epoch. But the religious respect for every line that has been traced by a celebrated pen should never turn into fetichism, nor lead to the publication of every little note, no matter how small or insignificant. Proudhon's letters, which were to consist of eight volumes (a large number as it is), have just reached a ninth, and we are threatened with three or four more. The writer's reputation would have gained, and the man would have been just as well known, had their number been reduced. It is to be hoped that the editors of Michelet's correspondence will exercise more discretion. But, after all, the letters the great historian wrote were very few. His wife, his son-in-law, and his friend M. Eug. Noel, of Rouen, are about the only people who have in their possession many of any length. Those addressed to the two latter will shortly appear in print. With regard to his widow, she will not think of publishing anything until she has got leave to remove the body of her husband to Paris. The memorial in which she has asserted her claim to his sacred remains, though printed, is not out yet, on account of the law-suit which is still pending. But the delay will not last more than a few days.

Among the many volumes of correspondence just published, there is one that is distinguished by a peculiar charm, namely, *La Correspondance de André Marie et de Jean Jacques Ampère* (2 vols., Hetzel). We made André Marie's acquaintance in the first volume, at the time of his marriage and during the few short years of his domestic happiness. The tender childlike spirit of the great scholar and theorist of electricity there revealed itself to us. Now we see him in his relations with his son, a devoted father as he had formerly been a tender husband. As for Jean Jacques, he has many of his father's qualities, the same enthusiasm and the same goodness, and the same demonstrative and confiding nature, but in the branches of science to which he especially devoted himself he is far from having his father's genius. He had, however what his father had not, great mental cultivation, a talent for writing, and knowledge of such a varied kind that he was at once a linguist, an archaeologist, an historian, and even a verse-writer. The attraction such letters possess is very great, chiefly because they are not written for the public, and show us great men as it were in undress and at their ease; and it is pleasant to find that though sometimes a man takes pains to conceal his vices from the outside world, it is often the case that from a kind of bashfulness or modesty he takes the same pains to conceal his virtues. The epistolary style of former days was not so easy and familiar as it is now; before newspapers came into existence it formed an important branch of literature. The letters were less sincere doubtless, but they had greater literary value, so that the discovery just made by M. Capmas, professor of law at the Faculty of Dijon, of a hundred and fifty unpublished letters by M^{me}. de Sévigné

will be a cause of rejoicing to the lovers of fine style and clever thought. As everyone knows, M^{me}. de Sévigné's autograph letters were destroyed by her granddaughter M^{me}. de Simiane, when, from having been a worldly and frivolous woman of fashion, she turned *dévot*e and thought she could atone for the sins of her youth by burning the letters of her grandmother—a grandmother who, as it happened, was far more virtuous than she, but whose freedom of speech alarmed her tardy piety. The copies we have of the correspondence of the amiable marquise are far from being accurate and complete. M. Capmas' discovery adds greatly to the riches we already possess, and is a help in many instances towards correcting faulty readings. The amusing thing is that certain words contained in preceding editions, supposed to be coined by M^{me}. de Sévigné herself, are now found to be simply misreadings.

It is lucky when inaccuracies in the editions of the classics are only the fault of the copyist or the printer. Too often it has been the editor who has deliberately altered the text of the author. Quite lately a certain Abbé Verlage, when he was publishing a series of *Lettres inédites de Fénelon* (Palmé), of which the originals are contained in the Bibliothèque Nationale, took the liberty of suppressing several passages which did the celebrated archbishop little credit. He has even omitted one entire letter.* This course of proceeding is somewhat like that which the Abbé Duvernet adopted in the last century, when he was publishing Voltaire's letters to Abbé Moussinot. M. Courtat has just been re-editing them from the original MS., and has effected a positive resurrection. Abbé Duvernet was inspired by a mistaken admiration for Voltaire, and had shortened, touched up, and added to the letters. He had even gone so far as to invent several.

There is an analogy between the letters and the memoirs of great men. Memoirs are, as a rule, more uniform in style and less free from constraint, but nevertheless they give us an insight into the inmost thoughts and feelings of the men whose lives they record, at least so far as they are willing to confide them to the public. French literature has always abounded in memoirs. It was a style even more cultivated in the sixteenth, seventeenth and eighteenth centuries than it is now. Private letters, journals and memoirs then filled the place now occupied by the daily papers with their gossiping and indiscreet curiosity. The memoirs of the present day are mostly so many chapters of contemporary history, which are related by the principal actors of the events with a view, more or less openly acknowledged, of making apologies for their behaviour. The *Mémoires pour servir à l'Histoire de mon Temps*, by M. Guizot, are a long "Apologia pro domo mea." M. Odilon Barrot also has left some memoirs which have just been published (Charpentier). He was an adversary of M. Guizot and the leader of the Left under Louis Philippe. Though a brilliant orator he was a second-rate writer, and a still more second-rate politician. Twice only he exercised any practical influence on political events, and on each of those occasions that influence was fatal in its results—first in 1838 when he joined with M. Guizot in upsetting the Molé ministry, and again in 1849 when he advocated the expedition to Rome. He powerfully contributed to the overthrow of Louis Philippe and the Revolution of 1848, and no one lamented it more than he did; he was one of the leading representatives of the alliance between Bonapartism and Liberalism from 1825 to 1848, and yet he hated the Empire, and was its steady adversary ever since 1851. In spite of the marked absence of success which distinguished his political career, his manifest want of practical understanding and depth of insight, Odilon Barrot is a sympathetic character by reason of his perfect integrity and his

* M. Gazier has treated these proceedings as they deserve in the *Revue Politique et Littéraire*, and has published the omitted letter.

loyal and generous nature, and especially in his memoirs his sincerity and simplicity stand out most charmingly. No doubt he aims at showing that if things did turn out badly the fault was his adversaries', not his own; but he does it without bitterness, without any offensive display of vanity, and without violence. The ruling idea in the narrative of Louis Philippe's reign, which occupies the entire first volume, is incontestably a just one, and one which, so far as I know, has never been so forcibly brought out—that is, that the fact of Louis Philippe never having understood the duties of a constitutional monarch, and always wishing his own political views to have the upper hand, was the cause of the weakness and the ruin of the July government. M. Guizot's power did not proceed from the dominion he exercised over the King; but, on the contrary, from his adopting a haughty, dictatorial manner towards the Chamber while he docilely followed the King's wishes. In this manner he concealed a purely personal form of rule under cover of a show of parliamentary government. The sentence pronounced on Louis Philippe and M. Guizot by M. Odilon Barrot's narrative is terribly severe, but we have no doubt that it is a sentence which will be ratified by posterity. Never have such small abilities been employed in the service of such paltry political measures, and there has never been any period in the history of France which for legislative and political unproductiveness is comparable to the period of seven years (1840–1847) during which Louis Philippe and M. Guizot, at the head of a compact majority, were complete masters to do as they pleased. All political men feel it necessary to make an apology for their conduct; and this necessity which, as I have just pointed out, is manifest in the memoirs of M. Guizot and M. Barrot, shows itself more offensively and in a yet greater degree in those of M. Talleyrand—which, though impatiently expected, are apparently not yet ready for publication. This secularised bishop, who was a revolutionist, a minister of Napoleon, and a minister of Louis XVIII. in succession, a type of the political *roué*, and a strange combination of the most shameful vices and intellectual qualities of the highest order, does nothing but try to exculpate himself from all the reproaches—reproaches unfortunately too well deserved—which rest on his memory. He wants to pass for a saint, while just that which constituted his merit was the demoniacal side of his nature—that cynical superiority to all the men of his time which was the outcome of his supreme contempt for humanity, and his freedom alike from all prejudice and all principle.

The Memoirs of Chancellor Pasquier, who died in 1862 at the age of ninety-five, will be more interesting. He held office under all the governments, and was acquainted with all the men, of his time. As he did not himself play any leading part, his memoirs are more particularly a spectator's view of a gallery of contemporary characters, the view taken by a clever and unemotional spectator. They are to be published shortly, as also the curious memoirs of Baudot, the member of the Convention, which supplied Edgar Quinet with all the interesting details for his book on the Revolution.

Through all these works, written by men who were themselves actors in the events they record, we are gradually acquiring a thorough insight into the history of the nineteenth century. Some writers, in anticipation of the time when it will be possible to write it in an impartial and impersonal manner, are attempting to record portions of it; for which purpose they are collecting together all the information which the numberless documents now within our reach can furnish. M. Lanfrey has just published the fifth volume of his remarkable *Histoire de Napoléon* (Charpentier), which takes in the history of 1809, 1810 and 1811, that is to say, of the Spanish campaign and the preparations for the war with Russia. M. Lanfrey is fiercely hostile to Napoleon, and falls into the

error of giving vent to his indignation too often, and above all of willfully misinterpreting all the actions of the Emperor. But he has made a careful study of his subject; he does not confine himself, as M. Thiers has done, to narrating the battles and the diplomatic negotiations: he examines the conditions of social and moral life in France and Europe; he goes below the surface of actual facts in search of their hidden causes. The volume just published contains a remarkable picture of the political situation which Europe, and England especially, occupied just at the outbreak of the Spanish war, and the state of men's minds at the time. M. Lanfrey is besides a very talented writer, a writer who puts life and colour into everything that he tells. It must be owned that as a military historian he wants clearness; M. Thiers has spoiled us in this respect and it is a dangerous experiment to try to compete with him. While the First Empire has formed the subject of M. Lanfrey's studies, the history of the second has been written by M. Taxile Delord, with less talent it is true, but with a zeal that is worthy of all praise. The sixth and last volume of his large work is just coming out (Germer Baillière). It contains the history of 1870, beginning with the formation of Emile Ollivier's ministry on January 2, and ending with the catastrophe of September. The effort to be impartial, and the conscientiousness which M. Delord has shown in this *Histoire du Second Empire* are doubly praiseworthy in a republican writer, and one who had to suffer from the severity of the Imperial régime.

Besides these historical works I must direct your attention to a book belonging to the domain of fiction which has just appeared, a novel called *La Faute de l'Abbé Mouret*, by E. Zola (Charpentier). M. Zola is a most exaggerated representative of what is called the Realist School. He wants to paint life, I will not say, as ugly as it really is, but as ugly as it appears to him, which is very nearly the same thing. Long trains of madmen, idiots and monsters defile before us as we read his novels, fools particularly—vapid insignificant creatures, of whom, as the author pretends, the larger portion of mankind really consists, and who have, therefore, to be painted in their true colours. Moreover M. Zola has scientific pretensions; he is a materialist and a fatalist, and believes that he has a mission to write the real modern novel and to place it on a level with the latest discoveries of physiology. His most important work is *Les Rougon-Macquart*; *Histoire Naturelle et Sociale d'une Famille sous le Second Empire*. One volume of the series, *Le Ventre de Paris*, made some sensation on account of a minute and wonderfully true description which it contains of the Halles in Paris. *La Faute de l'Abbé Mouret* is the fifth of the series. It contains fewer horrors than M. Zola's preceding novels; there is no description of the Morgue, and no horrible murder, and it even contains one sentimental and emotional scene that might almost be called poetical; but a certain mystical sensuality pervades the book, and this produces an unhealthy and painful impression. M. Zola has literary talent, his style is vigorous, energetic, and highly-coloured, but his system is false, and his ambitious pretensions prevent him from writing anything that is both simple and harmonious.

In the way of expected literary novelties, a new volume in verse by Victor Hugo has been announced, *Frances et Germains*. Will it be a part of the *Légende des Siècles*? Will it be a continuation of the *Année Terrible*? I cannot tell. In any case it will be a work worthy of interest, for if Hugo the prose-writer has greatly fallen from his ancient glory, Hugo the poet still has those flashes of genius which put him beyond all comparison with his contemporaries.

A very interesting literary curiosity has just been published by Messrs. Lemerre. Jules Breton, our great landscape painter, has brought out a

volume of verse entitled *Les Champs et la Mer*. It would be an insult to the painter to say, with some of his critics, that his pen is equal to his pencil; yet in his verses there breathes the same subtle and vigorous grasp of sea and country life which has won for him his high rank among our modern masters of landscape. G. MONOD.

OXFORD LETTER.

Oxford: May 18, 1875.

Of literary work this Term there is not much to be said. Theory and practice are currently supposed to be anything but good neighbours, and we have been so violently practical of late as to have but little spare energies left for the theoretical. Possibly, too, the seductive influences of spring weather and lady visitors have made us too languid or seraphic for severe study. Mr. Wallace, of Worcester College, has published a useful little pamphlet on the *Philosophy of Aristotle*, which compresses into a few analytic pages the outlines of that philosopher's system under the three heads of "Logic and Metaphysic," of the "Philosophy of Nature," and of the "Philosophy of Mind." In a vigorous preface Mr. Wallace remarks: "Were colleges, instead of their present indiscriminate almsgiving, to undertake works" like the translation of Aristotle's remains, "or at least secure that their contributions should be applied to some such definite object, the reproaches brought against them might lose to a great extent their force." Aristotle has been called the Oxford Bible; but I suppose Oxford in this case means the University and not the Colleges. Strangely enough, our trying climate seems to have more effect upon natives than upon foreigners. At all events it has not prevented Mr. Vigfusson, the editor of Cleasby's *Icelandic Dictionary*, from working hard at a volume of Sagas, collected chiefly from MS. sources, which he is bringing out for the Clarendon Press; or Dr. Neubauer, in spite of his visit to the MSS. of the Vatican, from having his Rabbinical commentary on Isaiah liii. nearly ready for publication. The first part of the work, containing the texts, is already printed off; the second part, giving the translations (in which the editor is being helped by Mr. Driver), is much advanced. It will be remembered that the book is being published at the suggestion and expense of Dr. Pusey.

Progress is being made with the cataloguing of the MS. treasures of the Bodleian. Two-thirds of Mr. Macray's catalogue of the Rawlinson MSS. is now printed, and Mr. Edkins, who will shortly return to Pekin, has finished in manuscript the catalogue of the Chinese books. Dr. Baehrens of Jena, the editor of the *Panegyrica* and the *Argonauticon* of Valerius Flaccus, has been collating certain MSS. of Catullus and the "poetæ minores" for forthcoming editions of those classics; and Dr. Eduard Müller has been beholden to the library for the use of some Prakrit texts. Among its recent acquisitions must be mentioned a collection of small Midrashim, some of them unique, including a Chaldee text of the Book of Tobit, and a commentary upon the Targum on the prophets. A complete copy of Kapsali's *History of the Turkish Empire* has also been obtained, as well as the second part of a hitherto unknown work by Joseph Katiyah, beginning with Mohammed and going down to 1643, and chiefly valuable for the light it throws on the history of the Jews in the Turkish Empire.

While the library has been thus adding to its stores, the Academic world has been much exercised in spirit as to where they shall be deposited. The basement rooms of the Bodleian are at present used for examination purposes; but learning and examinations, it seems to be considered, do not agree very well together, and one of the two will have to make way for the other. The governing body of the University has once more turned its eyes towards the gap in the High Street which

has now become one of the standing sights of Oxford, and in a moment of desperation Convocation has determined to see if it may not be filled up by appointing a delegacy to submit plans and estimates for two buildings, one ornamental in the shape of a front, and the other useful in the shape of schools. This curious illustration of a house divided against itself was adopted, according to the decree, "in the hope that possibly a plan for well-arranged Schools might be accepted, even if architectural opinion be against the plan proposed for the front hall." Considering the consummate knowledge of architecture displayed by Convocation, few architects are likely to venture upon submitting their plans to so critical and experienced a body.

If Convocation is a master of architectural science, Congregation is equally a master of natural science. The representatives of natural science wished to introduce a change in their department of study, which they were so foolish as to believe would be to its advantage. The classical members of the University, however, showed them their error and threw out the proposed statute, the ultimate object of which was to secure undivided attention to one subject at a time, instead of lumping such heterogeneous sciences as chemistry and biology together. Even a smattering of philosophy, it seems, gives us a sort of omniscient insight into all subjects under the sun, and makes us better qualified for deciding upon the way in which they ought to be studied than the special experts themselves.

Apologies of science, the new Observatory has cost more than was anticipated. Builders have a way of running up unforeseen bills, and the University finds itself unexpectedly more than 1,000*l.* out of pocket. The Savilian Professor, too, cannot manage with the 200*l.* a year for five years allowed him by Convocation for observing the stars, but wants an annual grant of 300*l.* Large telescopes are something like white elephants, and if the University once commits itself to the cause of scientific research its funds for feeding examiners and assisting indigent rectors are likely to be diminished. Science and telescopes, however, have been thrown into the background by the all-important question of balls and suppers. As everybody knows, the theatre has been deprived of the glory of the Encaenia and blue bonnets by the misbehaviour of the undergraduates, and the Hebdomadal Council determined to strike a further blow at the Oxford Carnival by advising the colleges to forbid all festivities, and send their men down as soon as the lecture season was over. A few poor scholars have been misguided enough to force an entrance into what all the world is aware ought to be the peculiar preserve of the rich; and the Council, being so old-fashioned as to retain its faith in the paternal theory of college government, imagined that a term spent in cricket and boating, in entertaining lady visitors, and in picnic parties to Nuneham, was as much as was good for the undergraduate, and that the usual legalised dissipation which ushers in the Vacation might easily be dispensed with. Newspapers without and members of Congregation within, however, soon taught the Council its mistake, and revealed to the public the great discovery of the nineteenth century, that the end and object of a University is to examine, to row, and to dance.

To turn from such serious topics to professorial lectures may seem a bathos, but I cannot refrain from noticing the course of biological instruction given in the Herbarium at the Botanic Gardens by Professor Lawson and Mr. Ray Lankester in daily lectures on the leading features of plants and animals; or the lecture, delivered to a crowded audience by Professor Monier Williams, "On some Points of Contact and Difference between the principal Religions of the World as represented in India." Considering our large possessions in the East, it is almost a pity that more interest is not taken here in Oriental matters. It is thought

desirable to study one half the Bible in its original tongue, but not the other and larger half; and we seem to conclude that if India will not adapt itself to our English customs and ideas, so much the worse for India. It is hopeful, therefore, to find the University at last proposing to found a course of instruction for candidates for the Indian Civil Service, and to give them the opportunity of substituting a residence in Oxford for the stimulating social atmosphere of a London "crammer's."

I have left to the last a history of the abortive issue of the attempt to make the colleges aware that such an institution as the University actually exists and has claims upon them. The colleges have returned their answers to the Vice-Chancellor's question whether they had the will or the power to devote any of their funds to University purposes, and, speaking generally, a singular unanimity may be observed among them. Those that have the will have not the power, and those that have the power have not the will.

CORRESPONDENCE.

WILD MEN IN INDIA.

38 Clanricarde Gardens.

The interesting account of these aborigines in last week's *ACADEMY* is by no means, as it is stated, the first detailed account of them that has been published. In Gladwin's translation of *Ain-i-Akbari* will be found the following passage (p. 89):—

"The bunmanis is an animal of the monkey kind. His face has a near resemblance to the human; he has no tail and walks erect. The skin of his body is black and slightly covered with hair. One of these animals was brought to his Majesty (Akbar) from Bengal. His actions were very astonishing."

That the author supposed these creatures to be human beings is clear from his placing "the jargon of the Bunmanis" among the dialects of Hindustan. Bunmanis would in Sanskrit be *Vanamanushya*, "wild man."

But to come nearer our own time. Here is a passage which I extract from that fascinating book of adventure, *The Hunting Grounds of the Old World*, by the "Old Shekarry" (see chap. vi., p. 90).

"Thus armed I clutched the supposed animal by the hair and shouted to M. and the rest to come up: when the thing I was holding began to moan and struggle, and shortly a curious kind of paw, with huge claws, emerged from below and fastened on my hand, and it was only by repeated blows with the handle of my knife that I could prevent them from tearing the flesh. At that moment I was not sure whether I had got hold of some kind of chimpanzee or ourang-outang, and I shouted out lustily for help. M., the shekarries and coolies soon got up into the tree, and with their assistance I dragged up from a hollow in the trunk two most extraordinary creatures in human shape. One was old and wrinkled, the other quite a child, and both belonged to the weaker sex, but whether of the genus man or monkey I was not at all sure. . . . We looked at them for a long time before we were quite sure whether they were human. I fancied at first that they were some kind of hybrid, for I never saw such strange objects. The nose was nearly flat, the mouth most capacious, and full of large yellow teeth."

I cannot extend my quotation any further, but must refer those who are interested in the subject to the book itself, where they will find an account of these wild men filling several pages. I may add that they wore no clothing whatever, and spoke in "curious grunting sentences." Their habitat was "the Chettagunta jungles."

R. C. CHILDERS.

INTERNATIONAL COPYRIGHT.

Merstone, S.W.: May 16.

The letter of Mr. Moy Thomas on the subject of international copyright, while recognising the distinction between authors' rights and publishers' claims (failure to recognise which has been the chief obstacle hitherto to a copyright treaty between the United States and England), does not seem, any more than previous comments on this side of the water, to take account of those rights of vested interests in commercial undertakings, even where they were originally based on wrong and usurpation, which English law universally respects at home. The fact is, but seems not to be generally known, that an author's copyright treaty was offered to the English Government by the American several years ago. This would have given the English author every substantial privilege which the American enjoyed; but it was refused by the English Government apparently because it would not have protected the interests of the publishers. What the English negotiators insisted on was that the copyright in England should extend over the United States, so that a publisher in possession of an English copyright should be able to control its publication there also. The equity of any such claim is open to debate—the expediency of conceding it in the face of the fact that such a concession would bankrupt our publishing trade cannot be even argued. When the American Government offers to the English author every privilege which the American enjoys, there remains neither ground of complaint to the former, nor room for the flippant abuse of "American copyright piracy" which certain English journals are so fond of indulging in. The further question of publishers' rights is one which, will they nill they, must be postponed until we in America have settled the general question of free trade and protection on wider grounds than the admission of books, free or otherwise; and if the English Government continues to insist on a publishers' copyright or none, it will be none, probably, as long as any present copyright exists. Mr. Moy Thomas says very justly "that even if the principles above laid down were fully recognised, their application in a mode satisfactory to conflicting trade interests must always be a matter of great difficulty;" but my American perceptions are not acute enough to see the relevancy of the sentence that follows—"they are

not content to refuse copyright in the United States because the Custom House regulations in that country continue to be illiberal towards the importing country, and injurious to the interests of American readers." It is the American reader who profits by the present state of things. American authors and publishers have long been quite willing to put the English author at home in America, but the former can scarcely be expected to put him in a better position than he himself enjoys, nor is the American publisher willing to accede to a convention which shall leave both American and English authors at liberty to print and publish their books in whatever corner of the world they can get them done most cheaply, and paralyse at once a trade in which millions of dollars and thousands of operatives are engaged. Justice is always, in the abstract, justice, but done at the wrong time may work infinite injustice.

English authors have only their own government to deal with, and their own publishers against them. I don't think that American authors are much interested in the matter, and American publishers have long shown the leading English authors that they are ready to go ahead of the law.

W. J. STILLMAN.

MR. GAIRDNER'S "HOUSES OF LANCASTER AND YORK."

May 19, 1875.

In a review of my *Houses of Lancaster and York* which appeared in the *ACADEMY* of May 8, it is suggested that I have been a little too credulous in adopting stories which do not come from the best contemporary writers. The same criticism, I am bound to say, has been made in other quarters; and if I could accept it as a true principle in writing history to omit all anecdotes which rest merely on the tradition of a later age, I must own that there are several things in my little volume which ought to have been cut out. Indeed, I was warned by some friends, even before going to press, against admitting into my narrative the received account of Henry V.'s youth, and the well-known story of his menacing Judge Gascoigne. But, on the other hand, it was—very judiciously in my opinion—made a part of the plan of the series in which my volume appeared, while omitting needless detail, to call attention to everything characteristic of the age or of leading persons in the story; and as I saw no substantial grounds for disbelieving these anecdotes, I repeated them as others had done before me. I admit, the testimony on which they rest is in itself slender enough; but we must be content with scanty testimony for a great many facts in the fifteenth century which we cannot possibly ignore and have no sufficient reason to impugn. Moreover, as to the particular story of Judge Gascoigne, let it be supposed for one moment that it is true, and I think there is no great difficulty in understanding why it should not have been committed to writing for a century after it occurred. For one generation, at least, it would have been imprudent to write such a thing: in the next there was an extreme scarcity of chroniclers.

Another point on which your reviewer thinks I have accepted fabulous history as genuine is the celebrated anecdote of Queen Margaret and the robbers. This, he says, "comes only from the Continuator of Monstrelet, who puts it at an impossible date, and places the scene of it in Hainault." I do not know whether your reviewer considers that "Angleterre" meant Hainault in the days when the Continuator of Monstrelet wrote, but I have simply translated the passage in my book from the original authority, and I make "Angleterre" England. As to the date, the Continuator of Monstrelet places the incident in 1463, which seems to me not at all impossible, but perfectly consistent with the facts of history.

JAMES GAIRDNER.

PEPYS' DIARY.

York Street, Covent Garden: May 19, 1875.

I do not think that Mr. Mynors Bright's theory that the late Lord Braybrooke sold the copyright merely of a transcript of an original shorthand MS., can be maintained. A transcript is not like a translation of a foreign work, which must vary with the ability of the translator. A transcript is simply a copy; and any other transcript must be a duplicate of the first. Can there then be any right, having any money-value, in such a copy while the possessor of the original MS. reserves the right of producing another at any time that he pleases. It is not credible that this imaginary right should have been sold at a public auction for several hundred pounds, and again have changed hands seven years later for a proportionately valuable consideration.

My claims are as follows:—1. That Lord Braybrooke sold this right, as being the actual copyright of the work, and nothing less. This may be legally proved from the entry of the extension of copyright in Stationers' Hall, signed by Lord Braybrooke and by Mr. Colburn, the latter being designated the "proprietor" without limitation. 2. That this edition has always been recognised by Magdalene College as an authorised edition of the Pepysian MS.; and though no order to that effect may be recorded in their books, the fact is sufficiently proved by their having allowed the work to be reprinted and even enlarged in several successive editions without question or reservation. Moreover, they accepted a valuable benefaction, derived from the proceeds of the copyright of this book which is known as the "Pepysian benefaction."

Should they now, before the term of copyright is fully expired, authorise another and entirely new edition of the MS. diary, the authorities of Magdalene will commit themselves to a line of action inconsistent with the attitude which they have hitherto maintained.

They will also destroy the value of a literary property, purchased by me, which has been the source of a substantial benefaction to their foundation, and will appear to repudiate the acts of the late Master and of his relative, Lord Braybrooke, the Visitor of the College.

I may add that six years ago, as proprietor of Lord Braybrooke's edition, I arranged with a late fellow of Magdalene College for the publication of an enlarged edition, if it should meet with the approval of the authorities, but permission was withheld. I am still ready to undertake this.

I have offered to the publishers who have announced the new edition terms which I should be willing to accept myself under similar circumstances, which, however, have not been accepted.

I regret to be at issue with Mr. Bright, for I believe the edition has been projected in ignorance of my claims, but I do not feel called upon to waive legal and moral rights to a property for which I paid a large sum eleven years ago, which I have not yet recovered.

GEORGE BELL.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 22, 3 p.m.	Royal Institution: Mr. W. H. Pollock on "The Drama." II.
"	Physical: Papers by Messrs. H. Bauermann, W. Spottiswoode, and E. J. Mills.
"	Crystal Palace: Second Summer Concert (Beethoven's Choral Symphony).
3.45 p.m.	Botanic.
MONDAY, May 24, 1 p.m.	Geographical: Anniversary.
3 p.m.	Linnean: Anniversary.
8 p.m.	British Architects.
"	Fifth Philharmonic Concert (St. James's Hall).
TUESDAY, May 25, 3 p.m.	Royal Institution: Professor Gladstone on "Chemical Force."
8 p.m.	Anthropological Institute: Mr. T. G. B. Lloyd on "The Beothucs," and "The Stone Implements of Newfoundland;" Professor Busk, "Description of some Beothuc Skulls."
"	Civil Engineers: Conversazione.

WEDNESDAY, May 26, 1 p.m.	Horticultural.
8 p.m.	Geological. Archaeological Association.
"	Royal Society of Literature: Mr. C. H. E. Carmichael on "The Petrarch Collection at Trieste."
8.30 p.m.	Psychological.
"	Messrs. Ludwig and Daubert's Second Chamber Concert, New Gallery, Argyll Street.
THURSDAY, May 27, 3 p.m.	Royal Institution: Professor Dewar on "The Progress of Physico-Chemical Enquiry."
5 p.m.	Zoological: Professor Garrod on "Camels and Llamas."
6 p.m.	Philosophical Club.
7 p.m.	London Institution: Professor Morley on "The Inner Thought of Shakspeare's Plays." III.
8 p.m.	Society of Arts: Mr. T. H. Wright on "The History of Bardism."
8.30 p.m.	Royal. Antiquaries.
FRIDAY, May 28, 3 p.m.	Mr. Charles Hallé's Fourth Recital, St. James's Hall.
8 p.m.	Quekett Club: Mr. M. H. Johnson on "The Organic Structure of Flint and of Meerschaum."
9 p.m.	Royal Institution: Colonel Lane Fox on "The Evolution of Culture."

SCIENCE.

Problems of Life and Mind. By George Henry Lewes. Vol. II. (London: Trübner & Co., 1875.)

It seems probable that in the future, perhaps a not distant future, the exposition of empirical philosophy will be made a simpler thing than it appears at present, for instance in this work of Mr. Lewes'. But we shall then have to remember—and it is right to say it distinctly—that the simplicity of scientific truth, when fairly established, is made possible only by the more complex and toilsome searches of those who established it. People, as a rule, are neither curious enough nor thankful enough concerning the work so done for them by their predecessors. While we hope that this will not be so with Mr. Lewes, let us yet make haste to thank him in our own time while his work is fresh.

The ultimate simplicity of empirical philosophy finds an admirable type in the answer given by Mendelssohn to Herr Souchay of Lübeck, who wanted to know what certain of the Songs without Words meant. Mendelssohn wrote to him that he had always found words much less intelligible than music, and all verbal explanations of music unsatisfactory. "If you ask me what I thought at the time, I can only say, just the tune itself"—*gerade das Lied wie es dasteht*—which possibly seemed a hard saying to Herr Souchay. If we may pursue the saying into a metaphor, we are here to listen to and understand the world's music: which is, and ought to be, music to us for this reason, that in an orderly world the love of order and of the knowledge of order for its own sake, is one of the things that make races survive and prevail. There are plenty of people who have their interpretations of the tunes, and will warrant their own to be the only correct ones; nay, they have authentic and exact information of the composer's intentions, derived in quite other ways than by listening to the music. Science lets them alone and cleaves to Mendelssohn's answer: *Gerade das Lied wie es dasteht*. A plain matter, it would seem, to give answers of this kind. Yes, when one fairly sees it, which is not without time and thought; and

when one can get other people to see it, which will be only with more time and thought than can at present be estimated. What Mr. Lewes has now done is to work out certain important and representative questions of philosophy with a fulness and variety of treatment which will make people see the empirical position, if anything will. We choose this form of speech because we hold strongly (as Fichte held and said, of course from the opposite side) that it is a matter of *seeing*, not of proof; the difference between empirics and metempirics is of a kind not to be decided by force of argument. Whether Mr. Lewes would go along with us here we are not quite sure. There are traces of clinging to formal proof and explanation in regions where, as it seems to us, the only right course is to say plainly that there is none to be had. Thus we find Mr. Lewes arguing against Mr. Bain that the uniformity of nature is not an assumption, but can be expressed as an identical proposition. We should call Mr. Bain's doctrine too clear for argument (from any empirical point of view), but for the fact that it is not clear to a thinker whom we so much respect as Mr. Lewes.* But we read here that "the true expression is the assertion of identity under identical conditions; whatever is, is"—so far well—"and will be, so long as the conditions are unchanged." Nay, but how do you know it will? What is your warrant for the indefinite future denoted by "will be" and "so long as"? In truth, one gets this, as Professor Clifford has already pointed out, only by assuming that time is not one of the conditions—which assumption is the chief part of the principal proposition. When therefore Mr. Lewes finishes his sentence thus: "And this is not an assumption but an identical proposition," we cannot follow him.

In the first volume Mr. Lewes was chiefly occupied with forging new weapons for the armoury of empirical thought: in this he shows us how they can be used. Chief among these is the theory of abstraction: a theory more or less perceived and acted upon by all empirical philosophers, but now wrought into a finished instrument of various application and exceeding power. But any theory of abstraction, it may be said, must be still only an affair of logic: and how shall a purely logical doctrine throw light upon problems such as those of Matter, Cause, and Things in Themselves? The answer is short: By dispelling logical illusions. And in fact Mr. Lewes lets in light upon a whole series of metempirical phantoms in a manner of which we can here only give the slightest hints. One feels at the end that one has travelled a good way along the road which Mr. Lewes truly says that the scientific study of metaphysics has to pursue, namely the substitution of intelligible for unintelligible questions.

We have room only to choose a portion; let us take up the volume at the point where Mr. Lewes does battle against that

* J. S. Mill's account (*Logic*, bk. iii. c. 21) appears on the whole, taken with the qualifying passages in the same and other places, to be a purely historical account of the genesis of the belief, and as such quite right.

old enemy the Material Substratum. Matter, he says, is not something at the back of the sensible relations in which material things are known. It has a reality, but a symbolical one; it is an abstraction standing for the sum of all the sensible relations, different from any some or one, but not from all of them. If it is asked, what is the nature of Matter in itself? the question is irrational. To this exposition we should like to add one thing, that the conceptions of matter and the identity of material things involve what may be called a Social Postulate. This paper before me is a persistent group of relations for you as well as for me. I call it a real piece of paper partly because I can feel as well as see it, but still more because I am sure that if you came where I am you would feel and see it, in the same way. The concurrence of the individual's different senses goes for nothing if the social test contradicts them. When in a particular case the social postulate breaks down, we say there is an hallucination: if it habitually breaks down, we say the man has lost his wits. In like manner it seems to us that Mr. Lewes' theory of Judgment, though good as far as it goes, is incomplete from not taking into account the social uses of language. A good many difficulties vanish when we bear in mind that the real use of propositions is to give information to other people. Then we come to the still more vexed problem of Cause. The causal *nexus* so dear to metemprirics is pitilessly shown up as a mere human figment; and the attempt to strike out an empirical theory by defining Cause as *antecedent* is also dismissed as being misconceived. Mr. Lewes' own solution is that not merely the mysterious *nexus*, but the whole conception of cause and effect as separate things, is a logical fiction. Cause and Effect are two aspects of the same thing; the cause is the analysis of the effect into a sum of conditions, and the effect is the synthesis of the cause into a resultant of conditions. "Could a cause exist as such before its effect, it could exist *without* its effect; but as the two are correlative aspects of the one event, this is impossible." Reserving the question whether it will ultimately be desirable to retain Cause at all as a scientific term, we think Mr. Lewes has at last disengaged the really scientific element which was involved in the current use of the word. But we are disposed to think Mr. Lewes is rather hard on Hume in this place. What looks like laxity and mere scepticism in Hume's language arises, we suspect, from its partly ironical character. He speaks with transcendental philosophers according to their transcendentalism. His position in the latter part of the *Treatise on Human Nature* is something of this kind:—If you ask experience for transcendental results you will get nothing; for myself, I am content with getting from it such knowledge as suffices for the conduct of life; but I say there is no other source of information, and for you therefore *with your notions of knowledge* there can be no knowledge at all, but only unanswerable questions; it is open to me, however, to leave such questions alone as being merely unreasonable.

Returning to Mr. Lewes' own exposition

we find the like treatment applied with even more effect to the whole doctrine of the Absolute, which is shown to be from beginning to end a mistaken realizing of mere abstractions. In one very important chapter Motion and Feeling are dealt with, much like Cause and Effect above, as "one and the same process viewed under different aspects." This expresses a view towards which there has been a marked convergence among those who have approached the question in a scientific manner. When it is said that we cannot conceive how Matter and Mind are related to one another, "what is meant is, that we are unable to imagine why one object is the obverse of the other: *which may be said of all relations.*" The conclusion is drawn that Feeling is the only "thing in itself:" which, one may remark, was also Hume's. After this chapter we do not quite understand what Mr. Lewes means when he says in an earlier place that he reserves the questions of Materialism and Idealism for another volume. We seem to have got pretty near the root of the matter already. It seems worth while to repeat here an often-repeated warning. No such extravagant proposition is put forward as that we are never to use popular and symbolical language. Mankind are not called upon to leave off talking about Matter and Causes; fictions and symbols are excellent things as fictions and symbols, the mischief is only the taking of them for realities. It may seem startling that people have gone on doing this so long; but one can only say that historically the thing is quite explicable, and in fact it could not be helped. Hereupon, no doubt, we are open to a whole battery of Hamiltonian declamation about veracity of natural faculties and so forth, all which we shall digest as best we may, and scientific philosophy will survive it.

It was only to be expected that Mr. Lewes should now and then be led into an excessive use of his chosen instruments of thought. Certain physical theories touching atoms and other things are treated as abstractions, whereas they seem to us to be direct statements about matters of fact, which experiment will one day show by direct evidence to be either true or not. Mr. Lewes also makes free use of analogies for purposes of illustration, and some of these seem doubtful in the same sort of way. In particular, we cannot accept his parallel between Imaginary Geometry and Metemprirics. We speak not of our own knowledge, but we understand from competent authority that the outcome of the new geometries of Lobatschewsky and others is that, as a physical matter of fact, we do not know what sort of space we are living in. Euclidean space is an ideal (and but one of divers ideals), and we only know that the real corresponds so nearly to it that we have not as yet been able to measure any difference. It is quite possible that by further experience of greater or smaller spaces than have hitherto been measured we may ascertain that there is a difference. Nor are we entitled, on the other hand, to say dogmatically that we may not somehow learn that there is no difference: in this case, however, the new knowledge, being absolutely exact would be different in kind

from any we now have. The mark of Metemprirics is the impossibility of verification: but here there is nothing in its nature unverifiable.

Passing over for want of space one or two smaller matters we meant to note, we make an end by again thanking Mr. Lewes for some of the best work done in these times in the cause of that which, in common with him, we deem the true philosophy.

FREDERICK POLLOCK.

Ecclesiastes; a Contribution to its Interpretation; containing an Introduction to the Book, an Exegetical Analysis, and a Translation with Notes. By Thomas Tyler, M.A. (London: Williams & Norgate, 1874.)

AMONG all the books of the Old Testament there is perhaps none which has given rise to such divergent and numerous conjectures respecting its purport and origin as the one which is discussed by Mr. Tyler in the volume before us. By one scholar it has been thought its object to deny, by another to propound, the immortality of the soul; by others it has been supposed (as the curious reader may learn from the pages of Dr. Ginsburg's *Introduction*) to embody a compact summary of the history of the kings of Judah, or the poetical effusions chanted by an assembly of sages upon a series of given themes; it has been held even, such are the eccentricities of expositors, to be a treatise on the principles of court-etiquette!

Mr. Tyler is more sober. In an unpretending, though far from uninteresting, volume, he examines with care and minuteness this perplexing book for the purpose of determining, if possible, more convincingly than has been done before, its historical position. It has, indeed, been for long generally recognised that Ecclesiastes reflects an age widely different from that to which popular tradition ascribes it; but still the absence of any explicit historical allusions has left scope for much variety of opinion when the attempt is made to do more than assign it broadly to some period between the return from Babylon and the birth of Christ. Mr. Tyler, however, believes that it contains passages which can be shown, on the one hand, to have been written before the apocryphal Book of Sirach, on the other to bear evident traces of the influence of Greek philosophy. Of the latter it may suffice here to instance the "Catalogue of Times and Seasons" (iii. 2-8), in which Mr. Tyler sees the expansion of the Stoic ethical principle to "live conformably to nature;" the frequent allusion to "madness" as antithetical to wisdom, in which he traces another well-known Stoic conception; and passages such as iii. 18-22, v. 18-20, which appear to him to embody the teaching of Epicurus. The date of the book is thus fixed at c. 200 B.C.; its design, to be at once a recantation on the part of the author himself, and an admonition to dissuade others from the delusions of philosophical speculation. After meeting in anticipation, by an appeal to the *Mishna* and to Josephus, the difficulty that will be felt in conceding at such a period the presence of Greek in-

fluences in Palestine, Mr. Tyler proceeds to discuss the name *Qohéleth* (his view of which seems scarcely reconcilable with the words in i. 12), the theology and diction of the book, and concludes with a long Analysis, and a Translation.

It cannot be denied that Ecclesiastes offers points for comparison with both Stoic and Epicurean teaching, although it may, perhaps, still be questioned whether they are sufficiently characteristic to justify the inference that they were actually derived from contact with Greek thought. So far as Stoicism is concerned, it is noticeable that the more striking parallels are with the form which it assumed in the hands of the Emperor Marcus Aurelius. Even apart, therefore, from the question of date, might not such thoughts and expressions as apparently owe their origin to the individual rather than to the system, present themselves independently to another who, from temperament or fortune, was led to regard human life from a similar point of view? Parallels between different writers may be remarkable; but they may also be misleading. Herodotus, it will be remembered, makes Solon fix the limit of life at threescore years and ten, and puts into his mouth a sentiment identical even to the form of construction with Eccl. iii. 19, *πάν ἐστὶ ἀνθρώπου συμφορὴ*. And while M. Aurelius again and again plainly connects his ethical standpoint with the conception of Nature as an ever-flowing stream, hurrying one object away, and bringing on another for a brief moment to fill its place (iv. 43, v. 23, vi. 15, vii. 19, etc.; also vii. 1, 25, viii. 6, which throw some light upon the meaning of iv. 32, xi. 1), Mr. Tyler fails to point out any traces of a corresponding line of thought in Ecclesiastes. Such resemblances as there are might well have suggested themselves to the author on the basis of passages like Ps. xxxix. 5, 6, xlix. 11, if, as seems indeed to have been the case, the circumstances of his life had been such as to force them with painful prominence on his attention. But although we thus, for more reasons than one, regard a comparison with M. Aurelius as likely to prove fallacious, we must admit that Mr. Tyler's labours have done something to render the presence in Ecclesiastes of Greek philosophical ideas, at least in a fragmentary form, not improbable.

In translation and exegesis Mr. Tyler cannot be considered very successful; his style suffers from being unduly modernised, his renderings are at times precarious, and his explanations inexact and unsatisfactory, see, e.g., ii. 3, 5; iv. 14 (p. 94); v. 3, 8, 9; vii. 7, 9. His argument on page 8 (even if we accept the interpretation of vii. 14, and recognise a coincidence more than accidental), might with equal—or greater—plausibility be reversed; and in comparing x. 8 with Sir. xxvii. 26, he appears to have overlooked what may be the common source of both, Prov. xxvi. 27. Faults such as these do not, however, seriously affect that portion of his book which is the most novel and attractive, namely, the Introduction; though, even here, we cannot help wishing that Mr. Tyler had made his work somewhat more complete. A larger synopsis of parallels from Greek writers, a sketch of the

philosophy of M. Aurelius as a whole, and a critical estimate of the arguments advanced by Grätz in his first *Appendix*, would, for instance, have formed valuable additions. But even in its present form, Mr. Tyler's fresh and not unsuggestive volume merits, as it will also repay, the attention of the student of *Qohéleth*. S. R. DRIVER.

SCIENCE NOTES.

ASTRONOMY.

Transit of Venus.—Detailed reports from the French Transit of Venus expeditions to St. Paul's Island and to Peking are given in the *Comptes Rendus*. At the former station, the transit occurred in the midst of a tremendous storm, but, comforted by the statement of the fishermen that the day of the new moon (which occurred on December 9), was always fine, M. Mouchez made every preparation, and was rewarded with complete success, the sky clearing just before the first internal contact, and clouding over again completely half an hour after egress. Although passing clouds interfered somewhat with the photography, no fewer than 443 daguerreotypes and 142 collodion negatives were obtained during the whole transit, and after deducting a certain number of unsatisfactory plates, there still remain 489 which will be available for measurement. With regard to the eye observations M. Mouchez saw a bright ring of light surrounding the part of the planet outside the sun, which he attributes to the atmosphere of Venus; and, further, an aureole, which seemed independent of the planet, and behaved just like a solar atmosphere. It is rather remarkable that while M. Mouchez, with the large eight-inch telescope, found great difficulty in fixing the time of internal contact with anything like precision on account of this aureole, his companion, at the six-inch telescope, saw nothing of it, and made what he considered to be most accurate observations. M. Mouchez, however, places most reliance on the micrometer measures and on the photographs. At Peking the observers were equally fortunate, though passing clouds caused great anxiety. Both internal contacts were well observed, a slight ligament being seen with the six-inch telescope, but no ring of light; while, with the eight-inch, nothing was seen but a few fringes. Contrary to what was anticipated, the Chinese received the expedition well, and even marked attention was paid them by some of the highest officials, while the dowager empresses showed their interest in the event by asking for a photograph of the phenomenon. The longitude of the French station was determined within one and a half seconds of time, and was also carefully connected by triangulation with the American station under Professor Watson's charge, while a survey of the town of Peking was made after the transit, the party being detained for two months by ice in the river.

Spectroscopic Observations.—Dr. Nicholas von Konkoly has for the last two years examined the spectra of meteors at every available opportunity, and has been enabled to establish the presence of the lines of sodium, magnesium, carbon, strontium, and possibly lithium, in the train, while the nucleus invariably gave a continuous spectrum in which the yellow, the green, or the red predominated, according to the colour, blue being very rare, and violet never seen. An interesting circumstance noted was that red meteors move with extraordinary velocity. Dr. von Konkoly also examined Coggia's comet of last year, and Encke's this year, observing the three well-known bands which are seen in the spectra of carbon compounds.

The Relative Motion of the Components of 61 Cygni.—Without being aware of M. Flammarion's results, Mr. J. M. Wilson, of Rugby, has discussed all the observations of this remarkable

double star, and is led to the conclusion that although all the observations of the present century can be perfectly represented by uniform motion in a straight line, yet this hypothesis will not satisfy the observations of the last century (three in number), the relative path appearing to consist of two straight lines inclined about $5\frac{1}{2}^\circ$ to each other, while the observations are not accurate enough to discriminate between two such lines and a curve touching them. In fact, Mr. Wilson considers it unsafe to draw any conclusion at present, the motion being so very nearly uniform and in a straight line, that no curvature in the path can be established with certainty. Mr. Wilson's paper is given in the *Monthly Notices* for April.

The Solar Eclipse.—The expedition sent to Siam seems to have had only a partial success, the attempt to photograph the spectrum of the corona, from which so much was hoped, having failed. Good photographs, however, were obtained of the corona itself, which are certain to be of great value, and satisfactory results were secured with the prismatic camera, a combination of a prism and a camera, which gives for every bright ray in the spectrum a corresponding image of the luminous object. It seems doubtful, however, whether anything more was obtained with this than photographs of the chromosphere and prominences, depicted as rings corresponding to four different rays in the spectrum, the central portion (the sun itself) being stopped out by the black moon. This being the first time that any such attempt has been made, perfect success was hardly to be expected, and the party seem, besides, to have been delayed so long on their journey that they had not sufficient time to get their instruments and photographic apparatus in good order. Dr. Janssen, also in Siam, got good results, which confirm those obtained in 1871, but he was not favoured with a very clear sky.

Temperature of the Sun's Surface.—M. Faye, in the *Comptes Rendus*, discusses Mr. Langley's observations on the relative temperature of different parts of the sun's surface, drawing special attention to the result arrived at by Mr. Langley that the equatorial regions of the sun are not sensibly hotter than the polar, and that therefore all analogies founded on terrestrial phenomena such as trade winds are false, the currents in the sun being, not towards the equator, but parallel to it, as shown by the drift of sun spots. M. Faye hence derives support for his theory of the sun in contradistinction to that of P. Secchi.

The Sun's Parallax.—From the observations of the small planet Flora made in 1873, at various northern and southern observatories, Professor Galle has now deduced as a definitive result for the sun's parallax $8''.879$, with a probable error of about $0''.04$; and though some discordant observations have been rejected, their retention would hardly affect the result, which seems deserving of great confidence, on account of the accuracy with which observations of a star-like point, such as the planet Flora, are made. The close agreement of Dr. Galle's value with those obtained by other methods is very remarkable, Le Verrier having deduced from his planetary researches a parallax of $8''.86$; while Cornu from the velocity of light, combined with Delambre's value of the time taken by the ray to traverse the earth's orbit (determined from a thousand eclipses of Jupiter's first satellite), found the value $8''.88$. The modern value, however, of the aberration-constant (which depends on the ratio of the velocity of the earth in its orbit to that of light), does not agree very well with this, giving a parallax of $8''.80$, so that there is still a little uncertainty, which we may hope that the late Transit of Venus will clear up.

Variability in the Star 61 Geminorum.—Mr. Webb, in the *Monthly Notices*, calls attention to the of the components of this double star, which seems to have undergone some curious changes, having been recorded in the Bedford Catalogue as of the ninth magnitude, though recent observers

have been unable to detect it at all. There is also suspicion that the principal star has changed its colour from deep yellow to white; so that the pair certainly deserve further attention.

ANTHROPOLOGY.

The French African Expedition.—An expedition is announced in the *Times* of the 8th inst., under the auspices of the French Government, for the purpose of exploring the unknown country situated between the basin of the Congo on the west, and the White Nile on the east. The expedition, under the command of M.M. de Brazza and Marche, will leave France early in September, and will ascend the river Ogoway in a gunboat as far as its junction with the Ngunie, at which place native pirogues will be taken for the ascent of the latter river, passing through the country of the Osyebas, a warlike tribe supposed to be allied to the Fans. One of the main objects of the travellers appears to be to throw light on the anthropology of this unknown region, and to trace the connexion which is supposed to exist between the Niam-Niams on the east, and the Fans on the west. The traditions of both tribes point to a central origin, and some of their customs are so nearly alike as to afford proof of social contact: both file their teeth to a point, and the resemblance of their metallurgic arts affords proof of identity. These connexions were brought to notice some years ago by specimens brought to England by Consul Petherick from the White Nile, and those obtained by Mr. Walker from the Fans. The peculiar form of their ogee-sectioned dagger and spear-blades, the form of their iron missile weapons, called Hunga-Munga in Central Africa, their double skin bellows, are quite unmistakable; but some of them afford evidence of connexion not only between these races, but also with the Bechuanas on the south, and the Marghi and Bagirmi of Baoth, in the neighbourhood of Lake Tchad. They afford proof of social contact, not of race, and point to a common origin for the whole of the metallurgic arts of the African continent and their connexion in remote times with those of India and the Asiatic isles. There is also a peculiar form of leather shield with projecting wings on the upper side, which is used by both the Fans of the Gaboon and the Bassutos of South-east Africa, the distribution of which the travellers would do well to notice should they come across it.

Anthropology in South Australia.—His Excellency Mr. Musgrave, Governor of South Australia, has applied to Mr. Stanford, through the Agent-general, for several copies of the *Notes and Queries on Anthropology*, lately published by the British Association. They are to be distributed to magistrates and inspectors of police in the country districts, where they come in contact with the aborigines. Much valuable information will be obtained in this way, and it is to be hoped that the example will be followed by other colonial governors.

Drift Implements in the Thames Valley.—A committee of the Anthropological Institute, consisting of the President, Colonel A. Lane Fox, Mr. John Evans, F.R.S., President of the Geological Society, Mr. Geo. Brabrook, Director, and several other members, met on Wednesday, the 5th inst., at Acton, for the purpose of examining the drift gravels of the valley in that neighbourhood. They were met at the station by Mr. A. Tylor, Mr. T. Belt, Mr. Park Harrison, Mr. Moncure Conway, Mr. P. Crooke, and others, who have lately devoted much attention to the prehistoric archaeology of this neighbourhood. The committee were then conducted by Mr. Crooke over the sites in which he has lately discovered implements of the drift type in gravels at the height of 80, 60, and 30 feet above mean tide; the principal localities being East Acton, Gunnersbury Park, Grove Road, Ealing, Bollow Bridge Lane, Drayton Green, and Stile Hall, Kew Bridge. At the

height of between 50 and 60 feet a narrow strip of the London clay crops out, dividing the high terrace gravels from those of the mid terrace. Near this strip of clay it was noticed that the gravel was less stratified than at other levels, and the seams of gravel were much contorted. The implements were usually found near the bottom of the gravel, and sometimes in actual contact with the underlying clay. Bones of the *Rhinoceros hemitoechus*, *Equus caballus*, *Hippopotamus major*, *Bos Taurus*, *Bison priscus*, *Cervus Clactoniensis*, *Cervus elaphus*, *Cervus tarandus*, *Ursus feror priscus*, and *Elephas primigenius*, have at different times been found in the mid-terrace gravels, in association with the implements. Mr. Crooke's discovery confirms the results of Col. A. Lane Fox's examination of the valley, which was communicated to the Geological Society in 1872, and adds thereto the discovery of implements in the mid terrace at levels of twenty to forty feet above mean tide. It was noticed that some of the implements from the mid terrace showed evidence of having been much rolled, probably from having been washed out of the high terrace gravels, and rolled in the river during a long course of ages. This is the first of a series of expeditions to be conducted by the committee of the Institute. In the course of the present year it is intended, with the permission of the owner, Captain Wisden, to make excavations in Cissbury Camp, near Worthing, the object being to fix the date of the camp with reference to the stone age, for which the locality affords unusual facilities, owing to the discovery of a large flint implement factory within the camp. The so-called Caesar's Camp, near Folkestone, will also be examined with a like object; and it would be desirable that, before the camp at Wimbeldon is completely built over, excavations should be made with the view of ascertaining the date of its construction by means of any relics that may be discovered at different levels in the silting up of the ditch.

CAPTAIN RICHARD BURTON, having lately returned to England, has communicated to the Anthropological Institute a paper on the prehistoric antiquities of Southern Italy, which will be read at a future meeting. Mr. John Forrest, the recent explorer of several hitherto unknown tribes of the Australian continent, will also make a communication to the Institute in the course of the session; and Mr. Herbert Spencer has intimated his intention of communicating a paper on the comparative psychology of savages, which will be looked forward to with interest by anthropologists. The interest taken by ladies in the department of anthropology of the British Association has induced the Institute to open its ranks to members of the female sex. Foremost among the list of the new members thus included we notice the name of Miss Buckland, the writer of several interesting anthropological papers; the names of Lady Claude Hamilton, Lady Hamilton Gordon, and Lady Maude Parry are also included among the new adhesions. In taking this course the Institute has followed the example of the Anthropological Society of Paris.

MEETINGS OF SOCIETIES.

CAMBRIDGE PHILOSOPHICAL SOCIETY (Monday, May 3).

A COMMUNICATION was made by Mr. Pirie, of Queen's College, "On a Method of introducing a Current into a Galvanometer Circuit." Mr. Pirie said that electricians had often to work with currents far too strong for their galvanometer. He mentioned various methods in use for checking the swing of the needle; but contended that an easily made and easily used controller for rough work was a desideratum. He described an instrument in the form of a continuously varying shunt, in which a moving connexion was obtained by a tube filled with mercury sliding on a wire of suit-

able resistance. This form of connexion was first used by Mr. Barrett, of Dublin. With the aid of Mr. Garnett, the Demonstrator of Physics, Mr. Pirie showed that a very good connexion was obtained by this means; and, subsequently, that the instrument described gave a control over the movements of the needle in a galvanometer whose resistance was not too different from its own.

PHYSICAL SOCIETY (Saturday, May 8).

PROFESSOR GLADSTONE, F.R.S., President, in the Chair. Mr. Crookes, F.R.S., exhibited and described some experiments on attraction and repulsion resulting from radiation, which he has recently submitted to the Royal Society, and of which an account has already been given in this journal (p. 189). It is unnecessary, therefore, to describe them at length, but it may be pointed out that one of the most beautiful of the instruments is one which Mr. Crookes calls a radiometer. It consists of four arms suspended on a steel point resting in a cup, so that it is capable of revolving horizontally. To the extremity of each arm is fastened a thin disc of pith, lampblack on one side so that the black and white faces alternate. The whole is enclosed in a glass globe, which is then exhausted as perfectly as possible and hermetically sealed. Several of these instruments, varying in delicacy, were exhibited, and experiments made showing the influence of light and heat of different degrees of refrangibility, and in proof of the law of inverse squares, &c.

The President, in expressing the cordial thanks of the Society, referred to Mr. Crookes's statement that the repulsion was proportional to the length of the vibrations, and asked whether at the red end of the spectrum there was an abrupt termination of the action and a gradual diminution towards the ultra violet.

Mr. Walen enquired as to the action of the magnet and of different axes of crystals in causing repulsion.

Professor Woodward made some observations with reference to the manipulation.

Professor Guthrie observed that researches might be divided into two classes: those in which the value of the result outweighed the merit of the author, and those in which a result of comparatively trifling significance is the outcome of years of patient labour. He expressed the conviction that Mr. Crookes's research had in a high degree both elements of greatness.

Mr. Crookes stated in reply to Dr. Gladstone's question that the glass envelope of the radiometer must be taken into account in considering the action of the rays of different refrangibility, and further, that the increased effect due to red light may have been in part due to the concentration of rays of low refrangibility which attends the use of glass prisms. A diffraction spectrum might give a different result. He added that when a ray falls on a surface capable of motion, which reflects it, very little work is done; but if the surface quenches the ray, motion is produced. He then thanked Professor Guthrie for his kindly remarks.

Professor Cornu, of the Ecole Polytechnique, described his recent experiments on the determination of the velocity of light. He gave an account of the method of Foucault, and exhibited the complete apparatus, including the arrangement of mirrors for multiplying the distance traversed between the two reflections from the revolving mirror. He described the toothed wheel of Fizeau and the improvements which he had himself made, in his own determinations by this method. He found that it was impossible to give a uniform motion to the toothed wheel, and therefore adopted an electrical registering apparatus to mark the increase of its velocity, an electric signal enabling the observer to point out the instant at which the right velocity is obtained. Another very important improvement is the substitution

of a pair of observations of the return ray for the single observation of a total extinction. Professor Cornu's most recent determination was made in the summer of 1874, the two stations being the Paris Observatory and the tower of Monthéry, 14½ miles apart. A mean of 508 experiments gave 300,400 kilometres, or 186,660 miles per second.

Professor Adams mentioned that M. Cornu had contributed in no small measure to the success which had attended the formation in France of a society closely corresponding to our British Association, and assured him that the Physical Society felt grateful for his presence, as he could well understand the difficulties with which the early days of such a society are beset. M. Cornu stated, in answer to a question of Professor G. C. Foster, that he objected to the revolving mirror method because it was impossible to say to what extent the movement of the revolving mirror, and the disturbance of the air in its neighbourhood, affected the reflexion and propagation of the ray of light.

ANTHROPOLOGICAL INSTITUTE (Tuesday, May 11).

COLONEL A. LANE FOX, President, in the Chair. Mr. Moncreux D. Conway, M.A., read a paper on "Mythology." He maintained that the evolution of Mythology was the reverse of what the facts of physical evolution might suggest; it was not from beneath, upwards to higher things, but rather from the grand in nature, that the human mind had arrived at the association of mystical meanings with the stock and stone, plants and animals, which figured so largely in popular mythology. Sacred animals were consecrated as symbols of the higher phenomena. Flowers and plants derived their potency from connexion with solar or lunar influences, still represented in the belief that to be healing they must be gathered at certain holy times or at certain phases of the moon. It was also maintained that the gods were personifications of power, and unmoral. They were gradually divided into good and evil, the demoniac powers being for a long time not diabolical, but personifications of hunger, thirst, and the dangers and impediments of life. The idea was combated that men had ever worshipped purely evil powers. The legend of Eden was held by Mr. Conway to be inexplicable by Semitic analogues. In India were found the myths of serpent-guarded trees and the apple of immortality, and the curse on the serpent which had puzzled theologians was explained by the theory of transmigration.

A paper, by the Rev. A. H. Sayce, M.A., was read, on "Language and Race." The author held that the fallacy of considering language a sure and certain test of race was one to which few modern philologists would commit themselves; there was no assertion which could be more readily confronted, more clearly be demonstrated to be false. Society implied language, race did not; hence, while it might be asserted that language is the test of social contact, it might be asserted with equal precision that it is not a test of race. Language could tell us nothing of race. It did not even raise a presumption that the speakers of the same language were all of the same origin. It was only necessary to look at the great states of Europe with their mingled races and common dialects to discover that language showed only that they had all come under the same social influences. Race in philology and race in physiology, meant very different things.

Mr. A. W. Franks, F.R.S., exhibited an inscribed wooden gorget from Easter Island.

GEOLOGICAL SOCIETY (Wednesday, May 12).

J. EVANS, Esq., F.R.S., President, in the Chair. Principal Dawson, of Montreal, communicated a paper "On the Occurrence of *Eozoon Canadense* at Côte St. Pierre." Having visited this locality last autumn, he examined the white thin-bedded crystalline limestone of Lower Laurentian age, and

detected two new forms of the celebrated foraminifer. Although these may turn out to be distinct species of *Eozoon*, it is safer to regard them at present as merely varietal forms of *E. Canadense*, and he accordingly distinguishes one as variety *minor*, and the other as variety *acervulina*. Dr. Dawson also described some serpentine casts of the globular chamberlets of a foraminifer resembling *Globigerina*. The Rev. Oswald Fisher, of Cambridge, offered some criticisms on Mr. Mallet's theory of Vulcanicity. Reviewing the several sections of Mr. Mallet's famous paper *seriatim*, he pointed out those sections to which he took exception, and gave his reasons based on mathematical and physical grounds. With reference to the hypothesis that the great features of the earth's surface are directly connected with the contractions of the cooling crust, Mr. Fisher maintained that if the crust cooled down from the extreme temperature of 4,000° Fahr. to 0°, the difference of contraction in two adjacent areas would not amount to more than a mile in a thickness of 400 miles. He argued against the hypothesis that volcanic phenomena are produced by the heat which is developed by the transformation of the mechanical energy due to movements in the earth's crust, since it appears difficult to understand how such heat could become sufficiently localised to effect fusion of the rocks. At this meeting Sir P. de M. Grey Egerton, Bart., was elected a Vice-President, and Mr. Carruthers a member of Council; the vacancies thus filled having been caused by the death of Sir Charles Lyell.

PSYCHOLOGICAL SOCIETY OF GREAT BRITAIN

(Wednesday, May 12).

MR. SERJEANT COX, President, in the Chair. Mr. Serjeant Cox read a paper "On some of the Phenomena of Sleep and Dreams," the purport of which was to show that the difference between the waking and the dreaming mind was caused by the suspension of the action of the will. The sleeper was conscious of the action of his mind, but was unable to control it as when awake. His implicit belief in the reality of the dream is due to this incapacity to try the reality of the mental impressions by the exercise of that combination of faculties which is employed in the process of reasoning. Mr. George Harris then read a paper "On the Psychology of Memory," describing the various problems presented by this mental faculty which await solution and should engage the attention of the Society. The subject of the next meeting will be "The Duality of the Mind."

ZOOLOGICAL SOCIETY OF LONDON (Thursday, May 13).

IN the fifth of the present course of lectures at the Society's Gardens, Professor Garrod treated of the chevrotains and of the hollow-horned ruminants. The chevrotains (*Tragulidae*) are small hornless animals which inhabit tropical Asia and Africa, and in outward appearance they strongly resemble the musk deer, with which they were formerly associated. In their anatomy, however, they show many points of affinity to the non-ruminating ungulates, notably in the structure of their vertebrae, legs, and digestive organs, and they are now consequently regarded as having changed less in organisation than the other ruminants, and as being the nearest living representatives of the ancient forms from which all the even-toed ungulates are probably descended. The general characters of the hollow-horned ruminants, or oxen, sheep, goats, and antelopes, were described, and the peculiarities of the more remarkable species were pointed out and illustrated by numerous specimens. Special attention was directed to the giraffe and the pronghorn, both of which are remarkable in the exceptional structure of the horns. In the former well-known animal the horns are covered by the hairy skin, and are not true processes of the frontal

bones, but are formed from independent centres of ossification. In the pronghorn of North America the outer covering of the horns is shed every year, but the bony cores are persistent throughout life. The next two lectures will be "On Camels and Llamas," by Professor Garrod, on Thursday, May 27; and "On Elephants," by Professor Flower, F.R.S., on Thursday, June 3, on each day at 5 P.M.

SOCIETY OF ANTIQUARIES (Thursday, May 13).

A PAPER was contributed by the Rev. Assheton Pownall, giving an account of a glass vial found in the church of Anstey, Hertfordshire. Similar vials have been discovered in churches in the counties of Leicester, Cornwall, and Warwick. It is supposed that some of these contained holy oil miraculously distilled from the relics of saints, especially of St. Katharine; but the contents of the Anstey vial were proved by analysis to be blood, probably itself a relic. Professor Bunnell Lewis sent for exhibition the rubbing of a Roman inscription, found on a slab of red sandstone measuring 4 feet by 1 foot 10 inches, near Brougham Castle in Westmoreland. The workmanship is inferior, the types of the letters being rude, and the spelling faulty. The inscription runs as follows:—"Plum. Lunari. titul. pos. coniugi carissim.;" the terminations of the second and last words are lost by mutilation, so that the sex of the deceased is uncertain. The best rendering offered was "Plumae Lunaris titulum posuit coniugi carissimae;" but the two names are so uncommon that this interpretation is very uncertain. A few other objects of interest were exhibited, including a Chinese *cloisonné* enamel incense burner from the Summer Palace at Pekin, now in the possession of Mr. Bruton; a silver ring of the fourteenth century found at Howth, ornamented with two hands and a crowned monogram, and a seal found near Drogheda, bearing a galley and the name of Walter Champioun.

ROYAL ASTRONOMICAL SOCIETY (Friday, May 14).

LORD LINDSAY, Vice-President, in the Chair. Mr. Russell, Director of the Sydney Observatory, gave an account of the observations of the Transit of Venus made in New South Wales, and of the various appearances seen by different observers with telescopes widely differing in size, after which Mr. Stone made some remarks on the "black drop" as seen at the Royal Observatory, Cape of Good Hope, a very bright field having been used, in order to exhibit this phenomenon in the most marked manner. An interesting discussion then followed, in which Lord Lindsay, Mr. De La Rue, Captain Abney, Captain Noble, Mr. Ranyard and others, took part, on the question of photographic irradiation as affecting the records of the Transit of Venus, and a short paper was read by Mr. Christie on the same subject. Mr. Dunkin then read a paper by Professor C. Piazzi Smyth, calling attention to a remarkable change in the proper motion of a small star in Cetus, which seemed to imply motion in an orbit, as in the case of Sirius and Procyon, and Mr. Dunkin confirmed this result by an examination of recent observations made at Greenwich. There were several other papers presented, but their titles only were read, the meeting having already lasted beyond the usual hour.

FINE ART.

THE ROYAL ACADEMY EXHIBITION.

(Third Notice.)

General Subjects (continued).—Two of the really fine exhibitors at the Academy are Mr. Alma Tadema and Mr. Herkomer: their pictures would be leading attractions in any annual exhibition in Europe (indeed, the larger work of the Dutch master was displayed last year in Paris with great applause), and would hold their place

well in a national or permanent collection. The larger Tadema is named *The Sculpture Gallery*: it has been considerably altered since it was in Paris, the amount of detail and of general enrichment having been observably increased. The subject is a Roman family congregated to look at a great sculptured vase of black marble, which is being turned round to feast their eyes: various other works of the carver's art are also on the spot. Portraits of the painter, his wife, and other members of the family, are introduced, and will always contribute to make this one of the most desirable examples of his handiwork. The different pictorial values of the hues of white and of greyish white in this picture are most noteworthy; and, along with this, the solidity of form and general firmness of execution. But it has become a superfluity to comment on the excellence of Mr. Tadema's art in these respects, and in its spirit of archaeological accuracy. His second picture, *Water Pets*, represents a Roman lady lying her full length on a mosaic pavement, to watch the motions of some gold and silver fish in a tank sunk in the flooring, and at moments to feed them with bread-crumbs. The whole apartment is in cool unvaried half-light: only at the right-hand corner of the canvas one sees the end of a curtain, and below it a glimpse of the light outside. The most conspicuous feature and feat of this picture is the mosaic in receding perspective; a monument of minute nicety, which nevertheless avoids being petty. Nor indeed is this any better painted than other details, such as the metal salver containing bread, and the plump cushion of a dim yellow tint on which the lady is slightly propped. Her face is well moulded without being particularly handsome: it hardly looks of pure European race, but rather Syrian or Asiatic. Mr. Herkomer's picture—*The Last Muster, Sunday at the Royal Hospital, Chelsea*—is a surprising piece of vigour; of the force, dignity, significance, and diversity, with which a subject of actual life (common in itself, yet far from common in its pictorial externals) can be invested by resolute unswerving realism, combined, as it here so strikingly is, with very advanced artistic power. The red-coated pensioners who throng the canvas, all old or oldish men, are treated with a singular grasp of the general and individual effect of such a group: they might on the whole have been made handsomer, but they are full of character. One, the principal figure, is a very aged white-haired man, not long for this world; he drowzes off as the service proceeds, and his next neighbour, a strenuous-looking veteran, touches him on the wrist. Another in front has a round solid bald head, with an air of bulldog tenacity; one to the extreme right is blind. They are seated on benches of rather light-hued oak, and tattered banners overhang them: the white daylight glances downward from a double range of windows, of which only one set is seen. A few non-pensioner members of the congregation sit in the background, men, women, and children. This highly remarkable picture surprises many visitors; others it does not surprise, cognizant as they were, from previous exhibitions, of the capacity of Mr. Herkomer, but it more than confirms the highest anticipations of those who were inclined to believe in him. Henceforth he occupies unmistakably a position among our leading painters. The manipulation is very free; with loaded colour and much variety of touch.

We shall run rapidly through a list of other pictures in this section. Waterhouse, *Miranda*, neatly felt and executed. Bedford, *Hermione*, the wronged queen of the *Winter's Tale*, posed as a statue; good in expression, yearning to declare herself to her husband and daughter, and resume her place among the living. Pettie, *Scene in Hal of the Wynd's Smithy* (from the *Fair Maid of Perth*), where Hal consigns the coat of mail to the Highlander; done on the principle of picturesque sketching, yet not unsubstantially, and

in a style well suited to this sort of subject-matter, which, after all, does not comport with more than a certain amount of severity of treatment. Mrs. Jopling, *Elaine*, one of the lady's best productions. W. V. Herbert, *Misery and Joy before an Altar to the Unknown God, Days of Ancient Athens*. This is a subject of invention, of some sincerity and some interest, but tending towards the flimsy. Misery is a crippled woman on crutches; Joy, a maiden in an attitude between expansiveness and adoration. The altar is so faintly designed that it seems hardly to represent an object having solid projection. F. H. Jackson, *Decorative Figure, Vocal Music*; a work having largeness and felicity of style, more especially in the management of the full-tinted green drapery. Miss A. M. Lea, *A Bacchante*, deserving of somewhat the same encomium; but with more vivacity, and no trace of the severe. A. Hill, *Andromeda*, standing naked on the naked ledge of rock, from which the lapping of the tide is receding; no sky is visible—only the chained woman and the desolate crag. This is mainly a nude study, but raised to a somewhat higher pitch by the conception and sentiment. Leslie, *On the Banks of the Thames*, A.D. 200; a British "young lady" of that rudimentary epoch, who might have come out of "an establishment for young ladies" of the present day, and the Kensingtonian suburb. Mr. Leslie is a painter who has ability, attractive power, and accomplishment, which appear to some extent or other in whatever he does: we cannot, however, profess to think highly of this performance, or to consider that Mr. Leslie has, in a general way, been advancing of late years; popularity and a ready market have damaged him. The drooping left hand of the British maiden is indifferently drawn. Mrs. Anderson, *Convent Life*; a careful commendable picture of two aged nuns, one with her distaff and a green parrot, another with rich silk embroidery; a convent pupil brings some flowers, which may serve as material for continuing the brodered design; a youthful nun is behind, rapt in holy or wandering meditations. Edward Hughes, *Family Prayer in the Olden Time*; creditably presented and put together, but a little more demonstrative than was needed. Symons, *In Hord Mortis*; an ancient Franciscan, worn by long austerities, dying in the convent precincts as his brethren descend the stairs, chanting vespers. There is true expression in this work, unmitigated, and to some eyes no doubt rather uncouth, and a picturesque as well as unhackneyed arrangement of the background and its personages. J. A. Fitzgerald, *Detected*; two thieves of the sixteenth century walking off from a church with the church plate, stopped by a mastiff of an enquiring air which may at any moment become perilously menacing; the rapscallions look at him with a sense of being in a fix, very faithfully conveyed. Cary, *Watching the Game*; two lovers and some of their elders on the lawn of an old mansion, in the days of Charles I., one of the best pictures the artist has exhibited this long while. Goodall, *The Day of Palm-offering*: "It is an ordinary sight every Friday, in the vicinity of Cairo, to see a blind fakier being led to the cemetery, hired for the purpose of reciting the Koran, and placing a palm-branch on the family grave." This is a rather large picture, executed no doubt with more than ordinary competence and skill—a picture essentially in the nature of a study, and gaining little or nothing by being carried out on this more laboured scale; the feet of the blind man have too much of a stationary look. Gow, *Mrs. Baddeley at the Pantheon*, with a motto from Thackeray setting forth how the ushers refused admission to "lovely Sophy Baddeley," but her numerous admirers drew their rapiers, and arched them across for her to pass underneath. This, like other works by Mr. Gow, shows any amount of readiness and nicety; it is considerably the largest painting that we remember from his hand. The objection, and

a serious one it is, is that Mr. Gow does not seem to have painted his picture with a view to beauty, or elegance, or sweetness or richness of colour and lighting; it is ordinary in all these respects, although the very essence of the subject is the fascination of Mrs. Baddeley, and among her admirers one might naturally expect to find some of the handsomest gallants in London. They do look reasonably like gentlemen, but not like *fine* gentlemen. W. Maclaren, *Scene in an Orange Garden in Capri*; a landscape with figures of women; well carried out, careful and even elevated in quality. V. W. Bromley, *Mid-day Rest, Sioux Indians*; painted in vigorous shadow, with some effective patches of light, and with a quick sense of the picturesque.

Domestic Subjects.—This is of course an extremely large section of the exhibition, if we give a somewhat wide range to the term "domestic"—although, indeed, we have already specified some pictures which might, without straining the term, have been included under the same designation. We count in this class no fewer than sixty-nine oil painters, and eighty-nine oil pictures, to which we have appended notes in the catalogue: in our review, some of these may of necessity fall out, through want of space, and disinclination to iterate and reiterate remarks of the like general kind. In our present notice, we shall restrict ourselves to four leading exhibitors—Messrs. Millais, Fildes, Walker, and Chierici.

Mr. Millais's domestic picture might with about equal propriety be called a portrait: he elects, however, to turn it into a domestic picture by entitling it *No*, and we follow his lead. The subject is a handsome young lady, with a bright complexion and a black dress, whose general aspect suggests perhaps rather a married than an unwedded woman. She is reading over a letter which she has written, and which, as the title of the work apprises us, contains a negative answer to a suitor; she scans it somewhat regretfully, not wishing to pain the poor fellow beyond what needs must be, and pondering the phrases wherein she has couched her refusal,—possibly even reflecting, ere the final moment comes for closing and despatching the missive, whether it *shall* be a conclusive refusal after all. The background consists of a dim brownish tapestry. This is one of Mr. Millais's simple and thoroughly efficient works,—masterly, without vivid effort or salient peculiarity. It evinces once again his distinctive gift for marking a shade or undercurrent of emotional expression, without the least external insistency; for certainly there is something of regret, of suspense, and of kindly consideration, in the face, though we could not fix upon any one point in it that emphasizes these feelings. Mr. Fildes paints *Betty*, a large-moulded milkmaid, who might be called strapping or buxom, but to whom the epithet "healthy" comes most appropriate of all: she is going out to milking, carrying her pail and stool—holding them with a vigorous hand and exuberance of physique which almost suggest a twirl. Her weighty crop of yellow hair harmonises with her wide eyes and slight half-smile. The freshness of the rural morning is about her, and she is no less fresh than that. This is a work of exceeding vigour; it might seem to have been placed on the canvas by its painter with a fullness of animal spirits corresponding to its subject, as certainly with the most unmistakable surehandedness. Mr. Walker's picture, named *The Right of Way*, likewise deals with a theme of pure rusticity. A woman with eggs, and a small boy with prim-roses, are walking on a path bordering a stream; they are accompanied by a black puppy. This innoxious beast, or some other abstruse incentive, has roused the ire of a ewe. She parts company with other sheep and lambs; and, followed by her woolly offspring, marches up resolutely towards the boy, who shows a disproportionate amount of nervous alarm, hardly

perhaps consistent with his country breeding. Rain is falling over a pale horizon; conformably to this atmospheric condition, the picture is painted entirely in local colours, without shadows. It is a naïve piece of nature, and none the less of art, genuinely enjoyable. Signor Chierici (whose address is at Reggio in Central Italy) exhibits two pictures which appear to be prime favourites with the lovers of domestic art, and, indeed, with the visitors generally; nor is their popularity undeserved, for they are extremely natural, with true and not overdone detail of incident and expression, and firm and accurate though rather ordinary object-painting. They are pleasant and highly competent works, in a style which one might have been disposed to identify rather with the British or Flemish than the Italian nationality. The first of these works is named *Mother is Ill*, and represents the home of an Italian fisherman, who, in the enforced absence of the mother (from whom, perhaps, an addition to the family may be in prospect), is taking care of the baby and four other children; he blows on a pap-spoon, from which he is about to feed the infant; a turkey-hen and her brood walk into the apartment, and other symptoms of unmaternal littleness are apparent *passim*. The second picture is entitled *The Bath*; the personages here, including a rufous-tabby cat, are partly the same as in the preceding composition. There is a mother with four children: the younger pair are about to take their bath in a large earthen pan—a girl about three years of age and a boy of one; both swerve their feet upwards, with a pretty shrinking from the cool liquid; a smile of affectionate amusement passes over the mother's features.

W. M. ROSSETTI.

THE SOCIETY OF FRENCH ARTISTS.

THE tenth exhibition of this society, housed at No. 168 New Bond Street, opened on the 17th instant. Mr. Deschamps, who had hitherto been the efficient and courteous manager, is now the lessee of the premises: he intends to continue "submitting to English connoisseurs examples of the highest French art." This, if heedfully carried out, is a laudable object: we shall always be glad to see "examples of the highest French art," or, indeed, of the highest German, Italian, Low Country, American, Japanese, or (were it forthcoming) Hottentot or Polynesian art. It is a very different object from that which has been diligently pursued of late years by various picture-dealers and others—viz. the flooding and glutting of the English market with second down to twentieth rate specimens of foreign art, offending the judicious, misleading the ignorant and gullible, wheeling the British bank-note out of lax and wealthy hands, and diverting the stream of patronage from many a fairly good native painter to many a positively bad foreign one. This is an abuse and an imposition against which we have heretofore protested, and shall not cease to protest as long as it remains unabated. Mr. Deschamps has certainly, on the present occasion, got together several very good works, not unmingled with others of a lower order. If he will lay to heart the sound maxim that good foreign art is welcome in England and everywhere, and that common or bad foreign art had better remain in its proper obscurity, undiffused and unpuffed, we and others will be his debtors.

The demands made on our space by the Royal Academy and other exhibitions are so considerable just now that we may be compelled to dispose of the Bond Street Gallery with some brevity; for the current week, we confine ourselves to a single contributor.

The chief feature of the collection is the numerous assemblage of works by M. Legros, an admirable painter and designer, domesticated among ourselves for many years past, whose productions we always contemplate with the highest respect, and often with heartiest delight. His manly, sincere way of regarding his subjects; his lofty,

serene, self-respecting, and unfrittered art; his solid attainments in design, draughtsmanship, tone, and colour, entitle him to a European reputation, which, indeed, by this time he hardly falls short of enjoying. The present exhibition contains two of his large oil-pictures, both previously known in London, and a good number of his water-colour and other drawings, and etchings. The *Chantres Espagnols*, painted in 1870, and further worked upon since then, is a grand performance; the two Bishops in front singularly fine and dignified, and other heads painted with a grave solidity that has more affinity to Holbein than almost any other painter of our time can boast. *Un Pèlerinage* was executed in 1871, and is hardly inferior to the earlier work—in some respects even more interesting; it is a picture of female and personal, as the other of masculine and partly external, devotion. The artist who has produced these works may feel pretty secure as to his future position in the art of France and of the nineteenth century. The *Portrait of Gambetta* is new. The likeness of the keen-brained and great-hearted Republican, the patriot who dared to resolve that France must still be herself and still august in the hour of her darkest agony and abasement, will of course be interesting to many, apart from its value as a work of art. In this latter respect also the picture is a fine one, though we are a little disappointed at a certain rather stolid look in the face, which is indeed characteristic of M. Legros, if not perchance equally of M. Gambetta. It is remarkable that the artist, himself a man of much *esprit*, paints in a style which may almost be called anti-French in its decided exclusion of *esprit*: his portraits very generally look as if the facial mask had hardly sufficient mobility and permeability to give a full account of the feelings which it overlies. We here see Gambetta as a red-complexioned man, with grizzling though scarcely thinning hair: his countenance is set and determined, with a kind of permanent and general challenge in its gaze; he looks contemptuous, and not at the pains of easing off his contempt, so as to save it from becoming a standing irritation to others. In photographs of the same statesman we had thought a different expression the ruling one—an expression of fatigue, partly *blasé*, partly self-withdrawn, but not the less vigilant for an opportunity. It may well be that the expression indicated in the painting is the truer to the fact. The minor works by M. Legros are twenty-nine in number. Among these we notice particularly—*Le Coup de Vent*, sepia, very fine; *Le Canal*, water-colour, with trees on the bank, diminishing in size as they recede to the angle where the water makes a turn; *Etude de Tête*, pen and ink, a likeness of the artist's wife, singularly Raphaellesque in feature and expression; *Le Bûcheron*, crayon, with some colour; *Les Bûcherons*, a water-colour of high excellence in colour and otherwise, with one of the workmen felling a tree, and two others dragging it down with a rope. Also the following etchings: *Un Vieillard*, splendid; *Un Portrait*, (110); another (111) beautifully finished; *Portrait de Carlyle*, very grand, and a noble record of the stately head, whose refinement seems to augment with advancing age—Rembrandt might have done it, and some powerful reformer of the Calvinist times might have sat for it; *Un Chantre*; *Intérieur d'Eglise*, with choir-singers, wonderfully deep and rich in effect—one of the artist's best-known and most powerful etchings; *Etude de Tête*, a leading Communiard, with a very elevated character of head, excellently good.

W. M. ROSSETTI.

THE CAPITOLINE MUSEUM, THE COLOSSEUM, THE PALATINE AND ESQUILINE HILLS.

Rome.

SEVERAL of the sculptures unearthed on the Esquiline Hill during the last days of 1874 have recently been placed in the Capitoline Museum,

where they add much to the wealth and attractiveness of the art collections. In the gallery on the ground floor we see the Bacchus, a half-length statue (heroic size), one arm wanting, the other (the right) raised, with hand resting on the ivy-wreathed head. The figure is refined in form and graceful in pose, but the head is inferior, perhaps the work of another artist. In the largest hall on the upper storey we now see, removed from another place in this Museum, the life-size nude statue of a nymph in Parian marble, found on December 23 last, and finally installed in an arched recess where formerly stood a colossal bronze Hercules, rescued from the ruins of a temple dedicated to him, near the church of S. Maria in Cosmedin, which antique structure was swept away, for the sake of the building materials, by the Vandalism of Pope Sixtus IV., who wanted stone and marble for cannon-balls. I have mentioned, what is now generally agreed to by critics and artists in Rome, that this lovely statue, from the Esquiline treasure-trove, is a nymph, or naiad, not (as first erroneously reported) a Venus, having indeed no attribute or characteristic of the Greek Aphrodite; though Greek, I believe, all are agreed in considering this precious work of art to be. The otherwise nude figure has sandals on the feet (which an undraped Venus certainly would not wear), and the vase placed beside the right leg, on which lies a mass of drapery, also a basement supporting that vessel, are adorned with small reliefs, a serpent-like fish, and flowers with leaves—none of these objects being among the known symbols of the Cyprian goddess. In the same recess with the marble nymph we see two busts, one on each side—Hadrian (not one of the finest among portraits of him), and Manlia Scantilla, wife of Didius Julianus—if the other head here before us, of a beautiful and interesting woman, almost in the prime of life, with elaborately curled hair, is rightly attributed to her. Next to these stand, well placed for effect, two finely characterised and dignified female figures, fully draped, one unfortunately wanting both arms; the other, with the left arm and hand, but the right totally cut off from the otherwise complete figure. One wears the long tunica talaris and the palla over it; the other, a similar long flowing robe and the short tunica, with a girdle round the waist. The head of this latter statue has a grand and almost severe character, which would be suitable for the Tragic Muse; and the details of part of a lion's hide over the drapery that falls from the right shoulder confirm the supposition that it is a Melpomene who here stands before us, with her attributes from the Heraklean fable. The other statue, the pose of which is somewhat dramatic—so far as in its mutilated state this can be presumed—has a countenance of more mild and lovely type, and may perhaps be the companion muse, Erato or Terpsichore. Neither of them, however, has any ornamentation or dressing of hair, proper to these Muses in known examples of art.

Beside them are placed two half-length Tritons, both alike armless, except the remnant of one arm left to one figure. They are grandly characterised and wild looking, with a certain enthusiastic and unearthly expression in the strongly marked features, the long hair falling in heavy curls down the shoulders; each has the marine, half-fishy nature indicated by the curious details of scales on the broad chest, and also, though in slighter relief, on the cheeks and foreheads.

The half-length statue (heroic size) of Commodus with the attributes of Hercules, the lion's hide thrown like a hood over the head, and knotted on the muscular chest, the club in one hand, the apples of the Hesperides in the other. This work is an extraordinary specimen of minute and elaborate execution, betraying the tendencies to decline. It now stands appropriately in the so-called "Hall of Emperors." The elaborately adorned basement alone required much of the restorer's labours; and as we now see it,

comprises many details—a small shield with the Medusa head in low relief, two miniature cornucopias and a globe on which are the signs of the Zodiac—the sphere itself supported on one side by a female figure kneeling on one knee, still left (as found) headless; the companion figure, which has evidently been in the same position, being represented only by remains of two feet on the marble surface. The only other restorations which have been made are in part of the lion's hide, and the hand holding the golden apples. One may conjecture that the singular aggregate of emblems here surrounding the person of the unworthy son of Marcus Aurelius refer to his notorious proclivities in favour of Oriental religions, the Mithraic and others, as well as to his vaunted devotion for Hercules, whose names and attributes he affected to assume. The diminutive kneeling figures are, probably, intended for Victories, gazing upward in admiration of this Commodus Hercules.

Works in the Colosseum, on the Forum, and on the Palatine Hill continue, not rapidly, but with a certain progress which, every now and then, secures valuable results. Under the direction of the learned and long experienced Fiorelli, much may be expected. On the Palatine the *scavi* are now concentrated at the point most interesting, namely, around that extraordinary group of buildings in lithoid tufa, no doubt of highest antiquity, brought to light a few years ago, on the western ridge of the hill. At short distances to the north-west of these have been found buildings of the later imperial period (as the brickwork indicates), with the apparatus for baths in several chambers, and hypocaust below. In the great amphitheatre we look down, from the level once occupied by the shrines of the Via Crucis, on a wide, excavated area, within which are three systems of elliptical building, concentric with the outer arcades; and we may now see, cleared from soil, in the innermost circle (on the ground-floor area) eight rectilinear walls connected by partitions of brick and stone work, mostly rude and irregularly built. The different styles of building in these lower constructions generally, where massive stone courses and the brickwork of the decadence are curiously combined, afford proof of the various dates and origin of the buildings so long left underground which recent research has here brought to light. A noticeable detail is the number of round cavities in blocks of stone, many of which are coated with bronze still perfectly preserved, opening at regular intervals on the pavement, as well in the major area, which is, no doubt, the ground floor above which the moveable stage, the arena proper, extended, as in two vaulted corridors, branching off from the ellipse on the southern side laterally; and another more wide and lofty corridor, not yet completely explored, which loses itself in darkness at the extremity, where progress is stopped by the encumbering soil not yet removed. In this central corridor are set up several graffiti on marble, rudely representing combats of gladiators, of men with animals, and, in some instances, animals without men. On two of these slabs the gladiator is seen victorious with his palm, and the crown (apparently set with gems) hung up beside him. Some rilievi on larger marble slabs, also dug up among the ruins, represent, and not without truthfulness, animals both wild and domestic, in combat: a stag, a hare, &c. Among other sculptured remnants are two male toroses, one wearing a chlamys, the other with a cuirass and a chlamys thrown over it; also a winged sphinx in relief, and three remnants of similar figures (as they appear in their mutilated state to be), all which may have served to adorn the sides of a state chair—perhaps for the Consuls, if not for the Emperor himself—on the podium immediately above the arena. A large piece of woodwork, now laid lengthwise amid the labyrinthine buildings, has puzzled antiquarians and all who have attempted to explain the things lately discovered

in the Colosseum. It consists of several immense beams laid parallel, and crossed by rafters, which seem to have supported a flat boarding—the whole being so blackened and charred as to attest the action of fire—perhaps the conflagration which devastated this amphitheatre, in consequence of its having been struck in the upper part by lightning, A.D. 217. It is possible (and this is one among sundry conjectures advanced) that the wooden framework served as an inclined plane, for raising up on to the arena the cages of wild beasts, or for such animals as could be introduced at liberty, to be led, or driven in, to the same stage on which they had to be exhibited. There are also several small quadrangular chambers, among the ground-floor buildings, for which one can hardly conjecture other use than as cells for cages, which may thence have been lifted up to the arena of performance. The many massive brackets of travertine at regular intervals around the elliptic walls, seem obviously destined for supporting a moveable stage.

The Esquiline and Viminal hills (especially the former) still continue to yield antiquarian wealth, and still does that high eastern plateau within Rome's walls present the singular features, picturesque in irregularity, of a transition state—the passing of an old into the conditions of a new city, of the pontifical into the national capital, under a sceptre of limited monarchy. Among late discoveries on the Esquiline height, near the Servian Agger, are twenty-seven marble bases, probably of statues, with dedicatory inscriptions placed by soldiers, who for the most part belonged to the Praetorian Guard, and were generally natives of the Danubian provinces. They pray the gods to preserve emperors, empresses, or Caesars—sometimes their own well-being. They seem to have adopted a sort of mixed worship, blending their own northern superstitions with the more refined heathenism of the Empire; and what adds to the value of these inscriptions is the indication of dates, not only by Consulates so frequently changing in the course of twelve months under the later "Augusti," but by years, months, days. Near these inscriptions, in the magazine to which they have been removed, is seen an altar dedicated to Sylvanus (several memorials of whose worship have recently come to light in Rome and Ostia); also a curious monument of later heathenism, in form of a cippus, with a rude bas-relief of three deities—Jove with his eagle, Mars in complete armour, and a goddess with veiled head, one hand holding an oar (or rudder), and one foot resting on a wheel—apparently Nemesis, for an inscription records that this was dedicated by a soldier to Jupiter, Mars, Nemesis the Sun, Victory, and all "Diis Parentalibus." Another rilievo placed near this (probably an *ex voto* from some temple) represents, with spirited design, a chariot drawn by prancing steeds. Not far from the spot where these military inscriptions were found, has been laid open a wall in good *opus reticulatum* of early Roman work, on which are several graffiti of names of soldiers, &c., leading us to infer that this building was a "statio," probably for troops always on duty on the Esquiline and the adjacent territories.

The existence of a superb residence may be inferred from remains lately found on the same hill of a pavement consisting entirely of veined oriental alabaster, 170 large quadrangular slabs of which were still *in situ*, and completely preserved. A provisional magazine for antiquies dug up in this highly productive Esquiline and Viminal region has been formed in an outhouse of the suppressed convent of Redemptorist Fathers, near S. Maria Maggiore. The memorial column, surmounted by a large crucifix and image of the Virgin and Child, erected opposite to that basilica by Pope Clement VIII. (1595), to commemorate the conversion and absolution of Henry IV., has been (as I have mentioned) taken down, on account of the leveling of the piazza where it stood. It now lies in that magazine of antiquities awaiting the time

when it can be re-erected, and (as I hear is proposed) on its former site. Report speaks of an intention to open a permanent museum for objects of fine art, &c., dug up in the course of excavations for building the new civic quarter. Another, and perhaps better, project is for considerable enlargement of the Capitoline Museum, and of that wing of the building where the magistracy holds its meetings, the "Palazzo dei Conservatori."

I have mentioned the generosity of a gentleman who has been passing the season at Rome, Mr. Allan Fraser, of Hospitalfield (Forfarshire), on behalf of the British Fine Art Academy here established. He has lately presented 1,000*l.* to the Academy, that sum being deposited in an English bank in this city, the interest accruing at once to the institution so benefited. The Academy will continue, till a better locale can be secured, to occupy their former place of meeting, where they have a reading-room and library, in the Via Sistina on the Pincian Hill.

A Committee of Archaeology and Fine Art, consisting of twelve members to be nominated by the Crown, and to be immediately associated with the Superior Council of Public Instruction, has been appointed by the Italian Government according to decree of April 22. A new "Belle Arti" periodical, *Roma Artistica*, has just begun its career, with promise of success.

C. I. HERMAN.

ART SALES.

At the sale of a collection of modern pictures and water-colours during the past week at Messrs. Christie, Manson, and Woods', the following prices were realised:—J. S. Cotman, *Hay Barges Becalmed*, 220*l.* 10*s.*; *Waiting for the Ferry Boat, Mouth of the Yare*, 178*l.* 10*s.*; *On the Norfolk Coast*, with a windmill, boats, figures, &c., 147*l.*; *Off Portsmouth, the Impending Storm*, 41*l.*; Müller, *The Bay of Naples*, which bears the name of the painter and the date 1840, 1,627*l.* 10*s.*; *A Spanish Gipsy*, by E. Long, 186*l.* 10*s.*; *Hay on the Wind and the Rain*, by J. McWhirter, 98*l.* 15*s.*; *Scarborough*, by J. B. Pyne, 225*l.* 15*s.*; *The Widow*, by Landseer, 70*l.* 7*s.*; *On the Yare, near Thorpe*, by Old Crome, 194*l.* 5*s.*; *Off the Coast of Norfolk*, by John Barney Crome (the son), 115*l.* 10*s.*; *View near Norwich*, by Old Crome, 273*l.*; *On the Thames—Windsor Castle*, by Sir A. W. Callcott, R.A., 94*l.* 10*s.*; *An Overshot Mill*, by W. Müller, 241*l.* 10*s.*; *Christ and Two Disciples*, by W. Mulready, R.A., 52*l.* 10*s.*; *A Spot in the Highlands*, by Peter Graham, 399*l.*; *Francis I. and his Sister*, by R. P. Bonington, 157*l.* 10*s.*; *A Misty Morning in the Highlands*, by Peter Graham, 472*l.* 10*s.*; *Rembrandt in his Studio*, by Sir John Gilbert, A.R.A., 483*l.*; *The Glen, North Wales*, by J. Holland, 120*l.* 15*s.*; *Homewards*, by Peter Graham, 414*l.* 15*s.*; *At the Spring*, by P. F. Poole, R.A., 123*l.* 18*s.*; *A Tablespoonful Three Times a Day*, by E. Nicol, A.R.A., 304*l.* 10*s.*; *A Precautionary Measure*, the companion picture, 204*l.*; *Looking out for the Return of the Fishing Boats, Aberdeenshire Coast*, by Peter Graham, 609*l.*; Sea piece, *A Cutter getting under Way*, 157*l.* 10*s.*; *With Wind and Tide*, by Colin Hunter, 425*l.* 5*s.*; *A Convocation of Clergy*, by Sir John Gilbert, A.R.A., 420*l.*

In the collection of thirty-eight modern pictures of the English school, belonging to a gentleman in Lancashire, the following were noticeable examples:—J. Holland, *A View in Venice*, signed and dated, 89*l.* 5*s.*; W. Müller, *A Landscape*, with figures by David Cox, 231*l.*; C. R. Leslie, R.A., *The Duke and Duchess reading "Don Quixote"*, engraved, 105*l.*; David Cox, *Pointing the Way*, landscape and figure, 220*l.* 15*s.*; W. C. T. Dobson, R.A., *A Mushroom Girl*, 77*l.* 14*s.*; W. Müller, *The Lark Boy*, signed and dated, 53*l.* 11*s.*; B. W. Leader, *Capel Curig*, 325*l.* 10*s.*; T. Creswick, R.A., *A River Scene in Wales*, 194*l.* 5*s.*; W. Linnell, *A Landscape*, 273*l.*; G.

Chambers, *A Sea View*, with vessels, 67l. 4s.; J. Holland, *San Giorgio dei Greci, Venezia*, signed and dated, 182l. 15s.; *Boats, near San Giorgio*, signed and dated, 294l.; David Cox, *Darley Dale Churchyard*, 1,018l. 10s.

Of the water-colour drawings belonging to the late Mr. Frederick Timmins, of Edgbaston, Birmingham:—By David Cox, *Big Meadow, Bettws-y-Coed*, 126l.; *Snowstorm, Bettws-y-Coed*, 93l.; *View near Penmachno*, 311l. 17s.; *Beeston Castle, early morning*, 267l. 15s.; *Road near Calais*, 78l. 15s.; *Going to the Hayfield*, 105l. By T. Collier, *The First Snow in Nant Francon*, 84l.; *Twilight after Hail, near Ogwen*, 84l. D. Cox, *Old Mill at Bettws*, 126l.; *Sheep in a Valley*, 105l. Robie, *Roses*, 72l. 10s.; *The Deserted Church*, 157l. 10s.; *The Wooden Walls of England*, 1,417l. 10s.; *Tantallon Castle*, 14l.; *Sand-hills near Barmouth*, 120l. 15s.; and *Collecting the Flock, Llanbedr*, 105l. Colin Hunter, *Mending Nets, Coast of Devon*, 153l. 6s.; *A Landscape, with Man fishing*, 168l. J. Syer, *View in Wales*, 126l. The total of the 130 lots amounted to 10,140l.

If the collection of water-colour drawings belonging to Mr. Charles Lewes Parker, with twelve works of De Wint, the property of a lady deceased, and twenty drawings from those belonging to the late Mr. R. Ellison, sold on Saturday, the following were the chief lots:—*Holy Thursday*, by Thorne Waite, 246l. 15s.; *Chepstow Castle*, by David Cox, 105l.; and another by the same, 118l.; *Bolton Abbey*, by G. A. Fripp, 157l. 10s.; *Rouen*, by S. Prout, 145l. 17s.; *Beverley, Yorkshire*, by P. De Wint, 971l. 5s.; *A Street Scene in Caen*, by S. Prout, 336l.; *Folkestone*, by J. M. W. Turner, R.A., 451l. 10s.; *A Neapolitan Girl*, by F. W. Burton, 492l.; *The Last Man from the Wreck*, by E. Duncan, 504l. From a different property were sold a drawing by Turner of the Interior of Ely Cathedral, which was painted for the Right Rev. James Yorke, Bishop of Ely, 252l. By Copley Fielding, *Bem-y-Glo*, a drawing bought from the Water-Colour Exhibition of 1844 by the owner, which the artist, in a letter, said was considered one of his best works, 388l. 10s. By W. Hunt, *Very Queer*, engraved, 94l. 10s. By S. Prout, *Interior of a Church in Normandy during Mass*, 157l. 10s.

THE *Times* gives the following account of the large and very interesting collection of Indian armour and arms, Chinese and Japanese enamels, carvings in rock crystal, jade, and agate, with other objects of Oriental art, formed by the late Colonel Charles Seton Guthrie, which was sold at Christie's last week. So many fine examples of the glyptic art as practised by the Asiatic workers have rarely been collected. Many of them had been exhibited in the India Museum, and we believe some of the choicest specimens brought over by Colonel Guthrie now belong to the national collection. Among the hard stone carvings were many of the intaglio known as Poniatowski gems, being the works of modern Italian artists in imitation of the antique, which were sold to the Prince in considerable numbers as real works of ancient art, and which are so excellent that even when the deception was found out the Prince still continued to buy them. There were about 300 of these intaglio, in red carnelian chiefly, many of which were handsomely mounted in gold, and they sold in lots of from two to five at prices varying from 7 to 10 guineas. The following were the more important objects of Indian and Chinese work:—A pair of knives with handles inlaid with gold, 34l. 10s.; a tulwar, with damascened blade with inscription in gold, formerly belonging to Meer Morad Ali Sirkar Khan, 8l.; a fine circular steel shield, with four bosses inlaid with gold, and inscription, from the Punjab, exhibited at the International Exhibition at Paris, 1867, 20l.; another, inlaid with florid pattern in gold, and four bosses, from Lahore, exhibited in Paris, 1867, 26l. 10s. The jade carvings sold well, at prices

generally from 2l. to 10l., some fine pieces going as high as 20 ga., and some exceptionally good fetching much higher prices, as lot 87, a beautiful oval fluted dish, carved with four bands of foliage and flowers, 7½ in. long, 2l. 10s., and 118, a dark green jade jar, the neck engraved with an inscription, 60l.; 119, a small mirror, with jewelled jade back, 40l.; 122, a small sword-handle, formed as a bird, and a knife handle 38l. 17s.; 126, an oblong aventurine box, with bands of ornaments in coloured enamels, 36l. 15s.; 138, a fluted bowl of white jade, mounted with enamelled gold handles, and foot set with rubies and emeralds, 56l.; a green jade bowl, inlaid with ornaments in silver, and a plain white ditto, 43l.; 146, an oval box and cover, studded with rubies and emeralds, 110l. 5s.; 156, a large octagonal pen-box, of white jade, with panels of pierced and carved green jade, inlaid, the borders set with rubies and emeralds, 320l.; a small basin carved in rock crystal, engraved with ornaments, and mounted with gold rim set with emeralds, corals, and onyx, 58l.; 193, a beautiful fluted bowl, engraved with flowers and foliage, 6½ in. diameter, 44l.; another, with faceted surface and carved handles, 6½ in. diameter, 34l. 12s.; a fluted vase and cover, with waved gold bands inlaid, the handles set with rubies, 125l.; a large oval box and cover, studded with rubies and emeralds in gold setting, 312l. 18s.; a globular vase, carved with groups of flowers in relief, flower handles, and an enamelled gold band round the neck, 141l. 15s.; a fine large bowl, with carved border and flower handles, mounted on beautifully enamelled gold foot set with onyxes, 183l. 15s.; a fine large bowl, with foliage handles, mounted on beautifully enamelled gold foot, set with onyxes, lapis lazuli, small diamonds, and rubies, 210l. The small Japanese carvings in ivory of grotesques sold for high prices—buttons at from 2 to 7 guineas; two grotesque figures, 11l. 15s.; a cylindrical nest of four boxes, with birds and flowers in mother-of-pearl and gold lacquer, 5l. 5s.; a matchpot carved with five figures, and a vase of flowers in mother-of-pearl, &c., 8l. 16s.; another, with hawks and foliage inlaid, 16l.; another, with a landscape in gold lacquer, and bronze figures in relief, 11l. 11s.; a pair of ivory altar candlesticks, formed as columns, surmounted by birds bearing nozzles, with four feet, decorated with birds, snakes, &c., in coloured and gilt lacquer, 25½ in. high, 34l. 13s. A fine oval-shaped fluted vase and cover, of pure white jade, with ring and foliage pattern handles and rings on the cover, 70l.; a cylindrical vase, carved with ornaments, and with four handles formed as dragons' heads with detached rings, 9½ in. high, 46l.; a very fine bowl and cover, of pure white jade, with four handles formed as masks, with rings and bats, carved with fruits and foliage in low relief, 9 in. diameter, 73l. 10s.; a pair of oblong-shaped slabs of white jade, elaborately pierced and carved with landscapes and animals, 11½ in. high, 48l. 6s.; a pair of white jade basins and stands, 6½ in. diameter, 24l.; a pair of ditto and ditto, 22l. 10s.; a group of finger citrons and foliage, 38l. 10s.; a curious square-shaped vase and cover, of dark-green jade, with cylindrical corners, carved with ornaments in slight relief, with dragon handles, and cover carved with dragons, 7 in. high, 66l.; a fine cylindrical matchpot, of dark-green jade, carved with figures, and a landscape, 6½ in. high, 43l.; a pair of ribbed beakers, of dark-green jade, with ornaments in slight relief, 10½ in. high, 76l.; a circular ribbed tripod incense-burner and cover, on mask feet, with ornaments in slight relief, the handles formed as dragons, 5½ in. high, 45l. 3s.; a beautiful flat-shaped bowl, on three feet, carved with masks and ornaments in low relief, the handles formed as dragons, with detached rings, 11 in. diameter, 75l. 12s.; a beautiful flat-shaped vase in rock crystal, carved with birds and plants in flat relief, enamelled metal gilt mountings, 43l.; a cup and cover, carved with foliage, a small fluted vase and cover, and a large ditto in car-

buncle, 20l. 5s.; a flat-shaped two-handled vase and cover, carved with ornaments, 53l.; a pair of swords, with Toledo blades, chased with ornaments and partly gilt, in metal-gilt sheaths, formed as snakes, 48l. 6s.; a dagger, with chased gold handle, set with rubies and emeralds, the cross-guard enamelled with flowers in colours on white ground, 83l.; a very large hookah, the bell of white metal enamelled black, with elaborate foliage pattern, 14l.; a diamond in the rough, three crystals, three gold rings, 63l.; an oval mirror of rock crystal, in silver gilt frame, surmounted by the Dunbar arms, the pillars of crystal spirally twisted, set with gems, on ebony base, with silver gilt ornaments, 57l. 15s. The whole collection, sold in 646 lots, realised 6,067l.

NOTES AND NEWS.

DR. SCHLIEMANN seems as determined to take Troy as were the original Achæans, and by all appearances it is not unlikely that he will have an equally long fight. The latest attack upon him was that of M. Saint-Martin (*Revue Archéologique*, March and April), and to this he now replies (May number of the *Revue*), declaring solemnly that there is no vestige of construction or of ancient human habitation on the height of Bunarbashi, and that on this point M. Saint-Martin and all who agree with him are entirely misled. His favourite argument is "come and see for yourself." He himself would doubtless spare no trouble for such an end; but his French critic will probably be contented with the assurance of Lechevalier and others that on Barnabashi foundations of masonry are to be seen. It is quite refreshing to hear the learned excavator repeat Homer's high-flown descriptions of the Scamander, and then chuckle over the bare imagination of M. Saint-Martin standing by the side of what he calls the Scamander, and endeavouring to reconcile with its present appearance the Homeric epithets.

THE festival of the fourth centenary of the birth of Michelangelo at Florence, as at present determined by the Commission, will be held in September next, from the 10th to the 15th of the month. The exhibition of works by Michelangelo will be of great interest. In the first place there are those by his own hands which exist in Florence. France will generously contribute, in her usual friendly and enlightened spirit, casts from works of sculpture in her possession, and photographs from all the drawings in her national collections. The Municipality of Bruges has been applied to for a cast from the Madonna and Child by Michelangelo, preserved in that city. From the Museum at Naples will come the colossal bust of Paul III. Bologna will contribute interesting examples of the great artist. From England the Department of Science and Art has supplied photographs from the drawings preserved at Oxford, and from works of Michelangelo in the Museum at South Kensington. From the National Gallery nothing is to be forwarded, but photographs of the two pictures there, ascribed to Michelangelo, will be supplied by a private collector. It is hoped that the Royal Academy of London, like other public institutions throughout Europe, will respond in friendly terms to the wish of the Florentine Commission to exhibit a cast from the noble relief in its possession, and will supply the relief. Photographs have been received from other collections in Europe. A general spirit of liberality has been prevalent. Photographs have also been forwarded from Windsor of drawings in the possession of Her Majesty, and it is intended to apply to the Duke of Devonshire, the Earl of Leicester, and other proprietors of drawings or other works of Michelangelo in England. It is believed that an English collector is in possession of the cartoon of the Leda. If this is the case he would confer a great favour by contributing a photograph. The Commission at Florence has been greatly gratified by the consent of the eminent house of Dominic Colnaghi and

Co., London, to act in Great Britain in the name of the Commission, and to gather and transmit to Florence contributions to the exhibition. The Commission hopes that collectors in Great Britain will communicate with Messrs. Colnaghi. The Government of His Holiness has taken a very friendly interest in the approaching exhibition, and it is understood that, by order of His Holiness, casts and photographs will be supplied. The Vatican, so rich in works of the immortal Tuscan, will thus contribute to do honour to his memory. It has been proposed by the Minister of Education that special commissioners from foreign governments should be invited to attend, but the Commission in Florence has not felt itself to be in a position to address governments, but has recorded its hope that foreign academies and societies connected with the fine arts will send representatives to Florence, where they will be received with the highest honours.

THE *Allgemeine Zeitung* announces that the recent excavations near the old Dipylon at Athens have brought to light the foundations of a house belonging to the time of Mithridates, in which were found fifty silver coins of the same age, some of which are of great value and unique in character. At Aquileia interesting discoveries have also been rewarding the zeal of explorers; and, according to recent reports, the foundation walls of a circus of colossal dimensions have been traced.

THE Art correspondent of the same journal at Rome announces with satisfaction that the well-known Danish artist, Elise Jerichau, has returned to Rome with the intention of making Italy her permanent abode, and has set up her studio in the Palazzo Lavati, bringing with her a large number of interesting portraits and *genre* pictures painted by her during her long stay in the East. No one has enjoyed such opportunities of seeing the interior of Oriental homes as Mme. Jerichau, who, during her numerous visits to Constantinople, Smyrna, Alexandria, and Cairo, obtained free access to the harems of the highest dignitaries, and was enabled to acquaint herself with the most minute and private details connected with the lives and usages of the inmates.

THE formal opening of an Austrian Oriental Museum took place at Vienna on May 10. The collection is especially rich in products of industry from Tunis and Egypt, but the Japanese and Chinese paper goods are said to be the most interesting of the special departments.

SOME unworthy doubts have been largely circulated in Norway with regard to Professor Rygh's suitability as Keeper of the National Museum of Antiquities. Herr Rygh has for many years exercised his office with zeal and energy, not a few of our own countrymen benefit every year by his courtesy and learning, and it is late in the day to come forward with charges of incompetence. The affair, however, has roused the scientific men of Scandinavia to no small indignation, and Professor Rygh has received from all sides expressions of sympathy. The matter must be now settled, since Dr. Hans Hildebrand, of Stockholm, as competent an authority on the subject as any in Europe, has written a letter to Professor Sophus Bugge, which appears in all the Scandinavian papers, in which he asserts Rygh to be "of all Norwegian antiquaries the one most accomplished in archaeological science. Not only does he stand in this respect far higher than all other archaeologists in Norway, but, outside Norway, the whole of Europe has few men who can be compared with him."

THE exhibition of works of art at Charlottenborg, the Danish Royal Academy, is now open. We learn that Carl Bloch, as usual, supplies the important picture of the year. We described the *Samson and Delilah* of this great master last year, a work of splendid and almost terrible force. His chief picture this year is *Christ driving the Buyers*

and *Sellers out of the Temple*. It is said to suffer from the bold effort the painter has made to compete on his own ground with Paolo Veronese, but yet to be a masterly production in composition and colour. He also exhibits *Old Folks*, two very ancient people in a quiet Danish house, read the Bible together, and *A Monk who looks in the Glass*, which seems to be a very odd work, representing the reflection in a mirror of a monk suffering from toothache.

THE French painter under notice in the *Portfolio* this month is Léon Bonnat, an artist who by education belongs almost more to Spain than to France. He chiefly paints Italian *genre* subjects, but has now and then treated classical and sacred themes with some degree of success. His *Christ on the Cross*, it will be remembered, excited a great sensation in the last Salon, although it was severely condemned for its somewhat brutal realism. The peasant woman and child, *La Tenerenza*—chosen to represent his art in the *Portfolio*—gives no idea of his style. Landseer's *Sleeping Bloodhound* in the National Gallery, etched by W. Wise, and a pretty little picture from Lalauze's *Le Petit Monde*, of two demure little French maidens trying to draw, are the other illustrations. Mr. R. L. Stevenson finishes his description of an "Autumn Effect," observed, we should imagine, through Mr. Hamerton's spectacles. Mr. Hamerton himself, leaving woods and rivers, discourses on the delusions to which we are subject in judging of the apparent size of objects.

THE *Gazette des Beaux-Arts* gives us an abundance of good things this month. 1. Under the title of "Maitre Pihourt et ses Hétéroclites" M. Edmond Bonaffé discourses learnedly on the supposed Italian influence over the Renaissance in France; and informs us that Maitre Pihourt was a French architect or master mason of the first half of the sixteenth century, who owed no obligation to Italy in carrying out the principles of the Renaissance in France. 2. M. Paul Mantz finishes his criticism of the works of the late Charles Gleyre. The article is illustrated by a photogravure of Goupil's of the same kind as the *Portfolio* now gives us. Hitherto the *Gazette* has not adopted this popular mode of illustration, and we venture to think that it would be more satisfactory to true lovers of art if, instead of thus calling photography to its aid in rendering such works as this, it would give better woodcuts. Some in the present number are by no means equal to its former productions of this sort. 3. A biographical and critical article on J. F. Millet, containing several of his letters, will interest every one at the present time. It is illustrated by several wood engravings from his pictures and an etching by Courty of *La Récolte du Sarrasin*, a picture that has more of cheerfulness in it than most of Millet's works. 4. "La Rôle décoratif de la Peinture en Mosaïque" is considered at some length by M. E. Didron, who writes with great knowledge concerning the ancient mosaics of Italy, and thinks that the art is capable of being revived, and should be encouraged by the French Government for all public works, for which it might fitly serve. 5. The interminable Costume History. 6. Two admirable photographic reproductions of two of Rembrandt's magnificent etchings, *Joseph relating his Dream*, and the well-known *Old Mill*. Lovers of Rembrandt's engravings who are unable to afford the fearfully expensive luxury of collecting, are after all not so much to be pitied when they can obtain, at an inconsiderable cost, such admirable renderings as photography now offers them of these works. Here photography answers better than any other means, and for faithful reproduction, therefore, nothing can be said against its use.

M. CORDIER's fine statue of Columbus, before described in the ACADEMY, will shortly be set up for exhibition in front of the principal entrance of the Palais de l'Industrie before it is sent to Mexico.

THE statue of Berryer, by M. Barre, was recently unveiled at Marseilles, where it is set up in front of the Palais de Justice. It represents the great orator in the act of speaking.

THE STAGE.

THIS has been a week barren of new plays, but one that has produced a book not without interest to those who are concerned with the fortunes of the English stage. It is a lecture delivered at the Fine Arts Gallery by Mr. Henry Neville, of the Olympic Theatre, and is called *The Stage in its relation to Fine Art*. Mr. Neville tells us much about the history of the Stage, and something about the history of Fine Art, but he has not established with preciseness the relation between the two. He breaks into joyful song respecting the dramatic glories of the past, and is reasonably indignant with those who have brought the English stage into disrepute, and who have compelled him to perform for more than two hundred nights so common a melodrama as *The Two Orphans*. For Mr. Neville has clearly had his ideals, and has killed them off one by one as the public refused to pay for them; and this pamphlet may be taken to be the embodiment of the heavy sigh with which he has received the unusual profits of his melodrama. Even within Mr. Neville's time the stage has visibly degenerated. When he was young, the provincial theatres were the nurseries of acting: budding tragedians were tested as Hamlet or Othello; light comedians were put through the parts of Young Rapid, Marlow, and Charles Surface: low comedians played Touchstone and Tony Lumpkin. The better sort of players were instructed in the classical authors, and especially in "those great tragedians who sat in Athens on their unchallenged thrones: Aeschylus clothed in the thunder of his world-shaking terror, Sophocles shining in the beautiful radiance of his orbicular perfection, Euripides sounding the depths of the heart with his world-moving pathos, and composing, in their united power and influence, a triple fountain of blessing to mankind." They learned to pause before Shakspeare's shrine and express their reverence, though it was only the silent reverence of a tear. "But now," says Mr. Neville, "all these things are changed: men come into the profession we know not whence, we know not how, without even a general knowledge of art, its principles and its history; and the result is a deluge of incapacity, ignorance and conceit, sweeping everything before it, and changing the once pure taste of the public into an anarchy of ideas and a Babel of opinions. It fills me with an inexpressible moral indignation to see my noble art thus debased by the irruption of this host of Goths and Vandals. Away with such needy and incompetent adventurers." Amid the roar of Mr. Neville's eloquence we are able to gather that his remedy for these evils is to place the stage under the protection of the State, and establish a national school for acting. We have already expressed our opinion in favour of some such scheme as this, and much theatrical reform seems to be tending towards it. On the recent occasion of Miss Helen Faucit's performance at Drury Lane it was announced that the proceeds would be devoted to the endowment of an institution of this sort instead of the original plan of building a Shaksperian theatre at Stratford-on-Avon. At the same time we would deprecate haste in the matter. The Comédie Française is the model for all such schemes, and at the present time the Comédie Française may be said to exist not by means of, but in spite of the French people. Its great influence is due to its traditions.

Mr. Neville himself offers us no suggestion as to the means of accomplishing his project:—

"The right method," he says, "is to disentangle the stage from its evils, to reform its abuses, to pass it through the fire of a moral reformation, to lay the

axe to the root of the foul parasites that are choking and destroying the noble tree, to break off the incrustation of its centuries of evil, and bring to light the sparkling gem whose radiance they have so long hidden and concealed."

To the purport of much of which we assent: but what is the first step?

THE very pretty chorus of ministers in Mr. Clay's comic opera *Cattarina* at the Charing Cross Theatre may be taken by way of compensation for the absence of ministerial affairs in Mr. Herman's play, *Jeanne Dubarry*. The comedy is poor stuff, and bears much the same resemblance to art that the Countess Dubarry's writings bore to literature. The principal character is sustained by Miss Edith Lynd, an actress of little experience, who, if she failed to realise the accepted conception of La Belle Bourbonnaise, was at least true to that part of the song which tells us that she was "fort mal à son aise."

No one who loves the gossamer fancies of Halévy, Boieldieu, and Auber, will miss the singularly complete series of performances of French comic opera that is now being given at the Gaiety Theatre. Halévy is seen at his airiest in the famous *Mousquetaires*, and if Boieldieu failed to endow the *Dame Blanche* with all the weirdness that M. Sach could have wished, yet the musician contrived to surround his work with a fascination that almost every Sunday night draws to the Opéra Comique at Paris an unwearied throng of enthusiasts. M. Tournié and M^{me}. Priola are presently to appear at the Gaiety.

"THE performance of *The Merchant of Venice*," says the delightfully honest announcement of the Prince of Wales's Theatre, "having failed to attract large audiences, the play will shortly be withdrawn. During the preparation of other works, for which arrangements have been completed, Lord Lytton's comedy, *Money*, will be revived." Mrs. Bancroft and Miss Ellen Terry will perform in it.

Andréa, by Victorien Sardou, was produced at the Opéra Comique Theatre on Thursday night for the representations of M^{lle}. Hélène Petit, of the Odéon.

ON Saturday, May 29, a drama adapted by Mr. Clement Scott from the French of M. Eugène Manuel, and called *The Detective*, will be produced at the Mirror Theatre.

MR. ALBERRY's comedy is to be performed at the Olympic Theatre on Monday next.

M. CADOL's comedy *Grand Maman* was produced at the Théâtre Français on Monday night.

SIGNOR SALVINI, we understand, intends, before leaving this country, to play Hamlet and, what will be a novelty in London, Coriolanus. Coriolanus is one of his great characters, and he has played it with marked success in Rome, in spite of the trimming to which Shakspeare's text was submitted by the authorities. It is rumoured that he may play in company with Signor Rossi.

MUSIC.

VERDI'S "REQUIEM" AT THE ROYAL ALBERT HALL.

It is not often that two musical events occur within a week of such interest and importance as the first production in London of large works by one of the great living German, and by unquestionably the greatest living Italian composer. Last week the production of *Lohengrin* was recorded, and to-day we have to report the performance of the grand "Requiem," which Signor Verdi has recently written to commemorate the death of his friend, the poet Alessandro Manzoni. It was on the anniversary of that event, May 22, 1874—exactly this day twelvemonth—that the work

was first performed in the church of St. Mark at Milan. Its success there induced M. Camille du Locle, the director of the Opéra Comique at Paris, to produce it in that apparently most inappropriate place; and now Messrs. Novello, Ewer, and Co. have arranged for a series of performances of the work, under the direction of the composer, at the Royal Albert Hall. The first of these took place on Saturday last, and the second on Wednesday.

The first announcement that the composer of *Rigoletto*, the *Trovatore*, and *Traviata* was writing sacred music naturally took musicians by surprise. This was Saul among the prophets with a vengeance! The greatest curiosity was naturally felt as to what would be the result; because at first sight the idea of Verdi's writing a "Requiem" seems nearly as incongruous as it would be to imagine Shakspeare writing the "Christian Year." And it may be allowed at once that the work has very little of the character of what is commonly called "sacred music." This, however, raises the general question, Is there any broad line of distinction which can be laid down between what is sacred music and what is not? There is more than one reason why this question should be answered in the negative. Of course there are certain musical forms which from their associations are distinctively secular. Had Verdi, for example, introduced into his "Requiem" a waltz or a polka (to put an extreme case), its inappropriateness would have been self-evident. But with such exceptions it seems impossible to draw a hard and fast line between sacred and secular music. Nobody would nowadays dispute the claim of Beethoven's Mass in C to be called sacred music; yet is it not more than probable that if Palestrina, or even the Italian church composers of the last century, could have heard it, they would have condemned it as utterly un-sacred in character? Again, the two greatest composers of sacred music whom the world has ever seen were Bach and Handel; and both of these repeatedly introduced pieces from their operas or secular cantatas into their sacred works, yet no one finds fault with these pieces as inappropriate. In justice to Signor Verdi, also, it should be added that in Roman Catholic countries the distinction between sacred and secular music is much less marked than with ourselves. It is no uncommon thing in a Catholic church to hear an operatic overture played as the voluntary after service. This is not mentioned as a desirable or becoming thing; but it ought to be borne in mind in forming a judgment on a work differing very largely from the conventional models of church music.

It has been needful to say this much by way of preface, because some critics have condemned this "Requiem" as too dramatic in tone; and the only fair way to look at it is to place one's self at the composer's stand-point, and not to estimate his work by comparison with the two generally accepted models of the Requiem—those of Mozart and Cherubini. That Signor Verdi's is not sacred music in the narrow acceptance of the term must be conceded; but it is a work of high and genuine inspiration, often most powerfully touching the feelings, and characterised throughout by deep earnestness, though addressing itself to us in a somewhat unfamiliar language.

Anything like a complete analysis of the "Requiem" in these columns would be out of the question; neither, indeed, would it be readily intelligible without the aid of musical quotations. A brief notice of some of the salient points of the work is all that will be possible. The opening movement, "Requiem aeternam," in A minor, is of remarkable beauty; the first part for chorus *pp* accompanied by the muted strings is certainly as funeral as could be desired. A charming effect is produced by the modulation into A major at "et lux perpetua." At the "Kyrie" the solo voices are introduced, first alone and then in combination with the chorus. The whole of the music is

not merely full of beauty but perfectly new; it may indeed be said of the entire work that it is thoroughly original from the first bar to the last. The "Dies Irae" is set in nine movements, several of which are of very remarkable power. The opening chorus may be, and probably will be objected to by some as ultra-dramatic; it certainly is a most forcible representation of the "Day of Wrath," which in sentiment (though in nothing else) may be compared with the corresponding portion of Mozart's "Requiem." At the "Tuba Mirum" Verdi has followed the precedent of Berlioz in his "Requiem" of placing additional trumpets in the corners of his orchestra; and the effect of the different groups answering one another, though certainly dramatic, is exceedingly fine. A short and expressive bass solo, "Mors stupebit," leads to a most beautiful mezzo-soprano solo and chorus, "Liber scriptus," one of the gems of the work, at the close of which a portion of the opening chorus "Dies Irae" is repeated. The following trio for two soprani and tenor, "Quid sum miser," is of most exquisite pathos, the modulation near the close from G minor to G major being particularly beautiful. At the "Rex tremendae" again (quartet and chorus), a fine opportunity is given to the composer, of which he has availed himself to the utmost. The declamations of the chorus are answered by the entreating tones of the soloists at the "Salva me, fons pietatis" in a manner as beautiful as it is fresh. We next have a very charming duet for trebles, "Recordare," and a most original tenor solo, "Ingemisco," to which succeeds a bass air, "Confutatis," which is by no means equal to the preceding numbers. Here Verdi's inspiration seems for once to have failed him; he has moreover introduced (evidently of malice aforethought) some consecutive fifths in the accompaniment of the song, the effect of which is simply distressing. That the rule of the theorists forbidding consecutive fifths may sometimes be violated with impunity, and even with advantage has frequently been proved by modern composers; but the effect must be the justification of such passages, and in the present instance they are certainly not justified. At the end of the air a fragment of the chorus "Dies Irae" is again introduced, leading to the "Lacrymosa," which is written for quartet and chorus. Here is another genuine inspiration, on which, did space allow, much might be written. It must suffice to allude to the novelty of the vocal combinations, to the charming phrase for unaccompanied solo voices at the "Pie Jesu," and to the remarkable modulations at the close of the chorus. The key of the piece is B flat minor, and the voices conclude in G major, the orchestra alone giving the final chords in B flat major.

The offertory "Domine Jesu Christe" is written for solo voices only. It is extremely pleasing, and charmingly scored for the orchestra, but, excepting at the "Hostias et preces," it scarcely rises to the height of some other parts of the work. Its thoroughly vocal character, however, and the flow of its melody are sufficient to ensure its popularity. The "Sanctus" is a double chorus in eight real parts, in which Verdi for the first time in the work attempts the strict fugal style. He does not, however, seem at home with it, and soon abandons it. This number must be pronounced one of the least successful of the Requiem. The following movement, "Agnus Dei," a duet for two soprani with chorus, is, on the contrary, not merely one of the finest movements in the work, but one of the most original pieces of music ever composed. It is written in a form seldom if ever before employed in sacred music—the variation form. The theme is first given out by the two solo voices unaccompanied, and singing in octaves, with a perfectly novel effect, and then repeated by the chorus and strings in octaves without harmony; after which it is met with sometimes for soli, sometimes for chorus, each time with a different accompaniment. No description, however, can

give any notion of the effect of this extraordinary movement, and even the reading of the vocal score conveys but a faint idea of the impression it produces in actual performance. The "Lux aeterna," a trio for mezzo soprano, tenor and bass, also contains some very remarkable music. The passage "Requiem aeternam" contains an accompaniment for a *pp* double roll on two kettledrums tuned in fifths, which is very new. Beethoven was the first to use the two notes of the drums at the same time (in the Adagio of his "Choral Symphony"), and Berlioz has in his "Requiem" employed chords for several drums at once; but Verdi's effect differs from both. The final number of the work, the "Liberate me," is for soprano solo and chorus. The solo is for the most part grandly declamatory in style, especially at the passage "Tremens factus sum ego et timeo." The first part of the chorus is mostly founded on the subjects from the "Dies Irae;" a portion of the opening movement of the mass is then introduced for unaccompanied voices with excellent effect; after which Verdi introduces an elaborate fugue on the "Liberate me, Domine," and (like Rossini in the "Stabat Mater") succeeds in proving that fugue writing is not his forte. The quiet close of the movement, and of the work, when the composer returns to his more natural method of expression, is of great beauty.

Such is an imperfect attempt to give some idea of a very remarkable work, description of which is more than usually difficult because of its originality. The effect produced by it on a second hearing was decidedly greater than that made the first time—a sure test of sterling music. With respect to the performance, it was in all respects admirable. Signor Verdi is an excellent conductor, and for finish and precision the rendering of the music could hardly have been surpassed. The solo quartet was exceptionally good, as the composer had brought over from Paris the four artists who had sung in the mass there under his direction. These were, Mdme. Stolz (soprano), Mdme. Waldmann (mezzo-soprano), Signor Masini (tenor) and Signor Medini (bass). Of these artists Signor Masini is the principal tenor of the operas at Florence and Cairo, the other three occupy important positions in La Scala at Milan, as well as at Cairo. Mdme. Stolz is a magnificent dramatic singer, with a powerful voice able, even in the Albert Hall, to dominate both chorus and orchestra; Mdme. Waldmann's voice has less brilliance but more richness; her singing possesses to a very remarkable degree the precious quality of *charm*. A French critic has aptly said of these two ladies, "the one with a voice of crystal, the other with a voice of gold." Signor Masini has a sympathetic tenor voice, sweet rather than powerful, and most artistically managed; and the bass, Signor Medini, is the possessor of an organ of remarkable richness and volume. The ensemble of the four artists was the most perfect conceivable; finer solo singing has seldom if ever been heard. Their performance of the Offertory, though hardly one of the finest numbers of the work, was alone worth the journey to the Albert Hall to hear. The choruses were sung by the members of the Royal Albert Hall Choral Society with great finish, and an excellent orchestra, led by Messrs. Sainton and Carrodus, did the fullest justice to the composer's masterly and elaborate instrumentation. EBENEZER PROUT.

THE first of the series of six Summer Concerts at the Crystal Palace took place last Saturday. These concerts will closely resemble in their general features the well-known "Saturday Concerts" which take place during the winter months; the chief difference being that fewer novelties are produced. The principal pieces brought forward on Saturday were: the unfinished Symphony in B minor, by Schubert; Beethoven's "Choral Fantasia," in which the pianoforte part was taken by Mr. Charles Hallé; and the overtures to *Guillaume*

Tell and *Rienzi*. The vocalists were Mesdames Lemmens Sherrington and Patey, Mr. Vernon Rigby and Signor Foli. This afternoon the "Choral Symphony," one of the specialties of the Crystal Palace band, is to be given.

IN addition to the two performances of Verdi's "Requiem" spoken of above, two miscellaneous "National" Concerts were given at the Albert Hall on Whit-Monday afternoon and evening. Being designed for the amusement of a holiday audience, they contained, as was only natural, no features requiring a detailed notice in these columns.

MDLLE. MARIE KREBS gave the first of two pianoforte recitals which she has announced at St. James's Hall, last Wednesday. We have so often expressed our opinion of this young lady's admirable playing that it is needless to repeat it now. We will, therefore, only say that her programme included a prelude and fugue in A minor, by Bach; Beethoven's Sonata in A flat, Op. 26 (with the funeral march); Bennett's Three Sketches, "The Lake," "The Millstream," and "The Fountain;" Chopin's Nocturne in C minor, and three of his Etudes; Haydn's Variations in F minor; Schumann's Arabesque and Novellente in E, Op. 21, No. 7; a "Pensée," by Carl Krebs, the pianist's father; and a "Tarantelle-Toccata," by Charles Mayer.

Two interesting articles have lately appeared in the columns of our contemporary the *Choir*, by Mr. J. Gompertz Montefiore, on a new system he has invented of writing music, to which he has given the name of "Musikography." It is in fact a kind of musical shorthand, designed as an assistance to composers in jotting down ideas, and making first sketches of new works with much less than the ordinary amount of mechanical labour. The system is not designed to replace the usual method of writing, as Mr. Montefiore well knows that this would be practically impossible; it is simply intended to supplement it, and for this purpose it seems well adapted, being apparently both simple and logical. We have not practically tested it ourselves, but the author says he believes that it "can be mastered by any one having some previous knowledge of music in a couple of hours at the outside," and after reading his articles we are hardly disposed to doubt the correctness of his estimate. Those who wish to make the acquaintance of the system will find the articles in question in the *Choir* of the 1st and 15th instant.

Two new operas have lately been produced at the Opéra Comique in Paris, *L'Amour Africain*, by M. Paladilhe, and *Don Mucarade*, by M. Ernest Boulanger. M. Paul Bernard, the critic of the *Revue et Gazette Musicale*, speaks coldly of the first work, but is loud in his praises of the second.

THE benefit performance given at the Opéra, Paris, on the 8th inst., for the families of the aeronauts who were killed in the recent balloon ascent, realised the sum of about 20,000 francs.

M. CAPOUL has just signed an engagement with M. de Locle. He will "create" next winter at the Opéra Comique the part of Paul in M. Victor Massé's work *Paul et Virginie*. The composer is very desirous that the part of Virginie should be assigned to Mdme. Patti, but it is doubtful whether the management will be willing to go to the expense of engaging her.

THE Folies Dramatiques is to be re-opened on September 1 with a new opéra-bouffe by Charles Lecocq, entitled *Le Pompon*. *La Fille de Madame Angot* was recently given at this theatre for the 529th time.

IN the report read at the annual meeting of the Société des Auteurs et Compositeurs Dramatiques, in the Salle Herz at Paris, some very sensible remarks were made on the recent performance of Verdi's "Requiem" at the Opéra Comique. From

consideration for the illustrious composer the committee abstained from entering a protest; they would, nevertheless, regret to see the theatres repeat the experiment; "for masses," says the report, "are much more in their place under the arches of a church than under the cloak of a harlequin."

A VERY interesting concert was given at Leipzig on the 2nd inst. by the Bach Society, under the direction of their conductor, Herr A. Volkland. The principal works produced were three very fine (though in two cases all but unknown) Kirchencantaten. These were "Du wahrer Gott und David's Sohn," "Es ist dir gesagt, Mensch, was gut ist" (the opening chorus of which shows a curious identity in its theme with "Their sound is gone out" in the *Messiah*), and "Ein feste Burg," in which Luther's well-known chorale is treated as only Bach could have treated it. The performance is spoken of as most excellent.

THE Singakademie at Breslau celebrated its fiftieth anniversary on the 4th and 5th inst. with a performance of Handel's *Samson* and a miscellaneous concert.

IT is stated that Herr Richter, the new conductor of the opera at Vienna, wished that the first performance of the *Meistersinger* under his direction should be given without "cuts," but that he was obliged to abandon the idea in consequence of the opposition of Herr Beck, who had to sing the arduous part of Hans Sachs.

THE post of organist and musical instructor at Eton College is vacant. The appointment rests with the headmaster and the governing body.

LITERATURE.

THE ALDINE PRESS.

Aldus Manuce et l'Hellénisme à Venise. Par Ambroise Firmin-Didot. (Paris: Firmin-Didot, 1875.)

THE Rector of Lincoln, in his able and comprehensive *Life of Isaac Casaubon*, remarks that the Italian students of the Renaissance were occupied with Latin rather than Greek literature. It is difficult to understand how so careful a student as Mr. Pattison can have adopted a position so paradoxical. In one sense the whole European scholarship of the fifteenth, sixteenth, and seventeenth centuries was more Latin than Greek, partly because Latin had never wholly ceased to be a spoken and written language, and partly because the greater difficulty of Greek has always made it the privilege of a select minority among the learned. M. Firmin-Didot's monograph on Aldus Manutius might be taken as an elaborate refutation of Mr. Pattison's sweeping statement. It proves beyond question, what indeed has always been apparent to Italian scholars, that Greek literature was saved in the fifteenth century wholly and solely by the indefatigable energy of Florentine students and Venetian printers. The Estiennes and Casaubon could not have existed if the Aldi and Poliziano had not preceded them. At a time when France, Germany, and Holland were sunk in the apathy of barbarism, Italy was keenly alive to the advantages of culture; and the fragments of Greek learning, saved from the wreck of Byzantium, are owed by the modern world to the acquisitive munificence of Palla Strozzi and Cosimo de' Medici, to the conservative zeal of Aldus Manutius and Andrea d' Asola.

A very peculiar interest attaches to this work of M. Firmin-Didot. The representative of that great house of Parisian publishers, who in the nineteenth century have continued the labours of the Estiennes, he devotes a long, careful, and enthusiastic treatise to the biography of his greatest predecessor in the art of popularising classical literature. The Aldi, the Estiennes, the Didots, will be for ever associated in the annals of typography. Each of these families can show at least three generations of illustrious editors; and the aim of each has been the same, to meet the requirements of culture in their age by rendering the Greek and Latin authors accessible to every reader in agreeable form. Consequently, M. Didot is treating of a subject which he understands in its minutest details; his observations on

the technical difficulties overcome by Aldus, for example, are such as only a master in his own department can make upon the work of a brother artist; while the deep sympathy which he feels for the father of Greek printing adds the interest of romance to what in other hands might have been a merely dry biography.

To rewrite the famous work of Renouard upon the Aldine Press would have been superfluous. There is no bibliographical catalogue in existence more complete than the *Annales de l'Imprimerie des Aldes*. Therefore, M. Didot wisely selects a department of his subject which had been omitted in the plan of Renouard. He devotes attention less to colophons and title-pages than to prefaces and dedicatory epistles, translating such portions as throw light upon the life and labours of Aldus and his collaborators, or illustrate the conditions of Greek scholarship in Italy, or display the spirit of Humanism at the opening of the sixteenth century. Since many of these prefaces are extremely rare, and at the same time most important to the student of European literature, he has done the world good service by thus placing the wealth of private libraries at the disposition of the public. The same may be said about his collection of original letters by Musurus and other Greeks settled in Italy, to whom we literally owe the "eternal consolation" of Hellenic culture. Biographical notices of the members of the Aldine Academy, a short sketch of Greek studies in Italy previous to Aldus, numerous details concerning Demetrius and the Cretan calligraphers who supplied patterns for Greek type, and some curious information about Alberto Pio, Prince of Carpi, may be reckoned among the subsidiary attractions of this comprehensive volume.

The interest of the book, however, centres, as is right and natural, in Aldus Manutius himself. When we remember that before this man began to work at Venice, only eleven volumes in Greek had been printed, and that he alone between the years 1493 and 1515 gave thirty-three first editions to the world, including Plato, Aristotle, Pindar, Sophocles, Euripides, Aeschylus, Aristophanes, Demosthenes, Herodotus, Thucydides, Athenaeus, Pausanias, Philostratus, we are able to comprehend both the magnitude of his achievement and the debt of gratitude we owe to him. During this short period of twenty-two years—while Italy was being rent with disastrous wars, French invasions, Spanish occupations, and menaces of Turkish conquest—Aldus succeeded in rendering Greek literature imperishable. Twice was the labour of the press suspended owing to the peril from a foreign foe which threatened Venice. More than one strike among compositors and printers threw the workshop into confusion. The difficulties of collecting manuscripts, of engaging competent coadjutors, of ascertaining the text of authors never edited before, of founding legible Greek type, and of correcting proof-sheets, were enough to daunt the most courageous pioneer of learning. In spite of all obstacles Aldus never relaxed in his self-appointed task. His house became the resort of Greek refugees and Italian scholars.

Thirty-three mouths were daily fed at his table. Besides printing, he had to superintend type foundry, ink manufacture and binding. Everything required for his great work—except the paper, which came from Fabriano—was made and finished on his own premises.

As Latin was the common speech in Estienne's house at Paris, so Greek was talked in Aldo's house at Venice. The common phrases of printers—type, character, and so forth—were Greek, and have remained Greek. The directions to printers, folders, and binders were given in Greek. Prefaces were written in Greek. Surnames of editors and correctors of the press were Grecised. The House of Aldus was, in short, a great Greek factory, where a new and modern body was fashioned for the indestructible spirit of Hellas.

Aldus died poor. It had not been his aim to accumulate a fortune by his industry. Nothing is more manifest than his single-hearted desire to restore to light the treasures of the ancient world, and to communicate to the poorest scholars the wealth of learning which hitherto had been the monopoly of rich *virtuosi*. A manuscript of Livy in the fifteenth century fetched the same price as a comfortable farm. Aldus sold the whole five volumes of his first edition of Aristotle for about 8*l*. The average price for each volume of his pocket classics was two shillings. When the student takes down one of these books, and compares its excellent paper and sharp clear type with a wretched German copy of the same author, reflecting at the same time how much it cost Aldus to produce the first Sophocles, and how easy it is to print a Sophocles now, he cannot but be lost in admiration.

To follow M. Didot through the different sections of a work of 622 pages would be impossible; nor is it easy even briefly to indicate the extent and value of his researches. If any stricture can be passed upon a book so profitable and so full of learning, it might be suggested that a want of method in the arrangement of material is occasionally noticeable. We have, for example, to gather our information respecting the price of Aldo's books, his numerous occupations, the causes of the inaccuracy of his first editions, and the privileges granted to him by Venice and Leo X. from widely separated pages. Some repetition in the history of Greek studies in Italy might also be pointed out. Finally, it might be questioned whether Greek quotations are always accurately rendered. On p. 549, for instance—

σίλας ἡμάδυνεν ὁραῖμον
ἥλιος· ἡ δ' ἄστρων φροῦδον ἔθηκε φάος,

is translated "Le soleil fait pâlir la lumière de sa sœur et disparaître l'éclat des astres." On p. 70, "Et vous aussi, les amis d'Aldus!" is given as an equivalent for καὶ ἐμεῖο φίλ' "Ἄλδον, where the Greek plainly refers only to Alberto Pio, the friend of Aldus. To detect slight blemishes like these, however, in a work of distinguished excellence, is an ungrateful task. May the notice of them be accepted as a proof that it has received diligent study.

J. A. SYMONDS.

Circus Life and Circus Celebrities. By Thomas Frost. (London: Tinsley Brothers, 1875.)

THIS is a good title, and it will recall to many readers the memory of pleasant hours spent in the tent or amphitheatre. All classes delight in horsemanship, and the young are not ashamed to acknowledge their liking, but adults usually shield themselves under the pretence of "taking the children," and enjoying their enjoyment. The circus has a tolerably long history, but although England has been described as the paradise of horses, an amphitheatre for horsemanship was unknown here until the close of the last century. Bull and bear-baiting were the favourite amusements of our ancestors, and the sights in the circus in olden times largely consisted of the antics of jugglers and tumblers. Banks and his bay horse Morocco, however, have made their mark in literature, for Raleigh and Shakspeare both thought them worthy of notice. Mr. Frost has chosen an unhacknied subject, but he gives us very little of its early history. We hear of Banks's horse, but nothing of the Bear Gardens in Southwark, and the treatment is so modern that in a volume of over 300 pages we arrive at the year 1841 as early in the book as p. 100.

Some will perhaps consider this as an advantage, because they like to be told what goes on behind the scenes they look at from the front; but others who care to read about the Astleys and Ducrows because time has thrown an air of distinction over these now historical characters, will be contented to see Sanger's and Hengler's Circuses without knowing anything of their internal arrangements.

The characteristic of circus people which differentiates them from other "artists" is the wandering life they lead. It is true that nowadays actors and musicians visit America and Australia, but they have not yet reached the standard in this respect of their brethren in the lower walks of art. Mr. Frost says:—

"There are few men or women of eminence in the profession who have not visited nearly every European capital, and many of them have made the tour of the world. Price's Circus was for many years one of the most popular institutions of Madrid, and the Circo Price was to English circus artistes what Cape Horn is to American seamen. Tell an equestrian or an acrobat that you have seen him before, and he will ask, 'Was it at the Circo Price?'"

Albert Smith once visited a circus at Pera where the playbill was in three languages—Turkish, Armenian, and Italian—and his astonishment was great when a real clown jumped into the ring and cried out in perfect English: "Here we are again, all of a lump! How are you?" The speech of the clown was quite incomprehensible to the audience, but his drollery of manner struck them at last, and then the fezzes were agitated like poppies in the wind. It is a question yet unsolved why the clown with his hot codlins is so peculiarly an English institution, and such an integral part of the circus, that he follows the horses even to places where his language is not understood. All the performers, whether their specialty be riding, vaulting, or clowning, are engaged

for "general utility," and are expected to understand the whole routine of circus business, but few troupes can boast of the talent exhibited by Sleary's company, described in Dickens's *Hard Times*:—

"All the fathers could dance upon rolling casks, stand upon bottles, catch knives and balls, twirl hand basins, ride up anything, jump over everything and stick at nothing. All the mothers could (and did) dance upon the slack wire and the tight rope, and perform rapid acts upon bare-backed steeds."

Circus life is not very different from the larger life outside, and these versatile individuals often lead but a sorry existence, until they can rise out of the ruck and do something different from their companions. They must astonish in order to live, and those that astonish the most will make the best living: so it has been with Van Amburgh, Carter, and other "lion kings," with Leotard, Blondin, and other gymnasts. Managers are sometimes hard put to it for a novelty, and their attempts to obtain one are often laughable enough. Wallett, the clown, and Pablo Fanque, the negro rope-dancer (otherwise William Darby), when in partnership together at Glasgow, hit on the expedient of turning an Irish posturer in their company, whose *nom d'arena* was Vilderini, into a Chinese. The Irishman was shaved, stained, and dressed in Chinese costume, and had the name of Ki-hi-chin-fan-foo conferred upon him. His appearance was so far a success that two veritable Chinamen, who had witnessed his performances, took him for a countryman of theirs, but each time they enquired for him at the stage door they were told he could not be seen. These repeated rebuffs made the honest "Celestials" suspicious—not of his reality but of his treatment by his employers. Thinking that he was held in durance and only released in order to appear in the ring, they went to the police court and made an affidavit to that effect. The unfortunate Pablo Fanque, therefore, was called upon for an explanation, and was obliged to put the Irish posturer into the witness-box to declare that he could not speak a word of Chinese, and had never been in China in his life.

Circus performers congregate together and speak a language of their own. Mr. Frost marks off a large district on the south side of the river as the professional quarter of London. He says:—

"At least three-fourths of what I have termed the amusing classes, whether connected with circuses, theatres, public gardens, or music halls—actors, singers, dancers, equestrians, clowns, gymnasts, acrobats, jugglers, posturers—may be found, in the day time at least, within the area bounded by a line drawn from Waterloo Bridge to the Victoria Theatre, and thence along Gibson Street and Oakley Street, down Kennington Road as far as the Cross, and thence to Vauxhall Bridge."

In a morning walk from Westminster Bridge to Waterloo Road, the acrobats and rope dancers of the circuses and music halls may be easily recognised by their dress; and a visit to Barnard's tavern, opposite Astley's, or the Pheasant, in the rear of the theatre, will show a large percentage of circus "artists" before the bar.

The author gives some specimens of the circus slang, which seems to have been

drawn from many quarters. A circus man never mentions a woman by any other term than *dona*, and *bono* is his ordinary word for good; but these foreign equivalents are few.

One chapter is devoted to American circuses, and gorgeous indeed is the description, for we read of gilded chariots, and dens plated and elaborated by the most cunning artisan which would excite the envy of a Croesus. Everything is on a big scale, for the street processions are three miles long and worth going a hundred miles to see. All the American circuses are tenting or travelling ones, and one of them (Howes and Cushing's) came over to England in 1870, threatening Messrs. Sanger with a formidable rivalry, but the Englishmen determined to drive the Yankees off the road, and thoroughly succeeded in their attempt. Barnum's Great Travelling World's Fair is by far the largest of the circuses of the United States, and the description of its marvels allows full scope for the genius of its proprietor. The tickets are dispensed by the "Lightning ticket-seller," who disposes of them at the rate of 6,000 per hour. He, however, cannot supply the demand, so there are several other ticket-waggons, and Mr. Barnum's book agent furnishes from "his elegant carriage" tickets free to all buyers of the life of P. T. Barnum, "reduced from three dollars and a half to one and a half." The sublime of description is reached by the greatest showman the world has ever seen, and we despair of being able to add even a touch to the gorgeous picture he has painted.

It is not remarkable that in a book on a new subject there should be a few mistakes, but it is perhaps worth while to take note of two of them. Mr. Frost states that the first mention of Vauxhall Gardens is to be found in a paper of Addison's in the *Spectator*; but this is not strictly correct, as the place, under another name, was much frequented in Charles II.'s reign. Evelyn went to the New Spring Gardens, which was the old name, in 1661, and Pepys found a great deal of company there in 1667. The following paragraph in the preface is quite incomprehensible: "Under the heading of 'Amphitheatres,' Watts's *Bibliotheca Britannica*, that boon to literary readers at the British Museum in quest of information upon occult subjects, mentions only a collection of the bills of Astley's from 1819 to 1845." How it is possible for a work published in 1824 to contain any such entry as the above is more than we can understand; perhaps Mr. Frost believes that the *Bibliotheca* was the work of the late learned librarian at the Museum, Mr. Watts, instead of Dr. Robert Watt, a Scotch physician.

We must take leave of an interesting book with the remark that *Circus Life* has been fortunate in its historian.

HENRY B. WHEATLEY.

WE are sorry to understand that the Rev. D. Silvan Evans is resigning the editorship of the *Archaeologia Cambrensis*. Mr. Silvan Evans found it the organ of a local society, and leaves it a journal the reputation of which is by no means confined to the United Kingdom. We are anxious to learn who is to be his successor.

English Constitutional History. A Text-Book for Students and others. By J. P. Taswell-Langmead, B.C.L., late Vinerian Scholar of the University of Oxford, Barrister-at-Law. (London: Stevens & Haynes, 1875.)

It is a gratifying sign of the times that so large a demand for historical works continues to show itself; and it is even more gratifying to see that this demand is worthily met by the production of much better books for student and ordinary reader than the past generation had an opportunity of perusing. Every one who takes a real interest in the history of the past and of the present—the true and living scion of that past—will gladly welcome the publication of such manuals as Mr. Taswell-Langmead's, which at reasonable length and in readable form and language will do much to make popularly known the origin and the growth of our institutions, and the reasons for their continued existence or moderate and harmonious reform. Such manuals, when compiled with the conscientious carefulness here manifested on every page, are not only useful to the large and growing class of students, but are handy summaries of history which no library can do without.

The plan of this compendium appears to have been well considered—an element often miserably disregarded—and the materials which the author has chosen to form the solid texture of his work have been judiciously selected. Nothing can be better than the use of Professor Stubbs' admirable volumes, Dr. Freeman's *Norman Conquest*, and Lappenberg's *England under the Anglo-Saxons*, for the groundwork of the earlier chapters. And it is really pleasant to see that there is no unnecessary resort to "original authorities," or neglect of authoritative masterpieces of historical literature, such as Hallam's and Macaulay's well-known works.

Commencing with an elaborate sketch of the primitive polity of our Anglo-Saxon ancestors and its gradual development from personal to territorial organisation, first under native and subsequently under Danish kings, an exposition which is now recognised as all-essential to the right understanding of the spirit of the national life which underlies the continuous current of its history, the reader is presented with an intelligible account of the real effects of the Norman Conquest, and the results of the centralising rule of the three first Norman Kings exhibited in the modification and restraint of the old liberties of the land, and in the needful strengthening of the executive power of the State, while in other respects the continuity of national history was not broken. It is satisfactory here to find Mr. Taswell-Langmead sustaining the older and more correct view of the harshness and selfishness of the personal characters of all the sovereigns of this line, while giving due prominence to their extraordinary capacity of organisation.

The ample commentary on *Magna Charta* to which the whole of a long chapter is devoted, is both useful and interesting, and the author has wisely given in the notes the whole of the original text of this celebrated "landmark in Constitutional History."

This memorable record is one which

naturally occupies a large space in any work of this kind, and just now there is special need for a more than usual completeness of treatment of the Great Charter by writers of history, inasmuch as there is much unfortunate parade of noisy ignorance of its terms and aims which heedless demagogues, by abusing the sacredness of historic truth, do not scruple to turn to their own ends. The Charter is, in fact, a most notable proof of the continuity of the sound English common-sense, which has been alike perplexing to kingly power and mere vulgar agitators; it is, as M. Perrens truly says in his *La Démocratie en France au Moyen-Age*, "a proof that the practical mind of Englishmen thought then as now less about vague aspirations than about securing both old and new rights by Charters and Acts of Parliament." It is also most memorable as the first of those great political compromises for the common weal which have dignified the whole course of the national life.

Passing now to the reign of Richard II., the "redeless Richard" so soundly and courageously taken to task by that great national poet William Langland, Mr. Taswell-Langmead has so thoroughly grasped the bearings of his subject that he must be allowed to speak for himself:—

"The reign of Richard II. is perhaps the most interesting period in the early constitutional history of England. It was the turning-point in the long struggle between constitutional liberty and that arbitrary power towards which the loosely defined prerogatives of our early kings were always impelling them. During the last two years of his reign Richard succeeded in establishing a practical despotism, and the question between him and his people was narrowed to the simple issue of absolute monarchy against parliamentary government. His deposition, and the election of the worthiest member of the royal house to fill his place, marked the final triumph of constitutional principles, and furnished a precedent of the greatest value when, nearly 300 years later, the last of the Stuart kings attempted once more to make 'the royal will the only law.' It was in the reign of Richard II., moreover, that the formidable insurrection of 1381 proved the turning-point in the history of villeinage, which thenceforth gradually declined until it died out without any legislative abolition; and in this reign also we recognise in the theological writings of Wycliffe 'the true epoch of the beginning of the English Reformation.'

"Under Richard II. not only did the commons confirm by frequent exercise the three main rights established under Edward III., that (1) no money could be levied, or (2) laws enacted without their assent, and that (3) the administration of government was subject to their inspection and control; but they also secured on an equally firm basis the two derivative rights, which had been asserted for the first time in the late king's reign—namely (1) the right to examine the public accounts, and appropriate the supplies, and (2) the right to impeach the king's ministers for misconduct."

Mr. Taswell-Langmead has chosen the period of this king's reign as that in which the condition of the labouring classes might be discussed to the best advantage; other writers have selected the reign of Edward III., but there is an advantage in adopting this later date, inasmuch as the insurrection of the *villeins* in 1381 was unquestionably the "turning-point in the history of predial servitude." Of late years, both on the Continent and in England, a special interest has been taken in the history of the pea-

santry, the real body of the nation, and historians are beginning to see that the consideration of the *status* and rights of the labourer and artisan forms an important chapter in mediæval history. In England the growth of feudalism led to the depression of the once free labourer, the villein; and this depression was rapidly brought about by the intrusion of the doctrines of the Roman law as to property in the body of the *servus*, which, as an interesting passage in the *Summa* of Vicarius shows, were beginning to be applied to this class in the reigns of Stephen and Henry II. It may be that the hatred to the civil law, which is so conspicuous in our history, is to be attributed in part to the use that was made of it by certain of the legists; but whether or not this is so, it is important to remember that the writings of both Glanville (why does our author write Glanvil?) and Bracton are coloured by their studies in that which they, like all contemporary students, credited as the "written reason" of law. Again, I have to compliment Mr. Taswell-Langmead on his accuracy in detecting the inconsistency between Glanville's statement of the servile condition of the villein and the evidence afforded by historical memorials of prior and later dates.

The epoch of what has with some affectation been called by certain recent writers "Tudor usurpation," is well handled, without declamation or narrowness of vision.

"During the 120 years spanned by this dynasty, the constitutional historian has scarcely any general progress of free principles, any important measure of improvement to record; but [adds the author] a silent transfer of power was taking place. The commercial wealth of the middle classes enabled them to buy up the estates of the old landed proprietors, and feudalism gradually died out. The persecution of the Puritans roused up a spirit of opposition to the Crown, and the struggle for religious freedom led on to the vindication of political freedom also. . . . At the accession of the House of Stewart, [England] had reached the zenith of material progress and assumed the position of a United Kingdom."

This retrospect of an age brilliant in achievements, but which has long been a favourite subject of exaggerated reprobation, is followed by an interesting and fairly complete account of the growth of the increased power of the Crown, and a well condensed and thoughtfully written history of the momentous Reformation. In treating of this great religious revolution, the author takes us back to the pristine times of the Church in England prior to the Norman Conquest, and proceeds briefly to sketch the growth of the Papal power from that date until the reign of Henry III. From this epoch, which Prynne's voluminous *Records* suffice to establish as of the highest interest and importance, the history of the English Church is one of resistance more or less successful to the claims of the Pope, which is exceedingly analogous to the older resistance to the attempted tyranny of the Crown, and in like manner illustrates the continuous subsistence of northern coolness of temperament and judgment, and teaches a lesson which might usefully be studied even nowadays.

It is, however, in dealing with that chief subject of constitutional history—parliamentary government—that the work ex-

hibits its great superiority over its rivals. The materials, which prior writers had not been able to avail themselves of, because the immense labour of research involved in extracting and editing them had not been undertaken, viz., the vast mass of documents which Professor Stubbs has edited in his *Select Charters*, are here used to good purpose, and the Professor of Modern History at Oxford may well pride himself on a scholar who has so appreciative a sense of his invaluable labours. The full importance of the first epoch of parliamentary development—that which terminates with the death of Edward I.—is here duly set forth, and all matters of difficulty explained by the light afforded by the painstaking criticism of both the older and modern school of historians. The growth of the power of the Commons is detailed at adequate length and though without any manifestation of partisanship, not without a strong smack of liberalism; which perhaps will be acceptable to most readers, but which in some of the subtler questions which are discussed betrays the bias of the writer's mind.

The last chapter is devoted to "the progress of the constitution since the revolution," and is composed under the marked influence of the writings of Dr. Freeman and Sir Erskine May, popular but hardly impartial contributors to political history. Nevertheless, the same scrupulous care to write with completeness and accuracy, and the same desire to maintain a temperate tone of judgment of men and measures, is still shown, and this notably in the discussion of the troublesome case of *Stockdale v. Hansard*.

There are a few slips which in another edition it would be well to correct. The personal property of felons is no longer forfeited: see 33 & 34 Vict. cap. 23, sec. 1 (p. 111). The *Mirror* was certainly composed after the reign of Edward I., and probably towards the close of the next reign (p. 117), and "the spiritual primacy of the Pope and his authority in matters of faith were (*not*) fully admitted" by the English Church from its first institution (p. 369), the relation of the Church in England to the Church of Rome was rather that of mother and daughter, as is explained by Matthew of Paris, in accordance with the general opinion of his day, than of superior and inferior; and the early Penitential of Theodore shows in a marked degree the independence of the Church's position even from its foundation anew by the emissaries of the Papacy.

ALFRED CUTBILL.

Waterside Sketches. A Book for Wanderers and Anglers. By W. Senior ("Red Spinner"). (London: Grant & Co., 1875.)

If proof were needed that Johnson's description of angling as "a worm at one end" of a rod and line, "and a fool at the other," was a gratuitous ebullition of rudeness unworthy to be had in remembrance, it lies to hand in the many volumes anent the gentle craft which bewray that their writers have a relish for other arts and pursuits in point of fact collateral. The book before us is one such witness, affording in every page the most satisfactory evidence that the angler can scarcely help being in some

degree a poet (even if he has never penned his inspiration), or at all events a critic of poetry; and that at the same time his pastime is compatible with the calling of the landscape painter, so that in truth the "brother of the rod" is oftentimes also the "brother of the brush." Add to this that, as "Red Spinner" shows in each of his chapters, an angler of experience is pretty certain to have made to a certain extent a study of mankind as well as of fish-capture; and we have dissociated the connexion between fishing and folly which tickled the churlish taste of the burly dogmatist. This is no less than due to one who has writ so lively a volume as these *Waterside Sketches*, wherein the reader is taken in succession to the chosen haunts of perch, tench, pike, barbel, bream, salmon, trout and grayling, and shown with what bait and manner of tackle he is to cast his line beside the many and diverse waters of English, Irish, and Cambrian rivers. Starting apparently from Cockneyland, and well acquainted with the club-prize systems which are in vogue there, and lead to the unsportsmanlike desire to bag fish—honestly or anyhow—and to catching pale lean pike in June, a month at least too early; familiar, too, with the professional Thames fisherman, whom he knows how to keep in his proper place, as well as with the punting triumvirate, whom at a holiday season "a lusty barbel or a wriggling roach concerns more than all their dividends, discounts, or exchanges,"—Mr. Senior does not limit his piscatory experience to suburban watersides, or exhaust himself in speculations (though he has a cosmopolitan interest in all such topics) as to the possibility of making the Thames a salmon-stream, and of getting grayling to adapt themselves to it. The pike and perch, he justly remarks, demur to the latter contingency; the realisation by a "Severn and Thames Salmon Company, Limited" of a plan for stocking the Thames with salmon *à la* the Severn (since they decline to survive the Pool and its multitudinous shipping) is the only feasible prospect of the other. But, if it be not a bull to put it so, our author is as much at home when further afield. He is eloquent on the fishing of the Dart from Totnes to Dartmouth, and has as keen an eye for the scenery of the "Rhine of the West" as an appetite for the Dartmoor troutlets, which are to be "scrunched body, bones, and head," the tale of tails remaining like damson-stones of a tart as sole record of one's table prowess. Anon we are transported to the Midlands, and taught to appreciate the truthfulness of Cowper's Muse when he sings of the "molten glass" of the "slow-winding Ouse," and of Kirke White's poetic photography when he characterises the bright, dashing, and impulsive Trent as "rippling." In both you catch plenty of pike: in the former the ugly "bream," which even Chaucer's authority will not raise to the rank of a decent edible; and in the latter the large coarse *barbel*, whose merit is not, any more than his cousin bream's, any special esculence when caught, but rather the pastime and patience which he gives scope for in catching. In Wharfedale, and in the vicinity of romantic Bolton Abbey, we make the acquaintance of the "grayling," introduced to "the swift Werfe"

(never doubt it) by the "monks of old" from the continent, and perhaps from Germany. Mr. Senior lingers on the autumnal tints of the woodlands, and on the singular stream-bed Wharfe (on one side gently shelving to the centre, on the other running deep under a steep curving shore) in the neighbourhood of Bolton Bridge, and would tempt his readers to linger over the traditions of the locale to the neglect of rod and fly, which latter may be "brown owl," "fog-black," "black gnat," or some other cunning device of Otley tackle and fly-makers. But we owe it to the pleasantest of towns in the West of England, Ludlow, to bid them press on to Ludlow and the Teme-bank if they wish to enjoy good grayling fishing from one of the most picturesque and delightsome of all centres. Mr. Senior is in doubt whether Lugg or Teme be the best "grayling" river; and it may be the doubt is reasonable, though we imagine that the "Leintwardine Fishing Club" is a more privileged and enviable fraternity than any one which hails from Leominster "of the five Ws." But there is no question between the two towns, from which the angler sallies forth, the only wonder being that any whom a fishing tour has led to acquaintance with memory-haunted Ludlow, can resist the temptation of settling down there and enjoying its charming scenery, as well as feasting on its "cucumery" (not "thymy") grayling in perpetuity. Mr. Senior gives us one good chapter on Angling in Ireland, and in it pronounces the Shannon the best river in the world for all-round angling. In general, he says, you may trust the very accurate data of Murray's *Handbook* in its Irish angling chapter; but he has a special word for the pike in Lough Gill, and the salmon and trout in Lough Neagh; though he warns the angler to eschew the river Main in the month of July, when the flax crop blackens and befouls the stream, sickening the fish and making wrath their would-be captors. In Welsh fishing Mr. Senior's experiences are neither large nor lucky. It is not fair to judge of the "Usk" (which gives the name of the "Three Salmon" to an hostelry in its metropolis) by the bad sport of a frosty February morning; and Llyn Ogwen might have yielded a better day's fishing on other than a hail-stormy Whit Monday. At least he learnt that the Llyn Idwal trout have two eyes, despite the legend. We should like to have heard what "Red Spinner" thinks of the "trouty" Montgomeryshire streams, and hope that his "second series" may report on these. His reading Llangorst for Llangorse, and one or two other misprints of Welsh names, make us deem his acquaintance with Wales superficial. But we could not wish a pleasanter or more intelligent companion, whether in person, or bookwise and by deputy; and his fishing anecdotes have generally a wonderful *vraisemblance*, though when he tells the story of the rats at the Dartmoor Inn which ate the hearts out of two dozen snipes in a cupboard, or of the bottom of the river at Galway Bridge seeming paved with salmon, we suspect he has been supping with Baron Munchausen.

JAMES DAVIES.

St. Helena; a Physical, Historical, and Topographical Description of the Island, including its Geology, Fauna, Flora, and Meteorology. By John Charles Melliss, A.I.C.E., F.G.S., &c. (London: L. Reeve & Co., 1875.)

In his suggestive lecture on Insular Floras, delivered in the Nottingham Theatre in 1866, before the British Association, Dr. Hooker treated St. Helena as a type of the class of Oceanic Islands, and roused the interest of his hearers by his sketch of the intricate biological problems which the peculiar indigenous products of such islands offer for solution. Biological science was not then, and is not now, sufficiently advanced to solve these problems, but the interest of the question is not diminished by the circumstance, and there are few subjects regarding which naturalists receive new facts with heartier welcome than the indigenous living products of these specks of land in the ocean. On this ground alone Mr. Melliss may be considered fortunate in the subject of his geographical monograph, and he has shown his appreciation of this main feature of interest by devoting by far the greater part of his volume to a review of the Fauna and Flora of the island. During the later years of a long official residence he appears also to have employed his leisure hours with good effect in collecting and observing, thus enabling him to add many new facts to the store accumulated by preceding investigators. His work is, however, by no means confined to the biology of the island. St. Helena has a history, not devoid of striking incidents which have given it a world-wide reputation, and to this division of his subject Mr. Melliss devotes forty-five out of the 400 pages which his volume contains. The Geology and Mineralogy are very fully treated of, in a section comprising thirty-three pages, and the Climate and Meteorology occupy twenty-two pages. There is little that is not readable in the entire volume, and some portions of it—especially those relating to the early discovery of the island, the gradual extinction of its strange flora, and the theory of the origination of the land as a volcano isolated in mid-ocean—rise to a high degree of interest.

One of the conditions of an oceanic island is its remoteness from the nearest tract of extensive land, and its separation from it by a sea of great depth—implying long isolation as measured by the scale of geological time. This condition is perfectly fulfilled by St. Helena, and Mr. Melliss combats with success the views of Edward Forbes, Andrew Murray, and other naturalists, who, in order to account for its original peopling of species, have called in imaginary existence tracts of land connecting it in past ages with Africa or South America. It stands in the very midst of the South Atlantic, 1,140 miles distant from the African Continent on the east, and 1,800 from South America on the west. An extremely narrow submarine ledge of not more than a mile and a half in width and sixty or seventy fathoms below the sea surface, surrounds its present shores, beyond which the great depths of the Atlantic, averaging probably 2,000 fathoms, separate it from the two conti-

nents; this latter fact excluding the idea of its ever having been connected with them during at least the lifetime of existing species of plants and animals. The length of the island, from east to west, is ten and a quarter miles, and the width eight and a quarter. Mr. Melliss, who has added very greatly to our geological knowledge of the island, fully confirms the statement of Darwin that, like other islands of its class such as Palma, St. Paul's, and others, it is entirely of volcanic origin. He found no trace whatever of granite or any other primitive or plutonic rocks, or, indeed, any formation to encourage the slightest suspicion of a continental land having ever occupied the site. The present configuration of its surface is roughly that of a much abraded volcanic cone, the broken crater forming a semicircular basin on the south side of the island, and the products of the ancient eruptions constituting the slope to the northward, where they were deposited in accordance with the direction of the strong prevailing winds from the south-east. The seaward or windward rim of the crater is broken down, but the inland wall remains tolerably entire and forms the culminating ridge of the island, varying in altitude from 2,000 to nearly 3,000 feet, the lava beds sloping from the ridge at angles of from 8° to 10° to the northern shores, where their edges have been worn away by the secular action of the waves, and left perpendicular cliffs varying in height from 450 to 2,000 feet.

"This great wall of rock," in the words of the author, "which, on approaching the island from all but a southerly direction seems to defy an entrance, is intersected by a number of deep and narrow gorges running at right angles from the coast line towards the central ridge, where they lessen considerably in depth and width, and the only town is situated in one of these gorges."

Nearly all these deep ravines have a stream of water flowing through them, and they are naturally the results of the wearing action of the drainage of the land. The lesson taught by this simple surface structure of the island has appeared so plain that, aided by a study of numerous vertical sections, which all showed successive layers of volcanic products, it is no wonder that Mr. Melliss has ventured boldly to sketch out its geological history, commencing with the time when the first bubble of a submarine eruption disturbed the surface of the solitary ocean, and resulted in the emergence of a volcanic cone gradually enlarged by accretions of ejected matter. He has extended his explanation even to the minutest details of the physical geography of the island, supporting his views by sections and diagrams, and careful descriptions of the observed phenomena. Towards the end of his Geological chapter he enters also into a discussion of the probable age of the land, as measured by the rate of denudation of certain observed areas regarding which he adduces facts of great interest and importance to geologists.

The volcanic forces of the island have of course long been extinct. Mr. Melliss goes so far as to state that it may be placed among the oldest land now existing on the face of the globe, founding his belief on

considerations of "its isolated position, its peculiar fauna and its very remarkable insular flora, together with its geological character." We confess ourselves unable to see how proof of such extreme antiquity can be furnished by isolation of position or by geological character in the case of formations purely volcanic; but the fauna and flora seem at first sight to warrant the conclusion he draws. The state of the facts is this:—The island when first its indigenous productions began to be collected and studied—which was not until after the forests that originally clothed it had been almost wholly destroyed—was found to be stocked, though scantily, with genera and species having no near affinity with those of any other part of the world; their nearest relatives being the productions of extra-tropical Southern Africa. The number of these extraordinary endemic forms was not great, some eighty species of plants, 100 species of insects, and a few of other classes; but many of the genera were highly peculiar, as well as the species, and the conclusion was a fair one that many others equally singular tenanted the island before the destruction of its primitive vegetation by the flocks of domestic animals introduced by the early settlers. Be this as it may, a sufficient number of indigenous forms have remained to establish the special character of its fauna and flora, and their non-existence in other lands being nearly equally well established, the question arises, whence did they come? As we said at the commencement of this article, biological science is not sufficiently advanced to enable a satisfactory answer to be given. The interest of the problem in the case of St. Helena is heightened by the definiteness of the issue which it presents, if Mr. Melliss's conclusions with regard to its perfect isolation from its very origin be taken as well founded. We doubt much, however, whether he is correct in arguing that because the fauna and flora are peculiar, the island must be of very great antiquity. We know too little of the processes of migration, dissemination, modification and extinction of species generally, to warrant us in drawing any such conclusion. Some classes of facts seem to indicate that these processes are immensely more rapid on continents than on islands: so that an island which had received its forms by accidental dissemination might retain them nearly unchanged long after they had become either greatly modified or extinct, through the severer competition, on the continent whence they had been derived. This is shown by the significant way in which islands of perfect isolation, however large—like, for instance, Madagascar—seem in their grades of organic forms to lag behind the neighbouring continents. If there is any truth in this supposition, degrees of affinity, or amount of modification, of organic forms, offer no absolute measure of lapse of time; lands may be of the same antiquity, although their living products may belong to ancient types in one case, and recent types in another.

That St. Helena originally received its now peculiar forms by migration or accidental emigration from other lands, and especially from extra-tropical southern Africa, cannot well be doubted. The prevailing

winds and ocean-currents set from that direction towards it, and the island is at present largely peopled by modern species introduced from that quarter. There is the evidence also supplied by the nearest relatives of the strange forms being now inhabitants of South Africa; some much more closely allied to them than others, indicating a difference in the dates of migration. To those considerations must be added the important fact that the whole of the native genera and species are not peculiar, but, on the contrary, a considerable proportion are undoubtedly waifs and strays of other lands, which have found their way thither by natural means of dissemination, leaving out of the question the unusually large number that have certainly been introduced by the agency of man. A large number of the plants registered by Mr. Melliss belong to this category; in fact it seems to be doubtful in many cases whether a species is an original native or introduced since the discovery of the island. In the excellent summary of the Coleopterous portion of the fauna, which Mr. T. V. Wollaston contributes to the volume, out of a total of ninety-five species, forty-two are considered unmistakably indigenous (and not found elsewhere), seventeen as doubtful natives (being natives of other countries), and thirty-six as undoubtedly introduced accidentally by man; but of the forty-two indigenous species there is every gradation of affinity with others known in other lands, from the extraordinary forms, "living fossils," the real oldest inhabitants, totally unlike anything known elsewhere, down to the slightly modified species which may have found their way to the island in recent times.

We think the usefulness of Mr. Melliss' work in reference to the questions we have here discussed would have been much enhanced if he had kept the lists of the indigenous genera and species of plants and animals quite separate from those of the introduced kinds. He has too faithfully recorded the occurrence of every living thing in the island, even including cage-birds and garden flowers, mixing them up in the same lists with the few extraordinary endemic forms, which thus appear swamped by hundreds of entries having little or no interest. A great interest certainly does attach to those acclimatised species, which have usurped the places of the fast expiring natives, and all details with regard to their encroachments ought to be faithfully recorded; but the cage-birds, &c., might have been very well left out altogether. The volume is copiously illustrated, and the full-page coloured drawings of all the endemic flowering plants, by Mrs. Melliss, are especially interesting.

H. W. BATES.

MR. F. A. DE RÖEPSTORFF has compiled a *Vocabulary of Dialects spoken in the Nicobar and Andaman Isles*, with short account of the natives, their customs and habits, and of previous attempts at colonisation. This acquires a special value from the fact that some of the dialects here recorded are dying out, and some of the customs and beliefs becoming obsolete. The work has been printed at Calcutta, at the office of the Superintendent of Government Printing.

Henry Brinklow's Complaynt of Roderick Mors, somtyme a gray fryre, unto the parliament house of England his natural cuntry; for the redresse of certen wicked lawes, euell customs, a[n]d cruel decreys. (About A.D. 1542.)

The Lamentacyon of a Christen Ayaynst the Cytie of London made by Roderigo Mors. (A.D. 1545.)

Edited from the Black-letter Originals by J. Meadows Cowper, F.R.H.S., Editor of "The Times' Whistle," "England in Henry VIII.'s Time," "The Select Works of Archdeacon Crowley," &c., &c. (London: Published for the Early English Text Society by N. Trübner & Co., 57 and 59 Ludgate Hill, MDCCCLXXIV.)

THE author of these two works was an apostate Grey Friar, who married—as nearly every apostate monk we have ever heard of did—and who became a mercer and citizen of London, and died in the last year of the reign of Henry VIII. Little is, or need be, known of him beyond the fact that Bale states that he was "fide magis quam eruditione clarus"—a fact which is amply testified by the two tracts which Mr. Meadows Cowper has brought to light. In the latter he twice speaks of an intended publication, which in all probability was the third work of his which Bale says he had seen in print, and was entitled *An Expostulation to the Clergy*. Among the signatures of the Grey Friars who resigned on November 12, an. 30 Henry VIII. occurs the name of Rodericus Boto. It seems probable, from the very unusual Christian name, that this is the same individual, and perhaps the spelling of the name Boto may be at fault.

It is very uncertain where these tracts were printed. The place assigned by the colophon of one of the copies of the latter work is fictitious, and perhaps no reliance can be placed on the statement of the colophon of the first tract that it was printed at Savoy, or on that of the other which assigns it to Nuremberg without mentioning a printer's name. The editor has paid more attention to the contents of the publications than to their bibliographical curiosity. And we must say that we do not think the introduction to such a volume is at all a fitting place for an editor to ventilate his opinions on religious or ecclesiastical matters. Brinklow's opinions may be, and really are, of some importance as indicating the line of thought adopted by himself—and, no doubt, by others of his class—at the time when the Act of the Six Articles was in force; and the tracts are valuable as throwing light upon the condition and conduct of the clergy of the day, however much or little credit the reader may be disposed to give to the testimony of one whose business it was to magnify the faults of those from whom he had apostatized.

One of the principal points of interest in the work consists in its contributing towards the proof of what has only lately begun to dawn upon people's minds—viz., how little direct influence Lutheranism ever has had in this country. Even as early as 1542—if that is the date to be assigned to Brinklow's first publication—opinions had widely spread in England which Luther would have dis-

claimed with as violent an impetuosity as ever he exerted against Roman doctrine. Indeed, this author goes beyond almost every other writer, of the men who belonged to the new learning, in his hatred of bishops; he inveighs against the observance of Sunday instead of the Sabbath, violently condemns auricular confession, calls the Mass the greatest of idols, and explains his doctrine of the Lord's Supper to be that, "as we have tasted, eaten, and seen this Holy Supper or Sacrament of thanksgiving, even so we verily believe that Christ died for our sins."

His prejudice against clerical celibacy leads him into several tirades against the supposed chastity of priests and bishops, and he says in one place that he could name the priests and the places also (p. 111). Of his mode of writing the following may be taken as a fair specimen:—

"What an abhominacyon is it that I shoulde go poure out my vyces in the eare of an unlearned buzarde, and specyally for a woman whereby Syr Johan knoweth where to be sped. Yea if she will not graunt unto hym, he will not shame to threaten her to open her vice, and so for feare she must agree to his abhominable desire." (p. 116.)

How much of truth may be looked for in such statements, or how far they represent the conduct of the writer himself during the time when he was a Grey Friar, must be judged by each reader according as his prejudice or his knowledge of history, or both, may guide him.

Assuredly the accusation he brings against Stephen Gardiner now appears for the first time. It shall be given in his own words:—

"Steuyne Gardner, which was the cheefe causer of that wicked act" (the Act, i. e., of the Six Articles) "is it not manifest and openly known that he kepeth other mennys wyves which I could name and will doo hereafter, if he leaue not his shameles whordom." (p. 64.)

NICHOLAS POCCOCK.

NEW NOVELS.

Three Feathers. By William Black. (London: Sampson Low & Co., 1875.)

Alice Lorraine. By R. D. Blackmore. (London: Sampson Low & Co., 1875.)

The Story of a Soul. By Mrs. A. Craven. (London: Smith, Elder & Co., 1875.)

Cremation; or, Sir Harry Forrester's Ring. By Miss Barrington. (Newport, Isle of Wight: J. Gubbins, 1875.)

Love Me, or Love Me Not. By Mrs. F. G. Faithfull. (London: Henry S. King & Co., 1875.)

Open, Sesame! By Florence Marryat. (London: Chatto & Windus, 1875.)

Russian Romance. Translated from A. S. Poushkin by Mrs. J. Buchan Telfer. (London: Henry S. King & Co., 1875.)

Most people, we suppose, whether they have followed the fortunes of Miss Wemma Rosewarne month by month, or have more wisely reserved them for continuous reading, will agree with us in thinking that Mr. Black has made a new experiment in *Three Feathers*. In all his former novels the characters have been, to use a vague but convenient term, interesting; and their interest has been delightfully enshrined in an

aspic of description. In *Three Feathers* there is very little description, and the characters are, to our taste, curiously devoid of interest in themselves. We always devote particular attention (probably from the innate blackness of the critical character) to the villain of a story; and we are bound to say that Mr. Roscorla, the villain of this book, does not come up to our mark. No doubt his crimes are sufficiently atrocious. To begin with, he is fifty years old, and he appears once to have played unlimited loo. Being engaged to a girl, and receiving a letter from her to the effect that she has fallen in love with a younger man (a friend of his, by the way, and cognisant of the engagement), he is so lost to all decency as to fly into a rage. And we are sorry to say that, the young lady having voluntarily re-engaged herself to him, and then without any notice eloping with the said young man, he is abandoned enough to lose his temper again. All this is very very wrong, but somehow it does not seem to us to justify the peculiar acrimony with which he is treated by the author and all the other characters. Then the young man just mentioned is a doubtful hero. He is not only an ill-mannered, unlettered, and ill-conditioned cub—this is nothing—but he appears to us every now and then to exhibit traces of a far worse fault, namely, positive vulgarity. And the heroine—though perfectly natural as any girl drawn by Mr. Black must infallibly be—is so inexcusably vacillating that she altogether fails to secure our sympathies. The minor characters are better, but they are not good—for Mr. Black. *On n'a pas impunément derrière soi* such novels as he has already written. As to the setting of the story, the author has apparently determined to revenge himself on certain critics by cartailing his descriptions. But he has not been able to resist the spirit always, otherwise we might have been defrauded of the following wonderful eye-and-ear picture:—

"From time to time, as they turned, they caught a glimpse of hills all ablaze with gorse; and near the horizon a long line of pale azure with a single white ship visible in the haze. On the other side of the valley a man was harrowing: they could hear him calling to the horses, and the jingling of the chains. Then there was the murmur of the stream far below, where the sunlight just caught the light green of the larches."

There is only one novelist in England who can write like that.

Alice Lorraine is an altogether satisfactory book. It does not require very great critical powers to formulate Mr. Blackmore's differences as a writer. Strong local colouring, with a most determined quaintness of thought and speech, made the fortune (and very deservedly) of *Lorna Doone*. But one is a little afraid of abuse in the management of such means, and certainly the monotonously elaborate oddity of *The Maid of Sker* was wearisome enough. We must congratulate Mr. Blackmore on a thorough recovery in *Alice Lorraine*. His mannerism has quite regained the crispness which we feared it had lost, and his powers as an actual story-teller have never been shown to better advantage. The book is a book which you

read straight through, not because as a reviewer it is your nature to, but because you can't leave off. And not only is the story interesting and the style attractive, with its odd rhyparography, but in the course of the book we come across passages and episodes of remarkable beauty. These are not quotable because, according to Mr. Blackmore's manner, they are diffused and not concentrated. But the pastoral of the first volume, describing Hilary Lorraine's Kentish visit, the siege of Badajos in the second, and the final scene at the Woeburn in the third, are things not to be easily forgotten by a reader of contemporary, or indeed of any, novels. And not the least merit of these episodes is that they are not really episodes at all, but climaxes of interest legitimately arrived at and departed from. The characters are all good, that is to say, they are as good as they need be for their purpose. Mr. Blackmore has never gone into the analytic business, but he knows quite well how to construct characters which shall be externally consistent, and up to their work. It is really very difficult to find any fault with the book; an ultra-captious critic might perhaps object to the profusion of Dutch painting, and to the unnecessary minuteness and repetition with which such personages as the boy Bonny and his donkey are (somewhat in Mr. Henry Kingsley's earlier manner) dwelt upon. But for our own part we have never been able to admit in matters artistic that you can ever have too much of a good thing, if it be good. And *Alice Lorraine* is most undoubtedly good.

We are not sure that if our advice had been asked, we should have given assent to the project of translating Mrs. Craven's *Histoire d'une Ame*. For we do not think that many of the large class of novel readers who do not willingly read anything out of their mother-tongue will care much for the service rendered to them. And, on the other hand, Miss Bowles (who by the way has translated the book admirably) has been exceedingly cruel to the agonised mothers who write to the *Queen* and similar papers, imploring some one to mention French novels which will not raise a blush on the cheeks of the young person. In such cases Mrs. Craven's books are an infallible specific, and if they are to lose their virtue by being translated we really don't know what is to become of the young person. But now that the thing has been done and done well, the young person must take her chance. *The Story of a Soul* has for subject an old enough theme, the unbelieving husband sanctified by the wife. That this theme is treated with great skill and taste, and in a very interesting manner, all who know Mrs. Craven's books will be prepared to hear; as also that it is dealt with in a key which prevents detailed criticism in this place. Any such criticism could only bring out the curious but obvious differences which arise from taking points of view which are not so much opposed to as remote from one another. For instance, Mrs. Craven speaks of "the facile gift of beauty!" But did not the late Mr. Mill talk about "the accident of sex?"

The subject of Miss Barrington's funny little pamphlet makes one expect something like the well-known "Blackwood article" of

ancient days. How a bereaved husband boiled his wife down and wore her in a ring, and what a painful effect she had on her successor till she providentially made a hole in the ring (which must have been bad gold) and ran out, seems at first sight rather appalling. But Miss Barrington has not followed the immortal directions given to Miss Psyche Zenobia, and there is nothing in the tale about the Supernal Oneness or the Infernal Twoness either. On the contrary, it is a pleasantly and sensibly written little story. But an advocate of cremation might justly urge that the title is unfair, for Mrs. Forrester number one is not cremated in an open and orthodox manner, but subjected to secret and unholy practices.

Love Me, or Love Me Not (the appropriateness of which title we confess that we discern but dimly) is one of a very numerous class of novels. When we have read a few pages we know, without the exercise of any black art, exactly what to expect. We know that we shall have to follow and sympathise with the perfectly gratuitous misfortunes of a young woman endowed with that peculiar transcendental sense of duty which shows itself in making herself, and most people with whom she has to do, exceedingly uncomfortable. We also know (at least so it happens, and it seems to us as if we knew it) that she will jilt an uncommonly good sort of fellow (on whom the whole blame will be laid), and eventually take her chance of happiness (concerning the value of which chance we have our opinion) with a foolish and cross-grained young man, of high moral principles and no manners. The name of the young woman in this case is Winifred Chace, and she would be rather nice if she were a little less dutiful and a little more aware of her own mind. The name of the young man is Mark Cameron, and his folly is, even among his class, remarkable. There is really nothing more to say about the book.

Mrs. Ross Church has chosen the machinery of Spiritualism as the main working power of her new story, nor is there anything to wonder at in the choice; indeed, it is rather surprising that so few novelists have as yet availed themselves of the pleasant excitement of dark séances and complaisant Katies as seasoning for their compounds. But we do not think that, in the present instance, the machinery has been very skilfully worked. Lord Valence's delusion, notwithstanding the pains taken (by the insertion of an inordinately voluminous diary), to make us believe in it, somehow does not impress us at all properly. Instead of sympathising with him, we only feel that he is a weak-minded young man who wants a good shaking. The wicked feminine conspirator—the Cat, as Mrs. Ross Church calls her, observing the capital letter religiously—could hardly have failed to be found out by him, and by the heroine also if either had a grain of common sense. The morals of the book are two—both something musty—first, that there is nothing like beginning with a little aversion, and secondly that you should not attempt to keep house with your sister-in-law. The heroine, with her healthy vigorous idea of curing her husband's delusions by the very drastic

remedy of eloping with another man, has some merits—and so indeed has the book, though it is sometimes oppressively lively, and sometimes oppressively slow.

The principal and very obvious drawback to the enjoyment of *Russian Romance* is the multitude of dark allusions—dark that is to say to us, and probably to other English readers. The translator does her best, indeed she informs us in foot-notes that *vodka* means a glass of spirits, and the like, till we grow slightly weary of the information and begin to wonder why she does not save herself the trouble by translating the word in the text. But we are, no doubt most unreasonably, irritated by such a sentence as this: "He wiped his tears picturesquely with his coat-tails, like zealous Terentitch in Dmitrieff's beautiful ballad." Who is zealous Terentitch? Who is Dmitrieff? Why do we not know that beautiful ballad of coat-tails? However, as we have said, this is no doubt most unreasonable, and we ought to be thankful for what is given us. Moreover, these tales are really attractive enough, especially by reason of the odd simplicity which seems characteristic of Russian story. Except in manner, there is nothing very original about them; indeed, the last scene of the first and longest story, "The Captain's Daughter," is, to use a very mild word, borrowed from Jeanie Deans' interview with Queen Caroline. Except when Dumas thought fit in *Les Louves de Machecoul* to translate several chapters of *Rob Roy*, we hardly know a parallel instance of adaptation. Still the stories are pleasant enough reading.

GEORGE SAINTSBURY.

THE COUNCIL OF CONSTANCE.

König Sigismund und Heinrich der Fünfte von England. Ein Beitrag zur Geschichte der Zeit des Constanzer Concils. Von Dr. Max Lenz. (Berlin: Georg Reimer, 1874.)

IN this little treatise of 215 pages we have an important contribution to European, and especially to English history. The relations between Sigismund, King of the Romans, and our own Henry V. are a subject which has hitherto been treated in a very superficial manner, while the political bearings of the Council of Constance have been almost entirely overlooked. Dr. Lenz has concentrated his attention upon these two subjects, and has examined closely and critically all the authorities relating to them—German, French, and English. In his analysis of the English sources of information, he corrects some hitherto unchallenged mistakes of Hearne and other editors as to the authorship of the works printed by them. The chronicle attributed to Thomas of Elmham is shown not to be really his. On the other hand, the anonymous chaplain's narrative, published by Williams with the title *Gesta Henrici Quinti*, is clearly proved to have been written by Elmham. The *Liber Metricus*, edited by Mr. Charles Cole in the *Rolls Series*, which is undoubtedly the work of Elmham, is declared by the author himself to be a mere epitome of a book written by him in prose; and this book can be clearly identified with the chaplain's narrative. These are points

which it will concern future historians of England to take note of.

But the main object of the present treatise is an examination of the policy of Sigismund King of the Romans, especially in his relations with England and France. His conduct, even at the first blush, has a suspicious look of double-dealing, which we may at once say is not by any means removed on closer examination. Dr. Lenz is no hero worshipper, and he certainly does not attempt to make King Sigismund greater than he actually was. He merely traces out for us in a very interesting manner the particular influences by which he was governed in each successive stage of his career during the life of Henry V. of England. Indeed, we are almost inclined to think that in one or two matters he depreciates Sigismund unduly, pointing in the end to the failure of his policy as if it was due to weakness in the man, and not, mainly at least, to the complications by which he was surrounded. Perhaps, even in our moral judgment of his character, these complications deserve to be considered; for it is needless blaming any one for not taking a direct route if the streets are all winding and crooked. At all events, Sigismund was a king who had a very distinct object in view, which he pursued through thick and thin as far as his power would serve. And it is hard to say that that object was a purely selfish one, merely because his own interests were in a remarkable degree bound up with it.

The point which strikes us as most remarkable in his career is the manner in which, from the most unpromising beginnings, he not only rose to be the secular head of Christendom, but certainly succeeded in reviving for a time the old predominance of the Holy Roman Empire. He had already reached middle age when he was elected King of the Romans in 1410. He was forty-six when he was crowned at Aix in 1414. Before that time he had been King of Hungary, where he ruled uncomfortably over a factious nobility at home, and when he went forth to resist the Turk, he lost a magnificent army at Nicopolis. For years he was an exile and a wanderer, and when he returned to his kingdom he was imprisoned by his own subjects. Nevertheless, on the death of the Emperor Rupert a small portion of the German electors gave him their votes. The rest supported his cousin Jobst or Jodocus, while his elder brother Wenzel, or Wenceslaus, who had been deposed, still maintained his pretensions. But in a short time Jobst died, and Wenzel resigned his claims, so that Sigismund, who certainly was supported only by a minority of the electors—a popular German rhyme said that a child and a fool had elected a king at Frankfort behind the choir—remained without a rival.

Yet, even as undisputed head of the Empire he had still to vindicate the importance of his position. That which undoubtedly gave him an influence in Europe not due even to the Imperial dignity, was the wonderful diplomacy and tact with which he succeeded in terminating the long-standing schism in the Papacy. There were at this time no less than three Popes claiming the allegiance of the Christian world. Two of them had been deposed by the Council

of Pisa, but refused to acknowledge its authority; the third was the worthless John XXIII., who had been driven out of Rome by the King of Naples. A Pope in this situation was not in a condition to resist the overtures of Sigismund for a general Council. The project had already been so far entertained before the Pope was driven from Rome, that the Council had been actually summoned to meet in the Imperial city itself. But Sigismund wrung from the legates of the exiled Pontiff the concession that it should meet in the German city of Constance; and, before the Pope himself had ratified the agreement, he issued a universal edict, as King of the Romans, for the holding of a Council there on November 1, 1414.

This was a crushing blow to Pope John, who saw that his ruin was now almost inevitable. Yet it was a bold step in one who was not yet Emperor, nor had even been crowned King of the Romans, seeing that the pre-eminent authority even of an Emperor would not have been acknowledged throughout Europe. Dr. Lenz, however, shows us clearly how Sigismund framed his course so as to avoid wounding national susceptibilities. To France he addressed himself, not as the head of Christendom, but merely as a member of the friendly House of Luxemburg, while England also courted his alliance. With the goodwill of both Powers he was crowned at Aix, and immediately afterwards opened the Council of Constance. In the professed interests of peace he afterwards visited both France and England, but having ascertained for himself that the victors of Agincourt were likely to maintain their ascendancy, he kept the peace negotiations at a standstill till he could lay his plans with Henry for throwing off the mask at a convenient season and declaring war against France himself.

From a merely political point of view it may seem that this double dealing ended in nothing at all. Neither Sigismund nor Henry gained any material advantage from the league formed between them at Canterbury. The Bohemians gave Sigismund so much trouble that he made no attempt to recover from France any territory that had once belonged to the Empire; and Henry for the same reason called in vain upon his ally to assist him in the war. But the understanding between England and the Empire had most important effects upon the proceedings at Constance, which were continued all the time of his absence. It effectually prevented the election of another French Pope, and perhaps averted another schism. The success of the Council of Constance in freeing Christendom from these evils certainly redeemed for a time the Holy Roman Empire from the contempt into which it had even then begun to fall.

On this part of the subject, however, we shall not attempt to follow Dr. Lenz minutely. The proceedings of the Council of Constance have, it is true, a special interest at this time from the reference made to them in Mr. Gladstone's recent pamphlet, and to understand them perfectly the student must henceforth make use of Dr. Lenz's labours. But for a detailed account of the facts, accompanied by a very thorough examination

of evidences, we must be content to refer the reader to the book itself.

JAMES GAIRDNER.

CURRENT LITERATURE.

Studies in Political Economy. By Anthony Musgrave, C.M.G., Governor of South Australia. (Henry S. King & Co.) If Governor Musgrave governs no more wisely than he writes, which we are far from supposing, South Australia would afford a signal example of the truth of the old saying, with how little wisdom the world is governed. The principal object of his *Studies* is to dispel an error in which he imagines that Mr. Mill and other economists have "floundered," namely, that money has no value and is a mere medium of exchange, and gold and silver become valueless as soon as converted into coin. Mr. Mill's exposition of the subject is that money has, like other commodities, a value dependent immediately on demand and supply, and remotely on its cost of production. How could sovereigns and shillings have different values, if neither had any value? Mr. Mill's theory is, not that coin has no value or exchangeability like other commodities, but that it has universal exchangeability which they have not, being legal tender and a thing which everyone will accept to any amount; on which account its value varies inversely as its quantity, which is not the case with other commodities—corn, for example. Governor Musgrave is not more happy in controverting Mr. Mill's doctrine that demand for commodities is not demand for labour; in other words, that the purchase of commodities is not equivalent to the payment of wages. If a man with 10,000*l.* a year spends that amount on commodities for himself, his horses, dogs, deer, pheasants, and other animals, he and his animals get commodities to the value of 10,000*l.* If, on the contrary, he spends the same amount directly in wages, labourers get 10,000*l.* worth of commodities. Labourers, moreover, would often starve had they to wait for their wages until the things they help to produce are sold. And when they are sold, the capitalist does not spend the whole price upon labourers; he deducts profit, rent, and the cost of materials, implements, and animals. Very little labour is employed for the production of some commodities. The governor of a pastoral country ought to know that labourers may get very little out of the price of a flock of sheep.

First Lessons in Business Matters. By a Banker's Daughter. (Macmillan.) This little book, which, as its title suggests, only deals with the most elementary parts of its subject, contains a considerable amount of information on various matters, and is likely to be useful to ladies who may be under the necessity of occasionally conducting their own business affairs. If all who need its first lesson (on the duty of writing plainly and concisely) would only buy the book and follow its advice, the authoress would have no reason to complain of want of success, and the world at large would receive no inconsiderable benefit.

The Unseen Universe. (Macmillan.) This is an ingenious series of corollaries from hypotheses that occupy the extreme border of scientific enquiry, and so belongs to a kind of speculation of which most scientific enquirers are not unnaturally jealous, and it is rather doubtful whether the orthodox are yet reduced to be grateful for such a defence as can be constructed out of a combination of Origenism and Atomism. As far as one can make out, the authors (one of whom it is a temptation to identify with a certain professor of Moral Philosophy who has written upon Matter and Ethics before) wish us to believe that God the Father is required (in accordance with the doctrine of continuity) as the postulate of the Universe of Matter, and God the Son as the postulate of the Universe of Energy, and God the Spirit as the postulate of the Universe of Life; and that if we prefer not to speculate on the Deity, at any rate a rather

Swedenborgian immortality is guaranteed by the interchange of energy between the Visible and Invisible universe, which seems to be implied in the doctrine that the history of the universe, or at least of the solar system, has been a long process of aggregation of mass and dissipation of energy. It is rather odd that there are people who think that speculations of this kind can make religion more stable than it is made already by the experience of saints, the habitual temper of comprehensive philosophers, and the desires of common people.

Songs of Two Worlds. By a New Writer. Third Series. (Smith, Elder & Co.) The concluding series of this popular work is quite worthy of its predecessors, and it is pleasant to find that the author has already begun to reconsider his intention of writing, or at any rate printing, no more poetry. "The Food of Song" and "The Birth of Verse" are a very clear and delightful account of the author's literary method, a subject on which some further light is thrown in the poem headed "From Hades," where we have refined and fanciful interpretations of the legends of Actaeon, of Orpheus, and Endymion. Actaeon is the type of souls overmastered by this passion; Orpheus, of genius willingly led captive of the commonplace through his affections (which in the "Home Altar" are treated as the consecration of life); Endymion, of those whose youth is well lost in dreams too fair to be realised. From "A Dialogue" between the author and his soul, we learn that, like the writer of the *Iliad*, he regards the body as the true self. Of the other poems, the most important is "Evensong" where the writer watches the sunset and listens to the music from a church where evening service is going on, while he goes over most of the ground traversed in Tennyson's "Two Voices," with much the same result. At any rate, he reaches no conviction too strong to be shaken by the death of an amanuensis. "Frederic" (the amanuensis in question) and "At Chambers" are both very pretty faintly *Heinesque* ballads on incidents of London life. "Street Children" only reminds us of Matthew Arnold by the metre. "The Enigma" reproduces Mr. Rossetti's "Jenny," in what some may call a chastened, others a washed-out version. In the same way it may be asked whether the noble and felicitous diction of the "Ode to New Rome" embodies the commonplaces of amiable Philistinism as the dictates of a generous and temperate philosophy. It is fair to warn the fastidious that both the Albert Memorial at Kensington, and the character of the late Prince Consort arouse the enthusiasm of the author.

The Pinetum: being a Synopsis of all the Coniferous Plants at present known. By George Gordon, A.L.S. Second Edition. (H. G. Bohn.) The first edition of this book was published in 1858, and has for some time been unprocurable. It will no doubt be found no less useful than its predecessor to persons who are interested in the cultivation of Coniferae, but who not being professed botanists do not possess the technical books which treat of these plants. Mr. Gordon's strong point is his practical empirical knowledge of the plants. For the technical matter which he has introduced he has apparently had recourse to other writers. The present book is therefore in no sense a fresh working up of the subject from a scientific point of view. That is a desideratum of which the need is still unsatisfied. But those for whose use the book is intended will find it very fairly answer their needs, and, at any rate for the present, a not untrustworthy—though perhaps not wholly satisfactory—guide. With so good an index it seems almost a pity to have abandoned any approach to a scientific arrangement of the genera for one so purely arbitrary as the alphabetical. Beyond this we have nothing to say, except to put in a plea for Don's original spelling *Athrotaxis*, instead of that so commonly adopted *Arthrotaxis*.

DR. BARLOW has added another to those contri-

butions to Dante literature for which he is already famous, *Sei Cento Lezioni della Divina Commedia* (Williams and Norgate). This is meant as a supplement to Lord Vernon's *Dante*, which reprinted the text of the four earliest editions of Dante, those of Foligno, Jesi, and Mantua, published in 1472, and also a Neapolitan edition without date. There is, however, another Neapolitan edition of the date of 1477. This Dr. Barlow first intended to reprint entire, but found that it contained so many typographical errors that he changed his intention, and has published instead a selection of some 600 readings, which are compared with the corresponding readings of the four texts in the Vernon Dante. Generally speaking there is a strong resemblance between the Neapolitan text of 1477 and that of Foligno.

In reprinting in facsimile Gilbert Burnet's *Some Passages of the Life and Death of . . . John Earl of Rochester* (Elliot Stock), in other words Burnet's account of the arguments by which he converted that witty reprobate on his death-bed to an acknowledgment of the truth of Christian morality, Lord Ronald Gower expresses a hope that the book may be a warning to those whose lives in the reign of Victoria resemble his "in a course of selfish and wicked indulgence." It is sincerely to be hoped that it may be so, but it may be doubted whether many will "have their eyes opened to the reckless folly of leading what is called a 'fast life,'" by a book the antique form and type of which must be rather repulsive to eyes familiar only with the railway novel of the present age, or by arguments which breathe the spirit of the seventeenth rather than of the nineteenth century.

Selections from "Odds and Ends," a MS. Magazine issued by the St. Paul's Literary and Educational Society, and edited by George Milner. Vol. I. (Manchester: printed for the Society.) This is the title of a small privately printed book, forming a memorial of the good work a literary coterie may effect under not very promising circumstances. St. Paul's is situated in a poor and densely-populated part of Manchester, and has been a centre of religious and intellectual life. With between two and three thousand scholars attending its Sunday schools, with charitable and provident societies in abundance, it has also its literary clubs and libraries. The papers and lectures read in a single session are numerous enough to set up half-a-dozen societies. It was founded in 1843, and has 201 members, of whom 45 are women. The MS. magazine has been in progress since 1855, and these selections show that no inconsiderable amount of literary power has been developed among its members. There are some good local word-portraits, and some very graceful verses by the editor.

Essays for Englishwomen and Law Students. A Profitable Book upon Domestic Law. By C. J. Bunyon, M.A., Barrister-at-Law. (Longmans.) The author, who is well known as a serious writer on the law of life insurance, has here undertaken to give "his fair friends," to whom he dedicates this little work, "such a modicum of law as may be profitable to them, or they may wish to know;" and he has done so in a very amusing style, "full of old saws and modern instances." He has a chapter on every subject which can arise in non-mercantile and non-professional life, and each is just as entertaining as a chapter in a novel, besides giving thoroughly sound instruction. We can confidently recommend it to those for whom it is intended. Though a man should not be his owl, lawyer, a man—or a woman either—should not be without the elementary notions on which the transactions of every-day life depend.

It has been known for some time among Mr. Tennyson's friends that he considers much of the "Doubtful Play" of *Edward III.* to be Shakspeare's. He has now, it seems, given leave to a Mr. Alexander Teetgen, of Lucerne, to print this opinion—"I have no doubt a good deal of it is

Shakespeare's;" and Mr. Teetgen has published the Laureate's words in a pamphlet, unfortunately as silly and bombastical as anything we ever saw. The title of this production is "Shakespeare's 'King Edward the Third,' absurdly called, and scandalously treated as a 'Doubtful Play;' an Indignation pamphlet; together with an Essay on the Poetry of the Future, by Alexander Teetgen. Self-justified Shakespeare. 'The Subtlest of Authors.'" (Williams & Norgate.) Having never seen the discussions on the authenticity of *Edward III.* in the ACADEMY of 1874 and other journals and tracts, knowing nothing of the English reprints of it, mis-stating facts about Professor Delius's careful edition of the play, Mr. Teetgen first shows his carelessness and ignorance. He then gives specimens of his judgment, by declaring that the unquestionably spurious *Birth of Merlin* and *London Prodigal* are, in his belief, by Shakespeare, in, at least, great part; that in "Luce" in the *London Prodigal* we have the sublimity of sweetness among Shakespeare's women (!); and that the only man who since Shakespeare's time has approached his "ring," "is Emerson, our only bard." Further, as one of his specimens of the poetry of the future, whose subject is Transcendentalism, which is "The Missing Rib in Shakespeare," Mr. Teetgen gives us:—

"If not, come, Autumn, with thy charms,
For charms thou hast indeed;
Sublime in mystic Death's dim arms—
Death, making life a weed."

He further informs us that "there is no sign of apprenticeship" in Shakespeare's works: and having thus shown that he is absolutely incapable of forming a judgment worth a farthing on any question of poetry, he wants us to take his opinion on Delius—the best Shakespeare editor in Germany—and on many other editors, and to believe him when he says that "'Shakespeare' is written in light (like the handwriting on the wall) all over every page" of *Edward III.* Mr. J. Payne Collier is, we believe, the only other person in England who has ventured a like opinion. Its fallacy was promptly exposed in THE ACADEMY of last year (April 25, 1874), and the windbag of Mr. Teetgen can add nothing to its weight. On the question of what part of *Edward III.* is Shakespeare's we trust that Mr. Tennyson and other competent critics will shortly give their judgment, with their grounds for forming it.

Lotos Leaves. (Chatto & Windus.) The gorgeous binding and good print of this volume are its chief attractions. It is said to be written by members of the Lotos Club, and if that means a club for doing nothing, we cannot wonder at the production. The writers number among them Wilkie Collins, Mark Twain, Whitelaw Reid, John Hay, Isaac Bromley, and others. The book consists chiefly of adventures, stories, and poems. The adventures are weak, the stories are weaker, the poems are weakest; but it will look well on drawing-room tables, and is the sort of book which became popular about fifty years ago as part of the furniture of a well-arranged sitting-room.

EDITOR.

NOTES AND NEWS.

We understand that *The Life and Letters of Lord Macaulay*, a work which has long been in preparation by his nephew, Mr. G. O. Trevelyan, M.P. for the Hawick District of Burghs, is now in the printer's hands, and will be published in the next publishing season.

ONE of the best generals of the Second Empire, Marshal Randon, left a series of Memoirs, the first volume of which has just been published in Paris. They are valueless from a political point of view, but throw great light on the history of Algeria from 1852 to 1857.

MESSEURS. PLON are about to publish a work of the highest interest for students of politics and diplomacy—*L'Histoire diplomatique de la Guerre*

Franco-Allemande, by M. A. Soral, *attaché* in 1870-71 to the mission of M. de Chaudordy, who has since given up the diplomatic career to devote himself to study and the duties of a professorship of diplomatic history at the Ecole Libre des Sciences Politiques. He was in a position to follow day by day all the diplomatic negotiations which took place during the war, and he relates them in the greatest detail, and criticises them with the impartiality of an historian. The book will contain an account of the unsuccessful efforts made by England in favour of peace—a subject hitherto very imperfectly known.

WALT WHITMAN writes to a correspondent:—

"Yes, I shall, unless prevented, bring out a volume this summer, partly as my contribution to our National Centennial. It is to be called *Two Rivulets* (i.e., two flowing chains of prose and verse, emanating the real and ideal), it will embody much that I had previously written . . . but about one-third, as I guess, that is fresh. *Leaves of Grass*, proper, will remain as it is identically. The new volume will have nearly or quite as much matter as *L. of G.* (It is a sort of omnibus in which I have packed all the belated ones since the outset of the *Leaves*.)"

THE Sunday Shakspeare Society is to wind up its first session by reading *As You Like It* on Box Hill next Sunday. Most of the members will walk from Epsom over Epsom and Mickleham Downs, and meet in front of the Keeper's Cottage on Box Hill at three o'clock for their reading.

A MEETING is announced to take place at Willis's Rooms on Monday, June 7, at 1.30 P.M., in favour of the institution of a Chair in one of the Universities of Scotland for the cultivation of the various branches of the Celtic Languages. The Marquis of Huntly is to preside on the occasion, and many noblemen and gentlemen distinguished in literature and art have signified their intention to be present. Dr. Blackie, Professor of Greek in the University of Edinburgh, is also expected to be present to advocate the claims of the aboriginal inhabitants of the British Isles, for the preservation of the ancient vernacular.

AMONG the suggestions made to the authorities in reference to the Arctic Expedition was one from the Vegetarian Society, pointing out the opportunity which it afforded of making observations in the matter of diet, and for disposing of the "very popular fallacy that a flesh or animal fat diet is largely essential to the sustenance of human life in Arctic regions." In reply, their Lordships regret that they cannot adopt the suggestion.

THE last number of the *Bibliotheca Sacra* contains a paper, by the Rev. Selah Merrill, on "Assyrian and Babylonian Monuments in America." There are "slabs enough, to say nothing of bricks and smaller relics, to panel or wainscot a wall 270 feet in continuous length, and the height of this wainscotting would be, for almost the entire distance, nearly 8 feet." Particulars are given of localities where these relics have been deposited.

A PUBLIC meeting of the ratepayers of Bethnal Green decided, in December last, to adopt the Free Libraries Act. The formalities required by the law were duly observed, but the Vestry now refuse to carry the resolution into effect, alleging that a poll of the ratepayers should have been taken. This bit of bad law is simply a cloak to hide the unwillingness of the Vestry, made up chiefly of small property owners, to tax themselves in the interests of popular enlightenment and education. We are glad, therefore, to learn that these foes of progress are to be fought. A committee of ratepayers has been formed to obtain a *mandamus* from the Court of Queen's Bench to compel them to organise a library in accordance with the wish of their constituents as expressed in the mode prescribed by the Free Libraries Act. The fund to defray the legal expenses which this course will involve has already

received contributions from the Duke of Westminster, the Archbishop of Canterbury, the Rev. Septimus Hansard, the promoter of the movement, Mr. George Dixon, M.P., and others. We wish the movement full success.

THE government of Peru has added a faculty of political and administrative science to the course of studies at the University of San Marcos. M. Pradier-Fodere, of Paris, has been charged with the organisation and direction of this school for the education of diplomats, consuls and public servants.

BACON'S Essays have been translated into Bengali by Dharmadās Adhikārī.

BABŪ RAJENDRALALA MITRA's long-expected *Antiquities of Orissa* has at length appeared. The first instalment forms a handsomely printed quarto, illustrated by the students of the Calcutta School of Art, under the superintendence of Mr. Locke.

MR. SKEAT has begun to print the Notes to his great three-version edition of William's *Vision of Piers Plowman*, for the Early English Text Society.

MISS EVA C. GORDON, of Pixholme, is translating for the Chaucer Society Dr. P. Lindner's essay on "Alliteration in Chaucer." Mr. Henry Cromie's "Ryme-Index to the Ellesmere MS. of the Canterbury Tales" for the same society is printed as far as "core."

THE poet Skelton's Englishing of Poggius's translation of the History of Diodorus Siculus is being copied for the Early English Text Society, from the unique MS. in the Library of Corpus Christi College, Cambridge, by Mr. Fowler, Master of the King's College Choristers' School.

THE REV. G. WHEELWRIGHT, of Crowhurst, East Grinstead, the sub-editor of the F words for the Philological Society's proposed English Dictionary, has put forth an "appeal to the English-speaking public on behalf of a new English dictionary." It contains a quarto sheet of specimens of his work, a statement of what has been done for the Dictionary since 1860, and an appeal for further help. The real want is a trained philologist, with a thousand a year of his own, and a resolve to work ten or twelve hours a day at revising the etymologies, &c., already prepared by the sub-editors, and at getting the rest of the material into order. But unluckily no English Littré has yet turned up; and the Oxford Press cannot be convinced that the work when finished will sell enough to pay them for the outlay necessary to finish it. About half the work is done. The Rev. J. E. B. Mayor suggests the formation of a separate Dictionary Society to take up the book. But who is to be the working man of the new society?

PROFESSOR WAGNER, in his late Report on Latin to the Philological Society, notes "that not a single contribution to Latin scholarship has been made by the French in 1874: many schoolbooks have been published, but what we have seen did not appear to be very scholarly. No independent French work, that can be called an actual contribution to Latin philology, has lately come to our knowledge. The Italians do not seem to produce anything important in the same branch of study, nor do the Spanish or Portuguese. Among the smaller nations, the Danes have produced respectable Latin scholars, notably Madvig. The Germans, the English, and the Danes—that is, the Teutonic race—are doing the honours of Latin philology."

AS we have before briefly announced, Dr. Giuseppe Pitre, of Palermo, has recently published in that city a very rich collection of Sicilian popular tales. It contains upwards of 400 "popular traditions," and occupies no fewer than four volumes of the extremely valuable "Biblioteca delle Tradizioni Popolari Siciliane," of which he is the editor. The work is one of which Sicily may justly be proud, and the highest praise is due to

Dr. Pitre for the great pains he has taken in collecting the stories it contains, the conscientious accuracy with which the exact words of the story-tellers have been reported, and the scholarlike manner in which he has handled his vast mass of materials. Thoroughly well acquainted with what has been done in other countries, he has known how to turn to the best account the resources of his own, and he has conferred a boon on foreign readers for which they may well be grateful to him, by presenting them with a copious Glossary and a *Grammatica del Dialetto e delle Parlate Siciliane*.

We learn from the *Pall Mall Gazette* that at the request of Professors Ranke and Giesebrecht, the Prussian Lieutenant-General von Troscki has undertaken to write the history of the military sciences for the great work originated by King Maximilian II. of Bavaria, *The History of the Sciences in Germany*.

In one of Giusti's most touching poems the poet tells how, as he hears the sweet strains of Mozart rising into the air from a military band composed of hated Austrians, his mind projected itself into the future and brought vividly before him the day when the Austrian should have left Italy free, and when his countrymen would hasten to embrace as brothers those whom she loathed as oppressors. Politically, as we all know, the prediction was realised when the King of Italy met the Emperor of Austria at Venice. Still more truly is it being realised every day by the scientific men of Italy, always prompt to receive new ideas from whatever country they may come, and to welcome the scholars who have laboured beyond the Alps. No narrow patriotism makes it hard for them to give ear to counsel conveyed in a foreign tongue. Only last month Professor Max Müller received a hearty welcome at Florence, and the readers of the *Rivista Europea* for the present month will be able to see with what generous acknowledgment of his merits he was greeted by Professor de Gubernatis, in a lecture delivered on April 3 in the Circolo Filologico at Florence, in which he showed something of his own familiarity with the science of Comparative Mythology, and declared himself prepared to fight against all assailants under Professor Max Müller's banner.

The first field meeting of the Woolhope Naturalists' Club was held on the 20th inst. at Caerleon-upon-Usk, under the presidency of the Rev. Charles J. Robinson. The day was almost wholly devoted to the examination of the important Roman remains with which the local museum is filled, and but scanty attention was paid either to King Arthur or to S. Dubritius, whose memorials are certainly of a less substantial character. It will be remembered that Caerleon (*Castrum legionis*) was occupied by the second Augustan legion, that it ranked as a Roman colony, and by its name of *Ica Silurum* was recognised as the chief city of the Silurians. But few persons are aware how extensive are the traces of Roman occupation throughout the immediate neighbourhood. The site of the amphitheatre may be plainly discerned, and the adjacent ground is still called "Bear House Field;" on the hill-side the plough and the spade are continually exhuming urns, coffins, and sepulchral slabs, and in the recent restoration of the church a vast mass of Roman masonry was discovered at its base. The contents of the museum, drawn chiefly from Caerleon and Caerwent, are extremely interesting. Special notice was directed to an inscription which recorded the building of certain "centuriae" for the soldiers. Mr. J. E. Lee (the author of *Ica Silurum*) suggests that this word means "barracks," and it is certainly difficult to see what other interpretation can be put upon it, though dictionaries are silent as to such a use of the word. On two inscriptions the name of Geta has been mutilated or partially effaced, affording strange contemporary evidence of the unpopularity of the son of Severus.

A very beautiful fragment of sculpture was exhibited, representing a combat between some wild animal and a dog of the mastiff breed. The latter bears but little resemblance to the wolf, the muzzle being much more obtuse, the position of the eyes different, and the frame more full. Amulets, antefixa, fibulae, Samian ware of foreign and domestic manufacture, tesserae, and other objects of Roman origin, are still found at Caerleon, and very recently the collection of coins in the museum has been enriched by the addition of one belonging to the reign of Otho, the earliest that has yet been discovered. The Club was entertained by Mr. Lee at the Priory, a modern building occupying the site of a Cistercian house, and traditionally the residence of Dubritius, the anti-Pelagian Archbishop of St. Davids. The temptations to worldliness which caused the removal of the see to the remote promontory of Pembroke certainly do not now exist at Caerleon.

AMONG the questions, historical and literary, raised in anticipation of the celebration of the Centennial of the Declaration of Independence said to have been signed at Charlotte, North Carolina, U.S., on May 20, 1775, is that of the real origin of the dedication of the town to that formidable patron, the hornet. Hornets' nests have been sent from every county and every State of the Union in such numbers, that the *New York Herald* thinks it advisable to inform intending visitors that the inhabitants of these frail structures are no more. Two reasons are generally given for this delicate attention to Charlotte. One is that the place was, during the War of Independence, designated by Lord Cornwallis the Hornets' Nest of America; the other that a doughty little patriotic journal of that name was published there a hundred years ago, the matter of which was pungent, while the texture of the paper itself resembled in colour the grey flakes of which a hornet's nest is composed. It seems, however, that there is no positive proof of the existence at that time of such a periodical. It is only certain that a journal called the *Hornet's Nest* was published at Murfreesboro during the war of 1812, being one of the eight newspapers then issued in the State; and that this title was also given to a paper printed in Charlotte as late as 1850.

Messrs. HODDER AND STOUGHTON will publish on July 1 the first number of the *Clergyman's Magazine*, a periodical intended to provide for the want experienced in the present day by many of the clergy in the shape of a magazine which will at once be of use to them in relation to their manifold work in the pulpit, the study, and the parish. The *Clergyman's Magazine* will be the recognized organ of the Church Homiletical Society, and its contributors will include the Archbishops of Canterbury and York, several of the Bishops, besides a large number of other dignitaries, and many eminent clergymen.

THREE of the monks of the Monastero della Trinita di Cava at Naples have brought out the two first volumes of a *Codex diplomaticus Cavensis*. (Napoli: Hoepli, 1873, 1875.) This is to contain all the documents preserved in the Archives of the Monastery of Cava. These archives, after those of the Vatican and of Montecassino, are the richest of all Italy in important documents relating to the history of the Middle Ages. The first of the two volumes now published contains 211 parchments, a *Synopsis*, a chronological table of the Princes of Salerno from 840 to 1083, and an appendix in which there is a description of a biblical manuscript of the sixth century. The second volume contains 247 parchments, a *Monitum*, and the description of two Codices. Each volume contains a chronological index of the parchments, and an alphabetical index of the names occurring in them, together with some facsimiles. Most of these documents relate only to the history of the Princes of Salerno, but they throw much light on the institutions and customs of the Middle Ages. The

entire collection of documents will embrace ten volumes.

La Guerra e la sua Storia, by Nicola Marselli (Milano: Treves), is the first of three volumes on the history of war. In an interesting chapter called "La Societa Civile" the author combats the arguments used by the old military school against national armies, and in the third book, "L'Esercito," he speaks of the necessity of compulsory military service.

THE Hanseatic Historical Association, which held its last annual meeting at Hamburg from May 17-19, has announced that it will meet in 1876 at Cologne, where the members are to assemble in the old Hanse Hall, in which, in the year 1367, the then powerful Hansers drew up the terms of their celebrated Confederation against Valdemar Atterdag, of Denmark. The result of that day's conference was calamitous to the merry monarch. After returning an offensive answer to the declaration of war from the seventy-seven Confederate towns, and telling the herald who brought it to go back to the "seven und seventigh Gensen" (i.e. Geese, in allusion to the name "Hanser," which was applied to a barn-door fowl), who had sent him, and let them know he had set up a golden goose over his prison-tower at Vordingborg in readiness for their coming—he was defeated by the Leaguers, and ultimately forced to take to flight and leave his kingdom at their mercy.

AN important addition is said to have been made to German incunabula by the discovery in the sacristy of the parish church of Kleinbautzen, in Saxony, of an Old Testament printed by Gutenberg. It had been presented to the church in 1677, by the Kammerjunker Heinrich von Nostiz Malschwitz, but had in the course of time been thrown aside and lost sight of, until a recent clearing away of rubbish brought it to light from the midst of the other books by which it had been concealed. According to German papers, this specimen of the firstfruits of printing has been bought by one of our own countrymen for 8,850 marks.

THE INDIA MUSEUM.

THOSE persons who attended, or took interest in the meeting of Orientalists held in London during the past autumn will, doubtless, remember the part reading of an elaborate paper prepared by Dr. Forbes Watson, official reporter on the products of India, advocating the establishment of an Indian Institute in connexion with the museum under his charge. The occasion thus chosen for mooted the proposal was unfortunate. A number of learned Orientalists had been drawn together to London to hear addresses and discuss questions which were, to them, not only of ordinary interest, but which would enable them to ventilate the learning they had acquired, and the theories they had formed throughout a lifetime of labour and perseverance. Men mostly of middle or advanced age, and, in some instances, of European repute, they could hardly be expected to lend their sympathies to a case which, however good and well put, was addressed rather to Her Majesty's Government in England than to an International Congress; and it is not surprising that the paper met with comparatively meagre consideration, and made way for more pressing and pertinent subjects. Moreover, it is only Englishmen who can properly understand the spirit which actuates their governing financiers in recommending for scientific objects that kind of State support which, according to the reported speech of an eminent ex-minister at the anniversary dinner of the Royal Geographical Society on Monday last, "makes no difference in the annual balance-sheet." Were foreigners consulted upon these points, there is but little doubt of the nature of their decision; and if such decision were adopted, it is probable that in addition to possessing Dr. Forbes Watson's proposed institute and museum, London would be embellished by a new

street opening out St. Paul's to the river, and boast of a subsidised national drama, purified and restored under the *aegis* of the Education Department.

But although Dr. Forbes Watson's project has not been definitively accepted, the views which he has expressed with so much force and intelligence, and illustrated by careful details resulting from long experience, cannot fail to command attention in giving practical effect to the disposition, in any form, of an Indian Museum. Our business is to see what has been done to meet the exigency of the hour, now that the Eastern galleries of the International Exhibition have been selected as the fittest place to receive for the nonce the collections transferred from the upper rooms of the India Office.

• The India Museum in its new *habitat* was visited by a limited number of persons on Monday afternoon, was open to a very large number at the hospitable invitation of the President of the Institution of Civil Engineers and Mrs. Harrison on Tuesday evening, and will be available as a public resort on the 1st proximo. Those who came to the conversation passed first through the French Annexe, most elegantly fitted up for the occasion with carpet hangings and a profusion of charming flowers; and, ascending the staircase at the further end, entered the upper gallery. Appropriated to the Museum are an upper and a lower gallery, each divided into five rooms or sections. The contents of the former, numbered from XX. to XVI. respectively (the higher figure being that nearest the hall of entrance), are classified under heads to which we shall make distinct reference.

No. XX., representing "Archaeology, Sculpture, and Architecture," is of mark and interest. In it are Dr. Leitner's collections and a special collection called the "Yarkand Museum" (*museum in museo*), arranged by Captain Chapman, a member of Sir Douglas Forsyth's recent mission. The first, exhibited already in the gallery of the Albert Hall, and officially reported on at the Vienna Exhibition as "tangible results of active and persevering labours," have not, perhaps, been yet appreciated at their full worth. Whether their antiquarian and artistic character, or their ethnological aspect in the illustration of a little-known people beyond the north-west frontier of India, be held the more attractive, it cannot be denied that Dr. Leitner deserves thanks for his substantial contribution to science, and acknowledgment of the patience and energy which have enabled him to bring together so many valuable and interesting objects. The specimens from Eastern Turkistan must be gratefully received in somewhat vague association with British India, until such time as Central Asia can be more fitly represented; but now that a knowledge of the people, the politics, and the geography of the regions extending from the Caspian to China Proper becomes daily more important, it might not be out of place to make some practical proposals for giving them a department of their own. Visitors will need little special guidance to remark the wonders of Ellora and Ajunta, or of ancient Indian architecture displayed in the copies of frescoes and photographs on the wall: nor will they pass unobserving the massive idols in the centre of the room. But it is more than probable that they will not be so spontaneously drawn to the inspection of the Brahmanabad collection of the late Mr. A. F. Bellasis. Let us, therefore, take the opportunity to mention that Brahmanabad is the name of a sort of Sind Herculeum or Pompeii, that it is the supposed site of a large Hindu city flourishing in the days of Brahmanical temporal power; that it has a legend of a wicked king who lived many centuries ago, whose misdeeds caused the destruction of his capital by an earthquake; that, although not widely known, it bears a great local repute; that Mr. Bellasis and other gentlemen found time profitably spent in excavating its mounds; and

that the pottery, glass, coins, carnelians, agates, and many curiosities recovered in the rooms of unearthed houses are well worthy of notice and enquiry. A pamphlet on the subject was published at Karachi in 1854, and was, it is believed, reproduced at a later date.

No. XIX. has more to exhibit of the rich "Yarkand Museum," besides a very valuable collection of arms arranged by the Hon. W. Egerton, M.P., in a manner to show them off to the best possible advantage. These are classed according as they belong to the aboriginal or non-Aryan, or to Aryan races. Among them we find specimens from the Andaman and Nicobar Islands, Ohhota Nagpur, and many varieties from Malabar to Thibet. A buffalo-hide shield from Nepal is handsome and substantial.

Nos. XVIII., XVII., and XVI. are more thoroughly Indian collections; and notwithstanding that the pottery and paintings, the gold and silver, and brass and copper work, the carvings in ivory and sandal wood, the kimkhwab, silks and shawls, have long become familiar to the British sight-seer, the specimens now shown are sufficiently artistic and beautiful to call for attention and approval.

The carpets are hung on the walls of the rooms generally, commencing from the lower entrance. Among them are some fine Indian productions; but the chief attraction is to the Persian samples which appear more numerous. To Mr. Vincent Robinson, owner of part of the collection, the Museum is indebted for a geographical arrangement of these. The manufactures of Senna and Persian Kurdistan, Hamadan, Mark-had, Herat and Karman may be recognised by the connoisseur; but a clear specification of locality whence derived might be attached to each with advantage. One very fine sample of Karman workmanship is exhibited. The carpets from this city are not so well known in England as those of Western Persia. Perhaps the better kind are not, as a rule, exported at all. We know of none finer than that made for the shrine of Shah Niámat Ullah, at Malúm, twenty-three miles S.S.E. of the capital of the province, by Ustúd Husain, the best of the skilled local craftsmen. The large district of Káian, in the east of Persia, is not well, if in any way, represented. Yet it has many carpet-manufacturing villages; and one, Darakhsh, bears a high reputation in the trade.

We can add little more than a bare notice of the sections in the Lower Gallery. Nos. XI. and XII. contain the zoological collections, which may be pronounced a sure success, both in respect of the scientific and sporting world as of mere pleasure-seeking visitors, men, women, or children. No. XIII., "Departmental Offices," is explained by its title; No. XIV. is assigned to "Mineralogy, Geology, and Physical Geography;" and No. XV. to "Vegetable Products." The Queensland Annexe, entered from No. XIV., is to be regarded, we are told, "as a commencement of a collection which will be largely increased as soon as the proposed and much-wanted Colonial Museum comes into existence."

In such good keeping as that of Dr. Forbes Watson, the director, and Dr. Birdwood, the curator—and with the aid of Mr. Moore and the other officers in charge of the several sections—the India Museum should thrive in almost any locality; but we confess to entertaining a hope that, unless it be fairly "imperialised," it may some day be brought into more immediate proximity to the Government office which is now to it *in loco parentis*.

F. J. GOLDSMID.

NOTES OF A TOUR IN THE CYCLADES AND CRETE.

VI. Crete (continued).

OUR object now was to re-cross the island on the eastern side of Mount Ida to the town of Megalocastron, or Candia, on the northern coast; but before doing so we determined to make a *détour* to

visit a place which is known in all the neighbouring district by the name of "the Labyrinth" (*ὁ λαβύρινθος*). Our host, Captain George, undertook to be our guide; and accordingly the next morning (March 29) we started in his company, and fording the stream close under the acropolis of Gortyna, ascended the hills towards the north-west, and in an hour's time reached the place which bears that name. It is entered by an aperture of no great size in the mountain side, where the rocks are of clayey limestone, forming horizontal layers; and when inside, you find what looks almost like a flat roof, while chambers and passages run off from the entrance in various directions. The appearance at first sight is that of artificial construction, but more probably it is entirely natural, though some persons think it has served for a quarry. We were furnished each with a taper, and descended by a passage, on both sides of which the fallen stones had been piled up; the roof above us varied from four to sixteen feet in height. Winding about, we came to an upright stone, the work of a modern Ariadne, set there to show the way, for at intervals other passages branched off from the main one: *irremediabilis error* would have been the certain fate of any one who entered without a light. Captain George described to us how for three years during the late war (1867-9) the Christian inhabitants of the neighbouring villages, to the number of 500, and himself among them, had lived here, as their predecessors had done during the former insurrection, to escape the Turks, who had burned their homes, and carried off their flocks and herds, and all other property that they could lay their hands on. He pointed out to us the places where the stones were piled up so as to form chambers, each of which was occupied by a family. When I enquired, half in joke, where their refectory (*τράπεζα*) was, he replied that far, far within, there was a large and lofty central hall, capable of holding 500 people together, to which they gave that name, and that here they used to meet from time to time, and dance, sing, and enjoy themselves. They had brought a provision of bread to eat and oil for light; and water they obtained from a spring in the innermost part of the cavern, though there are no stalactites or dripping water in other parts. The heat, he said, was often very great, owing to the confined air and the number of persons. After wandering in different directions for half an hour, during which time we had not penetrated into one-tenth of its ramifications, we returned to the open air.

Notwithstanding the modern name, and the opinion of some scholars in favour of this place, there is no reason for supposing that this was the original Cretan labyrinth. That place was in all probability a mythical conception, like the stories attached to it, though, like many other Greek legends, it may have been attached to some geographical feature, such as a cavern; and that such *subterranea* were associated with the early history of the country is rendered probable by the Greek word for a refuge, *σπηλαιόφυγον*, which seems to mean "a Cretan hiding-place." But all Greek writers localise the story at Cnossus, besides which in the island, bear as their emblem an idealised representation of the Labyrinth. Claudian indeed (*Sext. Cons. Hon.* 634) speaks of *semiferi Gortynia tecta juveni*, by which epithet perhaps he simply means "Cretan;" but it is quite conceivable that when Gortyna became the rival of Cnossus, the inhabitants borrowed the legend, and adopted this place as their labyrinth from its singular correspondence to the traditional idea, and that hence the legend became naturalised here.

Ascending the hillside, we crossed a plateau, the ground beneath which is mined by the Labyrinth, and at one point Captain George pointed out to us the position of the Refectory underground. Higher up we obtained a view of all the snowy mountains of Crete together, comprising the Dictææ mountains, Ida, Kedros, and the White Mountains. I have mentioned that Ida is now called

Psilorites; the original name, however, still survives in Neda (νην Ἰδα), as a small elevated plain is called which is deeply sunk amid the higher summits. The Captain now parted from us, and we continued to mount over stony barren mountains and clayey valleys, in which a few oleanders were growing, until we took leave of the southern sea, and once more crossed the ridge of the island, near which is the small village of Hagia Barbara. The road which descends from hence to Hagios Thomas is excessively bad, in addition to which our guide lost his way. We observed here what had struck us also on the west side of Ida, that the tracks in the northern part of Crete are far worse than those to the south, probably owing to the greater amount of soft soil. This renders travelling a difficult matter during or after bad weather: on our journey to Arkadi our baggage-horse once sank into the mud, and was with difficulty extricated, and on this occasion nothing but extraordinary surefootedness prevented it from falling. The absence of all traffic and communication, here and everywhere, was painfully remarkable.

Hagios Thomas occupies an elevated position just below a plateau of soft limestone rock of a light grey colour, which falls to the village in precipices of 40 or 50 feet high; from the face of these huge blocks have fallen away, and lie detached close beneath. In several of these, and also in the face of the cliff, very curious ancient rock-tombs have been excavated, which reminded my companion of those of Petra, and are more akin to the Lycian sepulchres than to anything that is found in Greece Proper. One block has three of these in various parts of it, and the effect they produce is strange, from their lying out of the perpendicular. They are all of the same shape, being entered by a small square-headed doorway, and are square within, with arched recesses surmounted by niches on three sides; the floor is also hollowed out in parts into shallow chambers. Nothing is known as to the ancient city that occupied this site, but, whatever its name, it was probably Roman, for only Roman coins were brought to me by the people of the village, one of them being of the Emperor Gordian. Descending again from hence by an intricate path, and passing at intervals through groves of chestnuts not yet in leaf, about nightfall we arrive at Venerato, a name which sounds as if it dated from Venetian times. On the way we obtained fine views of Mount Iuktas, which seems to have been regarded as the burial-place of Zeus, for the neighbouring villagers, hardly otherwise than through an ancient tradition, give the name of "the Sepulchre of Zeus" (τοῦ Διὸς τὸ μνημεῖον) to a ruin on its crest, and there is ample evidence that a reputed tomb of the god was shown in Crete even later than the time of Constantine. It rises to the height of 2,700 feet, on the opposite side of a wide and deep valley towards the east, and bears on its summit a white chapel of St. John the Baptist, while the village of Khani Castelli lies at its base; to the north the sea appears, with the island of Dia. In this connexion it is worthy of remark that the modern Cretans make use of the invocation Ζῶντι θεῷ, and on the sides of Parnassus the exclamation "God of Crete" is used to express incredulity, which seems exactly to correspond to a statement of Origen, who said that the early Christians were accused of ridiculing the worshippers of Zeus, because the burial-place of the god was shown in Crete.

The village of Venerato, which is situated in a commanding position on the edge of a cliff overhanging a gorge, is in a more pitiable state of ruin than almost any we had seen. The miserable room in which we passed the night was covered with mould, and anything but water-tight. This place was the scene of a horrible massacre at the commencement of the Greek War of Independence in 1821, when the Moslems, with the intention of intimidating the Christian population, issued from the neigh-

bouring town of Megalo-castron, and massacred all the males whom they found in this and the surrounding villages. To that town we descended the next morning in four hours, having timed our journey well, for not long after our arrival the smoke of the steamer by which we were to depart was in sight on the horizon. In all these parts Megalo-castron is familiarly known as The Castron, which name in Albania we had found to be given to Argyro-castron; and similarly throughout the Aegean and in European Turkey Constantinople is spoken of as The City (ἡ πόλις). A few persons of the upper class prefer to call it Hieracleion, using the name of the ancient city which occupied the site; this was the port of Cnossus, and the ruins of that ancient capital—if so they can be called, for nothing but a single wall remains—are to be seen at an hour's distance to the south, in a position remarkable neither for strength nor beauty. The same thing may be said of the two other principal Cretan cities, Cydonia and Gortyna. As to the Venetian name of Candia, by which Megalo-castron is better known—it is never heard now in Crete, and as a name for the island it never was used at all. The fame of the place in history mainly depends on the gallant defence against the Turks by the Venetians under Morosini, ending in a capitulation in 1669. It is still surrounded by the massive Venetian walls, and in approaching from the land side a deep moat has to be crossed, and a winding passage traversed, before you arrive at the gateway.

Outside the gateway a number of lepers were seated on the ground to beg for alms. This disease is a terrible scourge in parts of Crete, and since it is regarded as contagious, as soon as the first sign of it appears on the body, the unfortunate patient is excluded from the towns. Consequently, there is a lepers' village near Megalo-castron, and we passed a similar one not far from the gates of Retimo. It affects especially the hands and feet, the nose and eyes: one woman, who came close to me to beg, had her hand sadly disfigured, and a painful look about the eyes. This disease is different from what we conceive the ancient leprosy to have been. Within the walls everything presented the appearance of an ordinary Turkish town, with bazaars and veiled women; though the latter were not necessarily Mahometan, for here, as in one or two other towns in Turkey, the Christian women have adopted the Moslem costume. It is a large place, containing from 15,000 to 18,000 inhabitants, but the buildings are poor and straggling. The port, which is enclosed, like that of Khanea, by Venetian moles, lies on the eastern side, and faces east, like that at Retimo. Over a tower, which commands its entrance from the sea, the lion of St. Mark may be seen in two places, and on the land side, partly entire, and partly in ruins, stand the lofty arched roofs of the docks or sheds of the Venetian galleys. During the few hours of our stay we were kindly entertained by our Vice-Consul, Mr. Lysimachus Calocherino, a man of great information about the country, and reputed to be the wealthiest man in Crete, his father having been a long-headed person, and having made much money in the island. Like Mr. Triphylli, of Retimo, he came originally from Cerigo. From him I learnt that parts of the poem of *Erotocritos*, the most famous work that has been written in the Cretan dialect, are still sung by the peasants, but mainly in the eastern districts, of which its author, Cornaros, was a native. He estimated the entire population of Crete as from 280,000 to 300,000 souls.

As we leave Megalo-castron, it looks fine from the sea, with its minarets and walls, backed by the striking ridge of Mount Iuktas, which is here seen in profile. After nightfall, as we passed along the shore, the views of Mount Ida were fine in the brilliant moonlight, and in the morning we found ourselves once more off Khanea, from whence the White Mountains were seen superbly clear, with shapes more sharply cut and bolder outlines than those of any other of the Cretan ranges. We

had time to land and visit the Venetian docks, which resemble those of Megalo-castron, and have a place for drawing up the galleys; after which we walked round the eastern portion of the walls outside, where the breach was pointed out to us which had been made by the Turkish cannon. After a visit to the Consul, Mr. Sandwith, and our other friends, we embarked again, and arrived the next morning at Syra.

A journey in Crete, such as I have described, leaves a profoundly melancholy impression on the mind. Everywhere there was poverty, which in some cases bordered on destitution. It was painful even to feel that we ourselves had enough to eat, when others had so little; and, if we had any compassion to spare from human beings, the poor starved dogs were indeed a spectacle to move it. We were assured, indeed, by Mr. Sandwith, who has done everything in his power to alleviate the distress, that we saw it at its very worst, and that there was a prospect of a good harvest, which would mitigate the suffering. This, we may hope, has been the case, but still the root of the evil lies deeper. There is a widespread feeling among the people, that before ten years are over they will be again in insurrection, and for this reason they do not care to repair their dwellings. Now those who know the Cretans best affirm that, when unmolested, they are a quiet, peace-loving people, and certainly all that we saw tended to confirm this. The bad reputation of their forefathers for being "liars, evil beasts, &c.," does not apply to the present population, and we were much struck by the few complaints we heard, and the absence of begging. The bearing of the people generally in these hard times was most manly. It must have required a large amount of misrule, neglect, and oppression to bring such a people to such a condition. All the necessities of life, except wine, are excessively dear, and notwithstanding the fertility of the soil, the corn that is grown does not suffice for the consumption of the island. The tithe is the only regular impost, but the manner in which this is farmed greatly increases its oppressiveness, and the price of articles is seriously raised in the towns by the taxes or licences of shops, which in some cases are extremely heavy. Quite lately great injury has been caused by the introduction of a debased coinage, first by the government, and subsequently by merchants, in consequence of which the people are unwilling to receive the money. But causes such as these would have been quite inadequate to produce such deep-seated alienation, apart from the wholesale barbarities perpetrated by Omar Pasha's troops, which, were they not thoroughly well attested (see *Revue des Deux Mondes*, vol. lxxiv. p. 896), would be quite incredible.

The Cretans are usually about or a little above the middle height, though some are very tall and well-grown men. With few exceptions, they have dark hair and eyes, oval faces with rather a pointed chin, full cheeks, and noses somewhat aquiline and sometimes even hooked: the expression is generally good humoured and intelligent. The men's dress is quite different from what is found elsewhere in Greece and Turkey, consisting of a long boot reaching above the calf, blue baggy trousers gathered in at the knee, a red sash, white shirt, blue waistcoat, corresponding to the trousers, and a jacket; over which is worn a short capote, usually white, with a hood to cover the head, though sometimes a skull-cap is seen. Of these, the boots and cloak seem to have come down from classical times, the former being mentioned by Galen, who thinks their use was suggested by the ruggedness of the Cretan mountains, the latter by Aristophanes (*Thesm.* 730), who calls it the κρητικόν. To classical students the interest of the island consists, not in any important historical events of which it was the scene, but in the peculiarity of its institutions, and in its having been the principal stepping-stone by which Phœnician civilisation passed into Greece.

CORRESPONDENCE.

AN IMPORTANT MS. OF THE PSALMS.

Bodleian Library: May 24.

The last word has not yet been spoken concerning variations in the Old Testament. The Kennicott and De Rossi MSS. are now surpassed by the old fragments of the Imperial Library of St. Petersburg (see the variations communicated by me to the *Journal Asiatique*, 1865, i. p. 542). This library will soon possess the famous collection of the late Firkovitz (*ACADEMY*, July 25, 1874), in which a large number of ancient fragments of the Old Testament are to be found. The Eastern Jewish congregations no doubt still have old MSS. of the Old Testament which have never been collated; I mention, for instance, the synagogues of Cairo and Aleppo. A MS. of the Psalms (defective at the beginning and the end) of an ancient date is now in London in the possession of the well-known traveller, Rabbi Jacob Saphir, of Jerusalem, author of *Eben Saphir*, or *Diary concerning the Jews of Yemen, India, Malabar, etc.* (*ACADEMY*, 1875, p. 39), which I have lately had an opportunity of seeing for a few moments. The learned Rabbi asserts that it belongs to the ninth century; I, however, would ascribe it to the eleventh. But the date does not affect the importance of the variations. For instance, Ps. xxxvii. 8, the MS. reads אֶת־לִרְעָה אֶת־לִרְעָה instead of the strange אֶת־לִרְעָה. Ps. lxiii. 3, the MS. omits the word רִבְּהָ (compare verse 7), which offers very great difficulty; admissible indeed is only either the Syriac version, which refers the word to מִשְׁנֵבִי, or the Arabic, which takes it in the sense of *ever*. Ps. cii. 13, the MS. has כִּסְאָךְ instead of זִכְרֶךְ (compare Lam. v. 19), which latter gives no good sense and where the י spoils the beauty of the parallel passage. As far as I understand from the learned Rabbi, he has made collations of the biblical texts as well as of the Masorah in many libraries both public and private, and these he would bring out as a third part of his *Eben Saphir* if assistance should be given him for the purpose. In the presence of such MSS., can we advocate a definite revision of the translation of the Old Testament? Certainly not. Communications are easy enough now to all parts of the world, and competent persons ought to be sent out at once to make collations with old MSS. before the Revisers settle the sense of doubtful passages.

AD. NEUBAUER.

PEPYS' DIARY.

Kensington: May 24, 1875.

The question, "Are we, or are we not, to have a genuine *Pepys*?" is of such importance that the parties interested ought not to have the settlement all to themselves. To my thinking the claim of Mr. Bell as representing Dr. Neville, Lord Braybrooke, Mr. Colburn, Mr. Bohn, and perhaps several other intermediate hands, though urged, no doubt, in perfect honesty and good faith, is simply monstrous. Let us suppose a parallel case in the sister art of painting. In the Bodleian, as we all know, is a picture of the great Lord Burghley ambling along upon his mule, which we are likewise to suppose had never been engraved till the late Dr. Philip Bliss, shall we say, had a copy made which he presented to his brother, a square in Essex. The brother liked it so well that, in 1824, he published an engraving of so much of the picture as represented the great statesman's head and shoulders. This print at once became popular, and after twenty-four years the Essex squire thought he might venture to extend the plate so as to include the ears and tail of the mule, and accordingly, in 1848, this enlarged version was issued and very soon took the place of the other in every collector's portfolio. This satisfied the public for a time, but gradually people began to ask why the rest of the picture should not be engraved, and no answer being received from the expected quarter, one of the authorities of the Bodleian, after an interval of half a century, caused another and more accurate copy to be made, and, with the full consent and approbation of his brethren, announced an entirely fresh and complete engraving for immediate publication. But here at once the representative, three times removed, of the Essex squire steps in with, "Hold! you may engrave Burghley's head and shoulders, because my forty-two years' use of them expired in 1866, but there you must stop short. The mule's ears and tail are mine till 1890, and as for the fore and hind legs of the beast, the skirt of the statesman's gown, and the gilliflower he carries in his hand, they are mine, absolutely and exclusively mine, till such time as it pleases me to make them public, and for forty-two years afterwards."

The two cases appear to me exactly parallel, and should Mr. Bell's view be upheld, I do not see why he and his descendants by judicious subdivision of the new matter, making it public by dribblets at intervals of about forty years, should not continue to be enjoying the copyright in the reign of Albert the Thirteenth.

F. CUNNINGHAM.

23 Sussex Place, Regent's Park:
May 25, 1875.

I do not at all agree with Mr. Bell that my transcript is a duplicate of the first. The mistakes in the former editions are so numerous, and many of them so flagrant, that I intend, at the end of each volume, to publish a list of the chief of them, so that any one who chooses to take the trouble may compare the mistakes with the corrections and form his own judgment respecting them.

The position I maintain is this, that with the permission of the College I have a right to decipher and publish the whole or any part of Pepys' manuscripts, and when published I shall consider that edition as my copyright. But there is nothing to hinder the College hereafter from allowing any future Fellow to decipher afresh the original MS., if he thinks fit, and to publish it, although the copyright of my MS. has not expired.

I also do not see why Magdalene College should not have accepted "a valuable benefaction derived from the proceeds of the copyright" of Lord Braybrooke's book. Lord Braybrooke undertook the task as "a labour of love," and he gave the profits of it to Magdalene College (of which College he was the Visitor) *entirely as a free gift*. This has always been the full belief of the Fellows

of the College, and this is the decided opinion of his son, the present Master of Magdalene.

I will only add in justification of myself, that I never had the remotest wish to do Mr. Bell any injury, that I have been for a long time trying in vain to discover to whom the copyright of the edition of 1848 belonged, that I thought it was in the possession of the present Lord Braybrooke, that I received a letter from him dated February 9, 1875, in which he says, "I have no objection to your making use of the *Life of Pepys*, with the notes in the last edition, by my father," and that it was only three weeks ago (when it was too late) that I learnt accidentally that the copyright in question was the property of Mr. Bell.

MYNORS BRIGHT.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 29, 3 p.m.	Royal Institution: Professor Douglas on "The Chinese Language and Literature."
	8.30 p.m. Royal Albert Hall: Last Performance of Verdi's <i>Requiem</i> .
MONDAY, May 31, 3 p.m.	Asiatic: Anniversary.
	8 p.m. Welsh Choral Union (Second Concert), St. James's Hall.
TUESDAY, June 1, 3 p.m.	Royal Institution: Professor Gladstone on "Chemical Force."
	" British Orchestral Society (Last Concert), St. James's Hall.
	7 p.m. Sculptors of England: Anniversary.
	8.30 p.m. Biblical Archaeology: Mr. F. R. Conder on "Ancient Metrology;" Mr. S. Sharpe on "The Ancient Egyptian Shaw for the Head;" Professor J. Campbell on "The Ethnology of Palestine in the time of David;" Mr. E. R. Hodges on "An Unpublished Assyrian Inscription in the Vatican Museum."
WEDNESDAY, June 2, 1 p.m.	Zoological: Papers by Messrs. G. E. Dobson, H. Adams, and G. French Angus.
	3 p.m. Horticultural.
THURSDAY, June 3, 11 a.m.	Midle. Krebs's Second Recital (St. James's Hall).
	8 p.m. Microscopical.
FRIDAY, June 4, 3 p.m.	Society of Arts: Morning Meeting at Stafford House.
	Royal Institution: Professor Dewar on "The Progress of Physico-Chemical Enquiry."
	5 p.m. Zoological Gardens: Professor Flower on "Elephants."
	7.30 p.m. London Institution: Solré.
	8 p.m. Linnean. Chemical.
	" Royal Society Club. Inventors' Institute.
	8.30 p.m. Royal. Antiquaries.
SATURDAY, June 5, 3 p.m.	Mr. Charles Hallé's Recital, St. James's Hall.
	4 p.m. Archaeological Institute.
	8 p.m. Geologists' Association.
	" Philological: Mr. A. J. Ellis on "Some Points of Ancient Greek Pronunciation."
SUNDAY, June 6, 9 p.m.	Royal Institution: Professor Tyndall on "Whitworth's Planes, Standard Measures, and Guns."

SCIENCE.

The Micrographic Dictionary: a Guide to the Examination and Investigation of the Structure and Nature of Microscopic Objects. By J. W. Griffith, M.D., &c., Member of the Royal College of Physicians, and Arthur Henfrey, F.R.S., F.L.S., &c., Professor of Botany in King's College, London. Third Edition, edited by J. W. Griffith, M.D., &c., and Professor Martin Duncan, M.B. Lond., F.H.S., F.G.S., and assisted by the Rev. M. J. Berkeley, M.A., F.L.S., and T. Rupert Jones, F.R.S., F.G.S., Professor of Geology, Royal Military and Staff Colleges, Sandhurst, &c. Illustrated by Forty-eight Plates and Eight hundred and twelve Woodcuts. (London: Van Voorst, 1875.)

FROM the time the *Micrographic Dictionary* made its first appearance, which was in 1855, it has been considered an indispensable work for students of minute structure and elementary forms. This character was, on the whole, well maintained in the

second edition, completed in 1859; and, notwithstanding some serious deficiencies, it must be ascribed to the third edition, which, after greatly exercising the patience of those who subscribed for it in separate numbers, is at last finished in a manner that deserves considerable praise.

The preface to the new edition explains that "ill health and professional engagements" on the part of Dr. Griffith caused the delay up to the letter "H," after which the editorial task was undertaken by Professor Duncan, and proceeded more vigorously. The articles on Foraminifera were entrusted to Professor Rupert Jones; and no one—except his fellow-labourer, Mr. Parker—could be regarded as equally fitted for that portion of the work. The articles on Fungi have likewise been revised by the best man for the purpose—the Rev. M. J. Berkeley; and valuable notes on Lichens have been contributed by the Rev. W. A. Leighton.

The weakest part of the book is the "Introduction," together with the scattered articles concerning the microscope as an instrument, its objectives, miscellaneous apparatus, and methods of employment. Most of this matter is sadly out of date and very incomplete. For example, the information about immersion lenses is very scanty; the relation of angular aperture to focal length, as illustrated by the best new glasses, scarcely touched upon; the term "penetrating power" is still often used in the old and obsolete sense of separating power, whereas it is much more convenient to employ it, as most recent writers do, to express the power of bringing objects that are not precisely in the same horizontal plane into satisfactory view at the same time. This is not merely a verbal objection, as the way in which penetrating, resolving, or separating powers are defined affects the clearness, and often the accuracy, of the explanations given of the action of objectives constructed upon different patterns. Neither in the Introduction (section, *Object Glasses*), nor under "Achromatism," nor "Objective" can we find any account of the combinations now employed to get rid of chromatic and spherical errors. "Aberration" refers us to "Optics," but there is nothing under that heading. The article "Test Objects" ought to have been entirely re-written. It is throughout unfit for the present day. To give one example of this: the old story—true enough once—is repeated that "if we examine a valve of *Gyrosigma* [why not *Pleurosigma*?] by direct light, the minute structure will be invisible, however small or large the angular aperture may be, or how ever perfect the defining power." Now, the fact is, that unless a valve of *Pleurosigma angulatum*, or other species, is unusually delicate, its markings can be easily shown with a fine $\frac{1}{2}$, or lower power of recent make, and direct light obtained with an achromatic condenser and a stop, cutting off all oblique rays—say giving a pencil of 30° , or less. Powell and Lealand's immersion $\frac{1}{2}$ shows them well with the smallest central hole of Ross $\frac{1}{16}$ condenser, marked 20° , and Beck's $\frac{1}{2}$ with C eye-piece does it with the next stop marked 30° . The better the corrections, the less is the necessity for great

obliquity in exhibiting these objects, or for excess of angular aperture. It may be said that pencils of light having angles of 20° or 30° are not direct, though for practical purposes they are so considered. The most direct light that can be obtained is employed when the microscope is used in daytime, the stage mirror turned aside, and the instrument, without any condenser, simply pointed at the sky. So used, the $\frac{1}{2}$ above mentioned, with A eye-piece, defines even delicate valves of *P. angulatum* beautifully.

Since the last edition, the microspectroscope has come into considerable use, and the articles on "Blood," "Chlorophyll," and others relating to substances which it is employed to investigate, should have included particulars of the spectra to be observed. This is not the case, and under the heading "Microspectroscope" the information afforded is of little use.

Lepidocyrtus curvicolis is described under its old name "Podura," no notice being taken of Sir J. Lubbock's researches and classification. "The scales of several species belonging to even different genera" are stated to be "exactly similar, both in form and markings." This is a mistake which a mere inspection of the plates in Lubbock's book *Monograph of the Collembola and Thysanura* would have corrected, though the drawings there given would probably have been modified in some minute details if their author, the late Richard Beck, whose early death was a loss to science, had lived to re-examine them with the best immersion lenses.

We might point to other articles in which more pains should have been taken to bring the various subject-matter down to date, but enough has been said to show that there is room for a supplement if the work is to be made fairly complete.

It would, however, be unfair to the editors and publisher if only shortcomings were pointed out. Looking to new topics, we find "Pedalion," the interesting rotifer discovered by Dr. Hudson, among the fresh articles, and under the head of "Lichens" the new theories thus mentioned:—

"Schwendener states that all these growths (lichens) are not simple plants or individuals, but rather colonies which consist of multitudes of individuals, of which one alone plays the master, while the rest in perpetual activity prepare his food. The master is the Ascomycete, the slaves are green Algae. He asserts that Nostocaceous plants which live in moist or wet habitats, not those which are purely aquatic, form a foundation or basis of Collemaceae. But this opinion that lichens are parasitic in Algae is open to much doubt."

The recent views of Haeckel will be found sufficiently explained under the heads of "Plastids" and "Protista." The article on "Spongida" has been rewritten, and an entirely new and valuable one contributed on "Rocks." That on "Nerves" is considerably enlarged by new matter, so is that on "Muscle," in which Schäfer's views of its structure are explained and a new wood-cut given, exhibiting the distribution of nerve fibrils, or muscular fibrils. "Pebrine," the curious parasitic disease of silkworms, which has inflicted such heavy losses on

sericulturalists, and which Pasteur ably investigated, is also included in this edition.

The new matter is stated to amount to about 100 pages; three new plates have been added, 46, 47, 48, representing Fungi, Foraminifera, and various objects from Infusorians to a section of the spinal cord, after Lockhart Clarke; and the old plates have been re-engraved on copper. In introducing new plates, it would have been better to have made a fresh arrangement in the consecutive order of the old ones, and in re-engraving the former plates, some of their contents might have been better distributed. For example, Plates 40, 41, 42, and 48 are all "Various Objects," without any logical connexion; sorting them out would have enabled infusoria, rotifers, diatoms, &c., to have been placed in their natural position. Plates 18 and 48, instead of being far apart, should have followed, as both are devoted to Foraminifera.

A more extended notice, fairly drawn up, would show many more instances of omissions that ought to have been supplied, and of rectifications not made, and it would also point to numerous instances in which the work of revision has been well done.

On the whole, although there must be regret that a little more intelligent labour was not bestowed upon it, the *Micrographic Dictionary*, in its third edition, deserves far more consideration for its merits than blame for its defects. In spite of the latter, it is emphatically a valuable book.

HENRY J. SLACK.

A First Japanese Book for English Students.
By John O'Neill. (London: Harrison & Sons, 1874.)

THE study of Japanese has not received the same favourable attention in England as it has in France. For the explanation of this it is needless to seek, but the result has been that, while shelf-loads of manuals of that language have been published in Paris, Aston's Grammars, and Hepburn's Dictionary have until now been the only aids which the English student of Japanese has had at his command to help him over the difficulties in his way. To these, Mr. O'Neill has now added a "First Book," which will be found to serve as a most useful supplement to Aston's grammar of the colloquial language. In this work we have the text of a sermon—miscalled, by a slip of the pen, on the title-page, a "Buddhist Sermon"—by a priest belonging to the Shingakū sect, accompanied by an interleaved transcription in English letters, a literal translation, and interlineal glosses. And at the end there is given us a copious vocabulary, followed by tables of the Hiragana and Katakana characters. The style in which the sermon is written is purely colloquial, and as such, the study of it is just that which should occupy the attention of a beginner. The first object to be sought by one wishing to gain a practical knowledge of any language must be to learn to speak it. More especially is this the case with Chinese and Japanese, in studying which it becomes so necessary to depend on the verbal explanations of native tutors. As an aid to gaining this proficiency Mr. O'Neill's book will be found most useful.

But that the value of this assistance may be fairly weighed, it is necessary that our readers should understand that there are four kinds of characters in which Japanese may be written, and that there are five distinct styles of composition. The characters are—the square Chinese character, the cursive Chinese character, the native Katakana, and the Hiragana. The five styles are:—1. The style in which ancient poetry is written, and which is distinguished by a total absence of Chinese words, and by its richness in particles and grammatical terminations. 2. The style in which historical works, known as *Monogatari*, are written, and in which a small proportion of Chinese words is to be found. 3. The style employed in modern popular literature, in which Chinese words are freely used. 4. The style adopted in epistolary correspondence and official documents, in which a large proportion of Chinese words and idioms is admitted. And 5. The colloquial style, such as is found in the work before us, and which, as in the present case, is always written in cursive Chinese characters and Japanese Hiragana intermixed.

The particular sermon chosen by Mr. O'Neill to form the subject of his treatise, is one of which a translation is to be found in Mr. Mitford's *Tales of Old Japan*, and which is full of the quaint dry humour which characterises this kind of literature in that country. The audiences addressed are principally of the shopkeeping and lower classes, and the allusions and illustrations with which the discourses are seasoned are sometimes of a kind to offend more fastidious ears. Anecdotes are freely introduced, and if the published sermons are fair specimens of the productions of these wandering preachers, their listeners have a decided advantage as far as liveliness is concerned over most English congregations. The translation of the sermon before us has been carefully and most literally rendered, to enable students to trace the meaning and grammatical value of each word, and where difficulties arise they will find them fully explained in the footnotes.

The transcription of Japanese into English letters is surrounded with more than usual difficulty: not only are some of the sounds such as it is next to impossible to represent in English letters, but by the crasis of vowel sounds and by the elision of certain syllables, the difference between a literal transcription syllable by syllable of the Japanese words, and their transcription as pronounced, is very great. For instance, the Japanese word *Motsutomo* is pronounced *Mottomo*, and thus a further difficulty arises, namely, that of recognising the words in which such changes take place. The practicability of establishing a universal system of transcribing Japanese was one of the subjects brought forward at the Paris Oriental Congress, and after long and repeated discussions all hope of arriving at a definite method was abandoned. Mr. O'Neill has adopted Hepburn's system, which is, as he says, a practical compromise between the actual orthography and the pronunciation, and for the convenience of English students this, no doubt, is the best he could have followed. We trust his work will have the wide circulation it deserves. It amply fulfils

the object of its author, and forms a practical and useful introduction to the language of Japan.

ROBERT K. DOUGLAS.

SCIENCE NOTES.

ZOOLOGY.

Distribution of Animals.—The long-looked-for work on the geographical distribution of animals by Mr. A. R. Wallace may be expected to appear in autumn. It will be published by Messrs. Macmillan and Co., in two octavo volumes, illustrated by maps and by plates representing groups of the animals characteristic of each of the zoographical sub-regions.

Ornithological Works.—British ornithologists are by no means inactive at present. Lieutenant-Colonel Irby has just published a volume on the *Ornithology of the Straits of Gibraltar* (Porter, 6 Tenterden Street), treating of the birds found on both the Spanish and Moorish sides of the straits. Interesting details are given of the distribution and habits of 335 species, founded on the author's own investigations during a prolonged residence at Gibraltar, collated with the observations of Lord Lilford, Mr. Saunders, Mr. Tyrwhitt-Drake, and M. Favier. The first part has been issued of an *Ornithological Miscellany*, by Mr. G. Dawson Rowley. (Trübner & Co.) The scope of the work is somewhat indefinite, but this portion is devoted entirely to New Zealand birds, and is illustrated by fine coloured plates by Mr. Keulemans of the various species of Apteryx. Mr. H. E. Dresser continues the publication of his beautiful *Birds of Europe* with most praiseworthy regularity, and the second volume of Mr. R. B. Sharpe's *Catalogue of the Birds in the British Museum*, including the family of owls (Strigidae), will shortly appear. Mr. R. Swinhoe, formerly H.B.M. Consul at Chefoo, is about to issue the prospectus of a history of the *Birds of China*, uniform with Mr. Dresser's work. It will be published to subscribers in bi-monthly quarto parts, and coloured plates will be given of such species as do not come within Mr. Dresser's range. The two works will thus embrace the whole of the birds of the Palaearctic Region, excepting those of Japan and of North-Eastern Siberia, and it is to be hoped that one of these gentlemen will eventually fill up this small remaining blank. Mr. Swinhoe's investigations into the natural history of China are widely known, and this final embodiment of his results will be warmly welcomed by ornithologists.

Transit of Venus Expedition.—The zoological results of the Expedition of 1874 are beginning to come to hand. Mr. Slater has brought from Rodriguez an unrivalled collection of the bones of the extinct solitaire of that island, and is at present engaged in their arrangement. The Rev. A. E. Eaton has sent his first report from Kerguelen's Island to the Royal Society (*Proceedings*, xxiii. pp. 351–356). The only land mammals found on the island were the introduced goat and mouse, and the Expedition was attempting to add to the fauna by turning down some rabbits. Two species of seals had been obtained, and twenty-two or twenty-three of birds, mostly albatrosses, petrels, and penguins. Fish were scarce, and the marine invertebrata are passed over in the report as having probably been more fully collected by the *Challenger*. By far the most interesting part of the fauna of Kerguelen's Land appears to be the entomology. The insects collected belong to the orders Coleoptera, Colembola, Diptera, and Lepidoptera; and Mr. Eaton finds, in accordance with the observations of other naturalists on oceanic islands, that most of the larger species are incapable of flight. Thus the wings are much shortened in a species of Tinea, and the insect, though active, only moves by jumps, while they are reduced or even rudimentary in most of the flies, and the larger beetles have their wing-cases or elytra firmly soldered together.

Origin of Vertebrata.—The structure of the now famous ascidians and of the lancelet (*Amphioxus*) has recently been the subject of memoirs by several distinguished zoologists, in connexion with the supposed origin of the vertebrated animals. On December 17 last, Professor Huxley read before the Royal Society a "Preliminary Note upon the Brain and Skull of *Amphioxus lanceolatus*" (*Ann. and Mag. Nat. Hist.*, 4th Series, xv., pp. 225–230), in which he shows that although these organs are not fully differentiated in the lancelet, yet well-marked divisions of the nervous axis and spinal column exist which answer to the encephalon and cranium of the higher fishes. The homologies of the anterior pairs of nerves are worked out, and the skull is considered to be represented by the segments of the body which lie in front of the fifteenth, counting from before backwards. The many points of resemblance in structure between the lancelet and the young form or larvae of the lampreys (*Petromyzon*) are insisted on, and it is suggested that *Amphioxus* should be regarded as the type of a new primary division of the class Pisces to be called Entomocrania, characterised by its permanently segmented skull, as contrasted with all other known fishes, in which the primary cranial segmentation is lost, and for which the term Holocrania is proposed.

The view of most recent zoologists that the origin of the vertebrated sub-kingdom is to be traced through *Amphioxus* from the Ascidians, is supported by M. Ussow in the last published part of his "Zoologisch-embryologische Untersuchungen" (*Archiv für Naturgeschichte*, 1875, pp. 1–18; *Ann. Mag. Nat. Hist.* xv., pp. 321–333). He considers the Tunicata to be quite distinct from the Mollusca both in their embryonal development and in their type of structure. Their closest affinities are with the Bryozoa, but adherence is given to Schmidt's classification in which they form a distinct class of Proto-vertebrata.

Dr. Anton Dohrn advocates a contrary opinion in a memoir entitled *Der Ursprung der Wirbelthiere, und das Princip des Functionwechsels* (Leipzig, 1875). His embryological investigations lead him to seek for the probable ancestors of the higher animals among the Arthropoda rather than the Tunicata, and to revert to the views of the elder St. Hilaire, who described insects as vertebrates which run with their back downwards, rather than to those of Kowalevsky and his followers who trace the line through the Ascidians and the lancelet. So far from being the representative of the original vertebrates, the *Amphioxus* is regarded by Dr. Dohrn as a degenerate descendant of the cyclostomous fish, and the so-called larvae of the Ascidians are the result of a still longer continued process of degradation. With regard to the principle of change of function, the general rule is laid down that the function of an organ is made up of a principal and other secondary components; if the former decrease in force and the latter increase, the whole function is changed, and the organ itself is altered in consequence.

Handbuch der Zoologie.—By the recent publication of the second part of the first volume of Carus and Gerstaecker's *Handbuch der Zoologie* (Leipzig, 1875), that useful text-book has at length been completed. This final issue concludes the account of the Vertebrata, and treats of the Mollusca and Molluscoidea. The publication of the parts of this work have certainly been irregular, the second volume having appeared in 1863, and the first part of the first volume in 1868. The reason of this is now fully explained in the preface. Dr. Peters, of Berlin, who had originally undertaken the *Vertebrata*, was unfortunately forced by pressure of other occupations first to delay and then to relinquish the execution of the task; and thus, with the exception of the Arthropoda, which were treated of by Herr Gerstaecker, the whole weight of the work eventually fell into the able hands of Professor Carus.

Zoological Society.—The long projected "Lion House" at the Zoological Gardens is now rapidly rising, and when completed will form a handsome addition to the Society's buildings. It is intended for the better accommodation of the larger feline animals, as the lions, tigers, leopards, &c., and will have a frontage of a hundred and twenty-seven feet, with an elevation of about thirty feet. A large corridor with a glazed roof will afford protection from the weather to the visitors, and also obviate the necessity of closing up the cages of the more delicate species in winter. The dens will be fourteen in number, each with two sleeping apartments, and each can be made at will to communicate with one of four strongly palisaded open courts. Thus the animals will be enabled in turn to enjoy the luxury of uncramped movement and exercise, and thus will, of course, exhibit their power and grace to much better advantage than in their present confined quarters.

BOTANY.

Flora of La Plata or the Argentine Confederation.—Under the title of *Plantae Lorentzianae, Beschreibung der ersten und zweiten Sammlung argentinischer Pflanzen des Professor Lorentz zu Cordoba*, Dr. Grisebach, of Göttingen, has published an interesting contribution to the botany of South America. The vegetation of La Plata is comparatively little known, though better known to English botanists, it would appear, than to the author of the *Plantae Lorentzianae*, who has overlooked the labours of Miers and other writers on plants from the same region. German botanists are not behind at criticising the work of their British fellow-labourers, and justly reproach them for their neglect of physiology; but it may be affirmed that nearly all German work in systematic botany would be much better left undone by them, as they have not adequate material to bring their publications in this branch up to the knowledge of the times. Dr. Grisebach does not escape this censure, but his work should be known here, and we may note that it was published in the *Abhandlungen der königlichen Gesellschaft der Wissenschaften zu Göttingen*. The poverty of the flora of the Pampas of La Plata is fully borne out by the results of two years' assiduous collecting by Professor Lorentz, undertaken in the service of the Argentine Government. The provinces explored were Cordoba, Santiago del Estero, Tucuman, and Catamarca, lying between 26° and 31° S. lat.; and the total number of species of vascular plants collected amounted to less than a thousand. The vegetation of the Pampas was known to be monotonous and poor in species, but a more diversified flora might have been expected in the mountainous parts. This, however, does not appear to be the case, for the greater portion of the plants described are from the mountains of Cordoba, Tucuman and Catamarca. The endemic types form a considerable percentage of the whole flora—as much as forty per cent., according to Grisebach; but this estimate is doubtless much too high. Dr. Grisebach describes many "new genera," including twelve monotypic ones, and a large proportion of his species are described as such; but a careful revision would greatly reduce the number. Thus, his *Neosparton ephedroides* is probably a species of *Dioscorea*, his *Sterrhymenia Cynocrambe* is *Sclerophylax Arnottii*, a plant figured in a German work (Schnitzlein's *Iconographia*), as well as the less known *Illustrations of South American Botany*, by Miers—and we might give other instances. Among other things, Dr. Grisebach establishes two new genera of *Gramineae*, one of which (*Diachyum*) he considers of noteworthy importance in explaining the morphological nature of the floral structure of grasses. This plant he describes as having two distinct *paleae* instead of a single two-ribbed *palea*; but, judging from his own figure, it might be regarded as having one deeply divided *palea*, a more or less divided *palea* being of frequent occurrence. The descriptive portion of Dr. Grisebach's paper is preceded by a

general sketch of the characteristic features of the vegetation of the different regions explored, which, from the writer's extensive knowledge of phytogeography, is of more interest than the other, though it contains few new facts. Only one palm, *Copernicia campestris*, was found. We have only to add that many of the plants collected by Tweedie, Miers, and others, and previously described, will now be encumbered with synonyms.

The Hydrophyllaceae.—In the tenth volume of the *Proceedings of the American Academy of Arts and Sciences*, Dr. Asa Gray gives a conspectus of the North American *Hydrophyllaceae*. The family as understood by Gray, and most systematists of the present time, includes the *Hydroleae*. Even as thus constituted, this family attains its greatest concentration in North America, thirteen out of fifteen of the recognised genera being represented there. The exceptions are *Wigandia*, a South American genus, and *Codon*, a very curious monotypic South African genus. Most of the genera and species of this group have a somewhat restricted range of distribution, but *Hydrolea* is represented in tropical Africa, Asia and Australia, as well as North and South America, and several of the species of this genus have a very wide geographical area. The North American species of this family number nearly one hundred. Dr. Gray makes few alterations in the limitation of the genera. To *Phacelia*, *Eutoca*, *Whillavia*, and *Cosmanthus* are referred, forming a rather polymorphous genus, so far as habit is concerned, and embracing some fifty species. *Miltizia* of Gray is merged in *Emmenanthes*. In accordance with Mr. Bentham's suggestion, his *Ourisia californica* and the *Villarsia pumila* of Grisebach are brought hither under the generic appellation of *Hesperochiron*. A few new species are described, and some reduced.

The Pomaceae.—This group of plants has engaged the attention of botanists of the most opposite views regarding the limitation of families, genera, and species. Among the latest are Wenzig (*Linnaea*, 1874) and Decaisne (*Nouvelles Archives du Museum*, vol. ix.), of which we have a reprint before us. Bentham and Hooker (*Genera Plantarum*) reduce the number of genera to nine, and consider them as forming a tribe of the *Rosaceae*. Most Continental botanists, including the two named, raise this group to the dignity of an independent family, but no two agree respecting the limits of the genera and species. M. Wenzig's memoir is scarcely entitled to the same consideration as the more recent work of M. Decaisne, who, as a pomologist of the first rank, has made this group his special study for a long series of years. He admits twenty-four genera, including those established by Tournefort, Lindley, and other writers, besides three new ones—*Docynia*, *Pourthiaea*, and *Micromeles*—based upon species referred by other writers to *Pyrus*, *Photinia*, &c. M. Decaisne takes his characters from the aestivation of the petals, the attachment of the ovules, the position of the radicle with regard to the cotyledons, number of cells in the ovary, and ovules in each cell, &c.

The Cranial Nerves of the Spiny Shark, "Echinorhinus spinosus."—Messrs. W. Bruce Clarke and W. Hatchett Jackson, Demonstrators of Anatomy at the University Museum, Oxford, have just made a careful dissection of the cranial nerves of *Echinorhinus spinosus*, and have arrived at the following results, which differ more or less from those attained by other investigators:—

(i.) The three motor nerves of the eye are all present, but the third nerve, in addition to supplying the usual muscles, sends an extra branch to the external rectus, which is also supplied as usual by its own nerve, the sixth nerve.

(ii.) The Ramus ophthalmicus, which in *Hexanchus* is single, judging from Gegenbaur's description, is here differentiated into a R. ophthalmicus and a R. nasalis, both arising at the same point from the main trigeminal trunk. The Ramus

ophthalmicus runs behind the orbit and gives off dorsal sensory branches and a single ciliary nerve, and then perforates the anterior wall of the orbit. The Ramus nasalis runs below the superior and internal recti, and the superior oblique, as in man; and then perforates the anterior wall of the orbit about one-half externally to the R. ophthalmicus. The two nerves then anastomose repeatedly, and are jointly distributed to the skin on the dorsal surface and anterior margin of the snout. Consequently they must be regarded as a Ramus dorsalis, and cannot in any sense be said, as they have been said, to mark out an orbito-nasal cleft. The arrangement here described seems to be intermediate between that found on the one hand in *Hexanchus*, and on the other in certain other sharks, as *Acanthias* and *Carcharias*.

(iii.) The superior maxillary nerve is distributed chiefly to the skin below the orbit and on the inferior surface of the snout, the main stem running near the middle line.

The inferior maxillary, after giving off a Ramus dorsalis and a muscular branch, is entirely distributed to the external surface of Meckel's cartilage or the mandible.

The facial, which in this shark has a Ramus dorsalis supplies the internal surface of the mandible and the teeth it bears. It is the first nerve which has a visceral branch to the alimentary canal. This ventral nerve is distributed to the palate and to the teeth carried by the pterygo-palatine cartilage.

From these facts it appears to follow:—

(a) That the superior and inferior maxillary nerves respectively mark out a visceral cleft—the oral cleft.

(b) That the palato-ptyergoid cartilage is not a true visceral arch serially homologous with subsequent visceral arches, but is an intercalation—a result agreeing with the facts of embryology.

(iv.) The vagus, which arises by four well-marked roots, gives off three or four Rami dorsales, and the lateral line nerve from its mode of origin and its distribution appears to correspond to a series of Rami dorsales.

(v.) After giving off the branchial nerves, and before breaking up into cardiac and other visceral branches, the trunk of the vagus sends a nerve which, uniting with a factor derived from the cervical cord, supplies a muscle connected with the shoulder-girdle. In this nerve may perhaps be found the homologue of a spinal accessory.

(vi.) There are four small nerves, the two anterior of which rise from the inferior surface of the medulla oblongata, the two posterior a little further down, which pierce the occipital region of the skull. They must either correspond with spinal nerves which have lost their posterior roots, or they must be regarded as the anterior roots of the vagus. Against this latter view it might be urged that they do not join the main stem of the vagus, as do the anterior vagal roots described by Gegenbaur in *Hexanchus*.

The first nerve is distributed solely to a muscle which rises from the exoccipital region of the skull, and is attached to the supra-scapula.

The three succeeding nerves give branches to the same muscle and then join with the ventral cords of the first five undoubted spinal nerves, possessing well-marked posterior roots, to form the cervical plexus. The single trunk rising from the plexus first gives off the above-mentioned factor to the vagus branch described under (v.) *supra*, and then is distributed apparently to the muscles in front of the epicoracoid.

In these four nerves may perhaps be found the homologues of the hypoglossal.

Gegenbaur concedes that in *Hexanchus* both hypoglossal and spinal accessory exist, bound up with the main trunk of the vagus. In *Echinorhinus* the facts described under (v.) and (vi.) respectively, appear to point to a further differentiation—a step in advance to the stage found in *Hexanchus*.

M. W. DE FONVIELLE has reported to the French Academy the particulars of his ballean

ascent from the gas-works of La Villette on May 2. They encountered a good deal of snow, which made their balloon heavier, and only permitted them to reach an altitude of 3,800 mètres. About 4 P.M. they entered four layers of cloud, which they estimated at 5,000 mètres in thickness. They commenced about 600 mètres above the ground. The snow was in fine needles, like cut hair, and not branched. At 3,000 mètres they saw two shadows of their balloon, the upper one elongated, large, and upright; the lower inverted, but not deformed. The two shadows were surrounded with an immense aureole. A little higher up they saw three aureoles at once: one round the balloon, another round the car, and a third embracing both. All exhibited the red tint innermost. At 5.26 P.M. the sky was quite blue, but the sun so little bright that they could stare at it.

THE *Neue Jahrbücher für Philologie und Pädagogik* (Fleckeisen und Masius), vol. cxii., part ii., contains an important article by H. Baumgart on the well-worn subject of the tragic *catharsis*. The writer subjects Bernays' interpretation of *κάθαρσις παθημάτων*, and his whole treatment of the matter to a searching criticism. His own view of the expression approximates to that of Lessing. While admitting the existence of a medical metaphor in the word *κάθαρσις*, he conceives *κάθαρσις παθημάτων* to mean "a purging taking place in the sphere of the emotions;" a process by which the emotions are brought to their due measure of purity and intensity. And the whole passage about the effect of tragedy he translates thus: "Tragedy is the imitation of an action which, by means of sympathy and terror, effects a purgation upon the imperfect exhibition of these feelings." The other articles of importance in this number are a number of *conjectanea* by Bücheler, chiefly upon the Eugubine tables, and an interesting paper by Baehrens on the MS. tradition and criticism of the Vergilian *opuscula*.

In the following number the veteran scholar G. F. Schömann discusses the question of the Athenian *ephetæ*, a subject on which A. Philippi also contributes a lively controversial article against Schöll. Gustav Meyer writes on the subject of the Macedonian language, warning scholars against a too hasty inference from the existing glosses as to the Hellenic character of this language assumed by Fick. F. Görres contributes a paper on the textual criticism of some of the historians of the later Empire.

A long article by Rieck, entitled "Maturitätszeugnisse, nicht Maturitätsprüfung," occupies in both numbers a large part of the space given to educational matter. The writer argues with great earnestness in favour of a system of government inspection of the *gymnasia*, and against the present system of the granting of certificates of maturity after examination held jointly by the officers of the school and a representative of the Government. The granting of the certificate of maturity should, Herr Rieck thinks, be left entirely in the hands of the head master, and the interference of Government should be limited to a general superintendence. The argument is based chiefly on the assumption that the present system of examination tends to produce a dead level of uniformity hostile to the independent development of the schools, and fosters an inclination to cram and to deception. Space will not allow of our noticing the other and less important educational articles in these numbers.

THE most important articles in the *Zeitschrift für die Oesterreichischen Gymnasien* for March and April are the additions to Latin lexicography by Paucker and Wröbel. An interesting biographical sketch of Robert Rösler, by F. Krones, in the March number is well worth reading.

MEETINGS OF SOCIETIES.

CAMBRIDGE ANTIQUARIAN SOCIETY (Monday, May 10).

F. C. WACE, Esq., in the Chair. Mr. Pearson made a communication on the Mantuan vase, which he had inspected at Brunswick in January last. He commenced his remarks by reading a translation of the description of the vase given in a number of the volume for 1874 of a German art publication, issued at Stuttgart, called the *Kunst-handwerk*, from which he also produced two plates, giving different views of the vase. This description first narrated the history of the vase, from the time that it was found in the plunder of the palace of the Gonzagas at Mantua, in the year 1630, down to the time of its removal by the late Duke of Brunswick in 1830, at which time it still possessed the golden mounting now wanting; in 1630 it was valued at 20,000 ducats (about 9,000*l.*), since which date it has not changed owners by sale. The next point noticed was the golden mounting which is seen in the engravings given in the Leipzig *Acta Eruditorum* of 1683, or in vol. vii. of Gronovius' *Thesaurus*. This mounting, said to be of late Gothic style (i.e., the sixteenth century), was removed probably by the late Duke, at the time he had it with him, and is not now forthcoming. Now that it is removed, it is obvious that alterations were made in order to mount it, which slightly changed the style of the vase as originally designed. The vase is about 6½ inches high, and 2½ in its diameter, where greatest: it is cut out of a sardonix of the shape of a kidney, which has five or six layers of white and brown. The stone is so cut as to enable the different hues to bring out into relief the figures engraved on the vase: of this the writer gives instances, which can only be properly recognised by inspection. The general subject of the work is the Presence of Demeter with Triptolemus at the Lesser Eleusinia, and differences of opinion as to some of the details need throw no doubt on its main design. A full discussion of this point will be found in the two publications of the seventeenth century referred to. Its date is fixed by Professor Riegel, of Brunswick, the writer of the memoir from which these remarks are an extract, from 150 B.C. to 100 A.D., and the style of the figures engraved on it is said to be that of the best period of Hellenic art.

Mr. Pearson added some observations of his own in favour of the belief that we have in it a real onyx unguent-vase of the classical era. From the time of Herodotus down to that of Virgil, and of the Evangelists, small jars of the kind were evidently used for this purpose; and the size indicated by the word *λίτρα* (less than a pound troy) answers fairly to the size of the Mantuan vase. He also mentioned that the vase shows no tinge of dark red, a colour always found in the oriental onyx, a stone which the ancients and moderns agree in thus distinguishing from the common onyx. In conclusion, he bespoke the attention of the meeting to the bronze figure of a lion, said to have been erected by Henry the Lion on his return from the Crusades at the end of the twelfth century, standing on a high stone pedestal (near the cathedral) in the town of Brunswick.

METEOROLOGICAL SOCIETY (Wednesday, May 19).

DR. R. J. MANN, President, in the Chair. The following papers were read:—

"On some Practical Points connected with the Construction of Lightning Conductors," by Dr. R. J. Mann. The paper dealt especially with the material and dimensions of conductors, the nature and influence of points, the essentials of earth contacts, connexion with metallic masses forming a part of the construction of buildings, the power of induction in producing return shocks, the dangerous action of metal chimney-pots upon unprotected chimney shafts, and the facility with which houses may be efficiently protected when the defence is made part of the original design of

the architect. The conditions which were finally insisted upon as indispensable to efficiency of protection, were: (1) ample dimensions and unbroken continuity in the lightning-rod; (2) large and free earth contacts, with frequent examination by galvanometers of the condition of these to prove that they are not in process of impairment through the operation of chemical erosion; (3) the employment of sufficient points above to dominate all parts of the building; (4) the addition of terminal points to the conducting system wherever any part of the structure of the building comes near to the limiting surface of a conical space having the main point of the conductor for its height and a breadth equal to twice the height of the point from the earth for the diameter of its base; (5) the avoidance of all less elevated conducting divergencies within striking distance of the conductor, and especially such dangerous divergencies of this character as gas-pipes connected with the general mains, and therefore forming good earth contacts.

"On Certain Small Oscillations of the Barometer," by the Hon. Ralph Abercromby, F.R.S. These small oscillations of the barometer (sometimes called "pumping") have long been associated with gusts of wind, but the precise nature of their action has not been determined. The author gives two examples as typical:—1. Window looking south, wind nearly south, in strong gusts. In this case the first motion of the barometer was always upwards about 0.01 inch, as if the effect of the wind, being arrested by the house, was to compress the air in the room. 2. A corner house, one window to south, another to west, wind south, in strong gusts. With the west window open, there were violent oscillations, but in this case the first motion was always downwards. On opening the south window as well, the pumping ceased. The explanation seems to be that the wind blowing past the west window drew air out of the room; but when the south window was opened as much air came in as was drawn out, and the pumping ceased. It is well known to medical men that many acute diseases are aggravated by strong winds, and the author has observed this distress to be associated with pumping of the barometer. He suggests the following practical methods of palliation:—If windows can be borne open, try by crossing, or otherwise altering the draughts, to diminish the distress. When as in most cases, windows cannot be open, all doors and windows should be closely shut, as well as the vent of the chimney, if there is no fire, and, if possible, the patient should be moved to a room on the lee side of the house.

"Proposed Modification of the Mechanism at present in use for reading Barometers, so that the Third Decimal Place may be obtained absolutely," by R. E. Power, L.R.C.P.

NUMISMATIC SOCIETY (Thursday, May 20).

MR. W. C. ROBERTS exhibited the Ashantee Medal and the Best Shot Medal. The designs are by Mr. Poynter.

MR. C. F. KEARY read a paper in continuation of the subject raised by Mr. Pownall at the previous meeting—namely, the probability of Offa having employed Italian artists for his coins. In this paper the writer sought to show, by an examination of the contemporary Italian coinage and of the English and Irish illuminated MSS. of the period, that the art upon these coins was entirely native.

PHILOLOGICAL (Friday, May 21.—Anniversary Meeting).

THE REV. DR. RICHARD MORRIS, President, in the Chair. The following members were elected to the Society's officers for the ensuing session:—President, the Rev. Richard Morris. Vice-Presidents, the Archbishop of Dublin; the ex-Bishop of St. Davids; Edwin Guest, Esq.; Whitley Stokes, Esq.; Alexander J. Ellis, Esq. Ordinary

Members, E. L. Brandreth, Esq.; C. Cassal, Esq.; J. B. Cayley, Esq.; R. N. Cust, Esq.; the Rev. J. Davies; E. R. Horton, Esq.; the Rev. B. H. Kennedy; Russell Martineau, Esq.; the Rev. J. J. Mayor; J. Muir, Esq.; James A. H. Murray, Esq.; Henry Nicol, Esq.; Joseph Payne, Esq.; J. Peile, Esq.; Charles Rieu, Esq.; the Rev. W. V. Skeat; Henry Sweet, Esq.; Edward B. Tylor, Esq.; W. Wagner, Esq.; Hensleigh Wedgwood, Esq. Treasurer, William Payne, Esq., The Keep, Forest Hill, London, S.E. Hon. Secretary, Frederick J. Furnivall, Esq., 3 St. George's square, Primrose Hill, N.W. The thanks of the society were voted to the Council of University College, for the use of the college rooms for the society's meetings. The President read his Annual Address, containing reports by (1) himself, on the work of the Society in 1874; (2) the Rev. J. Legge, on Chinese Philology; (3) the Rev. K. Cheyne, on Semitic Philology; (4) Professor Ggeling, on Sanskrit; (5) Mr. T. W. Rhys Davids, on Pali; (6) Mr. R. N. Cust, on the Vernacular languages of India; (7) Mr. R. W. Morfill, on Russian Philology; (8) Rev. Professor J. B. Mayor, on Greek; (9) Professor Wagner, on Latin; (10) Mr. J. Rhys, on Celtic; (11) himself on English philology; (12) the Rev. W. W. Skeat, on the English Dialect Society; (13) M. Paul Meyer on Romance and Provençal; and (14) M. Picot, on Vallachian. The thanks of the meeting were voted to the President, and to the scholars who had helped him with their valuable reports.

ANNUEAN SOCIETY (Monday, May 24.—Anniversary Meeting).

MR. G. J. ALLMAN, F.R.S., President, in the chair. The Officers and Council of the Society for the ensuing year were elected as follows: President, Dr. G. J. Allman, F.R.S.; Treasurer, Mr. J. G. Jeffreys, F.R.S.; Secretaries, F. Currey, F.R.S., St. G. J. Mivart, F.R.S.; other members of Council, G. Bentham, F.R.S., G. Bush, F.R.S., V. T. T. Dyer, J. E. Hartwig, W. P. Hiern, Dr. D. Hooker, F.R.S., Major-General Scott, H. T. tainton, F.R.S., R. B. Sharpe, Charles Stewart, J. J. Weir. The President then delivered the usual annual address.

FINE ART.

THE WATER-COLOUR SOCIETY.

(Second Notice.)

MR. WALTER DUNCAN is a young painter of good capacity, in danger of doing himself less than justice by a somewhat blunt and off-hand mode of execution. *Hoodman's Blind* (a mediæval game 'blind-man's buff') is a case in point; it shows that the artist has a true vein to work, but he does not work it with much stress. *Undine rising on the Well* has not unnaturally an unreal look, but is not so very unreal in detail when one looks to it. *Agnes*, a young woman cast up on the shore, probably with the remains of life in her t, and found by a labouring boy, has a fair amount of force; but perhaps *The Sonnet* may be pronounced the best of the artist's contributions—plethoric cavalier of the Dürer period philandering after a handsome damsel, who walks on with trifling unheedfulness. Mr. Brewtnall succeeds at with *The Little Mermaid* ("Straight towards the shore she swam with the handsome prince"), and *The Alchemist*; the former has a certain fairy-like air in the city and atmosphere, pleasantly so, and the latter picture is ably done. The chemist, in company with a stalwart assistant, gazing wistfully at the liquor in a phial; he is fitting old, and feeble of eye and hand, and has a watery look, expectant, yet not thinking to have come right even yet. Mr. Haag continues to paint Oriental subjects with effect, though they are done, as usual, rather too much by receipt. *Nargileh* is talented, with the blueish-white light shining on the lustrous back of a brown

mulatto boy, and on the silk of the master's knee, and elsewhere about his figure, in the luxurious interior. *Waiting for the Coach* is a nice specimen of Mr. E. K. Johnson—a lady about to part from her son, who is going up to town, or in some other way launching out on the uncertainties of life. Miss Gillies paints with a good deal of sentiment *The Old Peasant and his Daughter*, praying in sorrow-struck silence in a Catholic church; the feeling of the design corresponds closely to its motto—"It was too hard for me, until I went into the sanctuary of God." Mr. Birket Foster is quite as much a figure-painter as a landscape-painter this year: the *Fish Stall at Venice* is the most noticeable of his productions, and is markedly clever, although it lacks something of the sunny and joyous: one feels that the whole thing is contemplated by an outsider. The national type, if not English, is not rightly Venetian either—hardly more so than in the home-picture named *A Cottage*, with a group of a crockery-seller and rural customers. *A Shrine, Venice*, is very agreeable: a vegetable-boat is passing along the canal, and one of the girls has gone out of it into the little oratory, to repeat a simple prayer and come forth again. Mr. Marsh persists in painting *The Garden Seat*—substantially the same pictorial material that we observed and praised in the last exhibition of the Society, though now projected backwards from the eighteenth century into mediævalism: we see the same blueish-green formless seat, and background of red and white roses, and of yellowing sunset sky. This iteration is not a promising symptom: moreover, the lady's drapery is formless to an extreme degree. No doubt, however, some eulogium, had not this been already discounted, would be due to the work of the current year. *A Gentleman of the Road* is a peculiar subject cleverly treated by Mr. J. D. Watson—a mounted highwayman, whose horse stops to drink, while he looks round at the ill-omened remote sight of a criminal hung in chains. *In the Wood*, two lovers pausing by a pool, is also a good example of this highly competent and very prolific painter. Mr. E. Radford shows himself a careful executant in *Blague*—a Zouave in vivacious talk with a more than commonly bare-legged peasant woman: both the figures are well posed. *Weary* represents with similar merit an English girl sewing in her bedroom.

Among the landscape-painters, we may give precedence to Messrs. Alfred Hunt, Albert Goodwin, Boyce, and North, and Miss Clara Montalba. Mr. Hunt has hardly done anything in which we take more pleasure than in his leading work, *The Pelican of Seaham unloading at Hastings—quick Work between Tides*: not indeed that there is any peculiar beauty about its materials, but the charm of natural rather mournful sentiment, and of art, is paramount. We look from the brown sands to the heavy saturated sky, with its dim break of pink upon cumulus-clouds amid the indefinite grey, and hence to the huddle of sails on the sea-craft beached below the bluff of crag. Throughout there is a sense of practical life and daily occupation; the human population are doing their business, and the sky and sea, gathering and relaxing, darkening and clearing, are doing theirs on their unmeasured scale. Another fine work is the *Cloud March at Twilight*: a boisterous seashore with a castled rock, somewhat recalling the style of Cox. *When Summer Days are Fine*, and *A Rent in Wetherlam*, might be cited as showing great knowledge, and the results of elaborate work aforetime, though these paintings are not themselves particularly worked up; *Going Nutting* is even rather slight, and may have been done chiefly with a view to sale. Mr. Albert Goodwin makes a very choice and uncommon little thing of *The Colours carried to their rest*; a street-scene in a cathedral city, on a grey faint winter-day, with a detachment of soldiers marching along, their backs turned to the spectator. *Eastward of Eden*, with Cain "gone forth from the presence of the

Lord," is about the most ambitious attempt we remember from Mr. Goodwin, who attains herein a fair level of success. The first murderer crouches by a leafless tree, near his unaccepted altar, under a stormy slaty sky, and amid herbage through which rock-masses protrude dispersedly. *The Hospital of St. Cross* is a noticeable and bold piece of effect; the sky, heavy with rain, is grey almost to louring, and contrasts, not altogether pleasantly, with the profuse mantling red of a Virginia creeper. *At Dunster, West Somerset*, is an excellent example of Mr. Boyce—an artist whom we never miss without regret, nor re-encounter without enjoyment. This is a charming piece of mottled tinting, green, red, and deep grey, tanned and stained with age, flecked with the perpetual youth of sunshine. Very good again is *On the Coast of Somerset*; a mounded hill-side covered with brushwood, close to the shallows of the sea, over which the horizon is of pale salmon-hue; the stony plain at its margin is clumped with grass-tufts: a sheep comes there to browse what he may, and two rooks to pick up the worms. *January in Algiers* is an important painting by Mr. North: the orange-trees make the winter luscious, roses and fuchsias grow wild and free. It is a scene of prodigal beauty, almost morbid and oppressive, and in execution somewhat too unsubstantial. *The Vicarage Croft* exhibits a similar tone of feeling; lazy profusion, whose languor passes into melancholy. *On the Way to the Campo Santo* is a Venetian lagoon-piece by Miss Montalba, remarkably fine. The priests and other members of a funeral-party are passing in a boat near the Church of the Salute, on a close rainy day which deepens the colour without obscuring it: they flit noiselessly by the white houses, with tiled roofs of dark red merging into brownness. All the constituents of this scene are vividly felt and realised.

Other landscape-painters whom we should not pass unmentioned are—Dodgson, *Pennard Castle, Gower*; E. A. Goodall, *The Remains of the Causeway which originally extended from the Nile to the Libyan Hills, described by Herodotus as a work more wonderful than the Pyramids*; Glennie, *View from the Capo di Sorrento*; Collingwood Smith, *Windsor from Datchet*, with the afternoon sun blazing through a tree; *Venice*; *Sunset on the Adriatic, from the Lido, Venice*, a *Reminiscence of Guido Reni*—the cloud-forms being thrown into a shadowy semblance of Guido's *Aurora*; Branwhite, *The Lake in Trotworth Park, Early Moonlight*; Powell, *Loch Corruisk*; Alfred Fripp, *The Mill Pool*; H. P. Rivière, *Sunset, Rome*, with the Castle of Sant' Angelo; Whaite, *Snow in Harvest*; W. M. Hale, *Moonrise, Lake of Como*; Palmer, *The Travellers*, highly characteristic of the master, and consequently, though not one of his very finest works, elevated and striking.

Mr. Marks comes forward as one of the principal animal-painters, with his two subjects named (in a rather superfluous resolve to be funny) *Darby and Joan*, and *Edwin and Angelina*, the former a pair of adjutant storks, the latter of cranes, quaint and elegant respectively. *A Group of Horses and Cattle on the Histon Marshes, North Devon*, is a leading specimen of Mr. Brittan Willis; and *Mist on the Hill Side*, a pleasant one of Mr. Jenkins—a group of sheep, with their breaths visibly exhaling. Mrs. Harrison (*Poppies and Green Corn*), and Mr. Albert Goodwin (*A Black and White Study*), represent floral art. The latter is, indeed, a figure-subject of an out-of-the-way kind, portraying a chimney-sweep in a conservatory, and a girl dressed in white muslin, accompanied by a Pomeranian dog; but the still-life here is the main ingredient.

THE SOCIETY OF FRENCH ARTISTS.

(Second Notice.)

WE have already spoken of this collection, so far as the contributions of M. Legros are concerned: we return to it to say a few words of the other leading exhibitors.

Fortuny's *Bull-fight* is an astounding piece of

bravura. It must no doubt be accepted as a mere sketch or dabbing-in of the subject, and as such it shows a fury of execution, an amount of point, certainty, and facility, enough to make the most accomplished painters open their eyes. One might even suppose it to have been jotted down as it stands during the performance in the arena. To see it is to believe in it; but no words of ours could realise to the reader's mind the whirl of its action, and the chaos of its precision. Munkacsy is an eminent professor of a style of art for which the name of "the ugly style" would hardly be too strong: he is forcible, truthful, and artistic, but seems to like those aspects of human form and nature which come nearest to the brutal. His picture of *Washerwomen* is an example. His manner is not unrelated to that of M. Roybet, author of *The Chessplayers*: this latter picture, however, is considerably less extreme in the same direction. De Nittis paints *The Skater* (a lady), and other items of Parisian scenery and its population: he has an observant eye and an adroit touch, but works too much within the sphere of the jaunty. Two excellent productions are the oil-pictures of Lhermitte—*The Market-place at Ploudal-Meizeau*, *Finistère*, and *Une Fileuse Bretonne*: the former, a composition of numerous figures, is skilful in the highest degree, and executed with great refinement. There is also a capital crayon drawing by this artist. The *Flemish Interior, Seventeenth Century*, by Pille, is a cross between the style of Leys, and that of some of the older Low-Country masters knowing in the painting of white satin: it is an able piece of work. A small Millet of a workman chopping timber, and *Le Cahier Bleu*, by Miss Nellie Eppe—a young woman lying lazily and luxuriously on a fur-strewn sofa, reading a French novel, with her eyes on nearly the same lateral level as the printed page, and holding a paper-cutter between the leaves—should not be overlooked: the first is a fair though not a very important example, and the second is extremely clever.

Among the landscape painters we encounter the brother-in-law of this lady, Mr. Alma-Tadema, and among the still-life painters her sister, Mrs. Alma-Tadema. *Cherry Blossom*—a tree in its yellowish-white bloom showing against a sky of a more dead or grey-tinged white—is contributed by the former, and is a choice little bit, although the result of the opposition between the two hues of white is rather noxious to the purity of the cherry-bloom, which looks in consequence almost dingy. The lady's work is named *Avant le Banquet*: it shows a table richly provided with wine-glasses, plate, and other objects, and shows it excellently: there is little shade in the picture, and hence the items are congregated together with an effect tending towards confusion, but this is hardly a fault. A very fine portrait-bust of this talented lady, a terra-cotta by Dalou, stands in the centre of the Exhibition room, highly lifelike in expression. Landscapes by Dupré, Corot, Courbet, C. F. Daubigny, Michel, and our own Wallis (*Study of Oaks, Dartmoor*, very forcible in its juicy handling), appear on the walls to more or less advantage; however, not one of these is a work of exceptional importance. *The Shepherd's Dog*, by Troyon, is a good specimen, with much expression, and more drama than is usual with this painter: the canine guardian has to keep a vigorous and calculating look-out after his charge on a gusty inclement day. M. Fantin, as usual, supplies some first-rate flower-pieces: see especially the *Narcissus*, with its glass vase of opalescent blue, the *Azaleas and Violets*, and the *Pansies* (84).

W. M. ROSSETTI.

NEW PRINTS AND DRAWINGS AT THE BRITISH MUSEUM.

THE sale of the prints and drawings belonging to the late Emile Galichon, which took place last

week in Paris, has enabled the Keeper of the Department at the British Museum to make a very valuable addition to the national art treasures. It is much to the credit of the present Government that it has once more proved its liberality in supporting the interests of art, and that by the help of a special grant made for the purpose some of the most precious specimens belonging to the late M. Galichon have passed into the national collection. The value and variety of the prints belonging to M. Galichon were widely known, and the sale attracted nearly all the principal private collectors on both sides of the Channel. But notwithstanding the keenness of the competition, the Museum has secured several examples of the highest importance, and a word of recognition is certainly due to English amateurs like Mr. Malcolm, who, in more than one instance, generously permitted the national collection to take precedence of his own. If it had not been for his self-denial, two at least of the most important prints must have passed beyond the reach of the resources at the command of the Museum.

Among the drawings by old masters thus added to a collection already rich, there is one which has a particular interest for the English student. One of the very few authentic works of Lionardo da Vinci in this country is the cartoon possessed by the Royal Academy representing the Virgin and Saint Anne. The picture in the Louvre may or may not be the painter's own handiwork, but about the cartoon, notwithstanding some obscurity in its history, there can be very little doubt. It was exhibited in Florence about the year 1502, and the scheme of the composition is minutely and enthusiastically described by Vasari. The drawing from the Galichon collection represents a study for this cartoon. It is executed in chalk and Indian ink, and so far as all the essential parts of the design are concerned it is complete. There exists in the Academy at Venice a finished drawing in red chalk for the picture in the Louvre, but so far as I am aware, this is the only drawing in existence in preparation for the cartoon in London. In the Galichon catalogue it was described as a drawing for the Virgin and St. Anne of the Louvre, but this is an error due no doubt to a want of familiarity with the beautiful work which the Academy has so long kept concealed. For it must be borne in mind that the two compositions are altogether distinct. There are important differences between them which prove that the cartoon could not have been made as a study for the Louvre picture. Of these differences one relates to the arrangement of the two principal figures; another is the existence in the cartoon of the figure of the infant St. John. This figure does not belong to the painting, but it belongs to the cartoon at the Academy, and it also belongs to the Galichon drawing. By the acquisition of this drawing, therefore, we complete the history of the one indisputable work of Lionardo that we possess in this country. At the foot of the paper on which the composition is made out are two or three sketches of engineering designs such as are scattered over many of Lionardo's drawings, and on the other side is a study in profile of a male head of a type well known and often reproduced by the painter. On looking at the reverse of the design it may be observed that the outlines of the principal composition have been traced through by means of sensitive paper, and this would seem to show, what is fully borne out by the general appearance of the drawing, that this was the sketch in which the artist by means of experiment worked out his idea to completeness, and that he afterwards took on another sheet a clean impression of its outlines.

The remaining drawings may be taken in the order of the catalogue. There is a study by Fra Bartolomeo for a Holy Family, executed in his careful style with the pen, and slightly injured, as nearly all the master's drawings are, by the action

of the body colour which he has used to heighten the lights. It is, however, a very graceful composition, showing the Virgin seated and holding out the form of the infant Jesus to meet the proffered caresses of the little St. John, who is in the arms of St. Elizabeth. To the left is the figure of St. Joseph between two angels. A sheet of studies by Botticelli forms an interesting feature in the series. On one side of the paper the artist has drawn a male figure in different attitudes and with different arrangements of drapery: on the other side there are three figures or three varied attitudes of the same figure. The drawing, which is in excellent state of preservation, is executed with the silver point upon tinted paper and heightened with white. In general character and in the prominence given to the study of costume and drapery, it resembles a drawing by Botticelli already possessed by the Museum. An old man's head of the life-size, by Lorenzo di Credi, and two sheets of studies by Verocchio, may be mentioned together as works of pupil and master. The latter are a valuable addition to the collection at the Museum, which is not rich in works of Verocchio. They are chiefly studies of infant form in the nude, of great beauty and delicacy in workmanship, and possessing in the type of the face qualities that may be traced through the work both of Lionardo and Lorenzo di Credi. The drawings form part of an album of sketches by the master, the greater number of which are now in the collection of M. Lasalle of Paris. A remarkably fine drawing by Benedetto Montagna, the materials for a composition of the Coronation of the Virgin, attributed to Cosimo Rosselli, and a drawing of a head in profile by one of the early Venetian artists, may be mentioned as prominent among the remaining examples.

The most important specimens of engraving belong to the early Italian schools. Here we find a print of the Virgin with Saints by Giovanni Antonio da Brescia, of great beauty as well as of extraordinary rarity. The works of this engraver generally alternate in style between the art of Mantegna and that of Marc Antonio, with now and then a slight trace of Dürer's influence, but the print now under notice possesses a distinct individuality. The method of execution with slanting lines shows the teaching of Mantegna, and there is no trace at all either in execution or sentiment of the system of Marc Antonio. But in the scheme of the composition and in the expression of the faces there is a tenderness and feeling which separates the work clearly from Brescia's ordinary imitations of Mantegna. The Virgin, with the Child in her arms, is seated in a niche, the figures of the two saints Helena and Michael standing on either side of her. The mother's face, of great sweetness, gazes calmly from the picture, while her arms encircle the child, to whom, with the right hand, she offers a pomegranate. St. Helena stands on the left gazing at the central group, and supporting, with joined hands, a large form of the Cross; on the other side St. Michael, winged and in armour, grasps a sword with the right hand; and behind them both, and above the low stone parapet that traverses the design, the tops of cypress trees are imaged against a quiet sky. The design is of great beauty, and the workmanship is masterly: the softness and elegance of the draperies is specially remarkable in a work executed upon these earlier principles of Italian engraving. This print was unknown to Bartsch, but it is described by Passavant (vol. v., No. 33). Another rare specimen is a Saint Anthony by Nicoletto da Modena, not mentioned by either of the authorities. The landscape behind the figure, with its wide expanse of water bounded by rocky shores, is of considerable beauty; and in this part of the print it is possible, as in many of the landscapes of Nicoletto, to trace the influence of Dürer. Another print by the same master, also rare, represents a design of a satyr cutting up a doe that hangs by the legs from the branches of a tree.

Both these works by Nicoletto are mentioned in the catalogue of his engravings published by M. Galichon in the fourth volume of the *Gazette des Beaux-Arts*. A small print of Hercules and Antæus, by the "master, of the year 1515," and two examples of Marc Antonio, both needed to complete the Museum series, are among the remaining engravings of the Italian schools.

In works by German masters the Museum series wants little that the Galichon collection could supply; but a splendid proof of the St. Michael by Martin Schongauer replaces a very imperfect print of the same subject. Finally, I may mention an interesting addition to the more modern part of the collection in several rare etchings by Goya. For the first of these, called *El Garotte*, the Museum already possesses the artist's original drawing. This is numbered (246) in M. Paul Lefort's catalogue of the painter's work. The three remaining examples—numbered respectively (255), (258), and (264)—are scarcely less remarkable as showing the artist's power.

J. COMYNS CARR.

THE FRESCOES OF THE SISTINE CHAPEL.

MR. HEATH WILSON delivered a lecture on the frescoes of the vault of the Sistine Chapel on April 29 before the Philological Society of Florence. He began by explaining that it was his intention to express a different opinion of the history of Michel Angelo's connexion with the Chapel of Sixtus from that prevalent, based on the authority of Vasari and Coudivi. He gave a brief résumé of their statements, including the well-known story of the employment of the Florentine artists, their sudden dismissal, and Michel Angelo's solitary labour, and his preparation even of colours and of lime for his work. He described Vasari's account of the time occupied by the great artist over his work, and accepted by so many subsequent writers as true, and especially what both biographers assert so emphatically, that he did not retouch the completed frescoes in distemper colour, nor gild ornaments upon them, although requested to do so by the Pope. The lecturer also adverted to the current opinion that Michel Angelo began to paint on May 10, 1508. He then showed upon practical and technical grounds that this was impossible, as Michel Angelo had not been six weeks in Rome, and the preparations usually described, and arrival and dismissal of the Florentine artists were, in fact, impracticable in so short a time. He then showed by documentary evidence that the vault was not even rough plastered, and that this operation was not completed till the following July. That Michel Angelo employed Francesco Guarnacci to negotiate with the Florentine artists, and that they had not left Florence for Rome so late as July 24. That Michel Angelo himself visited Florence soon after, and that his contract with them, although not dated, was obviously written afterwards. He showed that Michel Angelo did not unceremoniously dismiss them all; he provided for possible failure of the plan of assistance, and employed assistance and did not paint alone, although he did most of the work with his own hands. He showed that he could not grind hundredweights of colour in addition to his work as an artist, nor prepare lime for more than ten thousand square feet of vault, and rescued the memory of the artist from these foolish stories. He showed that when the chapel was first exhibited to the Roman people it could not be one-half of it. The payments by the Pope show that it was even less than one-third. The lecturer dwelt upon the effect of the frescoes on the style of Raphael, and expressed his belief that that great artist was not personally responsible for the intrigue of Bramante to deprive Michel Angelo of the rest of the commission to paint the vault. Having described at some length the subjects of the frescoes, and Michel Angelo's purpose as well as his treatment of his theme, the lecturer then stated

what he had seen when he closely examined the frescoes from the scaffold provided by the Papal authorities. He found evidence that Michel Angelo had not painted without assistants, and showed by a letter of his that Jacopo Z. Indaco remained with him till January, 1509. He saw clearly that the assertions of the biographers, that he had not retouched the frescoes in distemper, were entirely erroneous, for they are in almost every part glazed and retouched with size colour, the size in which is so soluble that a wet finger will remove it. He also described the parts of the frescoes which Michel Angelo had gilt. He then offered evidence which showed that Michel Angelo was still painting in the Chapel after the sack of Prato and the fall of Florence under the Medici in 1512, and that he completed the vault of the chapel towards the end of that year. That he never was paid the balance due on his contract, and that Julius died in his debt. The lecturer gave touching extracts from letters by Michel Angelo showing his personal sufferings and the harsh treatment to which he was exposed. He ended thus:—

"It might have been supposed that every means would have been taken to ensure the safety and preservation of the frescoes of the Chapel of Sixtus. Such is not the case; they are neglected, they have been wilfully maltreated. It may be asked by whom—whether by the troops of foreign barbarians or by revolutionary mobs? By neither, but by the sacristan and church decorator. These ignorant and unconscious enemies of genius and of its works have smoked to ink darkness the noblest pictures in the world with blazing tapers, or have nailed their gaudy hangings to the most precious examples of Italian art.

"Many square feet of the fresco of the Last Judgment are defaced by ladders placed against it to fasten up the tapestry of an altar-piece, the iron framework of which is fixed in the painting.

"Cobwebs hang from every part of the ceiling, and the busy spiders, in undisturbed security, weave myriads of their nets over the surface of the masterpieces. But this is not all; at some time much of the vault has been washed by the rudest hands with a caustic fluid, which in many parts has injured the frescoes beyond hope of restoration. In some places the plaster has fallen down, and has been mended with a carelessness which would have been discreditable in the dwelling of poverty.

"Where is there a lover of art or of his country, or of the memory of Michel Angelo, whose pulses do not quicken when he reflects on the indignity with which these great creations have been treated?

"They cannot be allowed to perish. The evil which has been done is of a past age. Among the good signs of the present we may reckon the care now taken both of the monuments of Christian art and of all art everywhere, and that it is felt that neglect is inexcusable, and a betrayal of the interests and of the most precious records of history and of civilisation.

"In Rome at the present time we may mark with gratitude and respect the loving care with which the venerable Pontiff has directed the preservation and restoration of some of the most interesting and valuable monuments of Christian art in the world. We may, therefore, hope that this will be extended to the Chapel of Sixtus and the noble works of art which it contains.

"Florence is about to celebrate the fourth centenary of the birth of her greatest artist, who at the same time was one of her noblest citizens. That celebration will be felt to be imperfect if it be allowed to pass without steps being taken to preserve for future ages the frescoes by Michel Angelo in the Sistine chapel."

ART SALES.

THE sale of the paintings of Millet took place on the 10th inst., at the Hôtel Drouot. The collection chiefly consisted of some sixty paintings and studies, principally of Gréville and in Normandy, with various sketches taken in Auvergne. *The Fisherman's Family*, 2,700 fr.; *Little Shepherdess seated*, 10,000 fr.; *Mother with her Children*, 7,050 fr.; *A Shepherdess (Winter)*, 3,000 fr.; *The*

Beach at Gréville, 2,100 fr.; *Cliffs and Rocks of Gréville*, 3,000 fr.; *House in the Village of Gruchy-Gréville*, with sea view, 6,400 fr.; *Millet's House at Gréville*, 4,000 fr.; *Milkmaid leaning against a Tree*, 7,600 fr.; *Woman spreading out Linen*, 4,200 fr.; *Potato gathering*, 4,000 fr.; *Wool-combing*, 4,600 fr.; *Woman carrying two Pails*, 5,150 fr.; *Woman milking a Cow*, 6,800 fr.; *Sheep-shearing*, 7,100 fr.; *Rocks and Apple-trees near Barbizon*, 4,000 fr.; *Wood Clearer*, 10,000 fr.; *End of the Day*, 7,300 fr.; *Pig Killers*, 24,000 fr.; *Shepherdess seated on a rock*, 13,000 fr.; *Shepherdess watching her Flock*, 4,700 fr.; *Fishing-boats at Sea*, 6,300 fr.; *Cowherd calling his Cows*, 4,000 fr.; *Whirlwind*, 10,900 fr.; *Church of Gréville*, 12,200 fr.; *Normandy Milkman*, 5,000 fr.; *Donkey on a Common*, 6,950 fr.; *Hunting by Torchlight*, 5,000 fr.; *Shepherdess returning with her Flock*, *Setting Sun*, 11,000 fr.; *The Sea seen from the Pastures of Gréville*, 14,200 fr. The water-colours and crayons all sold well: *An Auvergnat Girl tending a Goat*, 2,935 fr.; and *A little Shepherdess knitting*, 2,500 fr. The sale realised 221,034 fr. (8,841 l. 7s.).

THE choice collection of engravings and niellos of the late M. Galichon, director of the *Gazette des Beaux-Arts*, was dispersed at the Hôtel Drouot on the 10th and following days. The specimens were all of the first order; for the works of engravers had been the study of his life, and his judgment not even second to Bartsch or Passavant, the great oracle of collectors. Of the nielli:—*The Adoration of the Magi*, by Maso Finiguerra sold for 4,100 fr.; *Pyramus and Thisbe*, 905 fr.; *Artaxerxes receiving the Head of Cyrus*, 700 fr.; *Vulcan*, 455 fr.; *Knife handle*, 705 fr.; *Hercules and Dejanira*, 325 fr.; *Psyche*, 300 fr.; *A Pax*, 650 fr. Among the engravings:—B. Baldini, *Adoration of the Magi*, 2,000 fr.; Jacopo Barbieri (the Master of the Caduceus), *Man carrying a Cradle*, 420 fr.; *Venus*, 600 fr.; *Satyr playing the Pipe*, 900 fr.; *Sacrifice to Priapus*, 1,080 fr.; *St. Sebastian*, 4,105 fr.; *Woman looking in a Glass*, 1,205 fr.; G. A. de Brescia, *Virgin with Saints*, 7,700 fr.; *Hercules killing the Lernaean Hydra*, 1,200 fr.; J. Campagnola, *The Samaritan*, 2,300 fr.; *Ganymede*, 1,900 fr.; *The Young Shepherd*, 2,550 fr.; D. Campagnola, *Twelve Children dancing*, 3,700 fr.; Albert Dürer, *Adam and Eve*, 2,990 fr.; *St. Eustachius or St. Hubert*, 2,550 fr.; *Melancholia*, 960 fr.; *The Coat of Arms with Death*, 2,150 fr.; A. Vandyck, *Titian and his Mistress*, 330 fr.; P. Flindt, *Lamps, cups, goblets, and seventy pieces of metal work*, 4,000 fr.; Claude Lorraine, *Setting Sun*, 1,800 fr.; *Description of the Fêtes given by the Ambassador of Spain on the News of the Election of Ferdinand III.*, 4,250 fr.; Lucas of Leyden, *David playing the Harp before Saul*, 620 fr.; *The Passion of Our Saviour* (nine engravings), 3,900 fr.; *Return of the Prodigal Son*, 8,600 fr.; *Conversion of St. Paul*, 1,350 fr.; *Temptation of St. Anthony*, 1,500 fr.; *Mary Magdalen*, 8,500 fr.; *Mars and Venus*, 1,850 fr.; F. Lippi, *The Annunciation*, 3,305 fr.; *Christ presented to the People*, 3,305 fr.; *The Presentation in the Temple*, 1,005 fr.; A. Mantegna, *Entombment*, 920 fr.; *Mocetto, Triumph of Neptune*, 2,805 fr.; *The Virgin enthroned*, 3,900 fr.; *Bacchus*, 3,160 fr.; N. da Modena, *Orpheus*, 1,005 fr.; *The Vestal Lucia*, 1,950 fr.; B. Mantegna, *Rape of Europa*, 1,000 fr.; *Man with an Arrow*, 2,705 fr.; *St. Jerome and another Saint*, 2,000 fr.; Marcantonio Raimondi, *David slaying Goliath*, 1,300 fr.; *Descent from the Cross*, 2,000 fr.; *St. Paul preaching at Athens*, after Raffaello, 3,005 fr.; *Notre-Dame à l'Escalier*, 4,705 fr.; *Vierge au Palmier*, after Raffaello, 3,500 fr.; *Judgment of Paris*, after Raffaello, 6,705 fr.; *The Vintage*, after Raffaello, 2,250 fr.; *Venus and Cupid*, 2,705 fr.; *Mars, Venus, and Cupid*, after Mantegna, 1,400 fr.; *Amadeus*, after Francia, 2,300 fr.; *Poetry*, after Raffaello, 2,500 fr.; *St. Cecilia*, after Raffaello, 2,950 fr.; *The Serpent speaking to a Youth*, 4,000 fr.; *The Singer*, after a design of Raimondi, 7,005 fr.; *Les Grimpeurs*, 3,600 fr.; *Pietro Aretino*, after Titian, 3,500 fr.; Rembrandt, *Christ preach-*

ing, 1,100 fr.; *Christ healing the Sick* (the Hundred Guilder Piece), 9,600 fr.; *Christ presented to the People*, 4,700 fr.; *St. Jerome*, 2,605 fr.; *The Canal*, 2,000 fr.; *Rembrandt's Mill*, 630 fr.; *The Gold-weigher*, 700 fr.; *Portrait of John Luitma*, 3,000 fr.; *John Asselyn*, 3,000 fr.; *The Cottage and Hay Barn*, 6,511 fr.; *Robetta, The Virgin*, 580 fr.; *Schoengauer, The Entombment*, 500 fr.; *The Virgin seated in a Court*, 2,005 fr.; *Death of the Virgin*, 1,305 fr.; *St. George*, 1300 fr.; *St. Michael*, 2,500 fr.; *O. De Sesto, Decollation of St. John the Baptist*, 7,000 fr.; *Zagel, Martyrdom of St. Sebastian*, 400 fr.

THE collection of the late M. Adolphe Fould, son of the minister of Napoleon III., was dispersed on May 14, at the Hôtel Drouot. It consisted of ancient and modern pictures and a large number of water-colour drawings. Among the pictures were:—Boucher, *A Concert in a Park*, 2,600 fr.; Danloux, *The Little Gluttons*, a pair, 2,200 fr.; Fragonard, *Young Woman inspired by Love*, 2,900 fr.; Kraus, *The Night Watcher*, 800 fr.; Lépicie, *The Proposal*, charming picture full of feeling, dated 1776, 5,000 fr.; Reynolds, *The Promenade*, 1,005 fr.; Roslin, supposed *Portrait of Mme. Roslin*, 2,000 fr.; Valkenburg, *Still Life*, worthy of Weenix, 1,950 fr.; E. Detaille, *Un Incroyable*, 3,035 fr.; Marilhat, *The Caravan*, 9,000 fr.; Camille Roqueplan, *Rousseau gathering Cherries with Mdlles. de Graffenried and Galley*, 4,000 fr.; Tissot, *A Walk outside the Ramparts*, 7,000 fr.; Debucaut, *Public Fête upon the Place de la Concorde*, 750 fr.; and *The Marché des Innocents*, body-coloured drawing, 1,000 fr.; and another, *The Grandfather*, 601 fr.

M. ALEXANDRE, whose house was the most celebrated in Europe for fans, sold his collection on the 12th of this month, consisting of numerous paintings on fans not mounted, among which were some by the first artists:—H. Baron, *Fête in a Park*, 1,520 fr.; Mme. Calamatta, *The Triumph of Venus*, after Boucher, 1,360 fr.; Auguste Delacroix, *A Breton Marriage*, 1,030 fr.; Fragonard, *The Serenade*, 1,160 fr.; and *The Rustic Repast*, 1,030 fr.; *A Repast at Venice*, 1,200 fr.; *Life in a Château*, 1,200 fr.; Lami, *Ball at the Opera*, 1,950 fr.; and *The Fountain of Youth*, 1,950 fr.; Couture, *Pierrot before the Tribunal*, 3,800 fr.; Wyld, *View of Genoa*, mounted upon a tortoiseshell fan, 1,100 fr. The sale produced 70,745 fr. (2,830l.).

ON the 18th and 19th Messrs. Sotheby, Wilkinson and Hodge sold the fine collection of etchings and engravings formed by the late Mr. Vaughan, for which the prices obtained were extraordinary. The works of Albert Dürer, Marc Antonio, and Rembrandt were especially fine:—Albert Dürer, *Adam and Eve*, 49l. 10s.; *The Passion*, 26l. 10s.; *The Nativity*, 25l.; *The Crucifixion*, 30 gs.; *The Prodigal Son*, 11l.; *The Virgin with a Crown of Stars and Sceptre*, 20l. 5s.; Another, 22l. 10s.; *Virgin with a Pear*, 11l. 15s.; Another, finer impression, 20 gs.; *The Virgin and Child with the Monkey*, 30 gs.; *St. Jerome in his Cell*, 70l. 10s.; Another, 25l. 10s.; *The Great Fortune*, 21l. 10s.; *Lady and Gentleman walking*, 45l. 10s.; Desnoyers, *La Vierge au Poisson*, 14l.; Hollar, *Antwerp Cathedral*, 17l. 5s.; Lucas van Leyden, *David playing before Saul*, 25l. 10s.; *The Poet Virgil*, 10l. 15s.; Müller, *St. John*, after Domenichino, 17l.; Nanteuil, *Turenne*, 17l.; Marc Antonio Raimondi and school, *Joseph and Potiphar's Wife*, 8l. 15s.; *The Massacre of the Innocents*, 74l. 10s.; *Our Saviour in the House of Simon the Pharisee*, 58l.; *The Descent from the Cross*, 64l. *Paul preaching at Athens*, 77l.; *The Virgin ascending the Steps of the Temple*, 20l. 15s.; *La Vierge au Paimier*, 42 gs.; *La Vierge au Berceau*, 60l.; *The Martyrdom of St. Lawrence*, of the rare state, with the "two forks," 48l.; *The Five Saints*, 20l. 10s.; *St. Cecilia*, 65l.; *The Martyrdom of St. Félicité*, 115l.; *Dido*, 28l.; *Alexander and the Works of Homer*, 135l.; *The Triumph of Titus*, 64l.; *Mount Parnassus*, 37l.; *The Dancing Faun*,

37l. 10s.; *Mercury*, 47l. 10s.; *Cupid and the Graces*, 20l. 10s.; *L'Homme et la Femme aux Boules*, 63l.; *The Virtues*, 23l.; *The Women with Signs of the Zodiac*, 35l.; *The Cassolette*, 27l. 10s. Rembrandt: *Rembrandt leaning on a Stone Sill*, 32l. 10s.; *Rembrandt drawing*, 26l. 10s.; *The Angel appearing to the Shepherds*, 32l.; *The Flight into Egypt*, 30l. 10s.; *Christ with the Doctors*, 30l.; *Our Lord before Pilate*, splendid impression of the second state, 166l.; *The Crucifixion*, first state, 69l. 10s.; *the Ecce Homo*, first state, 87l.; *The Descent from the Cross*, second state, 73l.; *St. Jerome*, 50l. 10s.; *St. Francis*, 50l.; *Jason and Creusa*, first state, 40l. 10s.; *A Woman holding an Arrow*, 30l.; *The Three Cottages*, 42l.; *Landscape with a Flock of Sheep*, 51l.; *Renier Anslou*, 33l.; *Young Haaring*, a magnificent impression in the first state, sold for the enormous price of 330l.; *John Luitma*, first state, 115l.; *John Asselyn*, first state, 70l.; *Ephraim Bonus*, 90l.; *Utenbogardus*, 30l.; *John Cornelius Sylvius*, 90l. 10s.; *The Great Coppener*, third state, 110l.; *The Great Jewish Bride*, 32l. 10s. Martin Schoen, *St. James fighting against the Saracens*, 97l.; *Woman taken in Adultery*, 31l. 10s.; C. Vischer, *The Skaters*, after Ostade, 17l.; Wille, *Les Musiciens Ambulants*, 17l. 10s.; *L'Instruction Paternelle*, 15l. 15s.; Woollett, *The First Premium Landscape*, after Smith, 10l. 5s.; M. Zagel, *The Tournament*, 25l. 10s. The amount realised was 4,888l. 12s.

NOTES AND NEWS.

WE are gratified to learn that the Queen lately approved of the grant of a pension of 100l. a-year, from the Civil List, to the widow of the late sculptor, Mr. J. Birnie Philip. Nothing is more deceptive than large and seemingly lucrative commissions in fine art. We have it on good authority that the expenses entailed upon Mr. Philip by his great undertaking, the half of the sculptured podium of the Albert Monument in Hyde Park, swallowed up all his profits.

THE most recent acquisitions of the South Kensington Museum consist of a fine series of examples of Japanese art workmanship from the collection of the well-known author of *Tales of Old Japan*. The principal of these works is a magnificent sea-eagle wrought in iron, by Miyôchin Muniham, a Japanese artificer of the sixteenth century. "Under Heaven there never was a smith the equal of Miyôchin Muniham."—(*Japan Cyclopædia*.) The bird has apparently just swooped down with wide-spread wings and settled upon a rock. The animation shown in the form of the creature is really fine, and tells us, if any evidence were necessary, that Japan must have boasted of artists of no mean talent three centuries ago. The other acquisitions are a tazza supported by a dragon, in bronze, by Tô Un, eighteenth century; a tazza decorated with cranes, in bronze, by Sei Min, eighteenth century; a tazza decorated with dragons, in bronze, by Ts Un, eighteenth century; a tazza with Indian decorations supported on four elephants' trunks, in bronze, by Sei Min, eighteenth century; a toy halberd, consisting of a dragon's head, in bronze, eighteenth century; a small fish in bronze, by an artificer of the Tokugawa family eighteenth century; and a group of a dragon and tiger, fighting (emblematic of the wars of the elements), by Sei Min, eighteenth century. In the same glass case is a collection of Chinese and Indian works of art in jade (some jewelled) and in bronze, purchased at the sale of the late well-known collector, Colonel Guthrie.

MR. HEMANS writes to us from Rome:—"It has lately been discovered that Raphael's celebrated picture, the *Deposition from the Cross*, the chief treasure of the Borghese Gallery, has been much damaged, cracks having appeared on the surface. The Prince Borghese requested the Academy of S. Luke to investigate. Two well-known artists deputed by that body reported, after due inspection, that a restoration was requisite.

The Prince, desiring to act on this professional advice, consigned the picture to the Academy, with the request that a competent artist might be chosen for the task, and commissioned by the S. Luke Academicians themselves to undertake what is necessary for the preservation of this masterpiece in the Borghese Palace. An article on this subject is given in the first number of the newly-commenced periodical, *Roma Artistica*, published at Rome—the only 'Belle Arti' paper of any note now appearing in this city."

M. BERTRANDE has, after a fashion not uncommon on this side of the Channel, reprinted in the *Revue Archéologique* (May) an article on the Gauls, which he had written for the Dictionary of the French Archaeological Commission, and had read before the Académie des Inscriptions in April. But this effort at publicity is warranted by the needs of the subject, which is the distinction between the terms Celts and Gauls now so constantly confused. The Gauls were simply a branch of the great Celtic race, and did not assume the compact form of a distinct nation till the fourth or fifth century B.C. Archaeologically the remains of the Celts are to be distinguished as consisting of tools and arms of stone with a mixture of objects in bronze, while in those of the Galli or Galatas iron is conspicuous. It seems to have been with the introduction of iron that the Gauls rose into national importance. The Celtic remains are to be found principally in the west of France, the Gaulic in the east and south-east.

WHAT was formerly only a very reasonable conjecture, viz., that the ancient name of Scopelos, one of the islands of the Cyclades, was Peparethos, has now become an established fact by the discovery in a sixteenth century MS., containing extracts from Cyriac of Ancona, of a Greek inscription copied by him in Scopelos where Peparethos is given as the name of the island. The inscription bears the date of the Archon Coponius Maximus, and belongs to the first or second century A.D. This discovery has been made by M. Riemann, of the French schools at Athens and Rome, and is communicated by M. A. Dumont to the *Revue Archéologique* for May.

M. RAVASSON communicated in April to the Académie des Inscriptions a paper on the meaning of the banquet scenes which are frequently represented on Greek sepulchral stelæ. He contends that these scenes do not represent, as is supposed, a leave-taking between the deceased and his or her relatives on earth, but a reunion of these persons in an after world. It may be so, but it is not easy to forget to what lengths this same idea of a reunion led Panofka in his explanations of legendary subjects. It was his *deux ex machina*.

THE Exhibition of Corot's works was opened at the Ecole des Beaux-Arts on the 22nd instant. It includes about 250 of the master's pictures and studies.

THE *Journal des Débats* announces that a French subject, M. Blin, has bought the site of the ancient Cetobrica, near Setubal in Portugal. Cetobrica, the port and arsenal of Sertorius, was overwhelmed by the sea in the fifth century of our era, but the subsidence of the waters in 1814 restored the ruins to sight beneath their covering of sand. Only one previous attempt at exploration is recorded, which yielded, imperfect as it was, rich results; and it is now hoped that M. Blin will set on foot a systematic and thorough exploration of the buried city, which will yield results not unworthy to be compared with those attained at Pompeii. The *Débats* is not without hopes that a stroke of the axe may lay bare the statue of Sertorius and his white fawn.

A VERY important decree was issued on the 22nd inst. on the proposition of the French Minister of Public Instruction, of which the following are the principal provisions:—

(1) The establishment of an Upper Council of Fine Arts in the Ministry of Public Instruction, composed of

Minister, Secretary, and Director, the prefect of Seine, twelve artists (six painters, two sculptors, architects, one engraver, one musician), two members of the Academy of Inscriptions, one member of the Academy of Sciences, the perpetual Secretary of the Academy of Fine Arts, the Directors of the Ecole Nationale des Beaux-Arts, of the Conservatoire National de Musique, of museums, of bâtiments, a member of the Sévres Commission, and persons distinguished by their knowledge of art.

(2) the members who do not sit *ex officio* to be elected annually by the Minister of Public Instruction; (3) the Council to hold ordinary meetings once a month; (4) the Council may be called upon to give its opinion on the organisation of exhibitions of art, on prize competitions, on general questions relating to art-teaching and national manufactures, on state subscriptions to art works and publications, and undertakings and missions relating to art. A sub-committee nominated by the Minister may be consulted as to commissions for works of art, purchases, &c. The other clauses are for their principal object to give the Minister of Public Instruction the entire initiation and control with regard to the proceedings of the Council.

One of the latest discoveries in Pompeii is a full woollen manufactory, situated very near the place where the fresco representing Orpheus was recently discovered. Several charred fragments of pottery were found in this place beside various spindles for carding and weaving wool.

A SALE of pictures has lately taken place in Paris for the benefit of the French artist, Henri Fantin-Latour, who has become reduced in circumstances through long-continued illness. Many of the most distinguished French artists contributed wings and paintings, and the sale realised altogether 28,450 fr.

THE Minister of Public Instruction in Italy has called the attention of the Italian Chamber to the losses accruing from damp and other causes to the celebrated painting of the Last Supper, by Andrea del Sarto, in the refectory of the ancient convent of San Salvi, near Florence.

MODERN sculpture, to judge by the results of the Glessinger sale which took place last week in Paris, does not seem to be held in very high estimation by our French neighbours. Out of the sixteen works put up, only nine were sold, and even may almost be said to have been given away, such absurdly small sums did they fetch.

A DISCUSSION is going on in Rome at the present time concerning a fine portrait of Raphael in the possession of Cardinal Mossarenti. Several good judges consider this portrait to have been painted by Raphael himself; while others, equally sagacious, controvert this opinion. It represents the artist at the age of twenty-five or twenty-six.

THE French Archaeological School in Rome is about to close its winter course of study, and since the establishment of the institution, it is believed that the results obtained will confirm the favourable opinion expressed by the French Academy of Inscriptions and Literature on the work of the first year. The school is now located in a pleasant and secluded mansion on the slope of the Quirinal, near the once green and solitary vale filled up to make the Via Nazionale. The establishment consists of the scholastic staff and pupils from the Normal School, the School of Arts, and the Ecole des Hautes Etudes. There is a good library, which bids fair to be a great resource to studious Frenchmen residing in, or passing through Rome. M. Albert Dumont, the distinguished Director of the new French Institute in Rome, has, according to a correspondent, been invited to join the scientific Academy of the sciences (lynxes), of which Signor Sella is president, which reckons some of the most eminent scientific and learned men of the day among its members. This compliment—one fully deserved by M. Dumont, who is the author of several erudite works—has also been paid to Herren Henzen

and Helbig, the heads of the German Archaeological Institution.

DR. KARL SCHNAASE, the well-known German writer and art critic, died at Wiesbaden, May 20, at the age of seventy-seven. Although Dr. Schnaase was by profession a jurist, and graduated in jurisprudence at Königsberg in 1825, he was early led to devote himself to the study of art through the interest excited in his mind by a visit to Italy, made soon after the close of his university career. In 1834 appeared his *Letters from the Netherlands*, and from that period to the very end of his life he continued to write on questions of art. His *History of the Fine Arts*, begun in 1843 and completed in 1874, is a standard work, characterised by deep research, extensive general learning and special technical familiarity with the subject, and is considered by Germans to take the first place among books of its kind. In 1858 Dr. Schnaase, in conjunction with his personal friends Grüneisen and Schnorr, founded the *Christliches Kunstblatt*, and about the same time he resigned the legal appointments which he had held for some years at Berlin, in order that he might devote himself exclusively to the studies for which he had a stronger predilection than for professional pursuits.

It has been officially announced at Madrid that a general exhibition of pictures, statuary and other specimens of the fine arts will be held next October in the Spanish capital, and in accordance with a royal ordinance, such exhibitions are from this time forth to be triennial.

A STATUE of Jacques Callot, modelled by M. Laurent, and to be cast by Barbedienne, is to be erected in one of the principal squares of Nancy.

M. EDMOND BONNAFFÉ has recently presented to the Louvre the remarkable head of St. Mark, a piece of French sculpture of the thirteenth century, which he exhibited last summer at the Palais Bourbon. It appears to have been broken away from some cathedral, but its size and dignity proclaim it to have been more than a mere architectural ornament. It was engraved last year in the *Gazette des Beaux-Arts*.

THE distinguished professor Francesco Camilletti Perotti has designed some tables of elementary ornament for the use of technical or normal schools in Italy, that possibly might be of use to students in this country. They are published by Messrs. Liberati in Perugia.

THE Italian Government is re-organising, under the superintendence of the Commendatore Aloysio Juvassé, the large chalcographic establishment that was founded in Rome in 1732 by Pope Clement XII. This important institution has fallen into disuse of late years under Papal rule, but it is now intended to make it more effective than it has ever yet been, and an annual grant of 40,000 francs has been placed at its disposition for the production of new works. The institution has already 15,000 plates in its possession, many of them engraved by such masters as Marc Antonio, Salvator Rosa, Diana Pinelli, &c., from the most celebrated monumental paintings in Italy.

THE STAGE.

"THE SPENDTHRIFT."

WE are quite willing to give Mr. Albery all the credit that is due to his excellent intentions; but at the same time we are convinced that if such comedies as *The Spendthrift* are to become popular on the English stage, then such a plague of sorry conceits will fall on it as cannot fail to destroy it utterly. Mr. Albery has written a play in the manner of Congreve. Blackmore and Pye did an infinitely bolder thing when the first wrote epics in the manner of Homer and the other modelled his odes on Pindar. But Congreve had a style of his own; and though he manufactured a vast amount of nonsense about fauns and

nymphs and water-gods who supplied their wanting urn with streaming eyes, and winds that filled the swelling air with sighs, yet on the stage his wit was as easy and unconfined as his heroes' morals. Moreover, he had the true dramatic gift of movement, by means of which his puppets were carried so quickly over the stage that the spectator had no time to judge whether they were alive or cast in wax. There can be very little doubt as to the composition of Mr. Albery's personages. Each has his label of character fastened round him. Each is allowed one peculiarity and is carefully instructed to make the best use of it, for no other marks of individuality can on any consideration be given him. The jealous man must be jealous in his lightest word and action: the timid man must be such a creature as Falstaff would have been if his drink had been negus instead of sack: the superstitious man must adorn his study with astrological devices and babble the jargon of an alchemist: the lover must mouth courtly phrases and sing madrigals: the lady must read the romantic poets and sigh out her soul on the spinet. Then only are they qualified to utter the author's laborious witticisms and to utter them in season and out of it. Then only may the gallant perch on the branches of a tree and moan in figurative speech for man's ingratitude, while his lady sits below in her sedan and tells him that a woman's maiden name is the inn where she stops on her homeward way, that a woman's "ifs" resemble a mathematician's decimal points, and that the beating of a woman's heart is the knocking with which a state-room is fitted up for some illustrious guest. Meanwhile the play stands still and the audience goes to sleep.

The literature of the stage owes much to the career of the prodigal son. The Restoration dramatists dealt with its period of riot, the moralists of Queen Anne had regard to the penitent's return and the slaying of the fatted calf, and modern playwrights are wont to speculate on the prodigal's probable end. Mr. Albery's spendthrift is an irresistible being, who has spent his money and repented, and now goes out into the world on a mission of knight-errantry. Climbing a tree by chance in a lonely wood, he hears the cries of a distressed Dulcinea. He hastily descends to cudgel a band of robbers, and to find in a sedan a lady surpassingly fair. The chairmen having fled, and the maiden being lightly clad, our gallant offers her his shoes to walk home in. At first she prays him to rob her and have done with it, but finding that she is not required to dance with him on the grass, suffers him to lead her to her uncle's lodging, to sit outside her window on the branches of a second tree, to sing amatory songs so loudly and make amatory signs so plainly that her uncle, the astrologer, believes that Venus is in sextile with the moon and that his death is at hand. Not content with these exploits, the spendthrift follows his mistress the same evening to the house of a neighbour, and finds her dozing in an arm-chair murmuring the words of his madrigal, with a half-opened book in her lap relating the legend of St. Agnes, that the man whom a maiden first saw when she woke on St. Agnes' Eve was destined to marry her. It is needless to say that this is St. Agnes' Eve, and that the maiden wakes in the presence of the spendthrift: but it is quite impossible for a critic of ordinary intelligence to explain how the result foreshadowed in the legend was delayed for three more acts by duellers and drunken men in nightcaps, and beatings of the watch, with the final discovery that it was the heroine's father who ruined the spendthrift, and many interesting occurrences of a like nature. This, at least, we venture to say, that nothing so tedious and confused has been put on the stage for a very considerable time. The characters and dialogue belong for the most part to the old writers. The astrologer is Foresight, the sea-captain is Ben the sailor, the lover is Careless, the nurse is Lady

Politick Would-Be. Allusion is even made to "quaint old Marvel," whose ideas were not half so quaint nor half so old as those of Mr. James Albery, and the shade of Sir Thomas Browne is called up to furnish the well-known reflection on mummies and Pharaoh's dust.

And if these are our Congreves, where are our Bracegirdles? Miss Fowler is an actress of repute and she plays coquettes with a pretty petulance of manner. She is at no great pains to conceal her art, but has all the vivacity that is wanted in a comedy of intrigue, and while the play is enlivened by her sparkling presence it has a semblance of life. When she is gone, the action is hopelessly paralysed. It resembles nothing so much as one of those Sanscrit fables, composed of tale woven within tale, where the most terrible battles of hawks and cranes are instantly arrested by the remark of a bystander that their conduct reminds him of the jackal and the carpenter, and the hawks and cranes fall back to their ranks and ask with one voice what manner of story that might be. There is this difference, however, that the bystander has generally some story to tell, and Mr. Albery has none. WALTER MACLEANE.

M. VICTORIEN SARDOU has never been disposed to print his play called *Andréa*, and the reasons generally given for this are that he constructed the piece by contract for the American market, and therefore allowed a vein of farce to run through it which spoils it as a work of art. In form it is one of those glittering comedies that flutter between the *coulisses* of society and the *coulisses* of the stage, and in following its course we pass the shoal of old acquaintances who are always to be met in the narrow passage that leads from one to the other—the dissolute husband and loving wife, the siren in pink stockings and muslin skirts, journalists and hairdressers, jewellers and pickpockets, noblemen and their divinities of the dance—but in substance the piece is a very remarkable specimen of extempore wit and of that biting sarcasm in which M. Sardou leaves almost every living writer behind him. Nor has the English stage seen so perfect an actress as Mdlle. Hélène Petit since it delighted to honour Aimée Desclée. *Andréa* is the wife of the Count Stephen de Toepnitz, and she follows in disguise her truant husband to the dressing-room of Mdlle. Stella, a dancer at the opera. Stella sees something of her trouble in her face and goes instinctively to the cause of it. "Mariée," she says with a touch of pity. "Ah, quelle duperie! Il vous trompe, ce garnement-là;" then, listening to the wife's tale of love and devotion, she cries lightly, "Mon Dieu, est-elle jeune?" and runs off to the stage, where "ce garnement-là" is offering fabulous prices for her silk stockings and arranging banquets in her honour. Thus *Andréa* learns that some twenty minutes in the *loge* of an actress can outweigh the self-sacrifice of her married life. She goes to the director of police to prevent her husband's flight with Stella, and the director devises a plan of arresting the Count as a madman. With the aid of six trusty agents the Count is converted to a sense of better things, and seeing the dancer pass down the street with the escort of the opera band, he denounces her as his evil star and returns with much humility to the joys of his domestic hearth. Much of the play is insipid and much incongruous, but Mdlle. Hélène Petit rises far above insipidity and incongruity. It is now too late to criticise the method of this young and too little known actress, for she ceases to play after Monday next; but her performance of one of those true French wives who will always hold French society together for all their playwrights may say to the contrary, should be remembered among the most tender and artless impersonations of the stage. And what is the Français doing that it should leave her to the Odéon and to us?

MR. WALTER POLLOCK gave two lectures on

the drama at the Royal Institution on the two last Saturdays, in which he sketched the influence of religion on the stage, the growth of histrionic art in all European countries, the special encouragement given to it in France, and concluded with a panegyric on the play as a means of education.

On Monday afternoon, at half-past two o'clock, Signor Salvini will perform the character of Hamlet.

On Tuesday next M. Théodore Barrière's excellent farce *Les Jocrisses de l'Amour* will be played by the French company at the Opéra Comique Theatre. On Saturday next this piece is to be performed for the benefit of the Acting Manager, Mr. J. W. Curran, to whom much of the success of the season is due. And on the following Monday the company will emigrate to the Criterion Theatre and perform the new opéra-bouffe, lately produced at Brussels, called *La Filleule du Roi*.

On Tuesday next Mdlle. Priola will appear at the Gaiety Theatre in *La Fille du Régiment*, and on Thursday, June 10, M. Tournié will appear in *Zampa*. We hope to return shortly to these excellent performances of French comic opera.

MR. AIDÉ's new comedy is to be produced at the Court Theatre on the withdrawal of *Lady Flora*. This will probably take place on Saturday, June 5.

MR. IRVING's impersonation of Hamlet is not likely to give place for a considerable time to his impersonation of Macbeth; even if the actor finally determines to appear in the latter character.

MUSIC.

NEW ORCHESTRAL MUSIC.

Symphony in D for Orchestra. Composed by Johan S. Svendsen. Op. 4. Full score. (Leipzig: E. W. Fritzsche.)

"*Sigurd Slembe*": Symphonische Einleitung zu Björnstjerne Björnson's gleichnamigem Drama. Von Johan S. Svendsen. Op. 8. Partitur. (Leipzig: E. W. Fritzsche.) Variationen über ein Thema von Jos. Haydn, für Orchester, von Johannes Brahms, Op. 56a. Partitur. (Berlin: N. Simrock.)

In a notice of Mr. Coenen's second concert of new music last season (in the ACADEMY for March 7, 1874) mention was made of an octett by Svendsen, which was performed on that occasion. Those who heard it are not likely soon to forget the impression of very striking, it might almost be said startling, originality produced by the work. The symphony in D and the prelude to "*Sigurd Slembe*," which are now before us, afford the opportunity of a somewhat more detailed notice of this composer's music than was possible on the previous occasion, and, together with the octett, furnish materials for an estimate of his general powers.

The first and most striking characteristic of Svendsen's music is its essentially northern (Scandinavian) character. A fellow countryman of the composer's, after hearing the octett, remarked that it was wonderful how the music recalled to his mind the wild native melodies of Norway. It would be impossible without too much technicality to indicate the precise means by which this effect is produced; it may be generally said that it is the result of peculiar harmonic combinations with unfamiliar rhythms; and it is more than probable that no one but a

Norwegian could so far catch the spirit of the old Norse music as to be able to reproduce it perfectly, if he desired to do so. T. Svendsen, however, it appears to come spontaneously; and hence the feeling of perfect freshness and novelty which his music produces in the hearer—a feeling somewhat analogous to that with which one would gaze for the first time at a piece of wild Norwegian scenery.

Second only to the ideas in originality is the instrumentation. On this point it is necessary to speak with a certain amount of reserve, because no opportunity has yet occurred of hearing any of this music on the orchestra; and although it is comparatively easy to grasp with the eye the general effect of the instrumental combinations of a score there will always be some lesser detail which will escape notice, and an opinion given on a symphony merely from reading it may be open to some little modification when corrected by the test of actual performance.* A very slight acquaintance, however, with the present works will convince the reader that Svendsen shows much ingenuity in what may be termed the mixing of new tone-colours; while his harmonies though often bold, and sometimes even daring, are seldom if ever crude, and his counterpoint and power of thematic treatment prove him a worthy pupil of the Leipzig Conservatoire.

The first movement of the symphony in D commences with a bold and well pronounced theme, which at once proclaims the composer's originality. Some very novel and striking modulation leads to the second subject, a wild and plaintive melody, even more remarkable than what has preceded. The passage for the strings alone (p. 10 of the score), with the abrupt change from C to D major, is particularly noticeable. The first part of this movement—the "exposition," to use the technical term—is remarkably concise. The middle portion (the "free fantasia") is much more developed; it is full of the most unexpected episodes, and, though in part somewhat wild, of well-sustained interest. After the customary return of the first and second subjects, a short but effective coda concludes the movement. The *andante*, in A major, is one long stream of new and captivating melodies, set off with most original harmony, and instrumented with a taste and delicacy which shows clearly how the composer revelled in his work. It is, however, one of those movements of which no idea can be given in words. It must be read or heard to be appreciated. The following *scherzo* in G major is one of the most original movements that it is possible to conceive of. Whether the subjects or the instrumentation are more novel, it would be difficult to say. Such combinations as those on pp. 97–100 of the score, in which the staccato solos for the wind instruments are accompanied by some entirely new *pizzicato* passages for the strings divided into seven parts, are so perfectly fresh that it may be safely predicted that if adequately performed they would make a great effect.

* Since the above was written, the performance of the *scherzo* of this symphony at the Crystal Palace has fully corroborated the impressions formed from perusal of the score.

The whole movement is very difficult, and would require, for the wind instruments especially, such a body of finished performers as can only be met with in our best orchestras—as, for instance, that at the Crystal Palace, where the wind is simply unsurpassable. The finale is by far the least effective part of the symphony. It is no less original than the other movements; but the subjects on which it is constructed are deficient in charm, and the treatment is in places both diffuse and dry. Taken as a whole, however, the work is one of unusual interest, which would be well worthy of presentation at one of our orchestral concerts.

The symphonic introduction to "Sigurd Slembe" is apparently a piece of "programme music," or perhaps it would more correctly be said of musical character-painting. Through the kindness of a contributor to the ACADEMY, we have been furnished with an outline of the plot of Björnson's trilogy. It will suffice here to say that it deals with the adventures of Sigurd, an old Norse hero; and, so far as can be judged from perusal, Svendsen's music seems intended to delineate the character of Sigurd rather than to depict the various events of which the drama treats. This was the method of procedure adopted by Beethoven in his celebrated *Coriolan* overture, and from the abstract nature of music it is more within a composer's powers than any attempt to follow minutely the course of a poem or a drama. The present overture, for such it really is, though in a very free form, is not a work which on a first hearing would be likely to produce so much effect as the symphony just noticed. It is so utterly different from any other piece with which we are acquainted, that it is not until one becomes familiar with it that its beauties can be appreciated at all. Yet it contains ideas of great power, and intense originality—originality in places almost carried to excess, and verging on wildness. The opening theme of the *allegro assai*, with its crashing harmonies, and the very unusual effects of the "doubly augmented octave" (e.g. D flat in the bass against D sharp in the treble), is most striking; and the contrast of the tender theme for the strings (p. 26) with the fierce combats of the orchestra that have preceded is full of charm. The scoring of the whole work is masterly, especially in the use of wind instruments, and the effect of the piece altogether is highly satisfactory. Still, for the reasons above given, it may be doubted if it will ever become very popular. It appeals rather to cultivated and unprejudiced musicians than to the general public. So far as can be judged from these works, Svendsen can hardly be called a great composer, in the sense in which the term would be applied to Mozart or Beethoven. His is rather a very marked individuality which moves within a comparatively small circle; and we should be more disposed to compare him in this respect to such a musician as Chopin. Both are representative men, the one of Polish, the other of Norse music, and in both it is the strong national colouring which gives not only the peculiar tint, but the especial value to their compositions.

Brahms's "Variations" for orchestra are in several respects remarkable. In the first

place, the composer returns here to a form which has of late fallen almost into disuse in orchestral music. The "free variation" form was indeed used by Beethoven, as in the finale of his "Eroica" symphony; but the older and stricter form, in which each variation contains the same number of bars, and the same general outline, and is detached from that which precedes and follows, is now very rarely to be met with. It is not merely, however, the return to an old model which gives interest to the present work. Written in the antique style, Brahms has lavished on the present composition all the treasures of his theoretical knowledge and contrapuntal skill. Apart entirely from considerations of the value of its ideas, it is remarkable from the ingenuity of its technical devices. These are nevertheless (as they should always be) merely a means of expression, not the end and aim of the music itself.

The Theme by Haydn on which the variations are founded is entitled on the score "Chorale St. Antoni," and are said by Mr. C. F. Pohl, of Vienna (probably the greatest living authority on Haydn) to be taken from a collection of divertimenti for wind instruments, existing only in manuscript. It is of a very melodious and quasi-religious character, and the first portion is remarkable for being constructed of two five-bar phrases, in the place of the more usual four-bar rhythm. Brahms has given this theme to the wind instruments, with an accompaniment for the basses pizzicato; the employment of the low notes of the seldom-used contrafagotto gives a very peculiar tone-colour to the whole. In the first variation the strings are introduced in double counterpoint, fragments of the theme being heard from time to time on the wind. The second variation, in the minor, is a species of march, and remarkable for the novelty of its instrumental combinations. Variation No. 3, again, is full of counterpoint, totally different in character from those that have preceded it, and with some remarkable effects in the second part for the wind instruments. The fourth variation (*andante con moto*) is again in the minor, and a most ingenious piece of double counterpoint. The following variation (*vivace*) is in most striking contrast—very difficult of performance, and containing mixtures of various accents and rhythms which render the whole effect less clear than is the case in the greater part of the work. No. 6, again of a martial character, with an entirely new rhythm, is one of the most remarkable numbers. No. 7 (*grazioso*) commences with a charming melody for the unusual combination of the flute and viola in octaves, and contains towards the close some very novel rhythmic and orchestral effects. The eighth variation (*presto non troppo*), in the minor, is, as regards technical ingenuity, one of the most remarkable of the whole. The way in which the inversions of the subject are combined with the subject itself, and in which two or three themes are treated simultaneously, produces on the mind in reading the score a feeling somewhat akin to that with which one would examine a curious Chinese puzzle. Here again, the effect in performance (as

has been proved at the Crystal Palace) is hardly so distinct as could be wished. The finale (*andante*) is in the form of what is called variations on a "ground bass"—one short theme of five bars being persistently maintained till almost the close of the movement with ever changing accompaniments. The resource and variety which the composer shows here are truly surprising. In the *coda* which ends the work, the triangle is introduced—an instrument usually associated with dance-music, or at most with light operatic overtures; and the tact with which Brahms has employed it in this composition, which is mainly of a grave and serious character, without its seeming out of harmony with the feeling of the music, deserves special mention. A fragment of the original theme given out by the full power of the orchestra concludes this masterly work, which must as a whole be ranked as among the best which Brahms has yet given to the world.

EBENEZER PROUT.

RECENT MUSICAL PERFORMANCES.

At last Saturday's Crystal Palace Concert a commendable departure was made from the plan usually pursued there when the "Choral Symphony" has been performed. On most previous occasions, this colossal work has been placed at the end of a long programme, and both players and singers have come to it tired by an hour's previous work. The audience, too, unless possessing unlimited powers of musical digestion, would be hardly in a condition to fully appreciate a work requiring such closely sustained attention for its adequate enjoyment. On Saturday, however, Mr. Manns most wisely placed it second in the programme, it having been preceded only by the overture to *Oberon*. The result was a rendering which both for spirit and finish has never been surpassed and probably seldom, if ever, equalled. Not only were the three instrumental movements given to absolute perfection, but the extremely trying choral parts, in which Beethoven has treated the voices most unmercifully, were attacked by the Crystal Palace Choir with a decision and energy which reflected the highest credit upon them, and which must have been most gratifying to Mr. Manns. Never do we remember to have heard the choruses go so well. The solo parts were also excellently sustained by Mdle. Levier, Mdme. Antoinette Sterling, Mr. Henry Guy, and Mr. Santley, and the entire performance was a thing to be remembered by those who had the good fortune to be present. The remainder of the programme included Spohr's Concerto "Scena Cantante," finely played by Mdme. Norman-Néruda, the overture to *Masaniello*, and four vocal pieces by the soloists whose names have been already given.

The fifth Philharmonic Concert, last Monday evening, opened with a very good performance of Schubert's charming *Rosamunda* overture, which, by the way, it is known was not written for that work, but for a melodrama entitled *Die Zauberharfe*. The same improvement in the orchestral playing recently remarked on in these columns was again noticeable at this concert, not only in this overture, but still more in the novelty of the evening—Brahms's fine "Variations on a Theme by Haydn." This most interesting work has been given more than once at the Crystal Palace, but had not previously been heard here. It is a most intricate composition, abounding in contrapuntal artifices, and though the rendering was in one or two parts a little wanting in clearness, it was on the whole most creditably played. The remaining orchestral pieces were the "Pastoral" symphony, and the overture to *Ruy Blas*, on neither of which

it is needful to dwell. The great Italian violinist Signor Papini, was the instrumental soloist of the evening, coming forward with the Andante and Rondo from Vieuxtemps' Concerto in E. His tone, execution, and reading were alike masterly, but the composition is so trashy, that however objectionable in general the giving of only a portion of a concerto, it was impossible in the present instance not to feel thankful that only two movements instead of three were inflicted upon us. The vocalists were Miss Sophie Löwe, who sang excellently in Mozart's charming "Deh vieni" from *Figaro*, and in songs by Mendelssohn and Brahms; and Mr. William Shakespeare, formerly, we believe, a student at the Royal Academy, and late "Mendelssohn scholar," who in Rossini's "Ecco ridente," and in songs by Bennett and Mendelssohn, proved himself the possessor of an agreeable and well-trained tenor voice, and was received with much and well-deserved applause.

To judge from the very large audience at Covent Garden Theatre at the third performance of *Lohengrin* on Wednesday week, the interest in that work continues unabated. As the performers become more accustomed to their unusually difficult task, it is only reasonable to expect that the opera will go better; and a decided improvement, especially in the chorus, was observable at the third performance as compared with the first night, when it was at times painfully out of tune. A second hearing of the work largely confirms the opinions expressed a fortnight ago in these columns. It must not be judged merely as music: considered solely from this point of view, much of it would have to be pronounced unsatisfactory. Its great charm is in the masterly adaptation of the music to the dramatic situation—in fact, in the very combination on which Wagner so strongly insists of the music, the poem, the action, and the *mise-en-scène* to form the whole which he calls "Das Drama." It may be doubted whether the conception of some of the principal characters by the artists who represent them is exactly in accordance with Wagner's ideal. This is not said in any disparagement of the performers, but their reading in general is hardly a German reading of their parts. Mlle. Albani as Elsa would probably fully satisfy the composer: a more perfect realisation of the dreamy maiden can, indeed, hardly be conceived. M. Maurel's Telramund, too—whose naturally noble and chivalrous nature, as we see it in the first act, is led astray by the falsehood and malignity of his wife till he sinks to the level of a would-be assassin—is an excellent portrait. But Wagner would seem to have intended Ortrud as a grandly tragic character, a fierce and cruel sorceress like Medea, but without Medea's maternal tenderness. Such a delineation we may expect if Mlle. Titiens plays the part at Drury Lane. Mlle. d'Angeri, however, makes Ortrud rather a venomous little spitfire, giving an excellent portrayal of the character from this point of view, though it may be gravely doubted whether it is that of the composer. So again with Signor Nicolini's Lohengrin. It appears wanting in the supernatural element, and, though excellently acted, especially in the great duet with Elsa in the third act, it is rather a knight of the middle ages that is presented to us than a mysterious visitant sent by the Holy Grail. With Herr Seideman as the King, neither Wagner nor anybody else could possibly be satisfied. This unfortunate gentleman's voice is altogether insufficient for the part, which becomes in his hands a mere caricature. It is probable that only a German company could give a performance of *Lohengrin* which would satisfy the composer; and the above remarks are made, not in a spirit of unfriendly criticism, for the rendering of the work at Covent Garden is one which reflects great credit on that institution, but as the impression produced by a second hearing of the work, at which it was possible to form a cooler judgment than under the excitement produced by the first performance of

an opera differing so utterly from those to which in this country we are accustomed.

It is not often needful to notice provincial musical performances in detail in these columns; but a concert given yesterday week (the 21st) by the Cambridge University Musical Society deserves more than a passing word of mention. This society is no newly established institution, the present being its thirty-second year of existence. It is conducted by an enthusiastic amateur, Mr. C. Villiers Stanford, of Trinity College, and, unlike the majority of provincial societies, shows a decided preference for producing works not often to be heard in public. Last year the Society grappled with the difficulties of Schumann's *Paradise and the Peri*, and this year they have done themselves the honour of being the first to perform in this country the third (and finest) part of the same composer's *Faust* music. A complete orchestra, led by Herr Straus, was engaged, the soloists, with the exception of Miss Thekla Fischer, being amateur members of the Society. Though the performance under such circumstances should be exempted from criticism, it really was so good as not to stand in need of any special leniency. The chief shortcomings were on the part of the lady soloists, to whom, however, it is only fair to say that they were evidently too nervous to do themselves justice. On the other hand, the chorus was excellent, and their performance as a whole would not have done discredit to a London society. It is impossible here to speak of the truly inspired music—one of Schumann's very finest works; let us hope that before long an opportunity may be afforded of hearing it at the Crystal Palace. In addition to the *Faust* selection, C. P. E. Bach's Symphony in D was well played by the orchestra. An excellent amateur pianist, Mr. McClintock, performed Beethoven's concerto in C minor in capital style; and a new cantata to Klopstock's poem "Die Auferstehung," composed by Mr. Stanford, was performed for the first time. This work, written for chorus and orchestra, with incidental tenor solos, shows very decided talent, though it also bears tokens of inexperience, and needs revision. Mr. Stanford is by no means destitute of ideas, and his cantata is commendably free from reminiscences; but the orchestration is overloaded, being in places thick and indistinct—one of the commonest faults, by the way, with young composers, who too often, like the old theatrical manager, seem to consider that instruments are "paid to play, and not to rest." Some pruning of the instrumentation would be of great advantage to this very clever work. The whole concert was one which reflected the greatest credit on the society.

EBENEZER PROUT.

THE success of the first performances of Signor Verdi's "Requiem" at the Albert Hall has been so great that Messrs. Novello were induced to give two repetitions of the work at popular prices. The first of these took place on Saturday afternoon, and the second (and last) is announced for to-day.

THE second of the four Chamber Concerts now being given by Messrs. Ludwig and Daubert, took place on Wednesday evening at the Langham Hall, Great Portland Street. The programme included Beethoven's Trio, Op. 97, Bach's Sonata in A for piano and violin, Boccherini's Sonata in A for violoncello solo, and Haydn's quartett in G minor, Op. 74, No. 3. Mr. Franklin Taylor was the pianist, and Mlle. Hélène Armin the vocalist.

MISS JESSIE F. A. REID gave a pianoforte recital at St. George's Hall on Wednesday afternoon, with an excellent programme, comprising Weber's Sonata in D minor, Op. 49, Mozart's beautiful but rarely played Sonata in A minor, Bennett's "Lake, Millstream, and Fountain," and smaller pieces by Beethoven, Bach, Liszt, and Chopin. Miss Reid may be congratulated on the good taste shown in her selection.

HERE ANTON RUBINSTEIN, after giving a farewell concert at Paris on the 17th instant, left on

the following day for St. Petersburg, taking with him the libretto of a new opera by M. Jules Barbier, entitled *Néron*, which he intends to compose for Paris.

AUBER's *Cheval de Bronze* has been given at the Santa Radegonda Theatre at Milan with such success that there is a talk of producing it at La Scala. Before this can be done, however, it will be necessary to provide the work with recitatives in place of the spoken dialogue which at present divides the musical numbers of the opera.

LAST week's number of the *Musikalisches Wochenblatt* contains a most interesting letter from Vienna by Dr. Theodor Helm, giving an account of the first performance at the opera under the new conductor, Hans Richter. The work selected was Wagner's *Meistersinger*, and Dr. Helm speaks of the rendering as being most admirable.

OUR readers will probably be glad to read the opinion of one of the most eminent German musical critics, Dr. Eduard Hanelick of Vienna, on Verdi's "Requiem," which he has lately heard at Paris. Dr. Hanelick writes to the *Neue Freie Presse*, "The work is effective and interesting, and (like *Aida*) especially noteworthy as marking a fresh stage in the development of the composer. Whether we assign it a higher or a lower rank, whether we wish it more or less away, we shall assuredly exclaim, 'We never expected that from Verdi!' It contains pieces of unusual beauty, of touching expression, of grandiose effect; and withal it is entirely his own, it is unmistakably Verdi, though far removed from him of *Ernani*. The study of the old Romish church-music and of the German masters shines through the work, but only faintly, not as an imitation. Verdi desires rather to show the world what he can do than what is his faith."

SATURDAY, JUNE 5, 1875.

No. 161, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Dissertations and Discussions. By John Stuart Mill. Volume the Fourth. (London: Longmans & Co., 1875.)

THIS volume, which completes the series of Mr. Mill's *Dissertations and Discussions*, illustrates a passage in his Autobiography, in which he describes his own as "a mind which was always pressing forward, equally ready to learn either from its own thoughts or from those of others." History affords scarcely another example of a philosopher so ready to review his positions, to abandon them if untenable, and to take lessons from his own disciples, as the discussion, for instance, of Mr. Thornton's book on Labour shows Mr. Mill to have been. On the other hand, the volume adds links to a chain of evidence against another judgment pronounced by Mr. Mill on his own intellect, in a passage of his Autobiography which speaks of his natural powers as not above par but rather below it, and of his eminence being due, "among other fortunate circumstances, to his early training." His early training had undoubtedly a remarkable effect on his intellectual career—though in our judgment a very different one from that attributed to it, neither his system of philosophy nor his mental calibre can be properly estimated. It ought to be taken into particular account in connexion with some phases of his economics exhibited in the volume before us; but the question with respect to its influence has a much wider importance. It is a special instance of the great general question concerning not only the causes which produce great minds and direct their energies, but also those which govern the general course of philosophy and thought, since Mr. Mill's works had no small share in determining the ideas held in his time by a great part of the civilised world on some of the principal subjects of both theoretical speculation and practical opinion. For it will not be disputed that he was looked up to in several countries as the writer of chief authority on logic, political economy, and politics, and one of the first on psychology and morals. Latterly, however—not to speak of the passing influence of a political reaction on his popularity—it has been generally admitted that his methods in mental and social philosophy were inadequate; and his political economy is now censured, especially in Germany, for inconsistency and insufficient breadth of conception. "His ground-plan," says Dr. Roscher in his *History of German Political Economy*, "is a mere theory of the

tendencies of undisturbed individual interest, yet he frequently admits the existence of practical exceptions to the theoretical rules thus arrived at, and the presence of other forces and motives." Other writers, English, Germans, and Americans, have expressed astonishment that he could ever have adopted the doctrine of the wages-fund, which two of the dissertations in the present volume show that he finally discarded. The enquiry follows, Are the defects of his system to be traced to his own mind, or to his education?

One thing is plain in the matter. Education can nurture, develop, and direct the application of great mental powers; it can also misdirect, and even cramp and distort, but cannot create them. And no man without great and varied powers could have produced such works as Mr. Mill's *System of Logic*, *Principles of Political Economy*, *Examination of Sir W. Hamilton's Philosophy*, and the four volumes of *Dissertations and Discussions*; not to speak of minor works, such as his essays on *Utilitarianism*, and *Liberty*. One of his Dissertations shows that even a poetical fibre—one rarely found in the logician or the economist—was not absent from his mental constitution; and more than one of them refutes Dr. Roscher's criticism that "his was not an historical mind," if by that is meant that he lacked the genius for historical enquiry; though it must be confessed that the historical method is rarely applied in his philosophy. Add to this, that thirty-six of the best years of his life were spent in a public office in which he displayed administrative powers of the first order, and discharged his official duties not only with efficiency, but such ease and despatch, that he found time to distinguish himself among the foremost writers in several departments of intellectual speculation; and that he afterwards took a considerable place as a debater in Parliament. The man who did all these things also exhibited in private society remarkable conversational powers, quickness of apprehension and reply, a facility of allusion and anecdote, with a vein of gentle humour, and such felicity and force of expression that even when his conversation was grave, the present writer was often reminded of Steele's description of Sir Andrew Freeport that "the perspicuity of his discourse gave the same pleasure that wit would in another man."

If, however, Mr. Mill's "early training" does not account for his intellectual eminence, it assuredly went far to form his philosophy; but a great deal more than the peculiar mental discipline to which his father subjected him must be included in that early training. We must include the fundamental conceptions, and the method of enquiry, of the leading intellects of the age from which he received his education. It was an age in which Bentham was justly regarded as the first social philosopher—Ricardo less justly as the highest authority in political economy, in spite of the protest of Malthus against his abstractions and precipitate generalisation; Mr. Mill's father, James Mill, as the most eminent political thinker and writer of the time, and one of its chief lights in psychology; and John Austin as *facile princeps* in jurisprudence. No leaders of thought ever reposed more unbounded confidence in

their own systems than did this famous band. They seemed to themselves to hold in their hands the keys to every problem in the science of man. In psychology the master-key was the association of ideas; in morals it was utility ascertained by a balance of pleasures and pains; in political philosophy it was utility combined with representative government; in political economy it was pecuniary self-interest together with the principle of population; in jurisprudence it was a particular definition of law and classification of rights. All these methods the younger Mill applied with a power never surpassed, and in addition he in good part created a system of logic which may be corrected and improved, but will ever hold a place among the chief works of the human mind. It was the fault of his age and of his education if the doctrine of evolution found no place in his psychology or his social science; if the historical method was taken up in his Political Economy as it was in the Preliminary Remarks of his treatise, only to be laid aside; and if corrections from observation and fact of the inferences from *à priori* reasoning appear, both in that treatise and in the present volume of his *Dissertations and Discussions*, only in the form of practical exceptions to abstract theory, or of "applications" of economic science, when the fault really lay in the original conception of the science itself. It was not possible to weld the abstractions of Ricardo and the actual forces governing economic phenomena into a consistent and scientific system; or to furnish an adequate theory of the origin and growth of human ideas without investigation of the entire history of human society. But if any one individual is especially to be blamed for the shortcomings of his system, it is not John, but James Mill. No training ever was more carefully adapted at once to crush all originality and to inspire excessive confidence in the methods adopted, than that which the younger Mill received from his father. It should, too, be borne in mind that the *à priori* political economy had its chief charm for John Mill, not in the simplicity and symmetry which recommend it to narrower and shallower minds, but in the complete individual liberty which it supposes. How far he was from trusting to individual interest to secure the best economy in all cases, is sufficiently shown in the remarks in the first dissertation in the present volume (on Endowments) with respect to free trade in general, and to the doctrine that education should be left to demand and supply, in particular.

The action of demand and supply in another economic aspect, namely on value, is discussed with conspicuous ability in the second dissertation, on Mr. Thornton's book. The theory of a wages-fund, the proportion of which to the number of labourers in the country determines the price of labour, is there rejected; and it should be observed that this doctrine was not originated by Mill, but appeared in its most uncompromising and fallacious forms in the works of his predecessors, MacCulloch and Senior. It is, in fact, a corollary to the doctrines of an average rate of profit and an average rate of wages. If profits could not be higher, nor wages lower in one

employment or place than in another, there would really be such a mobility of capital and such a connexion between the funds out of which wages are everywhere paid, that it would not be very inaccurate to speak of them as forming a general fund on which the price of labour depends; though even in that case the combination of labourers might produce a higher general rate of wages and a lower general rate of profit than competition had done. What neither Mr. Mill nor Mr. Thornton seems to us sufficiently to bring out, is that the main power of trade unions to raise wages in particular cases has arisen from the actual inequalities of both profits and wages. Where extraordinary gains have been made in a business, the labourers have been enabled by concerted action to extort a share which competition would not have assigned to them; and again, where wages have been abnormally low, they have been able in like manner to compel a rise. The dissertation on the land question, and the papers on land reform in this volume, show that Mr. Mill, like most people of all political parties when they were written, underrated the strength of the forces on the side of the existing land systems; and the same remark is applicable to some passages in a review of Sir H. Maine's *Village Communities*, which deserves particular notice for the generous interest and admiration which it shows that Mr. Mill felt for works of genius and learning, even when allied to far more conservative tendencies than his own. The essay on Bishop Berkeley's works, besides its great intrinsic merits as a piece of psychological criticism, is remarkable likewise for the sympathy it evinces with genius allied to religious opinions widely opposed to Mr. Mill's.

The volume contains, besides other instructive essays, a review of Grote's *Aristotle* by one to whom few will deny the highest claim to be listened to as a critic on such a subject, and to whom many will assign a place beside Bacon among the most illustrious successors of the original founder of logic.

T. E. CLIFFE LESLIE.

Autobiography of Mrs. Fletcher, with Letters and other Family Memorials. Edited by the Survivor of her Family. (London: Edmonston & Douglas, 1875.)

THIS is the second, slightly modified issue of a volume originally printed for private circulation only, and the editor justifies its present publication rather by the distinct demand of a larger circle of friends interested in the writer than had been anticipated, than by a deliberate judgment as to the literary interest of the autobiography itself. To the general public, to whom the name of Mrs. Fletcher is unknown even by hearsay, the autobiography presents some points of interest, though the "Family Memorials" and pages which contain little or nothing but names and notes of visits paid or received from friends otherwise unknown to fame, might perhaps have been omitted with advantage. The volume is illustrated—in every sense of the word—by two charming portraits of the writer, one as a girl of fifteen, with the beauty for which she was

distinguished almost fully developed, and the other (after Richmond) as a great-grandmother of eighty, with the same features, and an equal, though altered charm of animated expression. Eliza Dawson (her maiden name) was born in 1770, the daughter of a thriving Yorkshire yeoman, of strong Whig opinions, which Eliza imbibed for life during the passionate discussions to which the American War gave rise, Sir George Savile, who reviewed the West York Militia in 1779, being her first hero. At fifteen she received her first offer, and was seriously alarmed by the fear lest the rejected suitor should die of her father's severity. At about the same date we hear of her being unable to go to her first ball, in consequence of the swollen eyes produced by an introduction to the "Sorrows of Werther and Charlotte," and of her disenchantment on seeing the poet Mason, "a little fat old man, of hard-favoured countenance, who squatted himself down at a card-table, and gave his whole attention to a game at whist," instead of the interesting embodiment of the "Monody" on his wife's death, figured by her imagination. Impulsive benevolence, overflowing enthusiasm, an affectionate nature, and a good deal of the amiable kind of vanity that comes from an affectionate regard for other persons' opinions, joined with a rather deficient sense of humour, complete the character which she traced of herself some sixty years later. Believing that Mrs. Hannah More had not dealt fairly with a *protégée*, a Bristol milk-woman who had written poems, the intrepid Eliza undertook to dispose by subscription of a new volume; but the most amusing trait in the picture of a charming young lady of a century ago is not supplied by the autobiographer, but by her future husband, in a quaint memorandum, "explanatory how Eliza Dawson acquired the name of Sophia in April, 1787." In 1779 or 1780 Mr. Fletcher, even then verging on middle age, had, during an illness, read *Tom Jones*, and lost his heart to—Sophia Western! Travelling from Scotland to London on political business with friends who knew the Dawsons, he was compelled much against his will to delay his journey to visit them. The first evening he was fascinated and perplexed by Eliza's charms of person and manner, till it flashed upon his mind that there was the true Sophia of his dreams, and from henceforth she began to supplant the ideal Sophia who had so long figured in his imagination. From London he sent her Ossian's poems, and began a correspondence which, after languishing somewhat on her side, was resumed after another interview; in 1789 Mr. Fletcher declared himself, and was rejected by his Sophia's father; she, however, continued the correspondence "with the sincere intention of prevailing on Mr. Fletcher to give up the engagement, for it would then have been less painful to me" (she writes fifty years later) "to have done so than to have offended my father. But I was unacquainted with the history of the human heart; at the end of two years I found that Mr. Fletcher had reasoned me into a conviction that it would be best for the interest and happiness of all parties that we should

marry"—and accordingly they did so in 1791. It was of her husband that Lord Cockburn wrote in his *Life of Jeffrey* as the "pure and heroic Fletcher, who knew not what jealousy was, and would have cheered on a personal enemy, if he had had one, provided he was going before him in the public cause." For some years after their marriage his practice at the Edinburgh bar suffered from the dread of liberalism then prevailing in Scotland, as it was supposed that judges would not decide in favour of any litigant who employed Whig lawyers; and it was gravely reported that his wife had provided herself with a guillotine and practised its use upon poultry and the like in order to be ready for action as soon as "French principles" should unfortunately become ascendant in the land. Notwithstanding these drawbacks, their married life was happy, and though Mr. Fletcher might have preferred rather more, and more brilliant society than was in reach, Edinburgh was then not without the materials out of which a drawing-room reputation may be made, and many young students, afterwards distinguished in politics and literature, who were welcomed with her usual kindness then, in after life were glad to renew their acquaintance whenever opportunity served. Jeffrey, after objecting to her as "one of the women who would bore him with rational conversation," became reconciled, and wrote to her in terms of sincere affection. The poet Campbell, whose weaknesses she used to lecture and tolerate, was another of her friends. For Joanna Baillie she had, of course, a profound admiration, and she records with amusing gravity how her daughters were "awed by the meekness" with which the said Joanna bore her overwhelming faculties. The connexion with Mrs. Barbauld and Miss Aikin was made closer by the two elder daughters being sent at different times to enjoy for a time the educational advantages of Mrs. Barbauld's society. The second daughter died young; Mr. Fletcher in 1828, at an advanced age. The doubt about, we will not say the propriety, but the discretion of publishing family chronicles of this kind scarcely arises till the third generation begins to appear upon the stage. But though we can take an interest in the person of almost any autobiographer, as his or her children grow up they "go out of the story," as the Sagas say, and they and their children, or grandchildren, have none of the individuality (to the reader), without which sympathy remains on the temperately cool ground of common humanity. Abridged of all that constitutes the real life of the parties concerned, a register of births, deaths, and marriages becomes in the end depressing, and all that emerges from the tedious detail is the fact that the writer's own sympathies and energies retained their vitality to the last, and that she was as happily ready to make heroes of her grandchildren and their friends, as of Sir George Savile or Miss Baillie. The lasting charm of her society may perhaps be summed up sufficiently when we find that in addition to beauty, intelligence, and strong opinions, she had an inveterate habit of seeing the bright side of things and people, which caused her to be re-christened "Miss

Bates" in a generation that knew Miss Austen better than Fielding.

In 1830 she visited Paris, and says that she never felt herself old till then:—"I wanted to find people to talk to me about the Federation in the Champ de Mars, about the fall of the Bastille, the scenes that took place at the Hôtel de Ville, but I could find no one that knew or cared about them;" she herself was just sixty, and had forgotten none of the keen excitement of her youth. The chief incidents of her later life were a removal to Rugby, for a grandson's education, where a warm friendship was formed with the Arnolds, leading to a final settlement in the Lake district, and a renewal of intimacy with the Wordsworths. She quotes with amusement the verdict of a Grasmere mason, to whom Mr. Wordsworth's authority was cited as a reason for having the chimneys built a particular way. "Yes," said the man deliberately, "m'appen he has as much sense as most on us." Besides the names already mentioned, we find mention of, or letters from Lord Brougham (one of Mrs. Fletcher's heroes), Sir Walter Scott, Lord Cockburn, Mrs. Gaskell, Mazzini, Mrs. Penrose ("Mrs. Markham"), the Davys (one of whom afterwards married a daughter), Mountstuart Elphinstone, Erskine, Cobden, Crabbe, Margaret Fuller Ossoli, Allan Cunningham, and others. The correspondence with Mazzini began in a very characteristic way: just after his first arrival in England he called with a letter of introduction, and his look of profound melancholy, joined with some expressions of strong admiration for the genius of Chatterton, made her fear that he meditated suicide himself, upon which she "took the privilege of age and experience to write to him a friendly exhortation," which elicited a profession of faith that set her mind at rest, while what she heard of his philanthropic efforts on behalf of his poorer countrymen from Ruffini raised her regard to admiration. She died in 1858. It should not be forgotten that, besides a strong interest in foreign and domestic politics, she had always felt much practical concern in social reforms, educational and otherwise, from a time when such movements were scarcely distinguished in popular prejudice from the "French principles" so strongly reprobated in good society.

EDITH SIMCOX.

History of the Reformation in Europe in the Time of Calvin. By the Rev. J. H. Merle D'Aubigné, D.D. Translated by William L. R. Cates, Joint Author of Woodward and Cates's "Encyclopædia of Chronology," Editor of the "Dictionary of General Biography," &c. Vol. VI. Scotland, Switzerland, Geneva. (London: Longmans & Co., 1875.)

THIS volume, which is entitled the sixth of the Calvinistic Reformation, is in reality the eleventh volume of the whole series, including the Lutheran period; and the English and Scottish portions have, not unnaturally, been classed with the Calvinistic rather than with the Lutheran Reformation. The English Church, when the development of doctrine which took place at the Restora-

tion is taken into account, may fairly disclaim being classed under either head; but M. D'Aubigné is utterly unable to appreciate the position which, at any rate, a large and influential part of English churchmen claim as their own, as distinct from either of the two streams in which continental Protestantism has flowed. But we can make no objection to the classification which places the English Reformers of the reign of Edward VI. and Elizabeth in the same category with Calvin; and of course no one can deny the propriety of assigning this place to the Scottish Reformers.

The volume which we are reviewing is divided into two equal parts, the first half being concerned with Scotland and the latter with Geneva—the earlier part consisting of a compressed account of the first quarter of a century of Scottish reform, the latter giving us a history of Geneva from the year 1536 to 1540. It will readily be imagined that the author is more familiar with Geneva than with Scotland; but we must confess that, even after the miserable exhibition of ignorance as regards England in a previous volume, we were not prepared for the extremely poor *réchauffé* of Knox's and Buchanan's histories which we have here presented to us, interspersed with a few anecdotes extracted, just as if the book were an authoritative history, from Foxe's *Acts and Monuments*. We, of course, did not expect much from a writer who in describing English affairs could speak of Bale, the scurrilous Bishop of Ossory, as Archbishop of York; and who thought it worth while to apologise for Mrs. Cranmer not being presented at Court on the ground that such a ceremony was unnecessary, and "might probably have embarrassed the pious German lady." But as M. D'Aubigné seems to know a little less of Scottish affairs than he did of English, the result has been that, in sticking closer to the authors from whom he derives his information, he has made fewer blunders in this section than in that which treats of English affairs; and he has not in this volume betrayed in the one quotation he has made from the Cotton Collection, his ignorance that in Galba B. VI. the B stands for a press mark and not for the initial of the word "Book." If he has really looked into that magnificent collection of manuscripts, we must express our wonder that there is but one reference to a single volume of the library, when there exist in it so many volumes full of documents referring to the political and ecclesiastical history of Scotland. Here and there we find a reference to the printed State Papers of the reign of Henry VIII. and to Spotswood's History. But with these exceptions, the works quoted scarcely amount to a dozen in the course of 260 pages. The book also contains much more of the political than the ecclesiastical history of the time. His own idea of the Scottish Reformation seems to be that it consists of nothing but the martyrdom of Patrick Hamilton and George Wishart, and the life of John Knox. The last worthy is reserved for a future volume, the history of the two former is detailed at some length from Foxe and other equally authentic sources. To show that we are not misrepresenting his view we give his

own words in summing up this portion of his narrative:—

"We have now traced the history of the ministry and the martyrdom of Patrick Hamilton and George Wishart. We shall have, by and by, to trace *Deo adjuvante* the mighty action of the third and greatest of the Scottish reformers, John Knox" (p. 256).

This passage, together with some remarks which follow it, give a very good idea of the author's historical, philosophical and logical powers. The passage we have already quoted is sufficient to illustrate his mode of writing history. As regards his powers of philosophic reflection, the following may afford a fair specimen:—

"The history of the Scottish Reformation serves to show the untruth of an assertion frequently made by the enemies of the Reform. According to them, the Reform could triumph only in those countries in which it had the protection of princes. This is a serious error. It was not the blood-thirsty Philip II. who established the Reformation in the United Provinces of the Netherlands. It was neither the feeble James V. nor the Popish Mary Stuart who secured its triumph in Scotland. That worthy scion of the Guises sought only to crush it. A stronger arm than theirs fought against these mighty ones and gave the victory to the weak. The enemies of the Reformation made use in Scotland of the very weapons which, in Italy, in Spain and elsewhere, arrested the movement of regeneration. The reformers were burnt also in Scotland, but the Reform arose out of their ashes. It was neither to their character nor to their strength that the Scots attributed the triumph. They knew that Jesus is the King of the Church, and that it is He who saves it. This is the feature which, more than any other, as we shall see, characterised the Scottish Reformation" (p. 258).

And this is the rubbish which passes with the Puritan school for philosophic writing of history. As might be expected, such an author has no capacity of throwing himself into the position or of appreciating the attitude of one who does not in all points agree with him. Mr. Buckle, in his *History of Civilisation*, had observed, with perhaps a slight exaggeration, that the Presbyterian ministers wielded "an authority nowise inferior to that which they had exercised as Catholic priests," and has specially offended our author by representing them as "the most effectual obstacle to popular progress"—and M. D'Aubigné has certainly not met the assertion by contrasting the demeanour and position of a Scottish minister of the present day with that of "the haughty Catholic prelates of St. Andrews, Glasgow, and other dioceses of the time of the Reformation." If the following passage be compared with that which we have quoted above, it will be seen that M. D'Aubigné closely follows in the wake of our own narrow-minded reformers who seem to have thought by some inexplicable confusion of ideas that the divine word in Scripture was in some mysterious way identical with the Divine Word the Second Person of the ever-blessed Trinity. He says:—

"The ministers whom it substituted for the priests having no longer the marvellous power of transforming a bit of bread into God the Creator these disciples of Jesus no longer seated on the despotic throne of the confessional to give pardon for sins—became simple heralds of the divine Word. This holy Word has its place in every family, and reigns supreme in the church.

Thus, ministers have ceased to be masters, and have become servants. The real offence of these Scottish pastors in the sight of their detractors is that they have always been a great obstacle, not to the progress of the people and of civilisation, as some have said, but to the progress of unbelief and materialism. Now, these mischievous doctrines are mortal enemies to the freedom and prosperity of nations" (p. 259).

Any reader of the first half of this volume would, we think, be inclined to wonder how M. D'Aubigné ever attained any reputation at all. Nevertheless, it would only be necessary for such a one to read the remaining half which refers to Calvin and Geneva to enable him to form a very different estimate of his strength. We have here the same capacity for descriptive writing which his previously published volumes exhibit. We do not, of course, hold the author up as an historian, for he has in our judgment no claim whatever to the designation; but he has great powers of writing, and on a subject on which, as on the history of Geneva, he is enthusiastic, those powers appear to great advantage. Moreover, there is a great deal of valuable matter in this part of the work which has never before seen the light. He has had access to the registers of Geneva and other manuscript sources, from which he has extracted much which illustrates the infant struggles of the congregation, or church as it is sometimes called, of Geneva.

This part of his volume possesses the highest interest, and indeed contains a fuller account than can be met with in any other English work—or indeed, as far as we know, in any foreign publication—of the internal feuds of the Swiss Reformation during the five years that followed the arrival of Calvin at Geneva in 1536. The whole interest of the picture drawn is centered in Calvin, but the other figures are extremely well grouped; and we are enabled to form an idea of the nascent church of Geneva in its ecclesiastical and political aspect, as well as of the differences that arose out of the development of the two systems of Zwingli and Calvin.

It is to be regretted that the volume breaks off where it does, before the recall of Calvin to Geneva. We suppose the next volume will contain the "Io triumphe" of the French Reformer's return. In the present M. D'Aubigné has to make the best of a bad matter. If we had had to guess what the next volume should be likely to contain, without possessing any knowledge from history of what it must contain, no one, we think, would venture to prophesy the re-establishment at Geneva of a more autocratic power than before. The feuds between those of the Protestant party who cared at all about religion, aggravated as the mischief was by the impatience of restraint of those who with the old religion threw off all moral obligations, gave a momentary glimpse of the possibility of Rome re-establishing her ascendancy.

But the movement in favour of reform was so intensely political in Switzerland, that there really never was any probability of this restoration. The subject for wonder is that the Protestant theory did not develop more quickly into a form of belief which should be more comprehensive and less definite. We shall probably have a future

opportunity in reviewing the seventh volume, of commenting on the results produced by the genius of Calvin. We look at M. D'Aubigné's hero from a very different point of view from that from which these pages were written. But the greatness of the man who controlled the irregularities which our author is obliged, by the truth of history, to describe must be admitted alike by friend and foe.

In saying so much in praise of the graphic descriptions of scenes, whether of debate in the Senate or of battles in the field, it will not be supposed that we ever experience any sort of sympathy with the writer. On the contrary, though the facts are detailed fairly enough, the defence of what is equivocal and the attempt to screen what is distinctly wrong on the part of the Protestant party are such as we are persuaded must be palatable to every tolerably fair reader. Indeed, the author signs his own condemnation when he says (p. 271), "CALVIN and the HUGUENOTS, that is the great motto of the sixteenth century." And the last quarter of the nineteenth century is really too late a period for an author to have a chance of influencing the higher intellect of the day by a history which divides Christians into Papists and Gospellers, and speaks of the Gospel and the Pope as the two antagonistic powers of the world.

NICHOLAS POCOCK.

Indian Public Works, and Cognate Indian Topics. By W. T. Thornton, C.B., Secretary for Public Works in the India Office. (London: Macmillan & Co., 1875.)

THIS book, alike on account of its subject and its author, will be interesting to all who take an interest in India. Among the English public, at least that portion who think at all about our Indian Empire, the liberal prosecution of public works is supposed to constitute our mission in the East, and to be the panacea for every difficulty in our rule. The esoteric idea is somewhat different; and the Anglo-Indian public who see the enormous expenditure, the constant mistakes, and the greater shortcomings of the Department of Public Works, have named it the Department of Profligate Waste, and rather dread its extension than believe in its efficacy. By the English public Mr. Thornton's book will naturally be regarded as an authoritative exposition of the subject which they regard as of the highest importance in the government of India; esoteric readers will look rather to the opinions of the author, who holds a position of such influence for good or evil, and to such the book will, I think, be more satisfactory than to the blind believers in the Gospel of Public Works.

Mr. Thornton is essentially honest, and, happily, is not an enthusiast. Regarded as a laudatory enumeration of the engineering feats of our Indian Government, his book is not so complete, and probably not so interesting as Mr. Markham's statement, which travels over exactly the same ground. Yet the chapters on Communications, Irrigation, and Miscellaneous Works, present the reader with a popular and a fair description in a very brief space of most that has hitherto

been effected; and the account of Sir Arthur Cotton's successful Irrigation Works in Southern India is both clear and accurate.

The commencement of the chapter on Irrigation is somewhat alarming. Mr. Thornton has a weakness for trite quotation; and he opens the subject with the first line of the first Olympian, and says he must treat it Pindarically. There is fortunately nothing which would generally be considered Pindaric, or enthusiastic in his treatment. Sir A. Cotton, whose marvellous personal success as an irrigation engineer in the Madras Presidency has rendered him fanatical on the efficacy of such schemes for the redemption of India at large, would regard him as a very lukewarm follower. Mr. Thornton touches very lightly on the failures: but, after enumerating successes, he makes the pregnant remark:—

"It may even be doubted whether, regarded in the aggregate and from a purely fiscal point of view, all the irrigation works belonging to Government are not as yet a source of loss rather than of gain; if those of the Madras Presidency be excluded, all the rest, taken together, certainly are."—P. 117.

Those who consider that as the only preventative of famines in India, irrigation must be extended at every financial risk, advance the bold theory that it must be *made* to pay, and that, like sanitation and education, irrigation must in India be compulsory, and its benefits be enforced on an unbelieving people. There is a school of high-handed doctrinaires who assert that if the recalcitrant cultivator refuses to take the water provided by a great irrigation scheme carried out for his benefit by a benevolent Government, he must at least be made to pay for it. Such is the audacious proposal of Sir John Strachey, an Indian administrator of some note, to make irrigation works lucrative. It appears to me that a more immoral suggestion was never broached. As conclusively shown by Mr. Thornton, the result would be to make the agricultural classes pay for the mistakes of our engineers, and it would be impossible to devise a plan more likely to alienate the good will of those hitherto the most contented with our rule. We held India in the cataclysm of 1857 because the rural population outside of Oudh was not on the side of the mutineers, in the Panjab and in Madras was emphatically with us. If this be the only remedy to avert famine, by creating discontent in the most loyal class, I would elect in preference the possibilities of a local famine occasionally, to the certainty of ultimate insurrection. But such an assertion is idly begging the whole question. Where irrigation works are suitable to the wants of cultivators no compulsion is required to induce them to use the water. Where irrigation is forced on an unwilling people, the risk is run of aggravating the very evil which it is intended to prevent. It is gratifying to find that Mr. Thornton's views are thoroughly sound on this subject, and the following remarks should be considered by those who may have been led incautiously to regard irrigation as the only insurance against famine:—

"The only sufficient excuse for an opposite policy would be the fact of irrigation affording perfect insurance against famine; but not only,

as we have seen, can it not do this, unless very exceptionally; it may, on the contrary, very probably aggravate exceedingly whatever famine it fails to prevent. For the larger the crops raised with the help of irrigation in ordinary seasons, the greater, probably, will be the population dependent on those crops, and the more numerous the sufferers in seasons of drought so excessive that irrigation itself is dried up at its source. In a country of such vast extent, and such various climate as India, there is never likely to be a general failure. The whole country probably always contains food enough for the entire population, the surplus in certain parts being always such as would counterbalance the deficit in others, provided only there were adequate facilities for transporting it thither. A complete system of internal communications of roads and railways would therefore be India's best security against dearth."—Pp. 124-5.

The intimate connexion of the land tenures of India with the effect of large irrigation works has induced Mr. Thornton to devote a chapter to this subject, on which his views are especially sound. He exposes fearlessly the miserable results of the Permanent Settlement in Bengal, by which Lord Cornwallis created a body of landed proprietors to whom he alienated in perpetuity the rights of the State, *i.e.*, the public at large, to the land. There is no doubt that this particular tenure is a cause of the utter failure of the Orissa Works, quite as much as the unwillingness of the actual cultivators to use the water; where in fact the estate has been given away to private individuals, it cannot pay the Government to improve it at a vast expense for their benefit. It is only where the Government deals directly with the cultivators, that it is possible to construct costly public works with any profit to the State. The improvement of private estates must be left to private proprietors. I can endorse heartily all that Mr. Thornton writes on the Indian Land Tenures, with the exception of his unjust diatribe against Madras Ryotwarry. Here he describes faults of the past, all of which have been completely rectified in recent years, and on such incorrect data founds his condemnation. "The distinctive excellence of every tenure really deserving to be so designated," he truly remarks, "is the stimulus it gives to industry, skill, and thrift, by making all increase of produce resulting from exhibition of those qualities the reward of him by whom they are exhibited" (p. 205). This is the boast of the reformed Ryotwar system in Madras and Bombay. I would only caution Mr. Thornton's readers that his remarks on this subject are the result of evident ignorance of all that has been carried out in Madras during the last twenty years—an ignorance that is strange in one so well acquainted with all the other Land Tenures of India, and astounding in one who has also made Peasant Proprietorship his special study. The eulogy applied by him to the Punjab system could be applied *totidem verbis* to that in Madras, the chief difference being that in the former, individual independence is not so much fostered.

After treating of the land tenures, Mr. Thornton devotes a chapter to National Education, which can hardly be deemed a cognate subject with Public Works, though he ingeniously connects its consideration, as

the only possible moral check on over-population, that necessary result of the security afforded by our Government to a community where the begetting of children is a religious duty. I confess I have no faith in any such check; but it is impossible not to read with pleasure the vigorous onslaught made by Mr. Thornton on the perverse fatuity with which our Indian educationalists do all they can to check the native desire to learn our English language. They sternly reprobate the readiness which the Hindoos exhibit to learn the tongue of their rulers, which would be the key to open all knowledge, and insist on giving them instruction in their own innumerable dialects, which are without a literature, and in which foreign scholars compose *ad hoc* their educational treatises.

In his chapter on Communications Mr. Thornton shows clearly enough the loss that has been entailed by the construction of railways by guaranteed capital, and the escape from the difficulty that has fortunately been preserved to the State, of taking possession of the railways from the guaranteed companies after a certain interval. There is one sufficient answer to all criticism on the system adopted, namely, that none other was feasible. It would have been idle for the Indian Government to invite private enterprise to construct the railways that were wanted, without a guarantee. You can call spirits from the vasty deep, but will they come when called? To have entrusted the construction to the Department of Public Works, raising loans for the purpose, would have been scouted by the whole Indian public, at that period, as an act of lunacy. Our Indian engineers, like Earl Russell in his youth, had pluck enough to undertake anything. They were ready to perform an operation for the stone, to command the Channel Fleet, or to construct a railway. They had as little experience of this work as of either of the others, and the reader has only to peruse Mr. Thornton's chapter on Establishments to see that the distrust felt in their capacity for such work was well founded. Bridges that stand at some distance from the road they are intended to carry across a stream; others that have fallen at the first flood; lines of road swept away at every ensuing monsoon; buildings that fall just previous to completion—are too frequent instances of the indifferent workmanship which Mr. Thornton acknowledges is intermixed with the masterpieces of Anglo-Indian engineering. The private companies formed by the guarantee system sent out to the country practical railway engineers, who constructed railways that, on the whole, do stand even against the force of Indian floods. Now that most of the lines are formed, and their constant efficiency ensured by a rigid Government inspection, not a word can be urged against the State taking them over at the first opportunity with their trained engineers, and thus getting rid of the evils of divided counsels, and securing the profits of their future increased prosperity. With regard to the lines now being constructed by the Government, it is to be hoped only that they may not be inferior to the work of the guaranteed companies.

The real difficulty in the Indian Public Works Department is the untrustworthiness of the subordinate agency. There is a superior staff of 1,100 members, paid nearly 900,000*l.* a year to superintend an expenditure of about eight millions. And the time of these highly paid and thoroughly-trained officers is chiefly taken up in matters of account. To check peculation on the part of dishonest subordinates, a most complicated system of accounts is insisted on, which absorbs all the energies of the higher officers that ought to be devoted to developing the resources of the country. In addition, 150,000*l.* a year is spent on audit alone. "The entire expense of the Audit Office at Somerset House," says Mr. Thornton, "by which are supervised the accounts, not of public works only, but of the whole public expenditure of every sort of the United Kingdom, amounts to less than 44,000*l.* a year" (p. 174).

Mr. Thornton argues boldly against the recent appointment of a member to the Governor-General's Council, to be in charge of the Public Works Department, that is, to do over again the work of the Public Works Secretary to Government. Both officers cannot be necessary, and to give the Bengal Secretary a seat in Council can only create possible differences with the minor Presidencies, who naturally trust in their own secretaries, and are jealous of unnecessary professional control. In truth, the Department does not require reform from above, but from below. Ultra-centralisation, the great blot of our Indian administration, is above all things to be deprecated.

I should wish to part in good humour with an author with whose views I find myself so generally in agreement, and whose honesty, as an official writing on his own department, is beyond praise. Mr. Thornton tries to prevent this. I have alluded to his weakness for trite quotation. He positively closes his book by quoting one of Virgil's best-known lines, and importing a false quantity. It is certain that Mr. Thornton fears nothing; but he must permit me to class this aberration among the follies of the wise.

JAMES INNES MINCHIN.

The Secret Societies of all Ages and Countries.

By Charles William Heckethorn. (London: Richard Bentley & Son, 1875.)

THIS work, founded on the *Mondo Segreto* of Signor de Castro, professes to give "the most comprehensive account extant in English, French, German, or Italian" of "those secret organisations, religions, political and social, which have existed from the most remote ages down to the present time." The term Secret Society, it should be observed, is used not only as applying to societies whose existence is sought to be kept secret, but to all which have "secret rites and ceremonies kept from the outer world, though the existence of the society itself be no secret at all." But the author strains his title still further, and includes on the one hand alchemists and mystics as "propounders of secret doctrines, or doctrines clothed in language understood by the adepts alone," and, on the other hand, the Inquisi-

tion, as having had "secret agents, and secret procedure." With such a wide, not to say loose, conception of his subject, it is difficult to see why the police of all ages and countries should not have found a place in Mr. Heckethorn's work, to say nothing of every conspiracy that ever existed, and of every persecuted sect and church. Of course it is idle to suppose that a couple of post octavo volumes can contain all that such a view required.

After observing that Secret Societies have been religious (Eleusinian Mysteries), military (Templars), judiciary (Vehmgerichte), scientific (Alchemists), civil (Freemasons), political (Carbonari), the author divides them for convenience' sake into Religious and Political, the whole of the first volume being devoted to the former, and the second, with the exception of Book IX., on the Mystics, and Book XIV., on the Inquisition, to the latter. The clue to Mr. Heckethorn's views is to be found in the First Book of the second volume, in which he speaks of Böhme as "the prince of Mystics," "a visionary of the stamp of Columbus," to whom it was given "to behold with his mental eye a hidden world, the world of the properties of Eternal Nature, and to solve the great mystery, not of this world only, but of the universe;" a "central philosopher, who from his standpoint could survey the whole sphere, within and without, and not merely an outer segment of its shell," and who "could therefore see the causes of things, and not their effects only." After an introduction, which will be best understood by means of the clue above given, the author devotes his First Book to "Ancient Mysteries," including under this head Magi, Mithraics, Brahmins, and Gymnosophists, Egyptian mysteries, metamorphoses of the legend of Isis, Chinese and Japanese, Mexican and Peruvian mysteries, Druids, and Scandinavian mysteries. Book II., under the title of "Emanationists," deals with the Cabala and the Gnostics. The "Religion of Love," which gives a heading to the Third Book, is found, strange to say, to be Manichæism, the author contriving, by means of the Albigenses of Provence, to bring in, under this head, the "Gay Science," and "chivalry" generally. The "Ishmaelites" of Book IV. include various Oriental sects, more particularly Assassins and Druses. Knights Templars have the Fifth Book to themselves. The "Free Judges" of the sixth comprise the "Holy Vehm" and the "Beati Paoli." Alchemists and Rosicrucians occupy the seventh; an elaborate account of Freemasonry in the Eighth Book fills the remainder of the first volume.

The opening Book (IX.) of the second volume is devoted to the Mystics, under which head the author includes, with Böhme and Swedenborg, Martinism and the "mystic masonry" of Martinez Paschalis and St. Martin, known in France as "Le Philosophe Inconnu." In his panegyric on Jacob Böhme, Mr. Heckethorn bursts—I cannot say blossoms—into rhyme:—

"Behold the solitary mental freeman,
The centrally illumined Jacob Behmen.

Yea, Jacob Behmen, although but a cobbler,
With small endowment of scholastic lore,
And by the outward world believed a gobbler
Of idle tales his crazy fancy bore;
Of mystic crudities a tedious babbler," &c.

Alas! poor Böhme! may the burthen of his admirer's poetry lie lightly upon him!

After the Illuminati of Book X., we come to a book entitled "Brigandage," which might easily have swelled into a volume (since every band of brigands that ever existed is necessarily a "secret society"), but which is devoted only to two bodies, the "Chauveurs" of France, and the "Garduna" of Spain. The account of these, for which no authorities are cited, and which is therefore probably borrowed from Signor de Castro's book, is really interesting, but one would like to know on what testimonies it rests. The "Fellow-crafts" of Book XII., under a title which seems here hardly well applied, comprise French and German workmen's unions—i.e., "compagnonnage" and guilds. The Carbonari fill up Book XIII., and are very unintelligibly separated by Book XIV., on the "Inquisition," from the "Minor Italian Sects" of Book XV., which they are closely connected with, while the "Inquisition" itself would seem to have deserved a place beside the "Garduna," with which it is stated to have been in "a sort of sleeping partnership." Then comes Book XVI., mysteriously headed "Youth," divided into chapters on "Young Poland," the "Union of Safety," "Union of Virtue," "Irish Societies," the "Fenians," "Communists," the "International and Commune," the "Permanent Revolution," and "Young Italy." Book XVII., on "Miscellaneous Societies," winds up the work; and when it is mentioned that among a host of little-known bodies it attempts to give an account of Babism, Dervishes, the Camorra, the Jesuits, the Ku-klux-klan, the Maharajas, the Thugs, and the Wahabees, it is matter of wonder that its forty-six pages should not have become multiplied by ten at least.

"Qui trop embrasse mal étreint," as the French proverb says, and the cardinal fault of Mr. Heckethorn's book is that of having attempted to pack into two volumes the matter of twenty. Moreover, while he has evidently read a good many books, his learning is not sufficiently substantial, and above all his mind is too uncritical in the true sense of the term (though he is constantly passing the most slashing judgments on whatever he disapproves of) to enable him to treat a subject so difficult with the discrimination which it requires. Take, for instance, his book on "Ancient Mysteries," in which he treats of the religions of Persia and India. Would it be believed that the list of authorities prefixed to this book contains the names—to cite only a few of the most prominent omissions—neither of Haug, Wilson, Max Müller nor Burnouf? that instead of any translation of the Vedas themselves, we are referred to "Jones's Extracts from the Vedas"? and that all the results of the interpretation of the cuneiform writings are equally ignored? Where such is the case, one cannot be surprised to find the author confidently asserting that Zoroaster "lived nearly seventy centuries before our era," and that the Brah-

mins "may be called the descendants of the Magi," whose name is nevertheless derived from the Sanscrit "Maya," while elsewhere again he says "The Buddhists were Magians, the Brahminists Sabaeans." I need perhaps hardly say that, being a mystic, Mr. Heckethorn's etymologies are to be utterly mistrusted. To quote one instance only—he derives the Italian *signore* from the Arabic *seydna* or *sidna*, as if the whole family of nearer or more remote derivations from *senior*—*senhor*, *señor*, *seigneur*, *sieur*, *sior*, *sir*, &c.—had no existence.

In short, while the work is full of curious matter, and professes to contain few statements "which could not be supported by numerous and weighty authorities," it is one which should be read all through with a careful reservation of belief in whatever may not be shown to be thus supported. For Mr. Heckethorn not only, as I have just shown, fails often to consult the best authorities, but he also seems at times unable to understand those which he does consult. He has read in Dr. Brentano's *Arbeitergilden der Gegenwart* an account of the rise of English trade unions on the ruin of the old guilds, and in treating of the latter speaks (vol. iv. p. 81) of the repeal of the Coalition Act (*sic*) in 1824. Yet in a violent tirade against trade unions at p. 224 of the same volume he uses the incredible words: "In this country no law has been passed against trade unions," as if the repeal of the coalition laws had not grown out of the failure of five centuries of such legislation. But indeed the sixteenth book, in which the last quoted passage occurs, the first authority for which is "Contemporary journalism of various countries," is of the slenderest value altogether.

It must now be added that while including in his work a number of matters which have but very slight connexion with its subject, Mr. Heckethorn overlooks others which immediately belong to it. For instance, amid all his elaborate, not to say tedious, details of Freemasonry, extending over more than one hundred and fifty pages, he has not one word to say of those really magnificent organisations, our great "secret" Friendly Societies of the affiliated type, two of which, the Manchester Unity of Odd Fellows and the Ancient Order of Foresters, have over 400,000 members each in England and Wales alone, besides Scotch, Irish, Colonial and Foreign branches, making up in all about half a million each. At least ten other "secret" orders belonging to this country have from 10,000 to nearly 100,000 members each; the United States have a number of similar organisations, and our Australian colonies have started some on their own account. It would surely have been quite worth while to have given some account of bodies which play so important a part in the daily life of our artisan and lower middle class (the average benefit payments of the Manchester Unity amount to nearly 500,000*l.* a year), to have shown how far they resemble, how far they differ from Freemasonry, and whether there is any historical connexion between the two. Of course, where bodies of this magnitude are overlooked, many smaller ones must be so likewise, even although they may still more closely approximate to Freemasonry, such as the Free

Gardeners of Scotland, the Cemented Bricks of the Royal Navy, the Antediluvian Buffaloes, &c. The chapter on "Irish Societies" is far from complete, and although a long and more or less apocryphal account is given of the "International and Commune," the French societies enumerated do not even include the famous Marianne.

Mr. Heckethorn apologises for misprints in the first volume and a portion of the second, on the ground of their having passed through the press while he was in Italy; but his list of errata does not even cover one so obvious as "Le Blanc, l'Histoire de Dix Ans" (vol. ii. p. 90). Expressions such as "Conrad de Kanffungen," or, in the account of the initiation of a German cooper, the insertion between parentheses of the French word *ébauché* as the equivalent of "put into shape," indicate at least carelessness in the digestion of his materials, as well as the use of second-hand authorities.

J. M. LUDLOW.

Janet Doncaster. By Mrs. Fawcett. (London: Smith, Elder & Co., 1875.)

CLEVER people seldom write novels, they know the difficulties too well. People of genius, whose works deserve the most careful criticism, and people with a notion that they are great observers, and can tell a story well, have the field of fiction to themselves. With the works of the former class, which ranges from George Eliot to Mr. Black, the reviewer seldom meets; the productions of the latter are before him every week, the crude endeavours of young and old ladies, of gentlemen of leisure, "these he gives his daily dreadful line to." Mrs. Fawcett's story comes between novels of genius and novels of ignorant conceit; she writes, as a rule, in decent English, though she permits herself to talk of persons "of the masculine persuasion," her characters are consistent, and in fact the book is the book of a writer of talent and of education. This may not seem very high praise, but it is praise which implies a sense of relief in turning from insipid and ungrammatical twaddle to bright and careful writing, clever studies of character, amusing touches of description.

Mrs. Fawcett has chosen a limited canvas, and has not arrived at very powerful or tragic effects. Her heroine is a wilful girl, brought up in the strictest sect an Evangelical, and all to no purpose, by a mother whose income is to die with her. To them, and to the gossiping little country town in Bassetshire, where they live—the gossip is rather exaggerated—enters the noble family of the Leightons, of Leighton Court. Why does Mrs. Fawcett steal a county from Mr. Trollope's geography-book, and a family out of the "Burke" of Mr. Henry Kingsley? The Leightons were an aunt, Lady Ann, a person of stern will; a feeble-minded mother, Mrs. Leighton; and Charles Leighton, her son, a martyr to *delirium tremens*. All his ancestors almost had drunk themselves to death, and only a faithful secretary, a young Cambridge man named Forsyth, and a butler, both selected by Lady Ann, kept poor Charles's head above water, if the expression is allowable. With her usual keen eye for character, Lady Ann "spotted" Janet as the

right woman to keep Charles straight, and as Janet's pious mother was dying, in great anxiety about her future, she accepted Charles's offer "to lie at her feet." Forsyth, who had fallen in love with her, believed Lady Anne's assurance that Janet knew all about the martyrdom to *delirium tremens*, and the marriage took place. Janet, by an improbable accident, introduced her husband to brandy, and her disgust at finding him dead drunk *sous la table*, like M. Gautier's moralists, took the shape of a determination to see his face no more.

This position will be disputed by the virtuous—it will be said that as Janet married Charles to serve her "private ends," she ought to have stood by him, while he drank himself into an early grave, to serve his. But Mrs. Fawcett does not seem to hold Janet's conduct up as an example; she acted on an impulse of shame and self-will, she refused aid from Leighton's family, and made 200l. a year by translating French Protestant theology for Messrs. Parsons and Hitchcock. The publisher of fiction pays 200l. a year for translations of French Protestant theology; he is an innocent and even benign creature, whom one would like to know at home.

When Janet had lived on the proceeds of French Theology for some time, she met Mr. Forsyth in a forest, they had a tender interview à la Octave Feuillet in a tower, confessed their chaste and mutual passion, and separated. Mr. Forsyth was eager to live on a Platonic footing, but Janet said it would not do. The cause of the higher education would suffer if scandal breathed on their pure names, and they were both very much interested in the higher education. So they parted, till Leighton's martyrdom was consummated by an early death, and then they lived happily ever after. Mr. Forsyth did not drink, but Leighton was a gentleman; Mr. Forsyth was fond of the higher education, but he swore profanely in the society of ladies. Neither hero is very pleasant; men seldom like ladies' heroes.

It is obvious that Mrs. Fawcett has chosen a curiously disagreeable incident for her story. Her characters do not develop, but remain the same in every change of circumstance. But they are living characters: the weakness of Leighton, the masterfulness of Lady Ann, the wilful and narrow force of Janet, the donnish rudeness of Forsyth, are true to life. Mrs. Fawcett treats such trifles as religion with a light and easy humour, and we cannot resist the temptation to quote a passage in which she has a fling at religion, and at the game laws:—

"Mrs. Doncaster was always very liberal in her distribution of violently Protestant tracts, and she found on returning home that her stock had run low, and that she had not a single copy left of the brochure entitled 'Papists, beware.' This, she had considered, would be so very suitable to Mr. Leighton, because it was conceived in the spirit of a notice to poachers. A kind of abstract of the spiritual game laws, and the penalties incurred by breaking them, 'Papists, beware' was a parody on 'Trespassers, beware,' and the whole of the four or five pages of which the tract was composed spoke of the wickedness of the Papists in trying to enter the Protestant preserves. It entreated the gamekeepers (i.e., the bishops and clergy) to be on their guard, and to watch both day and night, so that when the Great Day came

there should be a large bag for the rightful proprietor of the preserve."

The solemn associations which Christians usually connect with the Day of Judgment are very agreeably ridiculed here, and people who see Michael Angelo's or Orcagna's masterpieces will now think of Mrs. Fawcett and the first of September. This is one charming and desirable result of female interest in the Higher Education.

A. LANG.

WILLIAM THE CONQUEROR AND HIS SON.

Der Konflikt Vilhelms des Eroberers mit seinem Sone Robert und di Nachfolge im Englisch-Normännischen Reiche im iare 1087. Von Dr. H. Vattelet. (Zürich, 1874.)

DR. VATTELET has not chosen his subject for its attractiveness; for, however useful to point a moral, family dissensions are not exactly pleasant to dwell upon. The point of view from which he regards the wretched conflict which embittered the closing years of the Conqueror's life, is that of the historical critic, the object of his monograph being to examine more minutely than is possible in a general history the authorities from which our knowledge of it is derived. The chief of those is, of course, Ordericus Vitalis; and the pamphlet is really therefore an attempt—which is thoroughly well carried out—to elucidate and reconcile what is obscure and contradictory in Orderic's narrative. It is not necessary here to follow the author in his preliminary enquiry into the origin of the quarrel between William and his son. The two settlements of Maine, and William's formal and repeated recognition of Robert as heir to Normandy are surrounded with less difficulties than the subsequent course of events. Of Robert's demand to be put in immediate possession of both duchy and county, and his father's refusal, Orderic gives two accounts: one at the end of his fourth book; the other, fuller and more dramatic, in the middle of the fifth. These accounts plainly refer to the same occasion; but Robert's after-conduct is very differently narrated. In the one case the immediate cause of his revolt is not the rejection of his claim by his father, but a quarrel with his brothers, in which William interferes. On the night following this quarrel, Robert with his partisans deserts the King's company and makes an unsuccessful attempt to seize the castle of Rouen. This is his last appearance by name in the fourth book; but the rebels generally are represented as finding a protector in Hugh de Neufchâtel, and the book closes with the siege of Hugh's castle of Raimalast by the King. In the fifth book, immediately after the dialogue in which William refuses the cession of Normandy and Maine, we are told that Robert "his dictis iratus abscessit et relicto patre de Normannia exivit;" and lower down, "extera per regna ferme quinque annos pervagatus est." At the end of these wanderings he betakes himself to Philip, King of France, and is established by him in the castle of Gerberoi on the frontier of Normandy. Whatever may have been Philip's motive in this—and Dr. Vattelet sees no reason to suppose that it was

from hostility to William—Robert takes advantage of his position to ravage his father's territory, till the latter is forced to besiege the castle in form. Now Dr. Vatteleet successfully contends that the original rupture must have taken place at the end of 1077 or the beginning of 1078, and the siege of Gerberoi in January, 1079. As these dates are altogether at variance with Orderic's statement above that Robert passed five, apparently intervening, years in exile, he argues further that the account of his wanderings and adventures really refers partly to 1078, between the siege of Raimalast and the occupation of Gerberoi, and partly to 1083-1087, after Robert's second rupture with his father, when he finally quitted him. This theory, which is not inconsistent with Orderic's want of method and neglect of chronological sequence, is ingenious, and certainly offers a plausible explanation of what is otherwise inexplicable. The siege of Gerberoi, however, presents other difficulties than those of dates, such as the part taken in it by Philip of France, the story of the personal encounter between William and his son, and the circumstances which led to the siege being raised. Dr. Vatteleet's arguments on all these points are keen and discriminating, and give evidence of a thorough knowledge of all the authorities in any way bearing upon the subject. The same may be said of the concluding part of his task, in which he treats of the Conqueror's disposal of his dominions on his death-bed, and indeed of the pamphlet generally. It is a valuable contribution to Anglo-Norman history; and English historical students will do well to read it in connexion with that part of Mr. Freeman's great work which deals with the same subject.

GEORGE F. WARNER.

CURRENT LITERATURE.

The Gentle Shepherd (Edinburgh: John Ross and Co.) is an excellent edition of a work which, in spite of injudicious over-praise, must always occupy a high place in its own class. One may demur a little to the words of Burns (whose linguistic attainments, no doubt, made him a competent judge of the matter) that this is "the noblest pastoral in the world." And when one is told on the authority of Christopher North that "all the Idyls of Theocritus are not equal in worth to the single *Gentle Shepherd*," one may bracket the statement with another concerning Thucydides and the *Times*, and take no further heed. But it would be a very great mistake to let anything of this sort stand in the way of our recognising the unquestionable merits of Ramsay's poem. It is a very happy resolution of the difficulty of pastoral, the adornment of Art with a due allowance of Nature. And the edition before us deserves un-mixed praise. The get-up is very satisfactory, the text is carefully edited, there is a capital glossary, a very well written biographical introduction, and an interesting appendix on the scenery of the poem. Altogether the book is a model of its kind.

Our Dwellings Warmed and Ventilated as they Are, and as they Might Be, with a Chapter on Ventilation, by J. W. C. (Lockwood), is a somewhat rhetorical pamphlet on the evils of open fireplaces, with a recommendation that all future houses should be built with only two chimneys, one for the kitchen, and another for a single stove to heat the whole house. The author says "That open fires will be used in spite of all I or any other

writer can say about them, I do not for a moment doubt:" and we agree with him.

Cassell's Library of English Literature. Selected, Edited and Arranged by Henry Morley, Professor of English Literature at University College, &c. Illustrated. Parts I. and II. (Cassell & Co.) No one likes to find fault with so popular and genial a lecturer and writer as Professor Morley, who is stirring up so much work at English all over the country. Yet we must grumble a little at this last literary venture of his. It is the first part of some ten or twelve, shall we say, volumes meant to give Englishmen a notion of what their literature—and consequently their language—was and is. To this end four things at least are necessary: (1) that the pieces quoted should be English; (2) that they should be quoted as written, with a translation when necessary; (3) that the pieces chosen should be the most characteristic of their kind; (4) that the comment on them, or narratives in which they are set, should not be mainly a catalogue of other works, but should be first a critical estimate of the pieces quoted as representatives of the literature of their several periods, and contain a like critical estimate of the chief works not quoted. In defiance of these requirements Professor Morley gives us (1) translations of Celtic and Latin poems; (2) he quotes no Anglo-Saxon (only translation), and though he does rightly quote two pieces of Early English, he gives several others in a mixture of much Late and a little Early—fourteenth century hood and boots, and nineteenth century coat and trousers—to say nothing of translating "so-gate wan" (thus won) as "so got won, caused to be won;" (3) the Anglo-Saxon piece chosen from the Exeter Book cannot for a moment compare with a piece like the "Seafarer" for representative character; and (4) the comment or narrative about Anglo-Saxon literature does not even mention Cynewulf, the chief lyric poet, nor does it bring out at all the characteristics of the minor Anglo-Saxon poetry. Let anyone who wants to see what they are, turn to Mr. Henry Sweet's History of that poetry in vol. ii. of Mr. Hazlitt's edition of *Warton*.

So also the charming little thirteenth century love-songs are passed over without notice, interesting as they are as the companions of the Virgin poems of the time. But still we wish well to Professor Morley's book. It must stir some folk up to study English more. And there is a good bit of work in Part I. in the notes to the "Land of Cockaigne." If the woodcutter of the illustrations would but cut the "fat" lines of the early MSS., instead of the thin ones he does, we could praise his work too.

In Part II. the only "Minor Poem" given of Chaucer's is his "Flee fro the presse," and that from a eopy having but three verses out of four; and instead of any other of the Minor Poems, so interesting for the poet's life, one of the *Canterbury Tales* is given, while more are promised in a different section of Professor Morley's work. What, then, is the editor's principle of selection?

The Large Game and Natural History of South and South-east Africa. From the Journals of the Hon. W. H. Drummond. (Edinburgh: Edmonston & Douglas.) This illustrated volume will have a special interest for lovers of sport and students of natural history. Mr. Drummond plunges at once into the business of the plain, marsh, and jungle; and never draws breath or settles under tree or canvas until he has introduced his reader, by means of a separate chapter for each animal, to the South African buffalo, rhinoceros, eland, elephant, lion, and leopard. The three last chapters—for there are but nine in all—describe respectively hunting with dogs; riding down, turning, driving, or otherwise following the antelope; and the varieties of large and small game-birds peculiar to the regions visited.

Buffalo-shooting, a process full of excitement and danger, is illustrated by many stories and anecdotes. Nor is a fight between two buffalo-bulls a whit less vivid than the majority of these.

In the pursuit of large game our author, an enthusiastic but observant authority, has much to say in praise of his longed-for booty; and admires, though he does not spare, his victim. Even in the rhinoceros, an animal rather hideous than ungainly to the vulgar eye, he can detect nobility. The great white species, he tells us,

"is certainly a noble animal, when seen, as it often is in undisturbed regions, quietly grazing amid all the beauties of tropical vegetation, lopping up with its tongue the rank grass in huge mouthfuls, and a whole flock of rhinoceros-birds perched, half-asleep, or lazily picking off an occasional tick, on its broad back; while, it may be, a little hornless calf—a ludicrous miniature of its mother—runs between its legs and is gently guided forward by the maternal snout."—P. 86.

There is a very graphic account of the chase of an eland, an old blue bull; and the descriptive powers of the writer are displayed to great advantage in the picture of the animal drawn up to recover breath in the race with his determined destroyer. If committed to canvas as successfully as expressed in type, the performance would not do discredit to the reputation of an Edwin Landseer.

That the South or South-east African elephant differs in head formation from the same animal in Ceylon and India is strongly attested by the writer's experience. The forehead is proved impervious to the bullet. Mr. Drummond states that he has "fired without making the slightest impression point-blank from ten yards' distance, with a gun of six bore, at the exact spot that, in the Asiatic species, would be instantly fatal;" and his knowledge of the subject enables him to add that "the experiment has been as fruitlessly tried dozens of times." The lion, with certain exceptions in the common order of nature, he finds non-aggressive, and rather inclined to shun than provoke conflict with man. The leopard is esteemed generally "treacherous, cowardly, and savage;" and the "ingwe," or species common to South-east Africa, is certainly not of a better class.

As we have already stated, this book is essentially for sportsmen and zoologists. If it bring but a small and quite incidental contribution to geography and ethnology, its map of the countries of Amazulu, Amatonga, and Amaswazi, including portions of Natal and the Transvaal Republic, is at least welcome. It might almost, at a push, have served as a basis for the Delagoa Bay Arbitration. And the brief description of the Bombo chain, or "ridge of the nose" (pp. 33, 34), and tracts between the mountains and the sea, should not be lost upon cartographers. They should be careful, however, how they transcribe such names as Nkwavuma and Mbululzane, which we presume to have been duly transliterated.

United States Commission of Fish and Fisheries. Part II. Report of the Commission for 1872 and 1873. (Washington: Government Printing Office, 1874.) As is evinced by this and a former Report, the United States Government has, during the last three years, been lending its encouragement and assistance to an investigation of considerable importance, the objects of which are briefly announced under the following headings:—A. Inquiry into the Decrease of the Food-fishes. B. The Propagation of Food-fishes in the Waters of the United States. The expediency of making this investigation, and of organising a system of fish-culture on a large scale, sprang naturally out of the abuses to which most of the rivers, lakes, and estuaries in North America had been for a very long period exposed, and under which they produce, particularly fishes of migratory habits—the more esteemed species of the *Salmonidae* and *Clupeidae* to wit—had suffered to an alarming extent. To an Association composed chiefly of German naturalists and physicists the credit is freely given of having urged upon the American Government the importance of making the enquiry in progress. The examples and recommendations of

this Association—which was entrusted by its own Government in 1871 with the powers and authority of a commission, and includes men of tried ability, among others Dr. H. A. Meyer, Dr. K. Möbius, Dr. G. Karsten, and Dr. V. Hansen, each gentleman having charge of some special branch—have been followed and acted upon in a spirit befitting a great and provident nation. In the encouragement of scientific pursuits, and particularly such as point to the *utile* as their goal, Germany and the United States keep pace with, and in some respects are in advance of, all other Powers—Great Britain not excepted. The joint action of the American Government with the German Commission in this investigation, and in the experiments and enterprise founded upon it, is demonstrative of the fact stated. Taking into account the large territorial possessions held by the mother country in North America, with their numerous lakes and rivers and the vast extent of sea-board attached to them, it is a matter of surprise that Great Britain should not have taken the initiative in this enquiry, or at any rate been auxiliary to it. In the hands of enlightened and large-minded statesmen, the condition of those waters, fresh or salt, which are expected to supply a very considerable amount of sustenance to the human race, such causes for investigation as arise from this condition, and the remedies to be applied, should form questions, not simply of national importance, to be dealt with as subjects of petty jealousy, but as questions of sterling philanthropy. The United States, in regarding its fresh-water or coast fisheries with an eye of apprehension, and taking measures accordingly, is doing a duty, not simply to its subjects, but to mankind at large. If it were only for the new page in Natural History which the experiments in pisciculture carried on under his auspices promise to disclose, Brother Jonathan is entitled to the thanks of every community under the sun; nor is the band of German collaborators, which is spoken of in the report as prompting to the current enquiry, less deserving.

The Report before us, Part II., drawn out by Mr. Spencer F. Baird, the United States Commissioner on Fish and Fisheries, is replete with interesting and, to the British public, new matter. It embraces the natural history of fishes peculiar to many of the North American rivers and their respective estuaries. Among these, the shad, alewife and bass take a prominent part—the shad and alewife in particular, belonging both to the herring tribe, but of migratory habits. These fish, it appears, at one time were very abundant in the United States rivers, and as an article of food, whether in the fresh or salted state, held in high estimation. Owing to over fishing, the intervention of dams, the erection of saw-mills, the want of a fence season, and other causes, they have become nearly extirpated; and one of the principal objects of the United States Commission is to devise and carry out means for their restoration. Great efforts, we gather from this report, are being made to introduce the European salmon—the *salar* of the Rhine and the *hucho* of the Danube—into the rivers of the Northern States. The results are yet to be recorded. Mr. Spencer F. Baird does not pretend to be conversant with the habits of the migratory *Salmonidae*; and a statement made by him (p. 64) that the English sea-trout (*Salmo trutta* or *albus*) “is actually acclimated in Tasmania, and propagated naturally in the Derwent river,” would require corroboration from the proper quarter before it could be accepted. The introduction of the *fario*, or common trout, into the Tasmanian and one or two of the New Zealand rivers has, we are aware, been attended with remarkable success; but in attributing the same measure of success to the introduction of the migratory *Salmonidae*, a question is raised which home observation and many experiments carefully conducted have failed to set at rest.

This Report is worthy of perusal by everyone interested in fish-culture.

EDITOR.

NOTES AND NEWS.

PROFESSOR MAX MÜLLER has returned to Oxford and is in great measure restored to health after his illness in Italy. While in Florence he received from the students of the Istituto di Studi Superiori a most gratifying token of recognition in the form of a handsome album designed by Barbetti, and containing photographic portraits of the professors of the Philological faculty. On the cover is a portrait of Galileo with the motto “provando e riprovando,” while the frontispiece is decorated with the arms of the two great Indian travellers of Italy, Marco Polo and Filippo Sassetti. The book contains also a water-colour drawing by Benassai of the Tower of Arcetri, from which Galileo observed the movements of the heavens. The presentation took place in the presence of the Princess Dora d’Istria, the Duke di Sermoneta, and other distinguished persons. Professor Max Müller responded in French, and took occasion to recommend to the young men before all things the study of the original documents of the great literatures. “It is better,” he said, “to read Homer than to read a dozen commentaries upon him.” It is a curious subject of reflection whether if Helmholtz, or Curtius, or Ranke were to come to Oxford, the undergraduates would be moved to welcome them in any way like this, or would know who they were.

THE Earl of Albemarle has placed in the hands of Messrs. Macmillan and Co., for publication, a diary which will throw much new light on the social and political history of the early part of the present century. The volume will be entitled *Fifty Years of My Life*, and will contain an introductory chapter on the past history of the Albemarle family. The book may be expected in the autumn.

MR. W. WATKISS LLOYD has now completed his detailed history of the arts and politics of Greece during the period intervening between the Persian and Peloponnesian Wars, that is, between the histories of Herodotus and Thucydides. The work, which is to be in two volumes, under the general title of *The Age of Pericles*, will be published immediately by Messrs. Macmillan and Co.

MESSRS. E. MOXON, SON, AND CO., have in preparation a new edition of *The Eastern Life*, by Harriet Martineau, with a new preface by the author.

MESSRS. WARD, LOCK, AND CO. will publish shortly a volume of Travels in Portugal, by John Latouche.

WE understand that Messrs. Henry S. King and Co. have in preparation a series of “Introductory Handbooks to Study,” comprising introductions to the study of philosophy, music, art, English, classical, and foreign literature, history ancient and modern, &c., &c. They are intended to be strictly introductions to, and not to stand in the place of, study.

THE Fourth Part of the Palaeographical Society’s Facsimiles of MSS. is now being issued to subscribers. It consists of twelve plates, among which are specimens from the Greek Psalter, written on papyrus in the fourth or fifth century, and now preserved in the British Museum; from the Homer of the Ambrosian Library, Milan, written and ornamented with paintings, perhaps in the fifth century; from the Epistles and Sermons of St. Augustine, of the Bibliothèque Nationale, written on papyrus and vellum in the sixth or seventh century; and from Eadgar’s foundation-deed of Newminster, A.D. 966, and an interesting Visigothic MS. of a commentary on the Apocalypse of the year 1109, in the British Museum.

WE understand that Mr. Evelyn Philip Shirley, the accomplished author of *Deer and Deer Parks*, *The Noble and Gentle Men of England*, and other works, is engaged upon a history of the county Monaghan, Ireland.

MESSRS. LONGMANS announce for publication in the autumn Captain Wyatt’s *History of Prussia and its Military Organisation*, vol. i.; *The Indian Alps*, by a Lady Pioneer; a *Journey of a Thousand Miles through Egypt and Nubia*, by Miss Edwards; and the *Oration of Demosthenes on the Crown*, translated by Sir R. P. Collier.

M. FRANÇOIS LENORMANT’S indefatigable energy is really matter for astonishment. His work on *La Langue Primitive de la Chaldée et les Idiomes Touraniens*, of which we cannot speak too highly, is hardly out of the printer’s hands; and yet it is to be followed in a few weeks by another volume of the “*Etudes Accadiennes*,” containing a glossary of the Accadian language in which the words will be compared with those of the modern Turanian dialects. He has also another work ready for publication on *La Divination et la Science des Présages*, which will form a sequel to *La Magie chez les Chaldéens*, recently reviewed in the ACADEMY. A book on Astrology will close the series.

M. OPFERT is preparing for publication a volume on the grammar of the Protomedic inscriptions and the brick legends of Susa. His valuable papers on the Assyrian Measures, contributed to the *Journal Asiatique*, have just appeared in a single volume.

MR. GEORGE SMITH is writing a *History of Babylon* for the Society for Promoting Christian Knowledge, uniform with the *History of Assyria* already published. The fourth volume of the *Cuneiform Inscriptions of Western Asia*, so anxiously expected by Assyrian scholars, will appear, it may be hoped, before his departure for Kouyunjik in the autumn.

BRET HARTE, we learn from our New York correspondent, has nearly completed his first novel. Over 300 pages of it have been put into type by the well-known subscription house, the American Publishing Company, of Hartford. Meantime the conductors of *Scribner’s Monthly* have succeeded in negotiating with this company for the delay of its publication in book form, in order that it may run as a serial in that magazine during the coming year. The reading public have been on the *qui vive* for Mr. Harte’s first novel, and its capture by Scribner and Co. is a piece of magazine enterprise that will be appreciated.

ONE of the most noticeable features of Lord Selborne’s scheme for the establishment of a General School of Law is the perfect equality on which he proposes to place the two branches of the legal profession. This is well exemplified by the provisions which his bill contains for regulating the composition of the Senate of the proposed legal University. That body is to consist of thirty-eight members, of whom eight are to hold their seats *ex officio*, ten are to be nominated by the Crown, four are to be nominated by the Inns of Court, four others are to be nominated by the Incorporated Law Society, and the remaining twelve are to be the elected representatives of the members of the School of Law. It will thus be seen that the Incorporated Law Society is treated with exactly the same consideration as the Inns of Court; and, when we examine the provisions under which the representative members of the Senate are to be elected, we find that care has been taken to give solicitors as large a share in the management of the school as is conferred upon barristers. All barristers of five years’ standing who are members of Lincoln’s Inn, the Inner Temple, the Middle Temple, or Gray’s Inn, and all solicitors of five years’ standing who are members of the Incorporated Law Society, are to be members of the General School of Law, and, as such, are to be entitled to vote at the election of the twelve representative members of the Senate, six of whom are to be elected by the barristers, and six by the solicitors. The *ex officio* members of the Senate are to be the Lord Chief Justice of England, the Master of the Rolls, the Lord Chief Justice of the Common Pleas, the

Chief Baron of the Exchequer, the Attorney-General, the Solicitor-General, and the President and Vice-President of the Incorporated Law Society. Here, again, we see that the President and Vice-President of the Incorporated Law Society are to balance the two senior members of the Bar. The same principle runs through the other provisions of the bill. Thus, the educational arrangements of the School of Law and the examinations to be held by it are to be so conducted as to afford equal benefit to all "who may desire to avail themselves thereof for the purpose of preparing themselves for admission to the practice of the law in any of its branches in England." The lectures and examinations are to be open to all comers, whether they have any intention of entering the legal profession or not; but none, except such as have taken university degrees in law, are to be admitted to practise as barristers or solicitors, unless they have passed the examination and obtained certificates of proficiency. This last provision will materially affect the position of the Inns of Court, and Lord Selborne has accordingly introduced side by side with this bill another bill for the reform of those ancient bodies. They are to be allowed every opportunity of reforming themselves; but should they neglect to do so within a given time, the Commissioners to be appointed under the bill will undertake the duty in their stead. One provision relating to the examinations to be conducted by the General School of Law renders a professor or lecturer incapable of being an examiner. We should like to see this disqualification extended to the authors of the books which are among the prescribed subjects of examination.

In a notice of *Songs of Two Worlds* (third series) in our last number, Messrs. Smith, Elder and Co. were mentioned as the publishers. The book is published by Messrs. H. S. King and Co. By a slip of the pen, in a note on the meeting of the Woolhope Club at Caerleon-upon-Usk, St. Dubritius was spoken of as "Archbishop of St. Davids," instead of "first bishop of Llandaff." Also at p. 547, for "Vicarius" read "Vacarius."

THE new volume of the *Transactions of the Woolhope Naturalists' Club* contains a great variety of matter. As might be expected, the most important contributions relate to mycology, a branch of natural history to which the club has paid special attention. *Gomphidius maculatus*, *Cortinarius cinnabarinus*, and *Agaricus aureus* (all plants previously unknown in Britain), have been discovered by members within the area of the club's operations; and another fungus, named *Hygrophorus Houghtoni*, after its discoverer, has been added to our flora. The papers contributed to the present volume contain descriptions of the above, and of other rare fungi which have been found in Herefordshire during the last three years. Mr. James Renny describes some species of the genus *Ascobolus* new to England, and details his minute observations made on the *Ascozoni* found on the dung of rabbits and hares, birds and mice. Mr. William Adams, F.G.S., contributes a valuable account of Pontypool, its manufactures and coal field; and Dr. Chapman an admirable monograph on *Geotrupes stercorarius* and one of its parasites. Among the more popular papers we may mention Mr. Buchman's notes on some edible fungi; an archaeological paper by the late President (the Rev. James Davies) on Wapley Camp; the fungi of Gerard's *Herbal*, by Mr. C. W. Plowright; and the Domesday Survey of Herefordshire, by the Rev. Charles J. Robinson, President for 1875. Altogether the volume is entitled to take rank with its predecessors, both as regards the interest and the solid value of its contents.

M. VIOLLET-LE-DUC has destroyed one of the great attractions of Père-la-Chaise. The eminent architect has induced the Municipal Council of Paris to refuse to vote funds for the restoration of the tomb of Abelard and Heloise, and has given such substantial reasons for his conduct that the

most sentimental mourners over the hapless pair are unable to deny their force. He shows, in fact, that the mausoleum itself is a hopeless mixture of twelfth and thirteenth century work, and that the authenticity of its contents is more than questionable. Even the bas-reliefs on the tomb represent, not the funeral procession of Abelard, but that of Louis, son of St. Louis, who is carried to the grave by the King of England and certain French barons, while the busts of the celebrated Doctor and the Abbess of the Paraclete were simply ordered by Alexandre Lenoir—who, so to speak, compiled the monument—from the sculptor Deceine, "in the absence," as he complained, "of any sure types of the personages to be represented." This want was, indeed, but little felt by Lenoir, who did some remarkable things in the way of transmutation of sculpture, his most successful feat being the restoration of the statue of Mathilde on the tomb of Dagobert, the head of which having been lost, Lenoir boldly adapted a man's head found among the broken statuary to the trunk. Many casts have been made of the restored work, which naturally go far to justify such superficial criticism as that "Gothic art is admirable in detail, but wanting in ensemble."

A NEW edition of M. Henry Havard's *Voyage aux Villes Mortes du Zuyderzee* is just published by Messrs. Plon. The region described, though within easy distance of the principal European capitals, is now almost entirely unknown. "There are not perhaps," says M. Havard, and his statement has never been challenged by the Dutch press, "ten persons in Holland who have made the whole journey, and among foreign artists, writers, and tourists, there is not a single one." Meantime the sea-sand is fast covering the district once the cradle of the maritime power of the Netherlands, and the remains of the old towns of the Zuyderzee will soon have disappeared beneath the tangled weeds. It is, therefore, much to be wished that, although M. Havard has given an exhaustive and sympathetic account of all he saw, some English writer should do for this illustrious swamp what Mr. Basil Champneys has done for that quiet corner of our coast where a few famous old towns rich in association with the palmy days of England's naval glory are sleeping through their venerable old age far from the beaten track of tourists and holiday-makers.

THE Abbé Moigno's translation of Professor Tyndall's *Lectures on Light* is evidently a labour of love. The lectures are described by the translator, who also expresses the highest admiration for the clearness and transparency of the Professor's ideas and phrases, as a method of teaching at once analytical and synthetical "really new and admirable in itself." The work, published by M. Gauthier Villars, is very sumptuously got up.

TO-DAY, writes the *Perseveranza* of the 23rd ult., the studio of Manzoni was thrown open to the critics of Milan, who made quite a public pilgrimage to visit the house of the illustrious author of the *Promessi Sposi*. The students of the Liceo Parini brought two crowns, one of flowers with silver leaves, the other of laurel tied with black ribbon, both bearing appropriate inscriptions. These they deposited at the foot of his portrait.

THE special Commission of the French Academy has awarded the Thérouanne prize to M. Fustel de Coulanges, and has proposed that a prize should likewise be given to M. Charles Yriarte for his book entitled *La Vie d'un Patricien de Venise au seizième siècle*.

M. DE LORGERIL has at length permitted his muse to woo him from the sterner pursuits of political life, and has produced a new poem in *ottava rima*, occupying eighteen columns of the *feuilleton* of the *Univers*. This journal, long deprived of his assistance, is doubtless fully compensated by the present effusion, in which M. de Lorgeril has given the rein to his fancy, and, indeed, extended the same licence to his versifica-

tion, taking, as a French critic observes, thirteen feet if twelve are not enough for him. The poem is founded on the legend of the Caliph Mohammed-al-Maddhy, who being advised for a cure of intolerable sadness to put on the shirt of a happy man, travelled all over the world in search of this scarce being, and at last found him only to discover that he had no shirt. *La Recherche du Bonheur* as M. de Lorgeril's poem is entitled, abounds in political allusions, being especially severe on a country

"Où tout est disposé pour contenter le cœur;
Le peuple n'a de lois que ce qu'il veut en faire;
Là l'égalité règne avec la liberté;
Toutes deux pour lien ont la fraternité."

The sneer would, perhaps, be more cutting if the verses were better polished.

IT is announced from Bonn that Dr. Schönfeld, Director of the Observatory at Mannheim, has accepted the chair of Astronomy in the university, and the directorship of the Observatory at Bonn, as the successor of his former teacher, the late distinguished Professor Argelander. At Vienna, a vacancy in the chair of Astronomy has also been caused by the appointment of Dr. Theodor von Oppolzer to the post of director of the Observatory at Gotha, which had been rendered illustrious by the high reputation of its last holder, the eminent astronomer Professor Hansen.

DR. RICHARD PIETSCHMANN has published at Leipzig a monograph on Hermes Trismegistus from Egyptian, Greek and Oriental sources.

PROFESSOR RODRIGO AMADOR DE LOS RIOS contributes to the *Revista de la Universidad de Madrid* a study of the Arabic inscription on the Puerta de las Palmas in the Cathedral of Cordova. A careful examination of the black marble itself has enabled Señor Los Rios to correct some mistakes into which both Condé and Gayangos were led by inaccurate transcripts. The paper itself forms part of a forthcoming work on the Arabic inscriptions of Cordova, a companion to the volume on those of Seville, issued during the present year by the same industrious scholar.

A REMARKABLE sale took place at Messrs. Sotheby, Wilkinson, and Hodge's on the 10th ult. and following days, of the collection formed by Mr. Lewis Pocock, illustrative of the Life and Times of Dr. Samuel Johnson. It comprised above forty letters of the great lexicographer, beside some interesting autographs of his contemporaries. Johnson's letters averaged in price from 5*l.* to 7*l.*, with the exception of some of special interest. His memorable letter to Mr. James Macpherson, beginning, "Mr. James Macpherson, I received your foolish and impudent note. Whatever insult is offered me I will do my best to repel, and what I cannot do for myself the law shall do for me. I will not desist from detecting what I think a cheat from any fear of the menaces of a ruffian." This letter, perhaps the most bitter he ever penned, sold for 30*l.* The original manuscript plan of his Dictionary, with corrections by his own hand, 57*l.* A short scheme for compiling a new Dictionary of the English language, bears the draft of the above, entirely in the autograph of Dr. Johnson, 57*l.* A beautiful and pious prayer written in the year he died, 8 guineas. Consideration on Corn, an essay in his own hand, 22*l.* The Bible he habitually used, 13*l.* The celebrated letter to Lord Chesterfield (printed) 13 guineas. The note-book in which Boswell daily chronicled Dr. Johnson's sayings and doings, 47*l.* A MS. account of the Shaksperian Forgery, in the handwriting of Dr. Ireland, 70*l.* Mr. Thrale's Library at Streatham with portraits, 15 guineas; and the Boswell Family Picture, 10 guineas. Among the autographs, those of the actress Kitty Clive were most sought after. A letter of hers to David Garrick sold for 30 guineas, another for 13 guineas, and her portrait engraved by Mosley, 10*l.* The sale realised 1,558*l.* 5*s.*

THE library of Mr. Ernst Benzon was sold on the 24th ult. at Messrs. Sotheby, Wilkinson and Hodge's, comprising fine specimens of early printing and manuscript:—A fine copy of the *Story of the most Noble and Worthy King Arthur and of his Knights of the Round Table*, black letter, 1557, 94l.; *Biblia sacra Latina*, on vellum, Ven.: Jenson, 1476, 370l.; *Biblia Germanica*, first edition, without date, place, or printer's name, 75l.; *Biblia sacra Germanica*, without date, 1473-5, 52l.; the Coverdale Bible, a very fine copy, 360l. (was sold in 1873 for 400l.); the "Vinegar" Bible, 6 guineas. Among the other works were the second edition of Shakspeare, London, 1632, 62l.; the third, London, 1664, 69l.; Shakspeare's Works, edited by Halliwell, 71l., and his Poems, 1640, 65l.; Dugdale's *Monasticon*, 100l.; Dickens's Works, first edition, 65l.; Ritson's publications, 72l.; *Psalterium Latinum*, MS. of the fourteenth century, 79l.

On the 20th ult., Messrs. Sotheby sold the collection of autographs belonging to Dr. A. Callaghan:—Lucræcia Borgia, letter to Pope Alexander VI. relative to a quarrel with the nuns of Viterbo (she signs herself, her "obediente figura e servitrice"), 11l. Oliver Cromwell (hopes "that these poor wasted countries may be freed from the burden of the army"), 10l. 15s. Queen Elizabeth, fine letter of three pages to Henry IV. of France, thanking him for his portrait, and ending with profession of diligence in his service, 51l. Galileo, a scientific letter to his pupil Benedetto Castelli, giving a calculation of the orbits of Jupiter's satellites (Stella Mediceæ), and referring to the tortures to which he has been subjected by the Inquisition, 21l. 15s. Marie Antoinette, 7l. 15s. Mary, Queen of Scots, letter to M. de la Mothe begging him to speak to the King of France, and trying to induce him to send some help to her poor kingdom, 48l. Napoleon I., note of five lines, 34l. Lord Nelson to Lady Hamilton, dated September 28, 1806; probably the last he ever wrote, 21l. Nicholas Poussin, 10l. Rubens, 12l. Original manuscript of Gray's *Elegy in a Country Churchyard*, with the many alterations, corrections and erasures and variations from the poem as now printed (from the Penn collection sold 1854). The names of Caesar and Tully are erased, and Cromwell and Milton substituted. This interesting MS. was purchased by Sir William Fraser for 230l. The sale finished with the manuscript of Charles Dickens' *Christmas Carol*, 56l. Amount of the sale, 977l. 9s.

NOTES OF TRAVEL.

UNDER the title of The Belgian Society of Dredging and Marine Exploration, a society has been formed for the systematic exploration of the North Sea. The annual subscription is to be 15 francs. The materials as collected are to be submitted to various scientific men who have made the different departments their special study, and are afterwards to go to form a central collection accessible to all the members. Duplicate specimens not required for this purpose are to be sold each year at one of the meetings of the society. The circular which has been issued suggests that, by means of such a society, Belgium may be able to contribute its share to the advancement of that branch of science for which so much has been done by our own countrymen. We need not say that we wish it every success.

THE American Association for the Exploration of Palestine are sending out their second expedition. It will be commanded by Colonel James C. Lane, who will be accompanied by the Rev. Selah Merrill as archaeologist, and by Mr. Rudolph Meyer as assistant surveyor. It is reckoned that two years will complete the 4,000 square miles of Eastern Palestine. The work will be on the same scale as that of the English party. The Society have set aside a sum of 30,000 dollars, guaranteed or paid up, for survey purposes.

LIEUT. CONDER has cleared up a point of some interest with regard to Ascalon. Benjamin of Tudela mentions that the present site is that of the new town "built by Ezra the priest," the old town being at four parasangs' distance from the shore. Professor Pusey also called attention some time ago to the fact that in the year 536 there was a Bishop of Ascalon and a Bishop of Maiumas Ascalon—that is, "Ascalon by the Sea." There were thus two mediaeval places known as Ascalon. Lieut. Conder has found, in the hills north of Beit Jibrin, a ruin called Khirbet Ascalon at such a distance from the shore as seems to correspond with the four parasangs. These are the remains of a Christian church or convent, probably of the fifth or sixth century. No earlier ruins are mentioned. The discovery clears up the uncertainty caused by the two Christian Ascalons, and seems to leave the biblical Ashkelon where tradition has always placed it, on the sea-shore.

THE *Messenger du Midi* announces that the French African expedition, which is to take up the thread of Livingstone's labours, will sail from Toulon on September 1. It will be under the command of M. Safforzan de Brazza, and will be accompanied by two natives of the Gaboon.

DR. OSCAR FRAAS, Director of the Natural History Museum at Stuttgart, and Professor of Geology in the University, is at present at Beyrout, where, in conformity with the express desire of Rustem Pasha, he will shortly enter upon a careful scientific exploration of the Lebanon, more especially in regard to the geognostic features of the district. At the Pasha's desire he will also superintend the construction of a geological map of the mountain.

THE month of May was marked by the occurrence of considerable volcanic disturbance in different parts of southern Europe and western Asia, and from Smyrna we learn that the little town of Tschikli, near Uschak, and the neighbouring village of Tara have been wholly destroyed by an earthquake. The greater number of the inhabitants succeeded in escaping to the open fields beyond, but upwards of 200 individuals, chiefly young children and old or infirm persons, were buried in the ruins of their houses.

AT a recent meeting of the Lower Rhine Natural History and Physical Society, Professor Rath drew attention to the fall of sand and ashes which had been observed during the last week of March along the coasts of Norway as far north as Helgeland and Norland, and across Sweden to the immediate neighbourhood of Stockholm. Their volcanic origin had at once been determined by Professor Kjerulf, who hazarded the opinion that they had been carried by the wind from Iceland, a conjecture which derived support from the fact that manifestations of volcanic disturbance had occurred on the island at the time of the Scandinavian fall. The ashes, which were slimy or glutinous to the touch, fell in some parts of Bergenhuus in such quantities as to conceal in one night the snow-covered surfaces of hills and valleys under a thick grayish-brown deposit. When examined under the microscope many of the particles were found to be prismatic, nacreous and somewhat compressed; and intermingled in the general mass were vitreous filaments, which appeared to consist of tubular pores enclosed in cylindrically striated walls. Beside these vitreous bodies, particles of augite, sanidine and olivine were also present. And thus in many essential characteristics the Scandinavian ashes resemble the so-called "Hair of the Goddess Pele," a filamentous mass which is sometimes carried by the wind across the entire breadth of the large island of Hawaii, and is thrown up both from the Hawaiian Lava Lake, Mauna Loa, and the crater of Moku-Weo-Weo. This is not the first time that Icelandic ash showers have reached Norway, for in the eruption of the volcano of Katugja, in Southern Iceland, which occurred in 1625, showers of ashes fell at

Bergen, while in the eruption of Hekla in 1693, a considerable part of the Faroe Islands and certain districts of Norway were covered with volcanic sand and ashes.

THE *Allgemeine Zeitung* draws attention to the value of a Russian treatise on Russian Policy in Central Asia, by Dr. Grigorjew, Professor of Oriental History at the University of St. Petersburg, which has been transferred in a German form to the pages of the Russian *Revue* (1875). Professor Grigorjew was for many years at the head of the Government of the Kirghis Kasais of the Transaural Steppes, and his practical acquaintance with the people, coupled with his knowledge of the history of the East, and the political relations of Russia with the nations of Central Asia, makes his work a valuable contribution to the literature of a subject which, constantly as it is discussed, has not been often treated by any one so well qualified to elucidate it.

THE *Kölnische Zeitung* reports that Dr. Nachtigall, the distinguished African traveller, has been entertained at a grand banquet given in his honour at Rome by the Roman Geographical Society, at which several of the notabilities of the city were present. In replying to the complimentary address of the Vice-President of the Society, Senator Amati, Dr. Nachtigall pointed out the great advantages to trade, and the important results to science which may be expected from the labours of the expedition to Central Africa that has been planned by the Society, and will shortly be sent out at the expense of the Italian Government. Dr. Nachtigall has recently returned from a journey through Fezzan, Bornu, Wadai, and Darfur, and in the course of his address he gave the Society much interesting and new information in regard to these districts, which, it is understood, will soon be made public.

FROM the same journal we learn that the Emperor of the Brazils has presented Professor Virchow with a highly interesting collection of skeletons and skulls, together with many curious remains of the industrial arts of the Brazilian Indians found in ancient graves, caverns, mounds, and barrows.

AN UNPUBLISHED SPEECH OF LORD WENTWORTH.

WE print from a copy taken by Mr. S. R. Gardiner from the MS. in the Bodleian Library, a notable speech of Lord Wentworth which appears to have been wholly unnoticed, though it is mentioned in the Catalogue of the Tanner MSS. (lxxii, fol. 300). The MS. is not strictly contemporary, but was probably written about the time of the Restoration. The genuineness of the speech, however, is indisputable, and its recovery will be welcome to those who are aware how little is known of Wentworth's thoughts during the years intervening between his ceasing to be a member of the House of Commons and his acceptance of the office of Lord Deputy of Ireland. The speech will explain itself, though here and there a word or a phrase seems to have slipped out, and it is, therefore, enough to mention that it was probably delivered on December 30, 1628, and to draw attention to the curious echoes of the first speech of the previous session, expressions relating to his imprisonment for the forced loan, which show that he was not ashamed of his past actions, and to the paragraph about the Bishops, which enables us to form a pretty good guess at the impression which would be left on his mind by the action of the next session in ecclesiastical matters. On the whole, to an attentive reader, this speech will serve as a link between the speeches in the House of Commons in 1628, and his letters as Lord Deputy of Ireland. No one questions that Wentworth shifted his ground during these years. The only point at issue is, whether he did so gradually under the influence of external events; or, whether he did so

suddenly under the influence of ambition and self-will.

Dec. 1828. Thomas Lord Viscount Wentworth's speech when he first sat Lord President of the North.

"My Lords and Gentlemen,—Much reading or affected elegance in speech are seldom heard without some mixture of ostentation or levity; the modest sense, therefore, of my own weakness, the gravity of the persons, the dignity of the place, move us to become conformable to the rule of the architect, *Minerva propter virtutem sine deliciis aedificia constitui decet*. Indeed, natural, substantial plainness many times persuades, prevails most with sad judgments; nay, it seems, at least in the opinion of these times, even best becoming the Goddess of wisdom and eloquence herself. Without any shadow or light of art then, I must sett forth myself before you this day for the most obliged man in the world; an evident, a manifest truth; my testimonies are your own great trusts. We frequently communicated in diverse Parliaments; your cheerful affections enlarged not present alone, but in my confinement—in a degree exile—when I was as infection to others, you vouchsafed then again to take me into your bosoms. What confidence greater? Or what affection warmer? But cast the free bounties of my gracious master into the other scale; there weigh me, within the space of one year a bird, a wandering bird cast out of the nest, a prisoner, planted here again in my own soil amongst the companions of my youth; my house honoured, myself entrusted with the rich dispensation of a soveran goodness, nay, assured of all these before I ask'd, before I thought of any. Can you show me so sudden, so strange variety in a private fortune? Tell me was there ever such over-measure? The like credit given to so weak a debtor? Baulked indeed before I begin, owing more both to King and people than I shall ever be able to repay to either. Yet to the joint individual wellbeing of Sovereignty and of subjection do I here vow all my cares and diligences through the whole course of this my ministry. I confess I am not ignorant how some distemper'd minds have of late very farr endeavoured to divide the considerations of the two; as if their ends were distinct, not the same, nay in opposition; a monstrous, a prodigious birth of a licentious conception; for so we should become all head or all members. But, God be praised, human wisdom, common experience, Christian religion teach us far otherwise.

"Princes are to be indulgent, nursing fathers to their people; their modest liberties, their sober rights ought to be precious in their eyes, the branches of their government be for shadow for habitation, the comfort of life, repose, safe and still under the protection of their scepters. Subjects on the other side ought with solicitous eyes of jealousy to watch over the prerogatives of a Crown; the authority of a King is the key-stone which closeth up the arch of order and government, which contains each part in due relation to the whole, and which once shaken, infirm'd, all the frame falls together into a confused heap of foundation and battlement of strength and beauty. Furthermore subjects must lay down their lives for the defence of Kings freely, till those offer out of their store freely like our best grounds, *Qui majore ubertate gratiam quietis referre solent*.

"Verily these are those mutual intelligences of love and protection descending, and loyalty ascending, which should pass, be the entertainments between a King and his people. Their faithfull servants must look equally on both, weave, twist these two together in all their counsells, study, labour to preserve each without diminishing or enlarging either, and by running in the worn, wonted channells, treading the ancient bounds, cut off early all disputes from betwixt them. For whatever he be which ravells forth into questions the right of a King and of a people, shall never be able to wrap them up again into the comeliness and order he found them.

"So I trust you see that by this great access of honour and place, I am not only a stone—so to use a word of art—set upon my own bed for continuance, for lasting, but *acquisitive positus* too, gainfully, commodiously seated for the service both of King and people. And I take God to witness my chiefest comfort herein is to consider that the occasions whereby to express my duties to God, my faith to my master, my love to you will be more frequently put into my hands in this than in a privater condition, which I

beseech God I may do as I ought, as I infinitely desire to travail under and out of these great obligations with virtue, truth and thankfulness.

"Give me leave, therefore, as one who comming forth of the sweets, the ease of a private life, already feel the weight that presseth upon me, to charge, to adjure you each one, by those tender respects which have hitherto, and shall still move me rather to serve you uprightly than myself profitably, by those dear affections which you have ever born me, by the care you ought to have of him that will very gladly spend and be spent for you; by the private interest of your selves and posterity, not to leave me, shrink from me now when I have most need of you; but by your counsell, by your paines, to be still assisting, aiding towards the performance of this so excellent, so necessary a duty; surely it is the strongest engagement any mortal man can put upon me; this is my greatest ambition, above any earthly thing to serve his Ma^{ty}, and you acceptably and fruitfully. I challenge your best help then, I require it of you; you will not as friends, you may not as Christians, you cannot as lovers of your countrie deny it me.

"So as in full affiance thereof, I will leave my self, and observe some rules which concerne the place; a distinction by which I shall futrely govern my self; for in relation to my own person, never President expected so little; in relation to this place, never any more jealous of the honour of his master, never any that look'd for more.

"Unity inwards amongst ourselves; uniform justice outwards to such as come before us, are I trust the *Boni Gentis*, the acquir'd habits of this Council. I shall by the way then only do them reverence, entirely submit myself to their skill, their equal regiment, and so to pass on to the bleeding evil, which unless it be stanch'd, closed by a ready, a skilfull hand, will quickly let out the very vitals of this Court, I mean prohibitions; the necessity whereof cries not alone to us that are judges to attend the cure, but as you have heard, his Ma^{ty} himself requires it of us.

"Well, the disease is recoverable; the remedies I propound are two; the first to assume nothing to ourselves but what is our own, being ever mindfull that the voice which speaks here is *vox ad licitum*; we can go no farther than our instructions lead us, move only within their circle; once take wandering planets out of that sphere, presently the interposition of other courts shadow, eclipse the influence, the beams of this. Assure yourselves, the way to loose what we have is to embrace more than belongs to us. You that are of the fee must guide us herein, you are answerable for it, it is expected from your learning and experience, and therefore I am confident you will carefully intend it.

"Secondly, we must apply a square courage to our proceedings, not fall away as water spilt upon the ground, from that which is once justly, warrantably done; nor yet give off upon prohibitions till the suitor hath the fruit of his plaint, for the Commonwealth hath no more interest herein than that justice be done, whether with us or elsewhere it skills not; the inherent rights of a subject are no waies touched upon here; these are only disputes betwixt courts, actuated many times out of heat, nay out of wantonness. And thus the seats of justice, which should nourish, establish a perfect harmony betwixt the head, the members, and amongst themselves, degenerate, become instruments of strife, of separation, whilst these furies, like that enraged Turnus in the Poet, catch what comes first to hand, tear up the very bounderstones set by the sobriety of former times, and hurl them at their fellows in government: and therefore I will declare this point clearly, that albeit none before me revered the law and the Professors of it more, having the honour to be descended from a Chief Justice myself, yet if we here take ourselves to be within, they there conceive us to be out of our instructions, I shall no more acknowledge them to be our judges, than they us to be theirs, but with all due respect to their persons, must in these questions of jurisdiction appeal to his Ma^{ty}, the soverain judge of us all. Neither do I this barely in relation to my master's command, but to retain in ourselves a capacity, 1st, to serve you, for if we yield up our arms, how shall we exercise our virtue amongst you? 2^d, in consideration of the good and benefit of these parts, for surely however some may desire a dissolution of this court, yet I persuade myself so soon as the number, the heat of small suites carried far remote at great charges were multiplied amongst them, they would confess their ancestours to have been

much wiser who petitioned, gave a subsidy for erecting the Provincial Court, than themselves who are now so much for the taking them away. May the tent of this court then be enlarged, the curtains drawn out, the stakes strengthened, yet no farther than shall be for a covering to the common tranquillity, a shelter to the poor and innocent from the proud and insolent.

"To this end must I not only profess my entire filial obedience to the Church, but also covet a sound, a close conjunction with the grave, the Reverend clergy, that they to us, we to them, may as twins administer help to each other; that ecclesiastical and civil constitutions, the two sides of every state, may not stand alone by themselves upon their own single walls, subject to cleave, fall in sunder, but joint strongly bound together in the angle—where his Ma^{ty} under God is the Mistress of the Corner—the whole frame may rise up *unitate ordinata*, both in the spirituals and in the temporals.

"To this end and no other must I encourage you, the Deputy Lieutenants, to proceed roundly to see the arms of the County fully furnish'd, I say encourage, in regard some quicker sighted than those that liv'd before them conceive the law to be scant in that point: *Reverentius est credere quam scire* is an old rule I could wish were more practis'd nowadays as well in matters of State as Religion; for admitt the law were defective, yet then it will be confessed a necessary service for the State, for the defence of ourselves, wives, and children, so as we might manifest more discretion to wink at it than thus narrowly to pry into it. But the truth of the case is far otherwise, his Ma^{ty} hath power coercive. Let no prevaricating spirit flatter itself, it must be obedient; for after I saw the statute of 5 H. 4—not printed, I confess—therein, even upon the Petition of the Commons themselves in Parliament, authority given the King to appoint Commissioners of array for taking view of arms, charging all degrees of men, raising moneys for maintaining them at their discretions; nay yet more to imprison the refusers, to destrain upon their lands for the sums so imposed upon them; I had not then only the moderation of our ancestours in singular recommendations, who never question'd, repin'd at these necessary provisions for the honour the safety of the kingdom; but plainly said they were the wise, intelligent men, and we of these later times the ignorant, the misconceiving.

"Again to the same, and no other end must I awaken you that be the Justices of the Peace to become vigilant in the execution of your charges, who—being still upon the place—should seasonably wipe from the face of this government the very complexions towards disorder and idleness; I say awaken you, in regard you have alwaies ow'd an account unto this Council of your proceedings, we must call upon you for it, we shall strictly require it at your hands, albeit I am well assured the sense of your own honours and conscience will be quicker persuaders to you herein than any thing which can move from hence.

"Next must I come to the practisers before us: amongst them, Mr Attorney, you are the eye of the Court, to look abroad upon the pressure of the grievances of the subject, to bring delinquents to justice, that so the oppressed may go free. There is a band of Escheators, Feodaries, Undersheriffs, Clerks of the Market, Attorneys, Registers, Bailiffs, and such like, which snatch on the right hand, and are hungry, eat on the left and are not satisfied. It is befitting the integrity, the watches expected from you to be a means their fees be reduced to moderation and certainty; severity must effect it; these nettles gently touch'd, sting, bite; taken up with a closer hand loose their heat, their venom; this fartherance you have towards the work that we will thoroughly join with you in the undoing this heavy burthen; therefore if you slip, grow remiss in your duty you are the more to be blamed. So much to you alone.

"In the second place, I must admonish you with the rest, that your pleading be here heard with just regard to the dignity of this Court. The rules I will give you for the present are not many; they are these. First, that you do that for one another which we will do for you all, hear out patiently one side without interuption, so may you with better order, more advantage, defend your clients' cause; secondly, touch not upon the by, the person, the adverse party, but keep close to the matter; else you will appear more to study the passion of your client, than the respect you owe us, the civility you owe to yourselves. He that pleads more with foul language than reason must

cionem patitur saith the Law. So say I too. Thirdly, in the progress of suits to a hearing, move nothing against the constant, ordinary rules of the Court; I shall take it for a great presumption in any man that offers it. 4th. After publication, the proof before your eyes, inform truth, else your reward must be such as will little please you; neither shall it serve for a cloak either of your malice, or negligence to say, 'it is in my brief;' where it is your part in this case to take information forth of the books themselves. Look to it then, I say, and remember what Papinian recites: *Advocatum ordine motum ex falsâ recitatione*. These rules observ'd you will become worthy of your calling indeed, which certainly is one of the noblest; for what greater comfort greater honour than for a man by those abilities God hath lent him above others to vindicate silly naked truth from the vizard, the blemish, craft and power might put upon her.

"Finally, I do here offer myself an instrument for good in every man's hand, he that thus useth me most hath the most of my heart, even to the meanest man within the whole jurisdiction; and then excite all to lay aside to forget private respects, to join hands and hearts, that we may go on cheerfully as one man in the service of the publick, for where the thoughts of particulars are sever'd then the common business is in danger to be jointly lost. These are those waies which travail'd with integrity diligence and perseverance shall undoubtedly lead in a direct line to the honour of his Ma^{ty}, bring wealth and peace to his people; put upon this Court the garment of praise for the spirit of heaviness; and shew those wanton gallants that alwaies fly upon the superior powers that are next them, the necessity, the comfort of being govern'd by and under it. Thus may we walk and not faint; thus may we run and not be weary.

"Methinks I hear now the envious viper *mordens in silentio* whisper there is a great space betwixt promise and performance; it may be, I confess, the objection of wisdom too; therefore I end all with a suit I have to make; which is that in my particular you will proceed prudently, severely, give no credit to your ears, farther than charity wills, which is to hope the best, but call to witness your eyes too; for I had much rather you should take me from the original life of that faithfulness, that diligence, wherewith I shall express myself in your service, than from these weak draughts, these imperfect copies of my words."

CORRESPONDENCE.

WHO WAS THE JUDGE WHO COMMITTED PRINCE HENRY?

Athenaeum Club: May 25, 1875.

In your review of Mr. Gairdner's *Houses of Lancaster and York* (in your number of May 8, 1875, p. 470) you notice the author's unwillingness to give up the traditional view of history, and, among other instances, you observe that "the stories about Henry V.'s youth can have very little foundation; for that about Judge Gascoigne Lord Campbell can only quote the constant tradition of Westminster Hall!" Mr. Gairdner gives the story without naming the judge, in which he is right, for the earliest published account gives no name; but in his reply to your review (ACADEMY, May 22, 1875, p. 532) he also incorrectly names Sir W. Gascoigne as the judge in question. He defends the introduction of the story on the ground that he saw no substantial ground for disbelieving it.

The ground for disbelieving it is, of course, that it was first told at least 140 years after it is supposed to have taken place. But the ground for giving Sir W. Gascoigne the credit of it is still weaker; and I trust you will allow me space to state the true ground on which the story rests, and to show that if the tale is really true, my ancestor, Sir John Markham, was more probably the hero of it than Sir W. Gascoigne.

The incident was first related by Sir Thomas Elyot, in a book entitled *The Governor*, designed to instruct great men in good morals and to reprove their vices, and dedicated to Henry VIII. *The Governor* was published in 1544, and in it the version of the story is that a servant of the Prince of Wales was arraigned before the Chief Justice of the King's Bench, that the Prince interfered and threatened the judge, who committed him to the King's Bench prison. The next author who told the story was Hall, in his *Chronicle*, which was published in 1548. He says that the Prince struck the judge with his fist in the face. Baker, in his *Chronicle*, says that the Prince was committed to the Fleet, and consequently the outrage must have been on a judge of the Common Pleas, not of the King's Bench. None of these retailers of the story give any authority. None name the judge. All other writers copy either from Elyot or Hall; and the name of Gascoigne got mixed up with the story because Elyot and Hall mention the King's Bench, of which Gascoigne was Chief Justice from 1400 to 1413.

The subject has been fully discussed by Mr. Tyler, who doubts the truth of the story, and by Lord Campbell.

The most reasonable conclusion is that there was a tradition among lawyers in the time of Henry VIII. that Prince Henry was committed by a judge for contempt of court. The details were filled up by those who told the story, Elyot saying that it took place in the Court of King's Bench, Baker in that of Common Pleas, Hall that the Prince struck the judge, Shakspeare that, at his coronation, Henry V. magnanimously forgave him. The latter incident cannot be true of either Gascoigne or Markham. Gascoigne was dismissed from his office by Henry V. on March 29, 1413, eight days after his accession, and before his coronation. Markham died in 1409.

Now there is no collateral evidence whatever in

favour of Gascoigne and the King's Bench, to support that version of the tradition among the lawyers. But there is collateral evidence to support the version of Baker, that the hero of the story was a judge of the Common Pleas.

Sir John Markham, a puisne judge of Common Pleas from 1396 to 1409, had two sons who founded two families of Cotham and Sedgebrook, and in both families there were traditions, in the reign of Queen Elizabeth, that Sir John Markham committed Prince Henry to the Fleet for contempt of court. Francis Markham, of the Cotham family, in a book written in 1601 and never published, the original manuscript of which is in my possession, tells the story with Sir John Markham as the hero. Sir Robert Markham of Sedgebrook, a very distant cousin of Francis, says, in his diary, now in the British Museum (*Additional MSS.* 20,721), that his father always persisted in it, as a tradition in his family, that it was Judge Markham whom the Prince struck, for which he was committed. Now, these two traditions must at least have been derived, by the recorders of them, from their fathers who were contemporaries of Henry VIII., and are consequently quite as old as the traditions recorded by Elyot and Hall.

Thus, the evidence in favour of Gascoigne rests solely upon a version of a legal tradition as told by Elyot and Hall. The evidence in favour of Markham rests on the version of the same legal tradition as told by Baker, corroborated by two distinct family traditions handed down in two separate families descended respectively from an elder and a younger son of Judge Markham.

I claim, therefore, that if a story first told 140 years after the event is to be received at all, the evidence in favour of Sir John Markham being the hero of it is stronger than the evidence in favour of Sir William Gascoigne.

CLEMENTS R. MARKHAM.

THE AFFINITIES OF THE GIPSIES WITH THE JATS.

Paris: May 28, 1875.

THE ACADEMY of March 27 last published an interesting letter which only came to my knowledge a few days ago. In this letter Mr. Richard Burton, F.R.G.S., claims the priority in identifying the Gipsies or Tsigans with the Jat of the banks of the Indus, whose name, he adds, is pronounced Dyat. The question has lately been treated at length (25 pages in 8vo, almost entirely consecrated to this subject) by Professor J. de Goeje, of Leyden, who attributes the first idea of this identification to Mr. Pott in 1853, as is stated in the ACADEMY of February 27, in a short article mentioning this Dutch *Contribution to the History of the Gipsies*.

Mr. Burton, who has wandered far and wide in the valley of the Indus, and has much frequented the Jats, published in 1849 a grammar of the Jataka dialect (41 pages), which contains an interesting classification of this race, reproduced in his letter, and, in 1851, a volume upon Sindh—*Sindh and the Races that Inhabit the Valley of the Indus*—in which he starts the theory of a probable relationship between the Jats and the Gipsies, as proved in the extracts which he commences by giving of this work.

Allow me to claim a still earlier priority (dating from 1849), and to begin by establishing exactly the share belonging to each.

Professor Pott, in his great work, *Die Zigeuner*, vol. i. (1844), p. 62, had spoken of the tradition mentioned by Ferdoussey, by the *Tarikh-Guzdyeh*, and "by another . . ." that is to say, by the *Modjmel-al-Tevarykh*, according to which Bahram-Gur, King of Persia, had caused ten or twelve thousand musicians, designated in two at least of these three texts under the name of *Luri*, to come from India. One or two other names, of which it is not necessary to speak, are added to this one (see pp. 41-42 of my memoir, published in 1849, and mentioned by and by).

Five years later, Professor Pott, coming back to the subject in his article "Ueber die Zigeuner" published, as a second supplement to his great work, in the *Zeitschrift der Deut. Morgenl. Gesellschaft*, vol. iii. 1849, said (p. 326):—

"Concerning the tradition of which I spoke, vol. i. p. 62, of the transmigration of Indian musicians into Persia, ordered by Bahram-Gur, and set forth in the *Shahnameh*, a tradition which is applied perhaps rightly to the Zigeuner, I owe to Fleischer a very interesting notice, and wholly unknown to me hitherto, drawn from *Hamza Isphani*, Gottwaldt edition, 1834 [p. 40 of the translation of Gottwaldt], according to which Bahram-Gur, for the pleasure of his subjects, caused twelve thousand musicians, those designated by the name of *Zuth*, to come from India. They are called *Luri* in the *Shahnameh*, which is a proof that Hamza did not simply copy this fact. But Fleischer adds what follows relative to the name of *Zuth*, which I have not yet met with anywhere, and which was a complete enigma to me: 'The *Kamûs* says that the *Zoth* are a race of men of Indian origin, and that the true pronunciation of this word is *Djatt*, but that the Arabs pronounce it *Zoth*.' [See notes 3 and 4 at p. 43 of my memoir of 1849, concerning the rather free translation of this passage of the *Kamûs*.] In the French and Arabic Dictionary, by Ellious Boethor, we find: '*Bohémiens*, Arabe vagabond, Tchighiané, qui dit la bonne aventure, vole, etc., is called *Zotti* at Damascus, plural *Zotte*.'"

Nothing more. It is clear that, in the identification of the Djat of India with the Tsigans, Prof. Pott's share is very small up to the present. The great Indianist of Halle is rich enough in his own learning to be content with what belongs to him, and the respect I entertain for him and his kind feeling towards me are a sure guarantee that he will not be offended at my setting forth my claim.

I think I may say that it is I (thanks, it is true, to M. Reinaud) who first treated the question. I had published, in 1844, in the *Bibliothèque de l'Ecole des Chartes*, a rather long memoir upon the *Apparition des Bohémiens en Europe* (the *tirage à part*, which is long ago exhausted, has fifty-nine pages octavo). In 1849, I contributed to the same collection a second paper upon the same subject, examining especially Eastern Europe, and establishing for the first time that the Gipsies were in this region at an epoch far anterior to the date (about 1417) of their appearance in the West. I may add, incidentally, that nearly all those who have since spoken of the appearance of the Gipsies in Europe have done little more than draw upon these two memoirs, without always exactly saying what part belonged to me, so that I have often had the annoyance of seeing such or such an author, Francisque Michel more especially, mentioned afterwards in third-hand notices as the original source of what I had written. Now, my second memoir (*Nouvelles Recherches sur l'Apparition des Bohémiens en Europe*, 48 pp. in the *tirage à part*, Paris, 1849: Franck, rue de Richelieu, 67) ends with an "Additional Note" of ten very compact pages, the principal object of which is precisely to identify the Gipsies and the Indian Djath.

In this note, or appendix, I begin by collecting and giving, in French, in order that they may be compared, the accounts that Prof. Pott had only pointed out, relating to the ten or twelve thousand musicians that Bahram-Gur, King of Persia (420-440 of our era) had sent for from India, that is to say, the tradition related by Ferdousy in the *Shahnameh* (about 1,000), by the *Modjme'al-Tawarikh* (about 1126), by the *Tarikh-Guzideh* (about 1329, for this last I have not been able to give the text), and lastly, by Hamza Isphani, the Arabian author whom Prof. Fleischer had just made known to Prof. Pott, and who is the oldest of all, since he belongs to the tenth century, while Prof. Pott supposed him to have been posterior to Ferdousy. It is to be remarked that Hamza mentions the descendants of the twelve thousand musicians as still existing in Persia in his time under the name of *Zuth*, and that Ferdousy says the same of the ten thousand *Louri*, whom he

represents as vagabonds and thieves. But the new and important point is the name of *Zuth* given to them by the Arabo-Persian author of the tenth century; and it is here, as I remark in my work (p. 42 of the *tirage à part*) "that the real interest commences."

I again find this name (p. 44) under the form of *Djatt* and *Djatty* in a fifth account of the same matter by the Persian Mirkhond (fifteenth century); and, after having remarked that the same name is given by the *Kamûs* under the form *Zoth* as the Arabian equivalent of *Djatt*, an Indian race, and that, according to Ellious Boethor, it serves precisely, under the form *Zott*, to designate the Gipsies at Damascus, I start from thence to gather from the important *Mémoire etc., sur l'Inde*, by M. Reinaud, a few data upon the history of the *Zath* or *Djatt* of India, and to establish, pp. 45-48, the probable identity of this race and the Gipsies. I repeat that this is precisely the essential object of my "Additional Note."

I am not an Orientalist, and besides, as I have not failed to mention, this note of ten large pages was written when my memoir was already in the press. But I had the kind assistance of the learned and lamented M. Reinaud, to whose memory I am glad here to render my tribute of gratitude.

Also, the eminent scholar of Leipzig, the same who had first opened the way for discovering the connexion between the Gipsies and the Djatt, Professor Fleischer, in a general account embracing the scientific publications of three years (the same *Zeitschrift*, vol. iv., 1850, p. 452), has not disdained to mention my work in these terms:—

"Bataillard, the author, &c., taking up the supplement to Pott, published in our journal, iii. pp. 321-335, has, with the aid of Reinaud, shown the great probability of the opinion that the Zigeuner descend from the *G'at* or *G'et*, the most ancient inhabitants of the North-west of India; and might not the name *Zigeuner*, *Zingami*, *Zingari*, *T'gyrari*, &c., by the intermedium of the form *Gitanos*, be derived from the name of this people?"

This last supposition of Professor Fleischer's does not appear to me admissible, for there is no doubt that *Gitanos* is derived from *Egipcianos*, as *Gipsies* is from *Egyptians*.

I come at last to Professor Pott's article "Last Contributions towards the Knowledge of the Gipsies and their Language," in the same *Zeitschrift* of 1853 (vol. vii., pp. 389-399), mentioned in the ACADEMY, quoting Professor de Goeje, as the starting-point for the identification of the Gipsy and the Jat. What do we find there upon this subject? The fifteen following lines (p. 393):—

"I am indebted to the obliging friendship of Professor Fleischer of Leipzig (see our *Zeitschrift*, iii., p. 326) for an important passage upon the *Zuth* of Hamza Isphani, whose *Annals* are anterior to the *Shahnameh*, as M. Bataillard demonstrates in his *Nouvelles Recherches*, p. 42. For the origin of the Gipsies we ought to consider very attentively these *Zoth*, who, according to what Rödiger communicates to me, are also confounded with the *Zengi* (called also *Aethiopes*, and whose name is even sometimes employed for *Zingari*: see my *Zigeuner*, i. p. 45). In fact, the *Zuth* appear to be the same as the *Jats*, or, according to the Turkish *Kamûs*, *Tchatt*, concerning whom we find in Elliot, *Biogr. Index*, i. 270-27 (*sic*) (and especially, *ibid.* in Masson, *Journey to Kelat*, pp. 351-353), an interesting article. See, moreover, Reinaud, *Mém. sur l'Inde*, 1849, p. 273, note 3 upon the *Dschats*, which may also be compared with the *Proverb. Arab.* of Freytag, vol. ii., p. 580 (communicated also by Fleischer, to which I must add the further statement of Bataillard). Above all, it would be very important for us to have some details concerning their language."

Thus the learned professor of Halle here contents himself with the fresh mention of the passage in Hamza, for which he was indebted to Fleischer, and with pointing out some fresh sources to be consulted for the *Zoth*, *Jats*, &c., which had been made known to him by the same *savant*, and refers besides to my "further statements (*weitere Auseinandersetzung*);" and, as he

afterwards devotes a long page to the analysis of the principal part of my *Nouvelles Recherches*, which he had mentioned at full length (pp. 389-390), and which he quotes again in several other places, one would think that he had done enough.

This mention has none the less escaped, according to all appearances, Professor de Goeje, of Leyden, who nevertheless was acquainted with this passage of Pott (since he mentions it, p. 16, so as to induce the belief that the learned professor of Halle was the first to establish a connexion between the *Zott* or *Djatt* and the *Tsigans*), and who quotes in several places my long articles in the *Revue critique* on "*Les derniers Travaux relatifs aux Bohémiens dans l'Europe Orientale*" (of which the *tirage à part* forms an octavo volume of eighty pages, 1872), but who says not a word of my work of 1849. This is an omission such as the most conscientious *savants* sometimes make; and I do not intend to address a reproach to the learned professor of Leyden, whose work must besides have all the superiority belonging to a deep study made twenty-five years later by a most competent Orientalist. But since the question of priority upon this subject has been raised in your paper, you will, I think, perceive, in perusing what I wrote in 1849, which I send you with this letter, that I have a right not to be completely forgotten, especially when it concerns an interesting point in the history of the Gipsies upon which I have hitherto published only some fragmentary works, but to the study of which I have devoted so many years.

My letter is already long: allow me, nevertheless, to add yet a few more words. Although I have in my possession the work of Professor de Goeje (the author has had the kindness to send it to me), I cannot say that I am acquainted with it, because I cannot read Dutch, and have not yet found an opportunity of having it translated, which I doubly regret under the present circumstances. I think, however, that I may say that the point treated by the professor of Leyden, and twenty-five years ago by myself, although it be already sufficiently complex, is only one side of the very much more complicated question of the origin of the Gipsies, considered in all its bearings. I hope to be able to show that the historical documents of Eastern Europe, of Western Asia, and of Egypt itself, furnish very important data, hitherto very insufficiently considered, upon the question. I think I have also the means of giving an explanation of the word *tsigan*, and of the other names approaching to it, more certain and more interesting than those proposed by Professor de Goeje and by Mr. Burton.

It is not the less interesting to examine any point of the very complex question of the origin of the Gipsies, and especially one so important as this appears to be of their connexion with the *Jats* or *Djatt*. But this point itself has, so to speak, several faces. There is the part belonging to erudition in the strict sense, and I think that Professor de Goeje has treated it very ably; but there is the ethnological, anthropological and even the linguistic part of the subject, which does not appear to me to be very far advanced up to the present time. It is this part that Mr. Burton has handled, and as he has lived in the midst of the *Jats*, he was in some respects in the best condition for throwing great light upon it; but, on the one hand, he ought perhaps to have been better acquainted with the Gipsies, and, on the other, it does not appear that the connexion between the Gipsies and the *Jats* has occupied him much. He has perceived a probable relation between these two tribes of men, and he has expressed it in half a page; but this is not sufficient. No doubt in occupying himself specially with the *Jats*, in giving in 1849 a grammar of their language (of which I cannot appreciate the value, but which did not prevent Professor Pott, in 1853, from saying that we were wanting in information respecting this idiom), in collecting some very summary data concerning their division

into four tribes, and upon their history and manners, he has furnished some materials, but materials quite insufficient, for a comparison, *which is still unmade*, between this race and the Gipsies. He tells us, for example, that the appearance and other peculiarities of this race authorise as probable the supposition of a relationship between it and the Gipsies. But he does not give us even the smallest information respecting the type (appearance) of the Jats; and the other "peculiarities" which he does not explain, and which we are obliged to seek in scattered traits, furnish such fugitive comparisons that one can conclude nothing from them. In reality nearly every tribe in India (not to speak of certain tribes in other countries) will furnish, when compared with the Gipsies, quite as many, if not more, points of resemblance. Indeed this is, more or less, the defect of nearly all the comparisons which have been made between the Gipsies and such or such populations of India; the authors of these comparisons are not sufficiently acquainted with the Gipsies, and their study of the resemblances is not sufficiently *specific*.

The Jats must belong, I suppose so at least, to the Hamite (Chamite), and more particularly to the Kouschite stratum of the Hindoo populations, and for my part I do not doubt that the Gipsies, although their idiom is connected with the Aryan languages of India, belong to this same branch of the human species.—I remark, by the way, in the division made by Mr. Burton of the Jats into four tribes, that one of the districts inhabited by the second is called "Kach (Kutch)." —But this branch is widely spread in Asia and in Africa. It would be necessary, in the Kouschite family, to remark the particular traits which distinguish, on the one hand, the Jats, on the other, the Gipsies, in all the very complex affinities allowed by ethnography, and start from thence to compare them. This is what remains to be done in order to throw light upon *this part of one side* of the question of Gipsy origin. It is useless to say that, in following out more particularly this comparison between the Gipsies and the Jats, the other points of comparison that may be furnished by other tribes, related or not to the Jats, such as that of the *Tchangur*, for example, pointed out by Dr. Trumpp in the *Penjab (Mithail der Anthropol. Gesellschaft in Wien*, t. ii., 1872, p. 294, quoted by Miklosich in his third Memoir on the *Zigeuner*, 1873, p. 2), and several others, which it would be too long to mention, must not be neglected. But all this can only be well done in India, and by a person who has specially studied the Gipsies of Europe, of Eastern Europe especially, and, if possible, those of Western Asia and even of Egypt. Unfortunately, these conditions are very difficult to find.

PAUL BATAILLARD.

"PEPPY'S DIARY."

York Street, Covent Garden : June 2, 1875.

In reply to Colonel Cunningham, I can only say that he appears to mistake both my rights and my claims, and to misapprehend the chief point in question.

Mr. Bright denies that his transcript is a duplicate of Lord Braybrooke's, because he has corrected the mistakes of the latter. This is an admission that it is a duplicate *minus* the mistakes. Can he possibly think that the correction of (say) five per cent. of errors—twenty-five pages out of five hundred (which is a liberal allowance to grant)—is a sufficient justification for reprinting four hundred and seventy-five pages which are correct, and which I claim as my copyright on the ground that I paid for the exclusive right of printing them for a term of years?

Will Mr. Bright say that in making his transcript he went through the same process of discovery as the original decipherer, Mr. Smith? Did he not, in learning the cipher, use Mr. Smith's labours as the key? If he did, is he justified in

using the knowledge he attained through Mr. Smith's labour to supersede Mr. Smith's transcript?

A large amount of literary property is held under the same tenure as *Pepys' Diary*. It is an unwritten but well understood law that the first registered publication of any MS. carries with it the copyright; no attempt, so far as I can learn, has ever been made to dispute the equity of it.

Whatever applies to an ordinary MS. applies with greater force to the first transcript of a MS. in cipher because the labour of discovering the cipher gives the transcript itself the character of an original work.

Mr. Bright says that the Pepysian benefaction was a "free gift." I do not dispute it, for no condition was attached to the use of the MS. Lord Braybrooke undertook it "as a labour of love," and having realised a considerable sum for the copyright, handed over, as I believe, the whole nett proceeds to the College as an acknowledgement of their courtesy. The act would have lost its grace if it had been coupled with a request for a receipt.

This is the last letter we shall write upon the subject.

GEORGE BELL.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 5,	2.30 p.m.	Fourth New Philharmonic Concert, St. James's Hall.
	3 p.m.	Royal Institution: Professor Douglas on "The Chinese Language and Literature." II.
	"	Actuaries' Anniversary.
MONDAY, June 7,	"	Third Summer Concert, Crystal Palace (Wilhelms).
	2 p.m.	Royal Institution: General Monthly Meeting.
	5 p.m.	Musical Association.
TUESDAY, June 8,	7 p.m.	Entomological.
	8 p.m.	British Architects.
	"	Philharmonic Concert: St. James's Hall (Jaell).
WEDNESDAY, June 9,	8 p.m.	Anthropological Institute: Captain R. F. Burton on "The Long Wall of Salona," and "The Ruined Cities of Pharia, &c."
	3 p.m.	Royal Literary Fund.
	4.15 p.m.	Royal Society of Literature.
THURSDAY, June 10,	8 p.m.	Geological.
	5 p.m.	Zoological Gardens: Professor Mivart on "Kangaroos."
	8 p.m.	Society of Arts: Mr. T. Gilks on "Modern Wood Engraving."
FRIDAY, June 11,	"	Royal Historical Society: Dr. C. Rogers on "Memorials of George Wishart the Martyr."
	"	Mathematical.
	8.30 p.m.	Royal: Professor Cayley on "Potentials;" Professor Owen on "The Fossil Mammals of Australia, Part X.;" Professor W. C. Williamson on "The Organisation of the Fossil Plants of the Coal Measures, Part VII.;" Mr. W. Spottiswoode on "Some Experiments on Stratified Discharges with the Induction Coil and Holtz's Machine."
	3 p.m.	Mr. Charles Hallé's Recital, St. James's Hall.
	4 p.m.	Literary and Artistic.
	7.30 p.m.	Anthropological.
	8 p.m.	Astronomical. Quekett Club.
	"	New Shakespeare Society: Mr. H. B. Wheatley on "The Originals of Shakespeare's Plots."
	"	Mr. Leslie's Choir: Last Concert (St. James's Hall).

SCIENCE.

Assyrian Studies. Part I. The Names of Animals in Assyrian. (*Assyrische Studien. Assyrische Thiernamen.*) By Dr. Fr. Delitzsch. (Leipzig, 1874.)

Etudes Accadiennes. Vol. II. Pt. I. By Fr. Lenormant. (Paris: Maisonneuve & Cie., 1874.)

THE importance of these two works consists as much in what they imply, as in their actual contents. When more than four years ago I sketched the first outlines of an Accadian grammar in the *Journal of Philology*, and compared this primitive language of Chaldees with various Ural-Altaic idioms, it

was a new subject for the philological world. Thanks chiefly to the indefatigable labours of M. Francois Lenormant, this is no longer the case. He has placed a methodical grammar in the hands of students, has drawn up a vocabulary, and in the volume now before us has given an interlinear rendering of numerous ancient Accadian texts, as well as of the Assyrian translations which accompany them, so that all who would test the accuracy of the results arrived at are now enabled to do so. Dr. Delitzsch also, though primarily dealing with Assyrian, has been working towards the same end, and it is a significant fact that the Assyrian glossary at the end of the book is followed by an Accadian one. For the first time the names of beasts, birds, fish, and insects, given in Accadian and Assyrian in the long bilingual lists which the scribes of Assur-bani-pal compiled, have been subjected to the investigation of a profound Semitic scholar, who enjoys the advantage of having been trained in Talmudic literature by his father, the well-known Professor of Leipzig. Notes and excursuses explain numberless other words occurring in the syllabaries, and perhaps one of the most curious facts which Dr. Delitzsch has pointed out, is that the Assyrian names of the winds, hitherto so puzzling, are to be found in the Babylonian Gemara. The naturalist and antiquarian, as well as the philologist, will discover much to interest them in the book, and even the biblical student may derive instruction from the clay tablets of Nineveh. I would draw Dr. Delitzsch's attention to the explanation of the Hebrew *'okhim* (which our authorised version renders "doleful creatures" in Is. xiii. 21), afforded by the Accadian equivalent of the Assyrian *akhu*, which means "hyaena" (W. A. I. ii. 49.38). The cat is mentioned in the lists immediately before the dog, suggesting the possibility that "a cat-and-dog life" is a phrase not exclusively confined to the modern world, and the many varieties of dogs that are named would delight a fancier or a Darwinian.

It must be remembered that almost all the animals recorded in these lists, had been named by the Accadians long before they had taught the Semites the art of writing and the rudiments of civilised life. Researches into the Accadian language and syllabary are lifting the veil that has so long hung over the movements and struggles of the historical races of Western Asia, and it has become clear that the Semites were for many ages in close contact with a Turanian population, whom they first received the elements of culture from, and then out-distanced, giving liberally in return for their early lessons. While, therefore, the Semitic vocabulary contains very much that came from Accad, the Accadian vocabulary contains much, also, that had a Semitic source, and it is only by a comparison of the two that the great problem of the origin and growth of primitive Asiatic civilisation can be worked out. Certainly city life, writing, astronomy, and the calendar were borrowed from the old Turanian inhabitants of Babylonia, and even the parallelism of Hebrew and Assyrian poetry had the same derivation. A glance at M. Lenormant's book will

convince the reader of this. From Accad, too, came in large measure the theology and mythology of the Semites, and while the transparent character of the proper names in the agglutinative language of Babylonia affords an important verification of the much-abused "solar theory," the science of religion has been enabled by means of its decipherment to penetrate to the very origin of some of the historical creeds and dogmas of the West.

It is upon the philological side, however, that the new language so strangely recovered from the cuneiform records is likely to be most fruitful in results. Comparative researches into the Turanian or Ural-Altaic idioms have been grouping them into a family, and all that was needed was their Sanskrit—some ancient form of Turanian speech and literature to which the words and ideas of the modern dialects might be traced back. This has now been found in the Accadian, and many of the obscure problems of language to which the flexional idioms can give no answer or else a misleading one, may now receive their solution. The value of the key has been recognised in France, in Germany, and in England, and the band of workers, though still small, is active and increasing. Short as is the time since the Accadian language was first introduced to the notice of European scholars, it has seen a whole literature arise upon the subject; and the simultaneous appearance of the two works at the head of this article is a significant indication of the direction which linguistic and ethnological research is at present taking.

A. H. SAYCE.

MINOR SCIENTIFIC LITERATURE.

A Treatise on Magnetism, General and Terrestrial. By Humphry Lloyd, D.D., D.C.L., Provost of Trinity College, Dublin, formerly Professor of Natural Philosophy in the University. (Longmans.) Dr. Lloyd is well known as a skilful mathematician, and as the author of a treatise on the Wave-theory of Light. In the volume before us he discusses the determination of the elements of the magnetic force of the earth, at different points of the earth's surface, together with the various laws which regulate their changes of magnitude with change of place; and further, the variations which the elements themselves undergo during different intervals of time at the same place. The principal methods of observation employed are but slight modifications of those suggested by Gauss and Weber, and the instruments (which have been employed in the Dublin Observatory since 1838) were devised by Dr. Lloyd, and have been adopted by magnetic observatories all over the world. The first part of the work gives an account of the general phenomena of magnetism—artificial magnets, polarity, induction, methods of magnetisation, coercitive force, and the laws of attraction and repulsion. The second and larger portion treats of terrestrial magnetism. In the chapter which treats of coercitive force we find some interesting details concerning the influence of different substances upon the coercitive force of iron:—

"The circumstances upon which the coercitive force chiefly depends are *hardness*, and the presence of *foreign ingredients* in the iron. Steel owes its coercitive force to the carbon which it contains; and it has been found that similar properties are imparted to iron by the combination with it of phosphorus, sulphur, and arsenic in small quantities. When these foreign elements are combined with the iron in large proportions, they resist altogether the development of magnetism by any ordinary means. It is stated by

Dr. Matthew Young that the magnetism of iron is wholly destroyed by the admixture of antimony, even in a very minute proportion; and nickel is deprived of its magnetic quality by the addition of arsenic."

A capital map of isodynamic lines will be found at p. 110, which, however, might with advantage have been continued above 60° N lat. In a second edition, chapter viii. will be rendered far more useful if it be supplied with plates or photographs representing the various forms of apparatus described. In regard to magnetic disturbances (chap. xiii.), it is stated that the first important discovery in this direction was that of the simultaneity of the disturbances at very different places. Thus, as early as 1818 a considerable disturbance in the movement of suspended magnets was noticed simultaneously in two places forty-seven degrees of longitude apart. The days of disturbance are found to vary considerably in different years; thus in 1841 there were fifty-seven days, in 1846 forty-three, and in 1843 only seventeen. An appendix contains among other things a mathematical treatment of the theory of the dipping needle, and Gauss's theory of terrestrial magnetism. The work is a valuable addition to our scientific literature, and will be welcomed by scientific men in general, and by magnetic observers in all parts of the world in particular.

Brinkley's Astronomy.—Revised and partly rewritten, with additional chapters by G. W. Stubbs, D.D., Fellow and Tutor of Trinity College, Dublin, and Francis Brünnow, Ph.D., late Astronomer Royal of Ireland. 2nd Edition. (Longmans.) This book, written by Bishop Brinkley more than sixty years ago, has since 1808 been used as a text-book by the students of Trinity College, Dublin. Till now it has been almost unaltered, and it was high time that Dr. Stubbs and the present Professor of Astronomy should take it in hand, and make it *en rapport* with the astronomy of to-day. When it was written only four asteroids were known, now there are more than one hundred and twenty. The Bishop little dreamt of the Clio, Julia, Calypso, and Angelina which were to follow in the train of Ceres, Pallas, Juno, and Vesta. New additions have been made, and an account has been given of spectrum analysis, solar spots, and the most recent discoveries. The book is a dry and technical college class-book, scarcely suitable for the general reader.

Sun and Earth as great Forces in Chemistry. By Thomas W. Hall, M.D. (Trübner.) This is a very ill-considered and ill-written book, and we cannot commend it either to the general or to the scientific reader. We will let it speak for itself:—

"Nor can our earth over-cool or over-contract the potassic throb-size, for our sun through the potassic heat constitution will not allow it, hence the potassic throb-size under usual circumstances remains the same, and has during expansion enough of density of matter in it to give the resistance and coherence called solidity."

And again, p. 89:—

"But there exists an organic territory on the earth, and of this territory carbon is the latent-heat equilibrium centre, and hydrogen the multiplier, modifier, and transmitter of heat-discharges, and the distant equable sun, through oxygen and nitrogen the sole heat-source."

We recommend the author before he attempts to found a new theory to at least express himself in language which the scientific man can understand, and secondly to assure himself that his own scientific facts are sound.

The Chemistry of the Breakfast-Table: a Popular Description of the Constituents of Food. By F. R. Eaton Lowe. (Simpkin and Marshall.) This pamphlet does not appear to possess any advantages over the works already published, not only on the same subject but with the same title, such, for example, as the works of Johnstone and Bernays. It is small and compact, and if always kept ready

at hand might sometimes be of service to Paterfamilias.

An Elementary Treatise on Practical Chemistry and Qualitative Inorganic Analysis. By Frank Clowes, B.Sc., Science Master at Queenwood College. (Churchill.) This work is well adapted for use in school-laboratories, it is full of useful tables, and has the merit of giving the equation for the simplest chemical reaction. It is, we think, a little too elaborate and full of detail for boys who are beginning chemistry, but it may be used with advantage after such a book as the *Owens College Junior Course of Practical Chemistry*. We hope that the appalling list of *Corrigenda* will quite disappear from a second edition. A few more illustrations might be added with advantage.

Rudimentary Treatise on Clocks, Watches, and Bells. By Sir Edmund Beckett, Bart. (late E. B. Denison), LL.D., Q.C., F.R.A.S., President of the British Horological Institute. Sixth edition, revised, enlarged, and illustrated. (Lockwood.) This work (which originally appeared as one of "Weale's Series") contains an accurate and interesting account of watches and clocks from their first introduction, and at the end an imperfect account of bells. As the designer of the great Westminster clock, Sir Edmund is careful to give us a detailed account of that mighty and most accurate instrument. The history of the subject is scarcely so successful as the actual details of practice. Thus he tells us that Galileo made his discovery of the isochronism of the pendulum "in a church at Florence," and that the first pendulum clock was made for St. Paul's, Covent Garden, in 1621, by Harris, "though the credit of the invention was claimed also by Huyghens himself, and by Galileo's son, and Avicenna, and the celebrated Dr. Hooke." What sort of order is this? Huyghens was born in 1629, Vincenzo Galileo in 1606, *Avicenna* 980, and Dr. Hooke in 1635; while Harris put up his pendulum clock in 1621! (p. 28.) However, when our author gets on to "dead-beat escapements" and epicycloidal teeth, he is quite at home, and the new edition of his work will be welcomed by the Horological Society and no small circle of outside readers.

A Manual of Metallurgy. By W. H. Greenwood, F.C.S. Vol. I. Fuel, Iron, Steel, Tin, Antimony, Arsenic, Bismuth, and Platinum. (William Collins & Co.) This work forms one of Messrs. Collins' "Advanced Series," and will be succeeded by a second volume in the course of the year, which will embrace the metallurgy of copper, lead, zinc, silver, mercury, nickel, cobalt, and aluminium. The order is the same as that followed by Dr. Percy in his exhaustive treatise, and the author expresses his acknowledgment to his old master. The metals are discussed in detail, their principal properties described, and the methods of extracting them from the earth. New inventions and processes are fully described—such as Siemens' gas furnace and Bessemer's process for making steel. The work is admirably suited for the purpose for which it is designed—viz., as a text-book to be used by the South Kensington Science Classes.

The Intermediate Geography, Physical, Industrial, and Commercial. By the Rev. Alexander Mackay, LL.D. (Blackwood.) A comprehensive little book well suited for junior classes in schools. A noticeable and useful feature is the introduction of the names of places to be found on the same parallel as the principal place discussed. Thus:—

"London is on the same parallel of latitude as Cork, Antwerp, Berlin, and Warsaw."

"Athens has the same latitude as the Azores, Cordova, Smyrna, Yarkand, San Francisco, and Washington."

First Forms of Vegetation. By the Rev. Hugh Macmillan, LL.D., F.R.S.E. Second Edition. Illustrated. (Macmillan.) The first edition of this work was published thirteen years ago, and

has been long out of print. The present work has been considerably enlarged, and new illustrations have been added. It contains an introduction, and four long chapters which treat respectively of Mosses, Lichens, Fresh-water Algae, and Fungi. The last chapter is specially interesting and instructive; it discusses the various forms of fungi edible and non-edible which exist in Europe, and the whole is interspersed with stories concerning the mode of growth and properties of this curious form of vegetable life:—

"In many of their properties, the Fungi are closely allied to some members of the animal kingdom. They resemble the flesh of animals, in containing a large proportion of albuminous proximate principles; and produce in larger quantity than all other plants, azote or nitrogen, formerly regarded as one of the principal marks of distinction between plants and animals. . . . By chemical analysis, they are found to contain, besides sugar, gum, and resin, a yellow spirit like hartshorn, a yellow empyreumatic oil, and a dry volatile crystalline salt, so that their nature is eminently alkaline, like animal substances extremely prone to corruption."

Again, they resemble animals in the fact that some species are beautifully phosphorescent, so much so that a few plants of a certain Brazilian fungus will enable one to read in a dark room. They also evolve a high temperature, and unlike most other plants are almost insensible to light, indeed we know that they prefer a damp dark locality to any other. The rapidity of their growth is marvellous; they sometimes form twenty thousand new cells every minute, and the giant puff-ball has been known to increase from the size of a pea to that of a melon in a single night.

Mr. Ward saw a fungus grow at the rate of three inches in twenty-five minutes. The force developed during growth is considerable. Buliard enclosed a fungus in a glass vessel, and the plant expanded so rapidly that "it shivered the glass to pieces, with an explosive detonation as loud as that of a pistol;" again, Dr. Carpenter mentions that a paving-stone weighing eighty-three pounds was raised an inch and a half from its bed by a mass of fungi beneath it, and we know the story of the man who, having put aside a cask of sweet wine to mature in an empty cellar, found at the end of several years that the cellar was quite full of fungi from floor to ceiling, while the empty cask was hoisted on their shoulders until it reached the ceiling. We ordinarily come in contact with some dozen or twenty different kinds of fungus, and it is surprising to learn that the British species alone number 368 genera, each including some eight species. Some of these contain most potent principles; some act as narcotics, others as irritant poisons like arsenic. If the common puff-ball be burnt and the smoke inhaled, it deprives the patient of speech, motion, and sensibility to pain, while he is conscious of everything that passes around him; if the inhalation is continued, convulsions and death ensue. Mr. Macmillan's book is pleasantly written and well illustrated, and will be welcomed alike by the botanist and by the general reader.

First Lessons in Theoretical Mechanics. By the Rev. John F. Twisden, M.A. (Longmans.) *A Handbook of Applied Mechanics.* By Henry Ewers, LL.D. (William Collins & Co.) *Elementary Dynamics.* By W. G. Willson, M.A., Presidency College, Calcutta. (Calcutta: Thacker, Spink & Co.) The increased study of science in schools, and the general introduction of questions on mechanical philosophy into nearly all competitive examinations, has caused the appearance of a number of handbooks on Statics and Dynamics, both theoretical and applied. Mr. Twisden's book—very clear and concise, full of happy illustrations, and of questions with the answers given—is well suited to be an elementary handbook. Although written by a mathematician (Mr. Twisden is Professor of Mathematics at the Staff College), it is avowedly for those who desire "to study the first principles of mechanics before they

have obtained the knowledge of geometry, algebra, and trigonometry which most elementary books on the subject presuppose." Mr. Willson's work on Dynamics is more abstruse, and is fitted for the University student at the commencement of his course. The treatment of the subject of accelerated velocity seems to us very unnecessarily complex, and certainly puts the book out of the reach of schoolboys. The same remarks apply to the treatment of pulleys, and the relation between their power and resistance. Mr. Ewers' little book on Applied Mechanics will be found very useful when the principles of machinery have been mastered. There is a good deal of original matter, but the value of the arrangement is in some places questionable. Consecutive chapters treat of Woods; Metals; Water; Riveting and Strength of Materials; Common Tools; Machines worked by Water; Machines; Blowing Machines; Cranes; Machine Tools. Why, again, should the safety lamp be discussed in the same chapter with levers, pulleys, clocks, expansion joints, and moderator lamps? A little rearrangement of matter will improve the second edition of a book which is sound in matter, and not ill-written.

G. F. RODWELL.

SCIENCE NOTES.

METEOROLOGY.

Meteorological Observations for Travellers.—In the new German *Manual of Scientific Enquiry*,* already noticed in a general way in our columns, the portion specially relating to meteorology is by Dr. Hann, and it does not aim at affording minute instructions for the observations and the management of instruments, such as are contained in some parts of our own Admiralty Manual, but gives a clear and concise account of the general class of phenomena which can be advantageously observed by travellers, and of the particular points to which they should direct their attention in the way of gathering all the information they can from residents in foreign settlements, or even from natives as to the periodicity of their seasons, &c. Dr. Hann is eminently fitted for the task of preparing such hints as those mentioned, inasmuch as of late years he has done more than anyone else to elucidate the climate of distant stations.

Theory of Cyclones.—A new opponent to M. Faye's theory of the descent of the air in cyclones has arisen in M. Cousté, who had published his views on the origin of these storms in the *Comptes Rendus*, December 14, 1874, previously to the appearance of M. Faye's paper in the *Annuaire* of the Bureau des Longitudes. M. Cousté (C. R., April 26) argues:—(1) That the theory of descent does not account for the fall of the barometer in cyclones; (2) that both trombes and cyclones, if generated as M. Faye supposes, would be deficient in mechanical force, and could not advance from place to place. Their action on the atmosphere would not be greater than that of an aerolite.

Colding's Theory of the Motions of the Atmosphere.—The last two numbers of the Austrian Journal for Meteorology are mainly taken up with a condensation, by Dr. Hann, of Professor Colding's two papers on this subject, which appeared in the Proceedings of the Danish Society for 1871 and 1872. The views of the author have been well ventilated in this country, but it will be a convenience to most meteorologists to find an account of them in German instead of in the original Danish.

THE new number of the *Quarterly Journal* of the Meteorological Society is mainly composed of the President's Address and Report of Council, but contains also the Report of the recent Conference on the Registration of Natural Periodical Phenomena, which was held at the suggestion of the Society, and which it is hoped will tend to organise on a systematic basis these important

* *Anleitung zur wissenschaftlichen Beobachtungen auf Reisen* (Berlin, 1875).

observations, which have been carried on for years in Austria and Belgium, and which were instituted in 1845 in this country by a committee of the British Association, but were in great measure discontinued in a very few years.

Climatic Character of the Winds.—In the fourth volume of the *Repertorium für Meteorologie* which has just reached us, M. Köppen has published a very interesting paper on the dependence of the climatic character of the winds on their origin. He discusses the observations at St. Petersburg, taking four cases, according as that station lies—

1. Within the influence of a cyclone.
2. Within the influence of an anticyclone.
3. When the isobars over it are straight, showing no curvature.
4. When it lies at the centre of anticyclone.

The converse case to (4), when St. Petersburg lay at the centre of a cyclonic area, was too rare to be noticed.

The calculations are carried out for the two half-years of winter and summer, and the general result is that in case (3) the axis of the thermal windrose is nearly at right angles to the isotherm of St. Petersburg, and the wind shows its own origin very correctly. In this case, too, the contrast between the qualities of the wind from the extreme directions is most marked.

If the motion is cyclonic the pole of the thermal windrose lies, in winter 40°, in summer 14°, to the left of the normal to the corresponding isotherms. If it be anticyclonic the poles lie respectively 31° and 20° to the right of the same normals.

It appears, further, that the equatorial current in the case of straight isobars embraces the points from S. to W., of a cyclone from SE. to W., and of an anticyclone from SW. to NW.

The paper then shows how, without a change in the direction of the wind, the latter may change its characteristic properties entirely, according as a cyclonic system approaches the station in succession to an anticyclone, or the contrary.

In a preface to the paper Professor Wild maintains the view that such discussions as Köppen's of Synoptic charts will entirely supersede the publication of Windroses for different stations.

Distribution of Atmospheric Pressure in Russia.—In the same volume of the *Repertorium* Captain Rikatcheff publishes a paper on the distribution of barometrical pressures in Russia, in which he sets out with the remark that Buchan in his well-known paper on the "Mean Pressure and Prevailing Winds" has been led into serious error about his Russian data, from the idea that the altitude of the stations in that empire has been determined. Captain Rikatcheff says that there is not a single station in Siberia whose height above the sea-level is known.

He gives monthly charts and an annual one, for which he claims that they afford a probable accuracy of 1 millimètre in the determination of the mean pressure for Eastern Russia for the month and for the year; for Western Russia the accuracy is 0.2 millimètre for the year, and 0.5 millimètre for the month.

The monthly distribution of temperature and humidity explains the high pressure over Asia in winter and its translation westwards in summer, but does not explain the deficiency of pressure in high latitudes.

Lastly, the configuration of the coast and the contour of the surface exercise an influence on the course of the isobars.

The Severity of Last Winter.—The Registrar-General's Reports, published in the *Times*, have lately afforded us some particulars as to what we have had to endure in the way of protracted cold weather during last winter, and it is interesting to examine similar statistics from other parts, in order to see how they too fared.

It has generally been supposed, following Dove's opinion, that the climates on the two sides of the Atlantic were usually more or less complementary

to each other, at least as regards the character of the winters.

In the *Toronto Globe* of May 11 we find a long article based on Professor Kingston's Reports, in which it is shown that the winter of 1874-5 has been utterly unprecedented in duration, of recent times. The absolute extremes of cold registered have not been as severe as on some previous occasions, but at Toronto for one period of sixteen consecutive days the temperature never rose even to zero Fahrenheit! The longest period of a similar defect of temperature in the course of the last forty years has been only seven days.

As regards Sweden, the *Shipping Gazette* recently published a letter from its Stockholm correspondent giving the following table of the date at which navigation opened at that port during the last fifty years, from which it will be seen that this event is very irregular in its occurrence, ranging from January 3 in 1863 to May 17 in 1838. The present year shows a late period for its occurrence, but in this respect it has been exceeded on seven occasions since 1824:—

1825...March 31.	1851...April 19.
1826...March 6.	1852...April 12.
1827...April 14.	1853...May 6.
1828...April 26.	1854...March 27.
1829...May 8.	1855...May 2.
1830...April 16.	1856...April 16.
1831...April 21.	1857...April 15.
1832...March 26.	1858...April 12.
1833...April 12.	1859...February 22.
1834...March 10.	1860...April 12.
1835...March 7.	1861...April 12.
1836...April 5.	1862...April 26.
1837...April 27.	1863...January 3.
1838...May 17.	1864...April 19.
1839...May 6.	1865...April 19.
1840...April 14.	1866...April 15.
1841...April 15.	1867...May 5.
1842...February 18.	1868...April 7.
1843...April 21.	1869...March 27.
1844...April 26.	1870...April 14.
1845...April 25.	1871...March 31.
1846...March 19.	1872...March 8.
1847...April 30.	1873...March 13.
1848...April 5.	1874...March 2.
1849...April 2.	1875...April 27.
1850...April 22.	

Anemometer Testing.—In the fourth volume of the *Repertorium für Meteorologie* we have an account of a very interesting set of experiments by M. Dohrandt, of St. Petersburg, made to test the velocity of rotation of various anemometers of different sizes, which were compared by means of a rotation apparatus on Combe's principle, of which no further explanation is given.

The general result of a very complete series of experiments was, that not one of the eight anemometers tested accorded exactly with Dr. Robinson's theory that the velocity of the wind should be three times the velocity of rotation of the cups.

M. Dohrandt says that he has not as yet succeeded in finding an expression for determining the proportion between these two velocities from the dimensions of the instrument, but it appears at first sight that this proportion is more closely connected with the diameter of the cups than with the length of the arms of the instrument.

Meteorology in Victoria.—Mr. Ellery has just issued the Results for the Melbourne Observations, and for those of other stations in Victoria for the year 1872, when the publication of meteorological returns for the colony, which had been interrupted since the date of Neumayer's observations, was resumed. The volume contains a map of the colony, showing the position of the stations, and is a very useful contribution to our knowledge of Australian meteorology.

Report of the Chief Signal Office, Washington.—General Meyer has just published the third Report of his office (for 1874), which forms a portly volume of 400 pages, but is, however, less than half the size of its predecessor for the year 1873.

Among the most important parts of its contents are the mean results for Pressure, Temperature, and Wind, with the maximum and minimum temperatures for each of the stations, information on which subjects has never been given before in these Reports.

These, with the Monthly Weather Reviews, and the Reports of Inspection of Stations, make up the bulk of the book.

It appears from the whole Report that the Service is in a very creditable condition, but, as in the former Reports, there is no financial statement whatever, so that it is impossible to institute a comparison between the American organisation and that of our own country.

GEOLOGY.

SEVERAL publications issued by the Geological Survey of India have recently reached this country, and sufficiently attest the activity and ability of Professor Oldham's staff. Among these is a Memoir by Mr. R. Bruce Foote, forming the first of a series of papers "On the Fauna of the Indian Fluvial Deposits," to be published in the *Palaeontologica Indica*. In 1871 Mr. Foote was examining the bed of a small nullah near Gokak, in the Belgaum District, when he discovered the remains of a rhinoceros embedded in a black clay, probably of pleistocene age. The animal evidently belongs to the *Hypsodont* section of the family, but appears to have differed in many particulars from all previously described species, whether living or fossil; and the discoverer has therefore described it in the present memoir under the name of *Rhinoceros Deccanensis*. The remains indicate a smaller and slighter animal than *Rhinoceros Indicus*, but probably one larger than any other living Asiatic species. Although most of the bones of the skull are preserved, the nasal bones have not been found, and nothing is therefore known with respect to the horn or horns which the animal possessed.

As it is not often that the remains of birds are found in marine deposits, it is worth recording that M. Delfortrie has discovered a number of bird-bones in the faluns of Saucats and in the fossiliferous molasse of Léognan, in the basin of the Garonne. These remains have been described by M. A. Milne-Edwards in the last number of the *Annales des Sciences Géologiques*. Among the more interesting of the remains from the miocene beds of Léognan are the humerus and tarso-metatarsus of a large bird allied to the albatross, yet sufficiently distinct to represent a new genus; the author has consequently described it under the name of *Platornis Delfortrii*. Other bones indicating birds related to the gannets and petrels are described as new species, and have received the names of *Sula pygmaea*, *Procellaria Aquitana*, and *P. antiqua*.

SOME fossils from a new exposure of Rhaetic beds near Hildesheim, where they were discovered a short time ago by Herr F. Roemer, have been described and figured in the last number of the *Zeitschrift der Deutschen Geologischen Gesellschaft*. The fish remains have been studied by Herr K. Martins, of Göttingen, who regards them as representatives of new species, naming the one *Philodophorus Roemeri*, and the other *Hybodus furcatastriatus*. A beautiful little star-fish from the same deposits has been sent to England for description by Dr. T. Wright, who has bestowed on it the name of *Ophiopsis Damesii*.

In the same number of the *Zeitschrift* palaeontologists will find a number of papers of greater or less interest, including a notice of a remarkable deformity in a Devonian *Gomphoceros*, by Herr E. Kayser, of Berlin; a paper on the Belemnites of the Island of Bornholm, by Herr C. Schlüter, of Bonn; a description of some fossil freshwater shells from Siberia, by Herr E. von Martens, of Berlin; and a monograph on *Involutina*, a genus of Foraminifera, by Herr L. G. Bornemann, jun., of Eisenach.

WHEN the late Dr. A. Campbell was Superintendent of Dárljiling he called Dr. Oldham's attention to the reputed occurrence of coal in the neighbourhood; but this "coal" appeared, on examination, to be nothing more than the fossilised stems of individual trees, such as are not uncommon in tertiary deposits. Dr. Hooker, however, subsequently detected carbonaceous shales which pointed to the occurrence of the true Indian coal-measures in this locality. For a long time but little notice was taken of these indications of coal, but the recent connexion of Calcutta with the hill-districts by means of the Northern Bengal State Railway has given fresh importance to the subject. Moreover, it is well known that copper has been worked in the Sikkim mountains, and the mineral resources of the country were, therefore, well worthy of study by the Geological Survey. Mr. F. R. Mallet, who has been engaged on this work, has written an excellent account of his results, which has just been issued as one of the Survey Memoirs, accompanied by a geological map. It appears that the coal has unfortunately been subjected to such pressure that it is much broken, and in some parts reduced to the state of powder; hence before use it would probably need to be prepared as an artificial fuel. Serious difficulties stand in the way of working the coal, but still Mr. Mallet maintains that "the Dárljiling seams are well worth a fair trial." As to the copper-mining, it can hardly be said that the report is very encouraging, at least to European enterprise.

A RECENT visit to the coal-field of Wallerawang, about 105 miles west of Sydney, has enabled Professor Liversidge to publish a paper on the iron-ore and coal deposits of this locality. He recognises, in addition to several minor seams, three principal beds of coal; the lowest having a thickness of 17 feet 6 inches; the middle one 6 feet 6 inches, and the uppermost 4 feet 6 inches. The coal is said to be hard and compact, and promises to be of much value to the colony. Analyses of the coals and ores accompany the paper.

CONSIDERABLY more than a century ago Nicolas Desmarests, one of the most philosophical of the early geologists, wrote an excellent memoir on the evidence of a former land-connexion between England and France. This essay, though now nearly forgotten, is so sagaciously written, and is so rare withal, that we welcome a reprint which has recently been issued under the care of Messrs. MacKean and Co. It bears the title *L'ancien Jonction de l'Angleterre à la France, ou le Détroit de Calais, sa Formation par la Rupture de l'Isthme, sa Topographie et sa Constitution Géologique* (Paris: Isidore Liseux, 1875). The memoir is neatly printed, and illustrated with facsimiles of the maps and section which accompanied the original paper. It will be read with special interest at a time when the restoration of land-communication with the Continent is a project seriously discussed by practical men.

As an illustration of the study of English geology by French geologists, we may call attention to a paper by M. C. Barrois, recently published in the *Annales de la Société Géologique du Nord*, under the title of "Ondulations de la Craie dans le Sud de l'Angleterre." He points to the three principal axes of elevation in the chalk of the Hampshire basin, correlating the anticlinal of Kingsclere with that of Artois, the axis of Winchester with that of Bresse, and the line of elevation of the Isles of Wight and Purbeck with that of the country of Bray. The formation of the Straits of Dover has no direct relation with this series of great folds, since it runs perpendicular to them.

To the last number of the *Annales des Sciences Géologiques*, MM. Hébert and Toucas contribute a valuable paper containing a description of the Basin of Urchaux, one of the four chalk basins of France, representing gulfs in the Cretaceous Sea, the three others being the Paris basin, the Bas-

of Aquitaine, and that of Touraine. This forms one of a series of papers on the Upper Cretaceous rocks of France.

Jættegryder, or Giants' Cauldrons, is the name popularly given in Norway to deep hollows, varying in size, shape, and direction, scooped out in the solid rocks, and generally filled with water containing rounded stones. Many of these curious cavities in the neighbourhood of Christiania have been examined by Professor Kjerulf and his pupils, and have been described by Messrs. Brøgger and Reusch, both in the *Journal* of the Geological Society of London, and in the *Zeitschrift* of the Berlin Society. The authors believe that the cavities have been formed, or at least enlarged, by stones whirled round by a powerful rush of water during the ice-period. Professor Sexe has also recently published a memoir on the origin of these cavities. He is inclined to refer their formation to the friction of stones moved by a rotating column of ice which has been pressed down into hollows in the rock.

FROM a prospectus recently issued by the committee engaged in the exploration of the Settle Caves, we learn with regret that the work is likely to be materially restricted by lack of funds. Those who have watched the progress of the investigations at the Victoria Cave and know what interesting results have already been attained, confidently look forward to valuable discoveries in the future, if the explorations can only be continued with spirit. The cave is perhaps the most important historic cavern in the country; it was also inhabited by man in the neolithic age; it contains at a yet lower level the remains of pleistocene mammals, and a human bone has been brought to light from a bed of clay, which is regarded by Mr. R. H. Tiddeman, who has carefully studied the deposits in the cave, as of pre-glacial age. A fair prospect of future discoveries should stimulate the prosecution of this work, and support the appeal which the committee has been forced to make. Mr. Birkbeck, of Settle, is the honorary treasurer.

MR. WILLETT, as Honorary Secretary of the Sub-Wealden Exploration, has just issued his eleventh quarterly Report. It appears that the new bore-hole which was commenced on February 11, had reached a depth of 1,095 feet on May 26. It is, therefore, considerably deeper than the former boring; in fact, all is new ground below 1,018 feet. The clay which has so long been the prevailing rock gave way, between 995 and 1,040 feet, to a hard mottled sandstone. But notwithstanding this lithological change, the uncomfortable conclusion has been forced upon the committee that the bore is still in the *Kimeridge* clay. The evidence supposed to have been afforded by the occurrence of *Ammonites Jason*, that the Oxford clay had been reached, is now believed to be fallacious. The committee has determined, however, to proceed with the work to 1,500 feet, but unless new subscriptions fall in there is fear that the undertaking may then have to be abandoned.

MEETINGS OF SOCIETIES.

CAMBRIDGE PHILOLOGICAL SOCIETY (Thursday, May 20).

PROFESSOR COWELL, President, in the Chair. The Rev. W. W. Skeat made remarks on "Doublets," or words having a double form. These have arisen in English in five ways at least. We have (1) words in which both forms are of native origin; (2) words in which both forms are French; (3) French and Latin forms; (4) words French in form, but Teutonic in origin, or where one of the words is French in form; (5) the doublets which have arisen from a native source on the one hand, and from a classical source on the other.

In a paper on *arcesso* and *accerso*, by Mr. A. S. Wilkins, the writer totally separated the two

words from each other; and would explain *arcesso* as a compound of a lost simple verb formed from a primitive root *kars* (= Sanskrit *karsh*, "to draw, tear, plough"); cf. the lost simple verbs *-oleo*, "to grow," *-perio*, and *-cello*. This relation of two distinct but confused words, such as *arcesso* and *accerso*, would throw light on the similar pair *permities* and *pernicies*.

Professor Mayor made remarks on the phrases "to save appearances," and "in puris naturalibus;" and criticisms by Mr. R. C. Jebb and Mr. F. A. Paley were also read on *τραχυλίτις* as occurring in Theophrastus, p. 103 (Mr. Jebb's edition).

PHYSICAL SOCIETY (Saturday, May 22).

PROFESSOR GLADSTONE, F.R.S., President, in the Chair. The names of the following candidates for election were read for the first time:—Lord Lindsay, F.R.S., Sir W. Thomson, F.R.S., and Professor Sylvester, M.A., F.R.S.

Mr. Spottiswoode, F.R.S., exhibited and described a "Revolving Polariscopes." A luminous beam passes from a small circular hole in a diaphragm through a polariscopes, the analyser of which is a double image prism, the size of the hole being so arranged that the two luminous discs shall be clear of each other. If the prism be made to revolve rapidly, one of the discs revolves round the other and is merged into a ring of light which is interrupted at opposite sides by a dark shaded band, the position of which depends upon the position of the original plane of polarisation. The discs may be coloured by inserting a selenite plate, and the rapid revolution of the analyser then gives alternating segments of complementary colours, or, if a quartz plate be used, the rotating disc passes successively, twice in a revolution, through all the colours of the spectrum, and when the revolution is rapid merges into a prismatic ring.

The effect of the interposition of a $\frac{1}{4}$ -undulation plate, which converts plane into circularly polarised light, was then shown, and Mr. Spottiswoode also interposed a concave plate of quartz, and exhibited the effect of rotation on the characteristic rings of quartz.

Professor Adams, F.R.S., exhibited a polariscopes adapted for showing the optic axes of crystals in which they are much inclined to each other, as in the case of topaz. The part of the instrument by which this is effected consists of a frame in which the crystal is supported between two hemispherical lenses, the common centre of which is at the centre of the crystal. The frame is capable of motion round an axis at right angles to that of the instrument. By this means each of the axes can be brought under the cross wires, and the space through which the frame is moved affords a means of determining the angle between the axes of the crystal. The crystal may be immersed in a liquid in cases in which its optic axes are too far apart to be seen in air.

Dr. Mills made a verbal communication on "Fusion-Point and Thermometry." His apparatus for fusion-points consisted essentially of a beaker, in which stood an inverted funnel, the shortened stem of which carried a test-tube, supported by a contraction at its base. The test-tube contains naphtha of high boiling-point, and the thermometer and capillary tube containing the substance occupying its centre; the funnel has four equidistant semicircular cuts at the end of its stem, and six on its lip; the beaker is nearly filled with strong oil of vitriol, and has a wooden cover; on the application of heat below the beaker warm oil of vitriol ascends in the funnel, and cold oil of vitriol descending, enters at the lip; thus, an automatic stirring is kept up, and the mercury in the thermometer rises so regularly as to appear perfectly continuous in course even under considerable magnifying power.

The manner of preparing and filling the capillary tubes was described.

Attention was then drawn to the "zero error" of thermometers. In thermometers which have not been much used, the zero error must always be

determined immediately after experiment. It is also generally necessary to correct for the projection of the thermometer beyond its bath. This correction had been experimentally determined by the author, and required from 1,500 to 2,000 observations of temperature for each of four instruments used. It was ascertained that the well-known expression—

$$C = -0001545 (T - t) N$$

given by Regnault and Kopp is not supported by actual trial. If we write the expression thus—

$$C = x (T - t) N$$

experiment shows that x depends on the length N exposed, and

$$x = \alpha + \beta N.$$

For lengths of about $25''$ x is about $\cdot 00013$, and increases about $\cdot 00001$ for every additional $25''$. The exact values of α and β require, however, to be ascertained for each instrument.

Mr. Bauerman, F.G.S., described and illustrated a very simple method for ascertaining the electric conductivity of various forms of carbon. The method, which was originally devised by Dr. von Kobell, consists in holding a fragment of the substance to be tested with a strip of zinc, bent in a U form, and immersing it in a solution of copper sulphate. In the case of a bad conductor a deposit of copper takes place solely on the surface of the zinc, but when a good conductor is employed a zinc-carbon couple is formed, and a deposit takes place on the surface of the carbon. Numerous specimens were exhibited which showed that the conducting power is greatest in coal which has been subjected to a great degree of heat, and the lowest temperature at which this change takes place appears, in the case of anthracite, to be between the melting points of zinc and silver. Such experiments appear to be specially important as giving a clue to the temperature at which anthracitic metamorphism has been effected by the intrusion of igneous rock.

Professor Woodward exhibited an apparatus for building up model cones and craters. It consists of a wooden trough about 18 inches long, with sloping sides; at the bottom of the trough a bladed screw carries forward the ashes, sawdust, or other material used, to an opening through which air from a powerful bellows is forced upwards. A board 3 or 4 feet square with a hole in the centre is placed over the air jet, and on this the crater is formed. Several of the peculiarities of natural cones may thus be illustrated, and the structures shown by using sawdust of various colours.

ANTHROPOLOGICAL INSTITUTE (Tuesday, May 25).

COLONEL A. LANE FOX, President, in the Chair. Mr. T. G. Biddle Lloyd read the following papers: "The Beothucs of Newfoundland" and "The Stone Implements of Newfoundland." The first was a continuation of one read before the Institute the previous session, and contained further experiences of the author in Newfoundland, which island he had recently re-visited. The Beothucs had been extinct for many years, so that no personal experience of them had been possible to the author. He had, however, ascertained that they possessed several of the characteristics belonging to many of the tribes inhabiting North America, while, on the other hand, they differed from them in the following peculiarities:—lightness of complexion, the use of trenches in their wigwags for sleeping places, the peculiar form of the canoe, the custom of living in a state of isolation apart from the white inhabitants of the island, and their persistent refusal to submit to any attempt to civilise them. They were also remarkable for their inability to domesticate the dog: pottery as an art was unknown to them. Mr. Lloyd went at great length into the various theories of the origin of the Beothucs and their relations to the Esquimaux and other peoples. Professor Busk contributed a supplementary paper minutely describing two Beothuc skulls. He found that they

presented all the characteristics of the normal brachycephalic type of the Red Indian skull. In his second paper Mr. Lloyd described the stone implements he had brought and exhibited from Newfoundland, consisting of axes, chisels, gouges, spear and arrow heads, scrapers or planers, fish hooks with cores and flakes, whetstones, rubbing stones, sinkers, and stone vessels.

Mr. Park Harrison exhibited and described five photographs from Tahiti, of Easter Island wooden tablets. Mr. H. Taylor exhibited a series of thirty-four fine photographs of people of the South Sea Islands.

PSYCHOLOGICAL SOCIETY (Wednesday, May 26).

MR. SERJEANT COX, President, in the Chair. The discussion on Mr. Harris's paper "On the Psychology of Memory," was resumed by the Rev. W. S. Moses, Major Owen, Mr. Coffin, and others. The question chiefly debated was whether memory be a faculty of the brain or of the soul, the majority contending that the brain received the impressions, the memory of which was retained by the soul. Many cases were cited illustrative of the argument. One of the speakers who had been restored to life after apparent drowning gave a graphic description of the manner in which the events of his life then passed before him like a panorama. A discussion followed on Mr. Serjeant Cox's paper "On some Phenomena of Sleep and Dream," read at the last meeting. The principal contention was whether there be any, and what, resemblance between the mental condition in dream and in insanity. Many illustrative facts were adduced by the speakers. In consequence of the length of these discussions the reading of Mr. Serjeant Cox's paper "On the Duality of the Mind" was deferred to Wednesday, June 9, when the evening will be wholly devoted to the discussion. Reports were read of psychological facts and phenomena, communicated by several correspondents.

GEOLOGICAL SOCIETY (Wednesday, May 26).

J. EVANS, Esq., F.R.S., President, in the Chair. In some "Notes on Peculiarities in the Microscopic Structure of Felspars," Mr. Frank Rutley described a number of sections of various felspars, prepared for microscopic study. Some of the sections of orthoclase showed the cross-hatchings which have been taken to indicate admixture with plagioclase. In other specimens the striae were confined to included patches, while in others again they were developed in only one direction. In a crystal from the trachyte of Berkum, on the Rhine, the cross-striations were confined to the opposite sides of two curves, resembling the hyperbolic curves, with pectinate markings, observed by the author in Mexican obsidian. Attention was called to the fallacies connected with the use of striae in distinguishing microscopically between orthoclase and plagioclase. Mr. Ralph Tate described the Lias of Radstock, in Somersetshire, giving a section of an old quarry which showed the Lower Lias subdivided into the zones of *Ammonites angulatus* and *planorbis*, *A. Bucklandi* and *A. arynotus*; the whole being covered with the conglomerate at the base of the Middle Lias. Professor Seeley described the axis of a Dinosaur from the Wealden beds of Brook, in the Isle of Wight; this bone may probably be referred to *Iguanodon*. He also read a paper "On an Ornithosaurian from the Purbeck Limestone of Langton, near Swanage," and described this under the name of *Doratorhynchus macrurus*. Two specimens were found in 1868, and referred to *Pterodactylus*, but the author has been led to regard them as representative of a new genus. The vertebrae originally taken for caudal are probably cervical.

ROYAL SOCIETY (Thursday, May 27).

THE following papers were read:—"On the Liqation of Alloys of Silver and Copper," by Colonel J. T. Smith; "On Reversed Tracings,"

by Dr. Handfield Jones: "Note on the Discharge of Ova and its relation in point of time to Menstruation," by Dr. J. Williams; "Note on Mr. Mallet's Paper on the Mechanism of Stromboli," by R. Mallet; "Electrodynamic Qualities of Metals, Part VI. Effects of Stress on Magnetisation," by Sir William Thomson.

FINE ART.

THE ROYAL ACADEMY EXHIBITION.

(Fourth Notice.)

Domestic Subjects (continued).—M. Tissot is a painter of uncommon tact and versatility, who has tried various styles, and none without a true measure of attainment: he seems now to settle himself down for a while in one of the least satisfying of the many possible branches of art—that of fashionable life. This he treats with an eye to its festive and scenic aspects, and also to individual character, of a portraitlike kind in the heads. *Hush* represents an afternoon performance by a lady violinist in a house of the *haut ton*: every figure is a personage, not merely a clothes-horse: English national character has evidently been aimed at, and has been caught in a few instances, not in many. Two Indian princes (less well painted than the other figures) are present: several of the guests have seated themselves on the stairs to listen. The half-light, and the general effect of bright yet as a whole subdued colour, are very true, and the entire thing extremely complete in its artificial simplicity. *The Bunch of Lilacs* is a minor example of the same painter. *War-Time* is treated by Mr. Briton Rivière in a grave and manly spirit, pathetic when we realise to ourselves the emotion intended, as expressed in these lines by Dobell:—

"Over valley and wold,
Wherever I turn my head,
There's a mildew and a mould;
The sun's going out overhead,
And I'm very cold,
And Tommy's dead."

An aged shepherd is seen, holding a newspaper with bad news from the seat of war, looking over a stone fence, with a set and hopeless expression of countenance: the objects are vague to his eyes, and the thoughts to his mind—vague, but not the less oppressive. His dog alone sympathises with him, and seems disconcerted at his silence and abstraction. Mr. Hennessy paints *The Votive Offering*: "Many picturesque chapels along the coast of Normandy are dedicated to Notre Dame des Flots; and thither resort the simple and devout Norman sailor and his family, with prayers for a prosperous voyage, or thanks for dangers past, frequently bearing as an offering a carefully-fashioned model of his ship." This is an able painting, of considerable size, carefully executed, but rather deficient in concentration, or at least in point, of subject-matter: the back of the old curé who is seated on the heights, looking out on the sea, is one of the best items, and adds materially to the likeness of the whole composition. Another important subject of peasant life is that of Mr. Halswelle — *Lo Spasalizio, bringing Home the Bride*—from the neighbourhood of Arpino in the Abruzzi. The catalogue tells us of the fine physical type of the bride and bridegroom, of the great meal-chest carried by one of the escort, of the pifferari playing, and the boys scrambling for sweetmeats: all this is realised on the canvas in vigorously designed forms, and with a large amount of general strength and decision, qualifying the work to rank among the prominent modern pictures of national costume and manners. From Italy we pass to Spain in Mr. Burgess's painting of *The Barber's Prodigy*. A customer is kept waiting with lathered chin while the paternal barber shows about to the dispensers of reputation in his quarter the painted sketches which his little boy—who would have believed it?—has produced:

the proud satisfaction of the good-looking mother is well depicted, and there is abundance of true expression throughout. The costume takes us back to nearly a hundred years ago. France comes next, with the *Sain et Sauf* of Mr. Stone. A French linesman is rushing into his country-home, and finds his hearty delighted wife laid up in bed after a confinement: his little girl will not allow a minute for conjugal greetings, but motions papa forthwith towards the cradle wherein the new small baby is lying at rest. The handling of this work is bold, and the story told most perspicuously: it passes from figure to figure in a well-linked chain. The father, as soon as he can be allowed to talk otherwise than in hurried exclamations of delight and affection, will no doubt have plenty to relate of his military vicissitudes, and his wife will be profuse of domestic anecdotes. *Too Good to be True* is a clever and pleasant picture by Mr. Orchardson, although rather thin in subject-matter for so goodly a canvas. An elderly fruiterer, in his open-fronted shop, good-naturedly holds out an orange, to be taken by a shabby urchin with a spinning-top; the small scapegrace, whose position in life has not accustomed him to such blandishments, hesitates whether to advance or not, but his elder sister reassures him—the orange is actually to be his. *School Revisited*, by Mr. Leslie, shows us a young lady, *lancée* upon her own small eddy of the great whirlpool the world, who has come to behold the school of her girlhood: she is showing her rings—amid which a wedding-ring does not yet figure—to an admiring and coy circle of younger pupils: her white lap-dog is also to be inspected, and with discretion handled. This is an agreeable picture, kept down, in execution as well as in theme, to the level of an innocent simplicity. *The Path by the River* is a smaller picture by the same artist, but ranks the higher of the two: it is flushed with the golden sunshine of late summer, and with a tone of sweet and pensive reverie. A damsel, with her book by the riverside, is musing; the trees droop and whisper; crows (somewhat too small for their place in the composition) flit to and fro. A picture conspicuous for force and efficiency, both in expression and in execution, is *Our Soldiers, Past and Future* by Mr. A. Stocks: if the painter will only take care not to fall into a habit of offhand vigour of working, he seems capable of achieving whatever he may be minded to undertake. This picture represents a boy of about nine reading, in a modest but not comfortless interior, the *Peninsular War* of Sir William Napier to his aged grandfather, a military pensioner slightly hard of hearing: the child's face glows, and he almost rises in his seat, as his tongue and mind follow on the track of the valorous deeds in which perchance his now superannuated auditor bore a part. We find not many things in the Exhibition deserving to be preferred to this on general grounds; and, among those which can be said to compete with it on its own footing, hardly any. The same painter contributes two minor works, not of special mark, though creditable enough: *A Little Maid-of-all-Work* and *A Litter of Young Rabbits*.

Four pictures by Mr. Calderon may be counted among the domestic works. *Refurbishing, St. Trophime, Arles*, is a simple yet not unpeculiar subject, showing his skill at its best. Three of the faces (we except the fourth, that of the elderly curé, which has a humorous and indeed a rather ignoble cast) are of a more obvious and sympathetic order of good looks than the painter mostly affects: especially the young vicar, who stands with folded arms. A bright-visaged Arlésienne is polishing the silver statuette of the titular saint, just within one of the cloister arches: her companion is bringing some brass candlesticks and a censer, and other articles of church-plate lie in the foreground. The ancient and beautiful white architecture which forms the setting to this group is a powerful factor in the agreeableness of the total

impression. *Les Coquettes, Arles*, is another slightly and pleasant work. The coquette in chief, with two female friends, is walking along the street, taking the least—which means that she implies the most—practicable notice of a strapping young fellow behind, who follows with his reed-stemmed and clay-bowled tobacco-pipe; he smiles with sufficient self-confidence, having just as much aptitude at flirtation as his charmer. Two other women gaze after the others; they know what game is being played. *Toujours Fidèle*—a young woman carrying a wreath of immortelles to the cemetery, leaving the cornfields behind her—is hardly so good as the preceding two; the sentiment, though adequate and unforced, is rather cheaply obtained, and the handling tends to wooliness. *Great Sport* represents two children, knee-deep in grass and flowers, pursuing a butterfly. Mr. Marks must, we should think, have been rather “hard-up” for a subject for his larger canvas before he could reconcile himself to painting on this considerable scale such patent inanity as *The Jolly Postboys*, the three who, “sitting at the Dragon” (as the song runs), “determined to finish out the flagon.” A country barmaid is introduced to complete the group, and to tickle possible purchasers with a pretty face. The only sort of pictorial motive that we can discover in this competently painted work is the odd costume of the post-boys, with their bright blue jackets, tall white hats, white tights, and long boots; and even this is rather anti-pictorial than pictorial. The smaller work of Mr. Marks, *A Merrie Jest*, is to be preferred. A motto in verse (perhaps written by the painter himself?) is appended, setting forth the irrepressible resolve of a joker to find a listener for his funny anecdote—a listener, be he good or bad. The personages are a red-costumed burgher of the days of Edward VI., accosting, in a green country nook, the local parson or schoolmaster, who listens to his jocosity with a patient smile—acquiescent, but a little bored. A terrier is seated apart on the steps leading to a thicket. *Caught* is a nicely-invented composition by Mr. Storey. A middle-aged gentleman addicted to angling stands up in his boat, and looks over a garden-wall, on the hither side of which a young lady habited in a sack sets to at disentangling his fishing-tackle from her own, in which it had caught. If only he can hook a heavy trout as thoroughly as he feels that he is himself getting hooked, the day's sport will not have been lost. Among the more important domestic pictures, in scale and subject-matter, is *The Emigrants' Departure*, by Mr. F. Morgan; the sentiment and execution also are commendable, and gain upon one as one looks. The emigrants are leaving their hamlet for a sea-port; their relatives and neighbours, a varied but contemporaneous group, are out in the waning light, on the peaceful secluded country-side, to watch till the last moment, and linger after the last. For all of them the sense of retrospect is strong and moving: for some there is the onlook likewise, but, in the feeling of the moment, it forms only a faint and distant intermingling.

To these we may add the following domestic subjects. We give them as they happen to come, merely dividing them into (a) pictures by native female artists; (b) pictures by native male artists; (c) pictures by artists whom we know or infer to be of foreign nationality or domicile.

(a) Mrs. Staples, *The Record*. Two lovers in a wood, the man cutting initials on the bark of a tree. This is a very clever picture, with a good warm tone of colour, and well-skilled touch: it does not succeed, however, in making the personages interesting. *Love me, love me not*, by the same lady,—a girl seated in a wheelbarrow, trifling with the affections of the gardener,—has its share of similar merit, but decidedly less in degree. Miss A. Havers, *A Montevidean Carnival*: “The ladies, for the most part monopolising the roofs of the houses, pour down jugs and bucketsful [of water] on the heads of their admirers;

while these return the fire briskly with all manner of ingenious squirts, eggs filled with water, bouquets, wreaths, &c.” As the foregoing citation suggests, the planning of this composition is uncommon: it is efficiently treated, with a sense of grace, and subdued nice tone. Miss L. Starr, *Hardly Earned*. The subject is a young and needy daily governess, who has come home after a trying day's work in wet weather. Her music-roll lies on the battered cane seat of a chair that has no back; her soppy boots have been taken off; she slumbers by the fireside, but the fire has gone out, and her tea-kettle has ceased to simmer. The face is sweet and pale, with a pleasing turn towards the right. The picture, well executed within the scope of its attempt, excites many a sympathetic comment from the visitors, and deserves to do so. Miss M. Brooks, *Little Nell at the Window* (from Dickens's *Old Curiosity Shop*). A half-figure ably painted. The face of Nell does not, perhaps, closely respond to the prevalent impression of the personage, but it has a good deal of character. Mrs. Alma-Tadema, *A Bird's Cage*. The chief object here is the cage itself—a very large and curious one, of old-world German make; the picture is decidedly pleasant, though some additional firmness of work in the figures would benefit them.

See also—Mrs. Jopling, *A Female Cinderella*; Miss Eva Ward, *Absent*; Mrs. Ward, *The Poet's First Love* (an anecdote of the Ettrick Shepherd, James Hogg); Miss M. Backhouse, *Oh my love's like the red red rose*.

(b) J. D. Watson, *The Gleaner's Harvest*, in a style of picturesque literalism, with blurred but effective handling. P. R. Morris, *The Widow's Harvest*. She is leaving the gleaner's-field, accompanied by her three girls and a dog: her boy is securing the acquisitions of the day; done with ability, and no lack of elegance. *The Movers*, a talented realisation of difficult actions, which have been well studied, and are here rendered in a style having some affinity to that of the French school. F. G. Cootman, *The Weary Gleaner*: she is binding up her hair, and the air of fatigue is very truly conveyed. *Vigilance and Sleep*: a girl of some six years of age, half-clothed, with ruddy hair, is lying on a grassy bank, a wiry terrier beside her; there is a promising quality of design in this work. A. Dixon, *To be left till called for*; a small girl perched up on a bench in a railway waiting-room, quaintly prim. Crowe, *A Sheep-shearing Match*, taking place under an awning, the umpires sitting apart with cigars and a newspaper, a country-girl and others looking on; very accurately studied, and realised to the life in its abundant details. Nicol, *The New Vintage*; *Always tell the Truth*; *The Sabbath Day*. The first of these is a continental scene, perhaps in Marseilles or Bordeaux; the second and third are Scotch—one of the two figures in the second, and the sole figure in the third, being an ancient country dame of massive and abashing aspect both in face and costume. All three are, as usual with Mr. Nicol, strongly painted, with a vigour which artistic eyes can value, but which appeals more directly to the inartistic. The second picture is unsightly, but true in expression—a grandam lecturing a peccant little boy. The third is memorable in its way—the same old lady on her way to kirk through the Scotch country-side, with hills and rills, in a determined downpour, from which her ponderous umbrella protects her as it may. Prinsep, *I believe*. This represents agreeably a little girl in church, with a large white cap: we don't know what the peculiarity of costume indicates—perhaps some one of the many millinery-demonstrations of current Anglicanism. The grey dress, red hassock, and white wall, complete the colour-effect: the demure little damsel stands with joined hands, “believing” what the Apostles' Creed, and her spiritual pastors and masters, tell her to believe. The far more important work by this painter, *Home from Gleaning*—a work of really fine as well as attractive cali-

bre—has been already spoken of in our columns. Calthrop, *Getting Better*; a father and mother with a convalescent child; the interior is lighted partly through the window, but principally from the fire; a picture much above the average in strength and effective truthfulness. Fyfe, *A Good Catholic*: a figure of a contadinella of tender age, full-length, holding her beads and a loaf of bread, tellingly painted. Partington, *Hard Weather*—with the motto from Burns:—

“I thought me on the ourie cattle
Or silly sheep wha bide this brattle
O' winter war.”

The picture presents accordingly an old shepherd in a snowy winter scene, with his flock: the facts are realised in a faithful uncompromising spirit. Striking and true, the work becomes of necessity somewhat dismal: its style has a certain affinity to that of Millet. J. Clark, *Private and Confidential*: two little school-girls, with their slates, seated on a bench; a genuine success in its naïve childlike way: this must, we should imagine, be one of the most popular pictures in the exhibition. *The Sick Chicken* is also a superior specimen of the same rather timid and restricted but sincere painter. E. H. Fahey, *Queen Lily and Rose in One*; a conspicuous floral figure-picture, moderately well managed. Scannell, *L'Indovina*; the wise woman is truly characterised, and the young contadina to whom she interprets the future is graceful. Garland, *A Game of Four Corners*; slightly executed, but broad enough, and lifelike. W. Weekes, *A foolish son is a grief to his father, and bitterness to her that bare him*. The scene is the office of a low money-lending attorney: there is a prodigal son, with his parents much exercised in mind and means by his irregularities; a dog, his last friend unimposed upon and unestranged, licks his hand—a well-found incident. This is a forcible work, with expression tending towards exaggeration. T. Graham, *From his flocks strayed Corydon*—to make love to a rosy wench. A subject recalling to some extent the *Hireling Shepherd* which bore its solid part, years ago, in establishing the reputation of Mr. Holman Hunt. The present work is, however, as slight as that was strenuous and elaborate, but it has some true artistic impulse. Mr. Graham has turned his fine gifts to less valuable account than we had hoped he would do. F. Barnard, *Fifty Years ago*. The scene is in a barber's shop. The barber is the village wit, and he is now, besides his professional avocation, engaged in chaffing a squire whose muddy hat shows that he has had a tumble—over-free potatoes being no doubt the cause. There are five other figures in the composition. We regard Mr. Barnard as an artist of very exceptional talent, to which this picture once again bears unstinted witness. But, as in another tonsorial subject of the present year (that by Mr. Hodgson spoken of in a previous article), we find here too much tendency to be funny in an obvious sort of way, to the neglect of that element of comeliness or artistic suavity which should never fail in a picture that has any pretension to being complete or permanently satisfactory. We trust that Mr. Barnard will in future years combine this essential gift with others which he eminently exemplifies—in especial, character, and executive facility equally rapid and realistic. G. Aikman, *A Peaceful Evening, War-News*: a clever picture, in which a seaside view is associated with the domestic interest of the figures. F. W. W. Topham, *Market-day, Perugia*; groups scattered with dexterous unorderliness on the church-steps. Smallfield, *Town-nice, their First Day in a Country House*; an old-fashioned staircase picturesquely quaint, with two children in their night-dress, up in the early morning to peer about them; a pleasant little work. T. A. Jones, *Limerick Lasses*, dipping their feet in a runnell, on their way home from market; this is a well-sized and naturally treated picture, without much style. J. H. Hague, *The Ornithologist*; a sturdy homely old man in his

work-room, surrounded by all sorts of stuffed birds; he faces the window, presenting his back to the spectator. There is plenty of detail here, well characterised in a definite but not elaborate way; the colour is good, and the lighting and tone particularly so. It is a painting *d'un seul jet* (as the French say) in theme and method, and will be remembered hereafter by many to the credit of its author.

See also—C. Grpen, *Old Neighbours*; Shuckard, *Returning with the Spoils*; Frith, *St. Valentine's Day*; *Black and Blue Eyes*; Gow, *In Possession*; Cope, *Home-Attraction*; Burr, *Domestic Troubles*; J. M. Barber, *School-time*; A. L. Vernon, *Jealousy*; F. D. Hardy, *The Wedding-dress*.

(c) Perugini, *Tell him*: a lady at her writing-table is being urged, with kind insistency, by another, to make no secret of the love which she entertains for her correspondent. The painter has succeeded in telling this story very distinctly, by action and expression. A. Weisz, *Je suis mon Grand-père*; a child—not a boy, as one might expect, but a girl—has adopted the hat, stick, and big gloves, of her grandfather, her mother looking on, in a homely Swiss or German interior; well composed and nicely done. Frère, *Gathering Wood near Ecouen*, in thick-lying snow; one of the better recent specimens of this highly-prized painter, who has of late years produced (so far as we have seen) nothing entirely up to his mark of some fifteen years ago. J. L. Brown (Paris), *La Halte en Forêt*; a clever work of small dimensions. G. Bochmann, *Peasantry of Esthonia, West Russia, going to Market*, vigorously done, in a blocky mode of handling. Henriette Browne, *The Pet Goldfinch*: the bird is out of its cage, on the table at which a little girl is writing; a fair minor specimen of this able lady-painter. Israels, *Waiting for the Herring-boats*. Slight as is the handling of some of our native exhibitors, this foreign work surpasses in slowness, and sinks into the slovenly: in this respect it should count as a warning, not as an example. The numerous figures of women and children are almost doll-like in manner, and the sea approaches closely to the condition of soapbuds. A certain degree of skill is, no doubt, apparent; but such a production hardly claims to rank among pictures, rather among sketches. Linnig, *The Mother's Despair*: she is wailing, prone over the empty cradle—the infant, as we infer, being now on its way to the burying-ground. Broadly painted, and of adequate strength in sentiment.

See also—Boughton, *The Bearers of the Burden*; *A Path of Roses*; *A Grey Day* (these able and highly attractive works have been already reviewed in our pages); De Jonghe, *The Birthday Wishes*; Schäfer, *Home Lessons*.

W. M. ROSSETTI.

THE SALON OF 1875.

(Second Notice.)

Paris: May 28, 1875.

YOUR school has one great advantage over ours, in not being under the pretended direction of the State, or, as we call it here, "encouraged" by the State. On noble characters and manly natures such encouragement, it need hardly be said, never had any direct influence. Ever since the beginning of this century the great painters have all trained themselves independently of the Academy and the State, indifferent both to the glory and the orders they distributed. But this has not been the case with the majority. This influence has, in fact, been disastrous in its effect. It prevents men of more than average talent, who are not satisfied with painting subject-pictures, and require a large field for the development of their ideas, from establishing connexions with the municipalities of great provincial centres, which, with us, have a more marked diversity of origin than with you. It equally prevents them from putting themselves in communication either with the railway companies, who might advantageously em-

ploy them to decorate their principal stations in the large towns, or with other societies yet in their infancy, but growing every day more influential—societies which are being constantly recruited from the rich and bourgeois classes, and might furnish artists with piquant programmes. Thence a new school of art—modern art—will slowly develop itself. It will have the same diversity as the old, together with more vigour and more independence. At the present moment artists are in a visibly inferior position. They are subject to political changes. The appointment of a new Minister of the Beaux Arts is immediately felt in the studios. Thus the demand for battle-pieces ceased with the fall of the Empire, and the taste for disembowelled horses, for wounded soldiers smothered by the dead, for smoke intervening as a dramatic agent, for broken swords strewn upon the ground, began to die out. All this theatrical apparatus was no more serious than a performance at a circus. And yet war remains a fact which will unfortunately long continue to appeal to the popular mind, and it will be long before there will be a Salon without battle-pieces. The young generation who, either in Paris or in the provinces, under Gambetta's orders so bravely took a part in the defence of their country's soil and honour, recount their experiences in an almost realistic manner. M. A. de Neuville is perhaps the most enthusiastic. He has painted an episode of the campaign of the Army of the East with great spirit. On January 9, 1871, the men of the 18th Corps were engaged in taking possession of all the houses at Villersexel in which the Germans had barricaded themselves, and were making a stout resistance. Some Mobiles, under a heavy fire, have collected a heap of faggots before the door of one of the houses, and are proceeding to burn out the enemy whom they had failed to dislodge. M. A. de Neuville is a gentleman, and thought it would be discourteous to calumniate his enemies according to ancient custom, as well as stupid to represent them as cowardly. The attitude of the German officer standing exposed at the open window, coolly firing off his revolver at the young aggressors who are lighting the fire in the yard below, is very fine.

M. Auguste Lançon is a forcible painter, rather too forcible even; he seems to be trying to work out a problem of lights and shadows, vivid colours, and the result is that his painting in violence of tone resembles a majolica plate. I shall, therefore, not dwell on his picture, called *Les Echappées de Sedan*; a group of soldiers on the road to Mouzon, on the evening of September 1, 1870, gathered round a cart that has been shattered into pieces by an obus. It is truthful, touching, and simple, and resembles the letter of a well-informed correspondent. And the fact is, M. Lançon has only painted what he himself saw; he joined the army as *infirmier* at the very beginning of the campaign, was taken prisoner by the Prussians, escaped and came back to France just in time to enter Paris before the gates were shut.

But I wish, particularly, to call my readers' attention to M. Auguste Lançon's etchings. These are international productions, which are more easily exchanged and pass through more hands than paintings generally do. M. Lançon has engraved a certain number of etchings from the sketches he made during the war—interiors of churches in which the wounded were massed together, streets of villages destroyed by fire in which a charred corpse is lying in the last contortions, and a horse is wandering riderless; troops on the march in the dust and mud, sun and rain; whole droves of oxen smitten with pestilence in a single night, families herded together in the cellars of the catacombs during the bombardment, bodies being buried in the wide trenches after the fighting under the walls of Paris, &c., &c.

Since Goya's admirable series of sketches of the war in Spain came out I have never seen the chilling horrors of death so truthfully and feel-

ingly portrayed. These etchings convey a faithful expression of sudden death in action and lingering death from wounds and privation, and awake both horror and pity. M. Lançon is an artist of striking originality. But he is too severe, too hard, too naïf to attract the crowd as readily as more skilful and less emotional artists do—such theatrical costumiers, for instance, as the pupils of M. Meissonier and M. Gérôme. When the day of his success comes it will be great.

I have already said how strongly government influence and opinions are felt in the studios. The end of the Empire is seen in all its depravity in the number of nude women who have to excuse, not even that of beauty of form or splendour of tone, for displaying themselves thus unclothed, some lying extended on couches, others in the landscape. We do not wish to condemn the exhibition of the nude. We believe that our school owes the preservation of its technical superiority over all other Continental schools solely to its persistent study of the living model. Moreover, it is good for the public to take lessons in harmony and to be educated by the sight of the human form, and the female form especially, which is the summing up of all harmony. On this point our customs are more tolerant than yours. But it is a study which must be justified by the results produced. Otherwise these females become both ridiculous and objectionable: unfortunately this is too often the case.

There is a perfect avalanche of religious and mystical pictures. It is too palpably evident that since May 24 *l'ordre moral* has governed France. I see no harm in religious communities of every denomination decorating their edifices to suit their own particular taste, whatever that taste may be; but it is surely rather strong that the State should make all the forces of the contemporary school converge on so-called religious painting. The present Director of the Beaux Arts has made a great mistake in decreasing the general decoration of the Pantheon. Not only is he spoiling the interior aspect of a building the grandeur of which is in a measure due to the very nakedness of the walls, but he is creating a great disturbance generally in the minds of men. Religious manifestations of this kind call for such men as Orsel, or Perrin of Lyons, or Hippolyte Flandrin, minds with strong convictions and of a mystical turn. But our present Academicians or their pupils pass alternately from a mythological to a religious subject. M. Beruguereau, for instance (though he does not yet belong to the Academy, he shortly will), sends *Flore et Zéphyre* and *la Vierge, l'enfant Jésus et Saint Jean Baptiste*. Nobody looks at Flora because she has an *ennuyé* face, but right-thinking people are greatly pleased with the Virgin because she is pretty and has bright, clean feet. M. Caland—he does belong to the Academy!—exhibits at the same time a *Venus*, and an episode from the Book of Kings, *Thamar, outragée par Amnon, s'échappant d'enhaus dans la maison de son frère Absalom*. If only the Venus were beautiful instead of being a vulgar young woman half-clothed in rose-coloured drapery, I should be satisfied; likewise I should be quite content if there were any tendency to ethnographical or moral truth visible in his treatment of the biblical episode, either in the choice of types, in vigour of drawing or purity of colour. But nothing of the kind. Ever since the death of Ingres, the Institut has been drifting about like a vessel that has lost its rudder. This year it fills its best friends with the liveliest anxiety. M. Charles Louis Muller has sent, together with a *Roi Lear*, which is the outcome of Ducis rather than of Shakspeare, a composition that betrays a senility absolutely inexcusable in any immortal: a child left, *un instant seul*—that is the title of the picture, which is painted with gooseberry jelly—is pouring a spoonful of pee into a watch!

I am not drawing attention to these buffooneries from a mischievous desire to bring ridicule on art.

who are as it happens very indifferent to criticism—but in order to point out the danger of leaving the general direction of a school to a self-recruiting body!

The *grande peinture*, to use an administrative expression which the *grande critique* has at last made the public swallow, is also in great peril of death. Grand thoughts are expected of it, spectacles by which the heart is to be lifted up and the mind stirred, and which will appeal to all classes to exalt the grand sentiments. Instead of this, the pupils of the School of Rome think they have reached the desired end when they have laboriously covered their large canvases with meaningless colour and given extravagant gestures to heroes who are innocent of brains.

Our painters are surely off their guard! Study and progress are going on all around them. The whole people, the young, both women and men, are forming new opinions on every subject. On whom are we to count for the adornment of the public buildings where our large assemblies will be held, buildings which will serve as frames to the great *fêtes*, if our young artists do not learn to think and feel, as well as to paint? Last year the Salon medal, as it is called—the foundation of which, though useful in itself, exasperated the Institute, who looked upon it as a competitor of the prize of Rome—was awarded to a young man of the name of Lehoux, not by the jury, who refused to sanction the award, but by the Minister who would not yield to their ill-will. The deplorable idea was then conceived of sending him to Rome like the others, and thence he now sends a *Samson romping ses liens*, strained, mannered, violent, and as ridiculous as the Hercules of a fair who wants to play the bully. To make use of a noted expression, this young man is suffering from an *indigestion de Michel Ange*. Let him cure himself as quickly as possible. No medal of honour will be awarded for painting this year. The medal of honour for sculpture will be awarded either to M. Chapu for *La Jeunesse*, a decorative figure for Régnauld's funeral monument, which I have already described, or to M. Delaplanche for his *Instruction Maternelle*, a touching and beautiful group, as masterly as it is simple, which has won the sympathy of independent criticism generally.

The Salon prize will probably be awarded to an immense canvas of M. Becker's (a pupil of the Gérôme studio), conceived in the theatrical and superficial style of Paul Delaroche. The bodies of eight young men are hanging by their wrists on a gibbet, and seem to have died without convulsions. Rizpah, their mother, the concubine of Saul, is standing by, scaring away with a stick a vulture that has come to prey on the beloved bodies. The painter certainly deserves credit for undertaking such a vast subject, and for the manner in which he has acquitted himself of the task. But the absolute qualities are wanting which make a work live independently of the choice of subject, and render it impressive irrespective of all combinations for effect. They are purely pieces of workmanship which reflect honour on a pupil, or even on a school, but in whose production the generating functions of art have had no share. The old world is crumbling away!

I shall treat of subject-pictures, portraits, and landscapes in my next letter. PH. BURY.

ART SALES.

THE drawings were not included in the report last week of the Galichon collection:—F. dell' Abbate (Messer Nicolo), *Eight Angels carrying the Instruments of the Passion*, 820 fr.; Fra Bartolommeo, *Holy Family* (bought for the British Museum), 800 fr.; Berghem, *The Ford*, 800 fr.; Both, *The Stone Bridge*, 305 fr.; Botticelli, *Studies of Men*, 910 fr. (British Museum); Michael Angelo, *Fall of Phaeton*, 5,000 fr., and sketch for the *Last Judgment*, 5,000 fr.; Michael Angelo and

Rubens, *Ganymede*, 875 fr.; J. and D. Campagnola, *St. John the Baptist*, 2,500 fr.; A. Cano, *Holy Family in Repose*, 170 fr.; Cimabue, *Three Studies for a Martyr*, 850 fr.; L. di Credi, *Head of an Old Man*, 255 fr. (British Museum); A. Dürer, *Holy Family*, 525 fr., *Two Heads*, 2,850 fr.; Van Dyck, *Christ with the Crown of Thorns*, 4,400 fr., *Adrian Stalpent*, 4,000 fr.; J. van Eyck, *Philip the Good*, 6,000 fr.; B. Franco, *Dispute between Minerva and Arachne*, 700 fr.; Claude Lorraine, *Sunset upon the Sea*, 920 fr.; *The Ponte Molle*, 1,305 fr.; Giotto, *The Judgment of Joseph*, 1,000 fr.; E. de Laune, *Triumph of Faith*, 550 fr.; Fra F. Lippi, *Study for the Archangel Michael*, 1,650 fr.; *A Kneeling Angel*, 2,100 fr.; A. Mantegna, *Triumph of Caesar*, 1,600 fr. (British Museum); N. da Modena, eighteen designs for Borders, 780 fr.; P. Perugino, *Four Children*, 2,300 fr.; Rembrandt, *Judas restoring to the Priests the Price of his Betrayal*, 780 fr., *Cornelius Anselmo*, 7,300 fr.; Rosselli, three designs for the *Coronation of the Virgin*, 2,000 fr. (British Museum); Rosso, *The Three Fates Weaving the Life of Man*, 2,700 fr.; Rubens, *Drunkenness*, 2,300 fr.; Ruysdael, *Fishing*, 1,000 fr.; *Entrance to a Wood*, 1,110 fr.; Raffaello, *Flight of Lot with his Daughters*, 5,500 fr.; *Coronation of the Virgin*, 5,000 fr.; Van de Velde, *Sea Fight*, 180 fr., *Foul Weather*, 820 fr. L. da Vinci, first sketch for *The Adoration of the Magi* of Florence, 12,900 fr.; study for the picture of *St. Anne and the Virgin* (British Museum), 13,000 fr.; *Studies of Drapery*, 1,000 fr.; *Courier mounted on Horseback*, 5,500 fr.; *Three Studies for a Victory*, 2,025 fr.; *Beatrice d'Este and Ludovico Sforza*, 3,600 fr. Verocchio, *Seven Studies for a Child* (British Museum), 1,000 fr.; *Three Studies for a Child sitting*, 2,100 fr. Watteau, *Two Women sitting*, 1,420 fr. This magnificent collection realised above 510,000 fr. (20,400l.).

On the 22nd ult. were sold at the Salle Drouot the water-colour drawings of Gustave Doré:—*Christ carrying His Cross*, 1,900 fr.; *The Neophyte*, 1,500 fr.; *The Elevation of the Cross*, 1,900 fr.; *Roland*, 189 fr.; *The Circle of Fire*, 800 fr.; *The Agony*, 1,400 fr.; and *The Casemate*, 1,300 fr.: all these souvenirs of the war of 1870. *The Fortress of Hautes-Bruyères*, 1,100 fr.; *Sheep grazing in the Bois de Boulogne*, 1,380 fr.; *Encampment in the Bois de Boulogne*, 810 fr.; *A Relay of Artillery*, 1,100 fr.; *The Marseillaise*, 1,850 fr.; *Albace*, 1,060 fr.; *The Fairies*, 1,880 fr.; *The Troubadours*, 900 fr.; *Entrance of Gargantua into Paris*, 930 fr.; *La Puerta de Sarmental at Burgos*, 1,140 fr.; *Las Pobres de la Soledad at Burgos*, 780 fr.; *The Derby Stakes*, 1,800 fr.; *Return from the Derby*, 1,860 fr. The sale produced 60,000 fr. (2,400l.).

NOTES AND NEWS.

H.R.H. PRINCE LEOPOLD recently visited the studio of Mr. W. Britten, and Mr. Britten received a commission to carry out two paintings for his Royal Highness. The subject of one is a single figure—a *Greek Girl feeding Pigeons*; the other, a group of two, is from a design made by Mr. Britten a little while back, called *The Lesson of Love*. The painting of the girl feeding pigeons is now completed. The figure is seated on the brink of a fountain; in the background, buried in green woods, rises the grotto out of which the waters pour. A gleam of sunlight falls on the graceful figure in the foreground, lights up the pink-lilac draperies in which she is shrouded, and gives the attractive charm of warmth, and light penetrating within the recesses of cool green shades. Every part of the little composition has been studied with serious care, and worked out with infinite pains. It is precisely these qualities of conscientious labour and grave intention which distinguish Mr. Britten's work from that of most of the clever young men of his own age.

A HIGHLY interesting exhibition of works by Thomas Girtin has been held for some weeks past

in the premises of the Burlington Fine Arts Club, 17 Savile Row. Girtin deservedly bears a great name among connoisseurs; not only because he was an artist of quite exceptional mark in simple and forcible dignity of perception and composition, and in truthful decisive execution, but because he was the prime leader in the change which took place in water-colour painting "from mere tinting with light washes to the employment of local colour." In this change Turner co-operated with him, although the chief credit of the innovation is assigned to Girtin; at the present day, beyond the range of the connoisseur class, Girtin is himself chiefly remembered as an early friend of Turner. The two youths came together in a humble capacity in the studio of Raphael Smith, the engraver and printseller; they studied and progressed in concert. Girtin was born in 1773; he began to exhibit in 1794; painted in 1801 an oil-picture, with the view of competing for the Associateship of the Royal Academy, not bestowable upon painters in water-colour only; and in November, 1802, he died of consumption. The present collection contains three portraits of him by Opie, Dance, and Edridge: the last-named gives the most agreeable version of his face. Among the 136 works by Girtin here assembled, we may mention as specially noticeable—*Snowdon Range*; *Lincoln Cathedral* (7), very powerful; *Harewood Bridge*, extremely fine; *Distant View of Harewood*; *Harewood Castle*; *The Rocking-stone, Cornwall*; *Guisborough, Yorkshire*; *Durham* (80); *Turner's Farm, Wimbish, Essex*, with a good deal of clear colour; *The Stepping-stones, Bolton Abbey*; *Chepstow Castle, grand*; *Paris, from above Notre Dame*; *Kirkstall Abbey* (91); *Beddgelert*; *Mill at Stanstead, Essex*; *The White House, Chelsea Reach*, 1800 (to which the catalogue appends the note, "It is said that Turner declared this drawing to be finer than any painted by himself," and indeed the work is so excellent as to palliate even this excess of friendly zeal in over-statement); *Morpeth Bridge*, reputed to be the artist's last drawing; *Dartford*, pen and ink; *Knaresborough*.

We hear it rumoured that pictorial decorations on an extensive scale are to be undertaken in the Manchester Town Hall, one of the vastest buildings in the United Kingdom; and that the execution of these works is to be entrusted to Mr. Marks, A.R.A. Whether these statements are true or not we cannot take upon us to affirm; if true, the first statement is good news, and the second bad. Mr. Marks is undoubtedly a man of very considerable talent, and he is a proficient, and in some respects even a markedly clever painter: but why such a commission as this should smuggle itself into his single pocket, or go a-begging to Mr. Marks, of all men in the world, passes our comprehension. It is a commission of sufficient magnitude to be divided among several painters, and those the very best. If it is assigned to any one individual, the work will necessarily drag on for a vexatious length of time; and, if it is assigned to one or more of those artists who are not the best, the paintings, when executed, will be exasperating. Bottom the Weaver was not the finest possible actor for Pyramus; but, if the desire which he manifested in an early scene of the *Midsummer Night's Dream* had been humoured, and the whole *dramatis personae* had been allotted to him, the result would have been a good deal more disastrous and more ludicrous even than it proved. We trust that the Manchester men will show that they are not quite so ignorant of art-matters as this rumour represents them to be.

We regret to hear that Mr. Richard Burchett, the Head Master at the National Art Training School, South Kensington, died in Dublin on May 27. His age may have been about fifty-eight. Mr. Burchett was a painter by profession, and he has exhibited a not inconsiderable number of works from time to time, although his official and educational duties engrossed the greater part of his energies for many years past. Three of his

principal works, painted on a large scale, with numerous figures, and much vigour of expression, action, foreshortening, &c., were—*Edward IV. withheld by the Ecclesiastics from pursuing Lancasterian Fugitives into a Church; the Final Scene in Measure for Measure*; and the *Expulsion of Peasants by William the Conqueror, in laying out the New Forest*. The first-named picture contains a head studied from Cardinal Manning (Mr. Burchett was a zealous Roman Catholic); the last-named was in the International Exhibition of 1874.

A PORTRAIT of Handel, by Sir James Thornhill, from the collection of the late John Lodge Ellerton, Esq., has recently been presented to the Fitzwilliam Museum at Cambridge by Adam Lodge, Esq., of Woburn Lodge, Gilston Road, The Boltons, London.

WE earnestly hope that the town council of Liverpool will not let slip the opportunity that has now occurred to them of making a great experiment in mural painting for the adornment of their Council Chamber. At the suggestion of some influential lovers of art in the town, a design for a great fresco of "The Triumph of Commerce over the Elements of Barbarism" has been prepared by Mr. W. B. Richmond. Competent opinion speaks in the highest terms of the excellence of the design, and we cannot doubt that if the Council decide to have it put in execution, the decision will not only attest the growing culture of the community, but secure for the building in question an ornament of high and permanent value.

THE *Diritto* states that the Pope has resolved on carrying out his long projected plan of placing twelve statues round the cupola of St. Peter's, conformably to the designs of Michael Angelo. Twelve sculptors will each have a statue assigned to him, and the selection of artists will be carefully made to the exclusion of those who were not domiciled in Rome before 1870, and who have manifested any opposition to the cause of the Holy See. Pius IX. possesses all the resources necessary for the undertaking.

THE Municipal Council of Château Thierry have voted unanimously 4,000 fr. for the purchase of the house of La Fontaine, which is No. 13 in the street that bears his name.

THE jury of the Salon for 1875 has awarded the medal of honour for sculpture to M. Chapu, and none in the department of painting. The Prix du Salon falls to M. Cormon, for his picture entitled *La Mort de Ravana*. The other awards are as follows: (1) *Painting*: first-class medals—MM. Goupil, Jacquet, Courtat; second class—MM. Bastien Lepage, Silvestre, Eugène Leroux, Defaux, Sautai, Fantin-la-Tour, Wanters, Falguière, Beillanger, Weerts, Delobbe, Vuillefroy; third class—MM. Rapin, Delort, B. Constant, Poisson, Butin, de Penne, Carolus Duran, Herpin, E. Adan, M^{me}. Lavillette, Dupain, Cogen, Paul Colin, Torrents, Simon Durand, Yon, Denneulin, Bergeret, Zuber, Roll, Commère, Sain, Vayson, Weisz. (2) *Sculpture*: first class—MM. Lenoir, Degeorge; second class—MM. Morice, Moreau, Vauthier, Michel, Damé, Guilbert, Roubaud; 3rd class—MM. Laforesterie, Pallez, Devignes, Lefeuvre, Desbois, Geoffroy, Lançon, Cordonnier, Hux, Itasse, Louis Martin, Valton. (3) *Architecture*: first class—M. Dutert; 2nd class—MM. Baillargé, Louvier; 3rd class—MM. Bruyère, Formigé, Louis Sauvageot. (4) *Engraving*: 1st class—M. Huot; 2nd class—MM. Courty, Jacquet; 3rd class—MM. Gilbert, Froment, Lerat Ernest Boëtzel.

THE German papers announce the death, on May 21, of the steel engraver and painter, Adam Klein, at the advanced age of eighty-three. Klein, who was a native of Nürnberg, received his professional education at Vienna, where he entered the Imperial Academy of Arts as a student in 1811, and continued to make the Austrian capital his home till 1837, when he finally settled at Munich. He was best known as a painter of

animals, and of *genre* pictures in which animal life formed the principal subject; but although a careful and correct draughtsman, and an industrious artist, he is best known by his numerous etchings, some of which might be favourably compared with those of the best Dutch engravers. It is understood that he has left a complete collection of his own plates, and these will, it is to be hoped, be secured for the National Museum before the set gets broken up and separated.

THE statue of Mirabeau, which was to be placed in the Salle des Pas Perdus of the Palais de Justice at Aix, will be erected in a gallery of the museum of the town according to the original plan, when that statue was offered to Aix by the Imperial Government.

A LOTTERY has been projected at Vienna for the purpose of gaining funds for the erection of a monument to Schiller. A committee of ladies has been formed for carrying out the scheme with the Princess of Hohenlohe as their president.

THE Germanic Museum at Nürnberg has lately received another important addition, by the transference to it of the town collection of mediaeval works of art. This collection, which has hitherto been preserved in the old Rathhaus, consists of valuable examples of the old Nürnberg goldsmiths' work, especially a beautiful goblet formerly attributed to Wenzel Jamitzer, but now supposed to be by Paul Flynt, a fine collection of copper-plates, including an almost perfect set of Dürer's engravings, remarkably fine impressions, carvings in wood and ivory, glass paintings, several original models for the famous works of the Nürnberg workers in metal, and wood carvings by Veit Stoss and Peter Flotner. Truly if the Nürnberg Museum increases at the rate it has done lately, South Kensington will soon have a rival. We mentioned a few months ago the peculiar circumstances under which the Merkel family collection passed into its keeping.

M. BARBET DE JOUY, the conservator of the mediaeval collections of the Louvre, has been appointed to represent France at the Michelangelo centenary celebration in September. France has been extremely liberal in contributing reproductions of all the master's works in her possession, and her art authorities have done their utmost to promote the objects of the commission. The same can scarcely be said of those in England.

THE German landscape painter, Karl Reichardt, recently discovered in Venice six large tapestries of Gobelin manufacture, copied from Rubens's celebrated paintings in the gallery of the Prince of Liechtenstein in Vienna, representing events in the life of Decius Mus. It was known that these paintings were designed for the purpose of being worked in tapestry, but the tapestries themselves have never been known until now. They were bought by the Prince Solms, a nephew of the Prince of Liechtenstein.

THE annual picture exhibition in the Künstlerhaus at Vienna is now open, and is said to be a very good one, although it does not quite come up to the expectations that were formed about it. The numbers are small (not more than 400), only 200 artists having exhibited, but the quality makes up for the quantity, for only artists of established fame seem to have been admitted. Makart's great composition of *Antony and Cleopatra on the Nile* holds the place of honour and attracts great attention, but does not quite satisfy German criticism. Lenbach is represented by seven excellent portraits; L. Mayer, by a subject that he calls an Allegory—two life-size female figures placed opposite each other with no apparent connection between them; Professor Gripenkerl, by a Leda; Andreas Müller, by four small pictures of the various ages of history—The Golden, the Hellenic, the Mediaeval, and the Medicean; and the sculptor Victor Tilgner, by a series of ten portrait busts. This year is the first

that medals have been awarded by the Künstlerhaus. A jury of artists has now been formed, and medals are to be bestowed for the three best works of art of the year. It is tolerably certain that the first will fall to Makart, who exhibits five pictures beside his great *Cleopatra*, the second to Lenbach, and probably, the third to Victor Tilgner. Our Royal Academy and other picture exhibitions might take a hint from the decoration of the Künstlerhaus on the opening day of the exhibition. The works of art were rendered still more attractive by being placed, as it were, in a setting of nature. Beautiful floral decorations vied with the colours on the canvas and the sculpture was arranged in perfect arbours of foliage.

A VERY fine Etruscan vase in an admirable state of preservation has recently been bought at Angers by the Conservation des Antiques. It is seventy centimètres high, of black earthenware, with red designs representing the combat of the giants against the gods.

A COMMITTEE has been formed at Augsburg for the purpose of erecting a monument to Hans Holbein. The King of Bavaria is one of the largest subscribers. A design for it by Professor Widmann is at present being exhibited at the Augsburg Art Union, but it is not as yet chosen.

A LARGE panel painting by Rubens, representing the Virgin appearing to St. Francis, has, it is reported, been discovered in the church of Notre Dame, at Cassel. The circumstance that led to its discovery is thus related in the *Chronique*. It having been judged necessary that some of the pictures that ornamented the church of Cassel should be restored, the work was confided to a young artist of the town, who, on cleaning the picture of St. Francis, found to his astonishment that, as the thick coating of dirt that covered the picture gradually disappeared, a work by Rubens came to light.

THE first part of an important contribution to the history of engraving has just been published by M. Emmanuel Bocher, under the title *Les gravures françaises au XVIII^e siècle, ou Catalogue raisonné des estampes, eaux-fortes, pièces en couleur, au bistre, et au lavis, de 1700 à 1800, avec un portrait à l'eau-forte, par M. Lemaire*. This work can scarcely fail to be of great interest to connoisseurs and collectors, for, as the author says in his preface, there is a great gap in the history of art in the eighteenth century. This gap it has been his endeavour in some degree to fill up by gathering together "pour en former un ensemble, toutes les œuvres gravées par les artistes qui, de 1700 à 1800, ont occupé la France soit de leurs pincesaux, soit de leurs crayons."

M. REISER, the director of the National Museums in France, has recently addressed a note to the members of the National Assembly on the subject of certain ameliorations that might be effected in the administration of the French museums. The principal points and suggestions of this note have been published in the French daily papers and the *Chronique* of May 22. They are too long to enter upon here, but the principal end to which they all point is an augmentation of the budget, which, as every one interested in art complains, has been miserably insufficient during the last few years to fulfil the wants of a great art-loving nation.

THE *Zeitschrift für Bildende Kunst* opens this month with an historical and descriptive account of Schönbrunn, the Versailles of Vienna. A monograph has lately been written upon this favourite imperial castle by the Count de Crenneville, at the command of his royal master, the Emperor of Austria, and many interesting particulars about it have been made known. Robert Vischer finishes his valuable studies in Siena by a consideration of Sodoma's works in Mont' Oliveto Maggiore. Sodoma is a master who has lately received a good deal of notice from art critics, but Herr Vischer's detailed description and criticism of his frescoes from the life of St. Benedict com-

vey much new information and can scarcely fail to be of interest to all students of Italian art. Karl Woermann gives a foretaste of his forthcoming important work on *Landscape in Ancient Art*, by publishing the chapter on the landscape art of the old Egyptians. The impressions that these marvellous people received from external nature were, he points out, simple, but peculiar. The Nile dominated their landscape; beyond all was desert. It was naturally the same in their art. The plants and animals of the Nile are the only types represented. But for the representation of what we know as landscape in painting the Egyptians lacked the necessary technical means and skill. They only used a few simple colours and had no knowledge of shade, perspective, or modelling: landscape therefore was impossible to their art. Herr Redtenbach's views with regard to the architecture of St. Peter's at Rome, expressed in previous numbers of the journal, are controverted by Herr von Geymüller and many of them proved to be erroneous. A fine etching by Unger of the picture by Hobbema, a view of a town—*Stadtbild*—that we mentioned some time ago in the ACADEMY as having been exhibited by Herr Miethke at Vienna, forms the pictorial attraction of the number.

MR. R. J. JACKSON, of 29 Maida Vale, has recently executed a small terra-cotta bust of Mr. Irving. It is a slight work, but an unmistakable likeness, and records a moment of expression which is in itself attractive—the active intension of thought just touched by a shade of melancholy dreaming.

THE STAGE.

SALVINI AS HAMLET.

IF the perfection of acting is to realise exactly and minutely the ideas of the poet, then Signor Salvini's impersonation of Hamlet falls very far short of perfection: but if it be granted that the keynote of the performance is such as a cultivated ear will allow, it will be found to be harmonious in every detail. No one who has carefully studied the English play as Shakspeare wrote it can fail to have his prejudices somewhat ruffled; such critics as Goethe, Schlegel, and Coleridge would have been offended to the soul by this Italian actor. But it appears that Signor Salvini is wholly ignorant of the original text, of the glosses of German commentators, of the traditions of the English stage, and his former performances have proved beyond a doubt that he has not a jot of the Teuton in him. The materials on which he has worked have been a bald translation of the tragedy, pruned and clipped to the exigencies of Italian audiences. Whatever has a national ring in the play has been eliminated with care. And this is where all discussion of the matter must begin, that whatever may be thought of the merits of Signor Salvini's Hamlet, it is the Hamlet of Signor Salvini and not the Hamlet of Shakspeare.

The first noticeable point is that the character is played without a spark of humour and geniality. Mr. Irving may be remembered to have conceived it in the same way. Yet a mood of light banter was so common with Hamlet, that when the ghost had vanished, and the prince, wishing to conceal from his companions the purpose of his father's visit, tried to regain his wonted spirits in a burst of feverish mirth, Horatio and Marcellus detected nothing odd in it. Mr. Irving puts more into the scene than it can possibly bear: he utters the falconer's call of "Hillo, ho, ho, boy," as the short, sharp cry of a man on the verge of lunacy: makes a dark enigma of the jest that the villains of Denmark were arrant knaves, and omits altogether the shower of playful addresses to the old mole in the cellarage. Signor Salvini's method is simpler, for he avoids the entire scene. Indeed it may be taken as a rule that whenever there is a sudden transition in Hamlet's manner from grave to gay, from declam-

atory to sarcastic, Signor Salvini will have nothing to do with the humorous side. He will run no risks with an anticlimax. When Hamlet in good round oaths has called his uncle a villain, a smiling, damned villain, he is not to ask for his tables and set it down that one may smile and smile and be a villain. When the play has driven the murderer from the banquet hall, Hamlet's shriek of triumph is not to be marred by the couplet about the weeping of the stricken deer and the playing of the ungalled hart. Nor may attention be drawn from Hamlet's revenge to his whimsical interview with the players. But this exaggerated forcing of interest is quite in accordance with the practice of the modern school of acting, and would scarcely call for notice in another performer than Signor Salvini.

At the root of the actor's performance seems to be his desire to make the character a popular one. Hamlet must stand out in bold relief, and is therefore allowed no familiarity with Horatio, or Ophelia, or the courtiers, or the gravediggers. The Hamlet who was to teach Horatio the art of drinking deep: who reckoned his groans to his soul's idol, the celestial Ophelia: who let Polonius and Osric fool him to the top of his bent: who was undone by the equivocation of the grave-maker: has now to hold himself aloof from the world, malignant as a villain of melodrama and very much more impotent. He rails at this goodly frame, the earth, as a fallen angel might rail at heaven. He hurls invective at Ophelia as Mephistopheles reviles Marguerite for her innocence. He moralises on skulls with the cynical sneer of an Aretino. He is an operatic or a pantomimic figure. The noble Dane becomes an Italian with a *vendetta*, hasty in action and coarse in word. And yet the conception is a striking one; and if an English audience will accept a startlingly novel aspect of a traditional character, then the present performance only confirms the accepted opinion of the actor's merits. We have dwelt on his excellences so often as to make it superfluous to insist on them here, and will therefore merely say that by circumscribing the limits of his imagination Signor Salvini has been able to devote his dramatic genius to a careful elaboration of the details. Of the other performers the worst is the representative of Polonius, who is fortunately suffered to give his thoughts very little tongue; and the best is Signora Giovagnoli, who represented the madness of Ophelia with a weird beauty to which the stage is little accustomed.

WALTER MACLEANE.

AN infinite variety of contrasts may be drawn from the literary career of M. Adolphe Belot, author of *Le Testament de César Girodot*, one of the purest and best of modern plays, and of *Mdlle. Giraud, Ma Femme*, one of the foulest and worst of modern novels; but they would all have their origin in the fact that he has made a point of turning his versatile talent to whatever branch of literature he found at the moment to be most remunerative. Thus he came to write the series of nightmares called *Le Drame de la Rue de la Paix*, *L'Article XLV.*, *Le Parricide*, and *Lubin et Dacolard*; from the last two of which Messrs. Clément Scott and E. Manuel have taken their drama produced at the Mirror Theatre under the name of *The Detective*. M. Belot had more than a common tale of crime to tell. A certain Mdlle. Dalissier was found one morning with her throat cut, and a young girl of the neighbourhood, Pulchérie by name, discovered in the folds of her dress a dagger belonging to the son of the murdered woman. By concealing this dagger Pulchérie obtained the acquittal of Laurent Dalissier, but when she wished to devote her life to him found that he treated her with contempt, that he had engaged himself in the police with the intention of tracing his mother's murderer, and that he had finally brought to justice a rogue named Dacolard. Seeking him out she declared her love,

and, being goaded to madness by his disdain, "Bravo," she cried, "he talks of infamy, and gives himself proud airs. They are the aristocrats of crime, these sons of the guillotined;" and then when he listened in amaze to this outburst he learned that Dacolard, who was to be executed on the morrow, was his father. So when the axe of the guillotine fell he drank off a phial of poison, some of which the girl sucked from his lips and died in his arms, and the drama was brought to a fitting close by a picture of the excited populace singing ribald songs over the bodies of the parricide and his mistress. This pleasant little production has been humorously handled by the English adaptors, who have interpolated on their own responsibility several remarkable scenes in a prize-fighters' tent, where half the performers are able to conceal themselves in the straw and overhear the plans of the other half, and several still more remarkable episodes in a music-hall, where the detectives assemble in startling disguises, and the heroine, who has been singing comic songs, comes into the hall to hurl reproaches at her lover in the presence of the audience. But as the audience takes no sort of notice of her reproaches, she says she will return to "sing and smile, though her heart is breaking;" and the dramatists have not told us what was the effect of her songs and her smiles.

TO-NIGHT will be produced at the Princess's Theatre *Heartsease*, by James Mortimer, founded on *La Dame aux Camélias*; and at the St. James's Theatre *The Zoo*, by Messrs. B. Rowe and Arthur Sullivan.

THE comedy season of French plays at the Opéra Comique Theatre is brought to an end to-day, Saturday, with a morning and evening performance for the benefit of Mr. J. W. Currans, the well-known acting manager. The company has been playing during the week *Les Jocrisses de l'Amour*, of Barrière and Thiboust. On Monday the French performances at the Criterion Theatre will begin with *La Filleule du Roi*, in which M. Vogel's music will be sung by the company from the *Fantaisies Parisiennes* of Brussels.

MR. AÏDÉ's comedy will be produced on June 12 at the Court Theatre.

TUESDAY, June 29, is fixed as the date of Mr. Irving's last performance of the character of Hamlet.

THE Prince of Wales's Theatre revived Lord Lytton's comedy *Money* on Saturday last with great success. Mrs. Bancroft appeared as Lady Franklin, and Miss Ellen Terry as Clara Douglas: and it is needless to say that both characters were sustained with very excellent art.

THE Théâtre des Variétés, at Paris, has produced an opéra-bouffe by M. Serpette called *Le Manoir de Pictordu*. Isidore Flochardet is a journalist, an old liberal, true to the principles of '89, and wishing to retire, he buys the ancestral estates of the Count of Pictordu. But the Count regains the money he has lost at the gaming table and devises plans to eject the new occupier of his domains. The peasants are made to bring their fruits to Flochardet: it is a feudal custom, and each peasant must receive 500 francs. They bring their vegetables and take another 500 francs. Then come to him eight betrothed damsels, for the "droit du seigneur" has not been abolished at Pictordu. One of the eight is charming, and Flochardet is carried off by her.

THE most curious theatrical sign of the times at Paris is the revival of the old love for Scribe. The Odéon has been playing *Geneviève* and *La Demoiselle à Marier*. The Gymnase has been playing *La Protégée sans le savoir*. In the two first comedies Mdlle. Blanche Barretta has been making her last appearance before she enters the Comédie Française. The third has been revived in conjunction with *La Perle Noire* by Sardou.

THE Comédie Française is to produce *On ne badine pas avec l'Amour*, in order that M. Thiron and Mlle. Croizette may appear for the first time as the Baron and Camille respectively.

M. SARDOU's next play will be called *Le Remords*.

THE Polish theatre at Posen is a *fait accompli*. Polish art, says a correspondent, had till now no dwelling-place of its own in the province. It continued to exist by favour of the German manager of the town theatre, who gave up that building to the Polish company on certain days of the week. These actors, who arrived in Posen every autumn, also made use of the wooden summer theatre, which was, of course, but ill-fitted for winter performances. So things went on, till it became evident to the Poles that these expedients would not answer as a permanent arrangement. About three years since, the idea which had been long entertained in Posen of building a new German theatre began to acquire a definite shape. This decided the matter. The Poles see that the Germanisation of the province is the aim of the authorities, and perceive danger to their own language in the regulation requiring the use of German in schools. They therefore determined to provide a home wherein the Polish tongue may be heard without let or hindrance. The undertaking was immediately set on foot and pursued with great vigour, ground being bought in the Berliner Strasse, one of the principal thoroughfares of the town, until the original funds failed. An appeal was then made to the national feeling, which elicited a hearty response. Lotteries, private theatricals, and all the most approved methods of taxing the public were brought into play, collections for this object being even made at balls. Thus the work went on, and the theatre, which is to be opened in the autumn, is now finished, with the exception of the internal decorations, and remains a monument to the earnestness and perseverance of the Poles.

MUSIC.

FRENCH COMIC OPERA AT THE GAIETY.

A STRONGER contrast than that existing between such performances as those to which we are accustomed at the two Italian operas and those given by the very excellent French company at present engaged at Mr. Hollingshead's theatre in the Strand, can hardly be imagined. At both the opera houses the star system is in the ascendant. One or two parts will probably be admirably sustained by leading favourites, while the rest will be given to indifferent performers, and the "supers" in general seem to have about as much idea of acting as a cat has of cube-root. In the Gaiety company, on the other hand, there is no Titiens or Patti among the singers; but, as a compensation, there are no mere lay-figures, no animated walking-dolls. Of them, as of the children of Israel, it may be said "There was not one feeble person among their tribes." Hence the performances, taken as a whole, are eminently satisfactory; and to those who wish for a sound evening's amusement not making (like *Lohengrin*) great demands upon the attention, but good throughout, no better advice can be given than to attend one of the operas at the Gaiety.

On Tuesday last, the evening when I had the pleasure (and it was a real pleasure) of being present, the performance commenced with M. Victor Masse's one-act opera *Les Noces de Jeannette*. In this unpretending little work the whole interest rests in the two characters of Jeannette and her betrothed Jean. Both were most admirably sustained, the former by Mme. Naddi, an excellent singer, and the latter by M. Martin. The music, if nowhere very great, is always pleasing and tasteful, and, moreover, charmingly scored for the orchestra. The work, moreover, is not only ex-

temely well sung, but most admirably acted; even the smallest parts being just as carefully worked out as the principal characters. It is in this perfection of the general ensemble that the great merit of the performance consists.

To M. Masse's opera succeeded *La Fille du Régiment*, in which a most successful first appearance was made by Mlle. Priola, who undertook the part of Marie. This young lady has not only a very pleasing voice and good execution, but she is also a most excellent actress; nothing could have been more natural than her portrayal of the warm-hearted daughter of the regiment, while her farewell to the soldiers at the close of the first act, where she leaves her regiment to follow her newly-found relative, was perfect in the expression of pathos, without being too sentimental or exaggerated. No less excellent was M. Dauphin, as the bluff Sergeant Sulpice, while M. Laurent as Tonio, M. Sujol as the old steward Hortensius, and Mme. Henault as La Marquise, also deserve a word of special praise. But after all, it is not the merit of the principal performers, excellent though they are, that produces the greatest impression; it is the uniform finish of the whole rendering, which in this respect is truly unique. It is something new to see an operatic chorus which can really act, instead of standing about the stage like so many dummies. The orchestra, too, under the direction of M. Hasselmans, though small, is complete, and if not faultless, is more than satisfactory, and the whole entertainment is likely to give an amount of pleasure to those who care more to hear music uniformly well done than to hear a few popular favourites that can hardly be imagined by those who have not attended one of the performances. May Mr. Hollingshead's experiment in the naturalisation of one of the most pleasing, though not one of the greatest, classes of modern music—the light French opera—in this country meet with the success it most richly deserves!

EBENEZER PROUT.

THE last concert for the present season of the British Orchestral Society took place at St. James's Hall on Tuesday afternoon last, instead of in the evening, as usual. In consequence of the change in the time of performance our reporter was unable to attend; we can therefore only record the fact that the programme announced as the principal items Schubert's unfinished symphony in B minor, the overture to the *Freischütz*, a new concert-overture written for the society by Mr. T. Wingham, Sullivan's music to the Masque in the *Merchant of Venice*, and Mendelssohn's violin concerto, played by Mr. Carrodus.

THE second subscription concert of the Welsh Choral Union took place on Monday at St. James's Hall, when the chief works performed were Mendelssohn's *Athalie*, and the same composer's eight-part Psalm, "Judge me, O God."

MDLLE. KREBS's second recital at St. James's Hall on Wednesday afternoon was, in its programme, fully equal in interest to the first. It comprised Chopin's Fantasia in F minor, Op. 49, Beethoven's sonata in D, Op. 28, the Fugue from Handel's fourth Suite, and the whole of the fifth—the one containing the well-known "Harmoonious Blacksmith"—three Impromptus by Bennett, two short pieces by Moscheles, and Reincke's variations on a theme by Handel.

MDLLE. DELPHINE LE BRUN gave a *Matinée* at Dudley House, Park Lane, on Thursday, the chief features of which were Schumann's Piano-forte Quintett, a duet for two pianos by Otto Goldschmidt (played by Mdle. Le Brun and the composer), solos for piano by Chopin and Liszt, and violin solos by Herr Wilhelmj.

A GRAND Amateur Concert for charitable objects took place at St. James's Hall on Wednesday evening, with a most excellent programme, including Gade's symphony in B flat, No. 4, Men-

delssohn's "Vintager's Chorus" from *Loreley*, Brahms's "Song of Destiny," and Schumann's "Pilgrimage of the Rose."

A NEW operetta *Le Mémor de Pictordu*, by M. Serpette, the composer of *La Branche Cassée*, has been produced at the Théâtre des Variétés, Paris. M. H. Lavoix, in the *Revue et Gazette Musicale*, speaks on the whole favourably of the music, but says that the right word to describe the performance is to say that the work was "executed," as all the singers were persistently out of tune.

AT Nîort the annual meetings of the Association Musicale de l'Ouest will take place on the 18th, 19th, and 20th inst. The chief works to be given are Spohr's "God, thou art great," for the first time in France; an unaccompanied chorus "O vos omnes," by Vittoria; Mendelssohn's *St. Paul*; Beethoven's symphony in A; trio and finale from the second act of Méhul's *Joseph*; the overture to *Guillaume Tell*; and the march and chorus from the *Ruins of Athens*.

THE recent concert at Hanover in aid of the funds of the Bach monument at Eisenach, in which Liszt took part, has realised the sum of above 6,000 marks (300l.).

Lohengrin is at length definitely promised for this day week at Drury Lane. The comparison of the performance at the two operas will be full of interest.

SATURDAY, JUNE 12, 1875.

No. 162, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Poetical and Dramatic Works of Thomas Randolph. Edited by W. Carew Hazlitt. (London: Reeves & Turner, 1875.)

A few months before John Milton was admitted a pensioner of Christ's College, Cambridge, Thomas Randolph was matriculated in the same rank at Trinity College. By 1630 both were known as poets, and as young men of promise. Randolph, the older of the two, had been indeed the more precocious; at ten years of age he is said to have written in verse a "History of the Incarnation of our Saviour:"—

"He lisped wit worth the press, as if that he
Had us'd his cradle as a library."

But in 1630 it was Randolph's "Aristippus" of which Cambridge graduates were talking, a jocular piece—made up of scholarly chaff and animal spirits—in which are discussed the rival merits of beer and of sack. Milton's first noteworthy poem had just been written, the ode "On the Morning of Christ's Nativity." No two men less resembled one another. Milton, the "lady" of his college, presenting a firm and virginal front, was passing by "the ambush of young days,"

"Either not assailed, or victor being charged."

We know that Milton could, in fitting season, lend himself to recreation, and would even, when called upon, perform his duty of general merry-maker—as in the "Vacation Exercise"—with painful diligence. But who can conceive the possibility of Milton's being at any time clapped upon the back and shouted for as Jack? Randolph, when M.A. and a Fellow, was Tom Randolph, and after his death Tom he still remained. Mr. Hazlitt supplies us with a portrait of the poet re-engraved from the original print attached to the edition of 1640. It presents a face, of somewhat diminutive features, gay, vivacious, and mean—the lips about to let loose a jest, for the effect of which the eyes are already on the watch.

Tom Randolph's time at Cambridge was not one of unalloyed pleasure. His bright, quick intellect no doubt readily mastered the classical and logical eruditions of the place; and then he would hasten to complete his studies at the Mitre or the Dolphin tavern. There he would fain have piped in peace, like other learned shepherds of that pastoral time; but his purse was a poet's empty purse, which piping would not fill:—

"The reapers, that with whetted sickles stand,
Gathering the falling ears i' the other hand,
Though they endure the scorching summer's heat,
Have yet some wages to allay their sweat;
The lopper that doth fell the sturdy oak,
Labours, yet has good pay for every stroke;
The ploughman is rewarded; only we
That sing are paid with our own melody."

Such is the sorrow—no mere sentimental grievance—that besets him; creditors are on the watch, and "hexameter's no sterling;" the nine Muses are not held sufficient bail for a debtor; his doors are qualified to take an action of battery against innumerable duns; letters are thrust upon him neither in the style of Tully nor of Seneca. And, therefore, he must recompense himself by a laugh at his persecutors and at himself; it is his duty to teach them repentance; he must for their sakes refuse to pay:—

"You trouble me in vain whate'er you say;
I cannot, will not, nay, I ought not pay;
You are extortioners; I was not sent
To increase your sins, but make you all repent
That e'er you trusted me; we're even here,
I bought too cheap because you sold too dear."

But the misery is, these tradespeople are dull—too dull to understand his delicate vein of joking; their comprehension reaches no farther than "imprimis, item, and the total sum." Thus Randolph extracts amusement out of his distress, which is a good-humoured habit of his. Having, while quarrelsome, and probably drunk, lost a finger, he must have his joke about this misfortune also; he will henceforth be unable to scan his verses truly, lacking this instrument of his art (and accordingly a line one foot too short is introduced). More unlucky is he than the trees, which sprout again when lopped; he must only—and here Randolph grows one-half or one-third serious—hope for the resurrection, when he shall at last shake hands with his finger in heaven!

Randolph does not seem to have suffered from any greater troubles than the leanness of his purse; we do not find record of any conflict with his growing habits of ill-living; we do not read any rueful poems written on mornings after a carouse, and we do not regret their absence. Nor is it discoverable that Randolph was afflicted by any grievous sorrow of love. He was not the man to abandon himself to the tyranny of any great joy, or hope, or grief. He liked particularly to write an epithalamium for a friend, but had no desire to furnish any friend with the occasion of writing such a congratulatory poem on his behalf. For Randolph, as for other poets of that time, a woman was an animated surface to be travelled over in detail by the eye: cherry lips, pearly teeth, cheeks like roses, and the entire catalogue of feminine items are set out, in the accustomed fashion, as delectable wares to solicit the imagination; of true perception of beauty there is little. Such cool sensuality endeavouring to stimulate itself is a spectacle easy to endure; it is when a Fletcher, a Carew, or a Randolph affects the fervours of pure passion, and professes "Platonic" love, that we feel outraged. Schlegel described "The Faithful Shepherdess" as "an immodest eulogy of chastity." Randolph's "Platonic Elegy" is an animal indulgence in things spiritual. It were well if town and court poets had left the sage and serious doctrine of virginity to the writer of *Comus*.

Beside his jokes, Randolph had some more solid satisfaction to set over against the affliction of debts and duns; he had his seasons of "inestimable content in the Muses;" it was a pleasure to write so easily

and so well, and the great master of his craft, Ben Jonson, had named him his son. There is a certain family likeness between father and son in other points than the common relish for sack. Randolph has a portion of the intellectual vigour, he knows the secret of that firm verse and that steady power of progressing, which are characteristic of Jonson. He acknowledged his spiritual parentage and was proud of it. On the great occasion of his adoption he writes a gratulatory poem:—

"I am akin to heroes being thine,
And part of my alliance is divine."

Phoebus henceforth is his grandsire; the Nine Muses are, every one of them, his aunts; all that is in him of poetic fire is inherited from his father. May Phoebus cure the old bard of his palsy; but if Heaven take immortal Ben, it is surely to write anthems for an angels' quire! Elsewhere, "Tityrus" is represented as bequeathing "Damon" his pipe. Damon, who is Randolph, nobly opposes Jonson's bequest:—

"And do you think I durst presume to play
Where Tityrus had worn his lip away?"

Jonson survived his poetical son, who died in March 1634-35, in his thirtieth year, a victim to loose living and sherris-sack.

The dramatic writings of Randolph exhibit in a striking manner Jonson's influence upon the younger poet. The piece which is best known, "The Muses' Looking-Glass," carries to the extreme limit Jonson's mode of characterisation,—that of constructing a person out of a quality. The ethical theory of Aristotle had been turned to the purposes of allegorical epic poetry by Spenser; Medina, the golden mean, with her two sisters, Elissa and Perissa, the extremes of defect and excess, moralise the second Legend of the *Faery Queene*. It was a singular feat to set in motion among the knights and ladies, the fauns and satyrs, the graces and the virtues, these lay-figures carved from the philosophy of Aristotle. But Randolph attempts something more extraordinary. Bird, the Puritan featherman, and Mrs. Flowerdew (also of the sanctified fraternity), a supplier of small wares to Blackfriars Theatre, become the spectators of a series of moral scenes in which the Nicomachean Ethics are transferred bodily to the stage. Plot there is none; and each scene repeats with monotonous uniformity the plan of its predecessors. The two extremes, bearing their Greek names, Deilus and Aphobus, Acolastus and Anaisthetus, Orgylus and Aorgus, appear, deliver speeches at one another, are each in turn commended by the flatterer Colax, and having done nothing retire to view themselves and note their own deformity in the Muses' Looking-Glass. Finally, Mediocrity advances and declaims; the Puritan featherman and the haberdasher's wife, who have been witnesses of this spectacle, confess that they had erred, and will henceforth believe that the stage is a pulpit, and comedies are pious exercises. Vigorous writing there is in this piece, but neither plot, person, nor poetry.

Jonson wrote pastoral masques or dramas, and Randolph writes his "Amyntas, or the Impossible Dowry;" but the son had been two years dead before the father, in

a happier mood than was often vouchsafed to him in his decline, conceived his "Sad Shepherd." It might almost be surmised that Randolph, now after his decease, was paying back to Jonson something of what he owed him. The *Æglamour* of Jonson's pastoral, stricken with a deep love-melancholy, bears a fraternal likeness to Randolph's *Amyntas*, who is similarly afflicted. The Sicilian shepherd is, however, considerably more demented than Robin Hood's woodland guest. The treatment of mental distraction by our early dramatists, excepting Shakspeare, when it attempts the pathetic often becomes inexpressibly ludicrous; in cases where the effort was to be comic, the effect of laborious incoherency, and studious nonsense is at times sufficiently wearisome. *Amyntas* is quite as mad, but not as disgustingly mad, as Fletcher's Jailer's daughter in the *Two Noble Kinsmen*. He is classically mad as becomes a Sicilian swain, and raves a sad quantity of Greek mythology. "*Amyntas*" has been described as "one of the finest specimens of pastoral poetry in our language." To be able to employ strong words like these it is necessary to read down one's judgment and taste to the very low standard of the average seventeenth century play; then the beauties of "*Amyntas*" rise conspicuous. Perhaps it is treasonable, in this age of indiscriminate republication, to have confessed the secret of acquiring gratitude for such small mercies of poetry as are vouchsafed in the present volume.

Randolph's earliest dramatic entertainments are slight pieces written at the University—"Aristippus," in which a Cambridge student seeking instruction in philosophy is initiated by the founder of the Cyrenaic school, with large array of mocking logical terminology, into the one true philosophy,—that of sherris-sack; and "The Conceited Peddler," the monologue of "a Socratical citizen of the vast universe," untrussing his wares, and commenting, with special tips for Cambridge laughers, on each article produced. The "*Jealous Lovers*," printed in 1632, a comedy of the more ordinary type, containing a succession of ingenious incidents and intrigues, and much dull effort at fantastic mirth, is perhaps the best of Randolph's plays. It is noteworthy as containing an imitation of the grave-diggers' scene in *Hamlet*, running into less close a parallelism than the earlier imitation in Raynolde's "*Dolarny's Prime-rose*." Last, "*Hey for Honesty*," an adaptation to the seventeenth century of the "*Plutus*" of Aristophanes, left unfinished by Randolph, and completed after his death, is of value chiefly on account of its crowded allusions to contemporary or recent events, objects, and persons. Shakspeare wrote his comedy for *Plutus*' sake, says Chremylus. The Ghost of *Hamlet* is coupled with Jeronymo, as if a tradition of the pre-Shaksperian *Hamlet* still survived; and the "rich rubies and incomparable carbuncles" of Sir John Oldcastle's nose supply a metaphor.

Mr. Hazlitt has not allowed his task of editor to become over-laborious. A little more attention to punctuation would have saved several passages from becoming nonsense.

And surely Mr. Hazlitt is wrong in supposing that Sir Aston Cokain's reference to a prose original of "The Muses' Looking-Glass" intimates that Randolph followed some unknown treatise. The unknown writer was Aristotle. EDWARD DOWDEN.

Monumental Inscriptions of the British West Indies from the earliest date, with Genealogical and Historical Annotations, etc. etc., chiefly collected on the spot. By Captain J. H. Lawrence-Archer. (London: Chatto & Windus, 1875.)

IN the year 1815 was printed at Calcutta *The Complete Monumental Register*, a collection by M. Derozario of all the epitaphs and inscriptions in the different churches and burial-grounds in and about Calcutta, with others from Madras, Bombay, the Isle of France, etc. The compiler appears to have performed his work faithfully and conscientiously, and its value for purposes of British family history cannot easily be computed. Doubtless hundreds of the inscriptions thus preserved have already disappeared from their original localities, and would otherwise have been hopelessly lost. The volume is extremely rare in England—so much so that a perfect copy, in good preservation, would command from a genealogical collector almost any price its possessor might choose to demand for it. Having recently the good fortune to secure the only copy that has been in the London market for many years, the writer found it instantly available for perfecting several pedigrees, and clearing up various doubtful points in numerous family histories, the data for which he had vainly sought from every other source.

What M. Derozario thus did for the East Indies, Captain Lawrence-Archer has now done, to a certain extent, for the British West Indies. He does not profess to give us transcripts of all the inscriptions decipherable at the date of his collections, and so far the volume is imperfect. He intimates that he has furnished all of the "old, curious, or dignified epitaphs," and included "many of no particular interest, which can only be expected to acquire a slight value in the lapse of time." But how does Captain Lawrence-Archer know that the very ones he has omitted are not now, or may not become in the lapse of time, of equal, if not greater importance than those at least which come under his second classification? It is difficult to see why he should have carefully preserved the brief inscription on the stone of "Mr. John Smith" (page 201), and left to almost certain speedy destruction the epitaphs which doubtless commemorate the virtues of many a Brown, Jones, and Robinson. As it is probable that some person exists to whom the inscription for "Mr. Smith" will be interesting, so it may be presumed that somebody would have been interested in almost every one that was rejected as of comparative unimportance. The failure to secure all the inscriptions in the localities examined is the more to be regretted, because we are told in the preface that, in Jamaica especially, between the destructiveness of nature and the vandalism of man, the duration of a monument scarcely reaches half a century;

and also because it is not probable that more than once in fifty years an antiquary with the enthusiasm and perseverance of Captain Lawrence-Archer will make his appearance in those regions. On reading his brief and modest account of the difficulties he encountered, it is impossible to censure him for not having accomplished more, and would be unfair and ungenerous not to thank him for, and congratulate him upon, having done so much:—

"In Jamaica," he says, "where the wild vegetation of nature is so remarkable, the explorer of its older and private cemeteries must resort to manual labour, and the author has not unfrequently passed days, from breakfast time until sunset, with the common woodman's cutlass, clearing away the dense and matted undergrowth, while approaching the objects of his search."

Under such circumstances we must not complain of, however much we may regret, the incompleteness of his labours, especially as we may be pretty certain that he has given us all the inscriptions relating to persons of such social standing that they are likely ever to be of much value, besides many others that may prove of more or less importance.

It is also to his credit that he did not reject the inscriptions that were partially illegible, but transcribed such portions as could be deciphered. A curious instance occurs on page 91, in the imperfect name " . . . rneley." This inscription unquestionably refers to a person the date and place of whose death the writer had vainly sought for years. In the course of a few years more, probably the rest of the inscription would become illegible, and its facts lost beyond recovery. (Those possessing the volume may safely perfect the name by making it "Ferneley:" he was of the heraldic family of that name in Suffolk.)

The most of the volume—342 out of 442 pages—is devoted to the monumental inscriptions in the churches and various burial-grounds of Jamaica. Barbadoes occupies fifty-six pages, and the rest are divided among Antigua, St. Christopher, and other colonies. The few annotations by the editor are generally interesting and suggestive, and the brief chronological tables, and lists of governors and other officials, will be found of great convenience. But the positive value of the book consists in the monumental inscriptions themselves, pure and simple—the "raw material" of genealogy and family history. The coats of arms, wherever they exist, are given both in trick and blazon, and the mechanical execution of the work—so far as type, paper, and binding are concerned—is entitled to unqualified praise. The volume is indeed a sumptuous one, and must necessarily find a place in the library of every antiquary. It is, therefore, to be regretted that the index and table of contents are not always to be depended upon, and that the proof-reader did his work so carelessly as to omit an important letter on the title-page itself. The former fault in a work of this sort is unpardonable, and the latter a grievous disfigurement in the eyes of a book-lover.

Now that the monumental inscriptions in both the East and West Indies have been secured, it would be well if they were sup-

plemented by those relating to the earliest generations of British settlers in New England and the other American colonies, which would undoubtedly serve to fill many a hiatus in the pedigrees of British families. Those from Virginia would be especially valuable.

JOSEPH LEMUEL CHESTER.

History of Christian Theology in the Apostolic Age. By Edward Reuss, Professor in the Theological Faculty and in the Protestant Seminary of Strasbourg. Translated by Annie Harwood from the Third Edition, with a Preface and Notes by R. W. Dale, M.A. In Two Volumes. (London: Hodder & Stoughton, 1874.)

We sincerely congratulate the religious public in England on having henceforward at its disposal a work of such remarkable excellence and power as the *History of Christian Theology in the Apostolic Age* by Professor Reuss of Strasbourg. Equally highly appreciated in Germany and France, and able to write and to write well in both languages,* Professor Reuss has become in the two countries one of the most authoritative masters of biblical criticism. He is about to crown the labours of his life by publishing in French his great work on the whole Bible, with translation, commentary, and special introductions to each book, and we in France owe him a great debt of gratitude for not allowing the official changes which have occurred in his professional relations with the Protestant churches of France to divert him from this immense work, from which we expect the most valuable results.

The prolonged sensation produced in France by the work before us is due to the fact that it was the first which systematically treated the books of the New Testament from the historical point of view. Hitherto, with a few not very noteworthy exceptions, the only point of view from which they had been regarded was the dogmatic. Mr. Dale has well summarised M. Reuss's principle of interpretation, when he says, in his preface:—

"He is not anxious to make it appear that the authority of St. Paul can be alleged for any modern theory of the doctrine of justification; his only concern is to show what St. Paul himself believed. He writes the history of the theology of the early Church just as he would write the history of Greek philosophy from the age of Plato to the age of Plotinus."

This is perfectly right; only one may ask whether it is possible to remain always faithful to this principle of pure objectivity without starting from a highly rationalistic principle with regard to the inspiration and authority of Scripture. How can the student preserve the perfect impartiality of the historian when he tells himself that, according to the results of his exegetical labours,

* The annotator of the English translation says in his preface that M. Reuss does not write good French. I cannot refrain from appealing against this over-strong statement. Of course his style is not altogether in accordance with academic or classical purity; it has what is called "the accent of the soil;" but, beside being always correct, it has a freshness and originality *sui generis*, in which in France, as I can certify, we find a very agreeable savour. To form an idea of it, it would be enough to compare M. Reuss's writings in French with translations made directly from German originals, even when the work of skilful translators.

he will be driven either to believe in doctrines which are repugnant to him, or to renounce beliefs which he holds it of vital importance to retain? Should we be wrong in expressing a fear that Mr. Dale's notes often betray the difficulty of remaining faithful to historical impartiality, when the student believes himself threatened in the possession of doctrines which are dear to him, by the immediate consequences of the natural interpretation applied to the sacred books, as we should apply it to the writings of Plato, Aristotle, and Plotinus?

Thus, one of the most manifest results of the historical method is the difference, or even the divergence, between the various types of apostolic teaching. No scholastic subtlety can, without doing violence to the texts, succeed in forcing under one Christological formula the varied conceptions of the writers of the New Testament with regard to the person of Jesus. The inspired prophet, ordained by God the Messiah of Mark and the Acts, the son of Joseph and Mary of the genealogies, the child miraculously conceived in a Virgin's womb of the first and third Gospels, the heavenly being manifested in earthly form, but a man in heaven and on earth of St. Paul, the Word made flesh of the fourth Gospel—are all so many differing and divergent notions which neither Arius nor Athanasius, neither Socinus nor Calvin has ever succeeded in fusing into one harmonious whole. They can be explained historically, given the person of Jesus and his spiritual greatness; they cannot be fused dogmatically—and naturally enough, for they start from different principles. M. Reuss, without declaring himself on dogma, treats the narrative as an historian, and scarcely troubles himself to know whether it does or does not agree with the rigour of the dogma of the Trinity. This does not fail to alarm his annotator, and we must notice the care with which he strives to fill up the crevasses which, without thought or wish of its own, historical theology produces at every moment in dogmatic theology. Let us take as an instance the baptism of Jesus. It is clear to every interpreter who is writing the history of doctrines, that the account of this baptism, which is mentioned by neither John nor Paul because it would fit in but very ill with their favourite doctrines, proceeds from authorities to whom great importance was attached for marking the precise moment when Jesus of Nazareth, hitherto undistinguished in the bosom of his people, became the object of a divine declaration and of a supernatural gift of the Holy Spirit, which constituted him from that moment forward the Messiah *de jure*. But then it is clear that these same Judæo-Christians scarcely thought of the second person of the Trinity incarnate for about thirty years in the body of a child growing to manhood. Mr. Dale has his explanation ready. "The supernatural powers," he says, vol. i. p. 395, "by which He was to fulfil His ministry could not become His, on the theory of the Incarnation, until His human nature was sufficiently developed to receive them." We must ask Mr. Dale to pardon us; but according to the theory of the Incarnation, Jesus has not to receive supernatural powers: He possesses them from

the beginning; they already exist in his person in all their fulness, in childhood as in manhood. Perhaps it will be said that they can only manifest themselves when the human nature shall be sufficiently developed. The supernatural, according to this view, is in remarkably strict subjection to the natural laws of development, and we confess that we do not clearly understand why Jesus at the age of twenty-five, for instance, should have been less capable than at thirty of revealing the double consciousness of man and God, or, if that expression be preferred, the consciousness of man-God which he bore within him. But what is certain is that he possessed all in himself from the first hour, and that he had nothing to receive afterwards. And no less certain is it that the account of his baptism comes to us from Christians of the earliest days, who thought, on the other hand, that he had much to receive from on high and from without to become the Messiah of Israel.

We attribute to the same repugnance to a frank adoption of M. Reuss's strictly historical point of view, the occasionally curious notes tending to identify the Pauline theory of justification with the Augustinian and Calvinistic doctrines of another age, or to diminish the character of "free composition" which distinguished the discourses of Jesus as reported by the fourth evangelist.

We regard M. Reuss's book on *Apostolic Theology* as an excellent introduction to the questions raised by criticism, rather than as offering us a definitive solution of these questions. Very decided and very independent in his exegesis, M. Reuss is extremely prudent in his conclusions relative to the age and authenticity of the books of which he treats. It appears to us opposed to the rigorous postulates of historical criticism to refer to one body of theological doctrine the teaching contained in the whole of the epistles attributed to the apostle Paul, and decidedly impossible to force the theology of the fourth Gospel into the mould of the apostolic age strictly so-called. In our opinion the last-named book presupposes a state of Christian thought and Christian theology which only finds its chronological place after the middle of the second century.

The Pauline Christology likewise seems to us a weak point of the work. In fact, M. Reuss reduces it to something very like Arianism, and does not in our opinion lay sufficient stress on all contained in St. Paul's favourite parallel of the "two Adams," which he seems to consider as the two poles, the two representations of humanity, at once earthly and heavenly. Therein lies a difficult problem, not yet near its solution, and bound up with that other question which is suggested by many special trains of thought to the great apostle. To what extent did Paul clearly distinguish between an historic and individual person, and the principle of which that person is the representative? Sometimes one is tempted to believe that for him the individual Adam is none other than the *σάρξ* inherent in the earthly nature of man, and that the person of *Ἰησοῦς Χριστός* passes insensibly into the category of the *πνεῦμα*. Many of the obscurities of his special doctrine would be cleared up if we

could form an exact idea of the precise Rabbinical theories which he brought to his mode of conceiving what he called *his* Gospel. We can profit for the interpretation of the fourth Gospel by our exact knowledge of the course of Platonic or rather Philonic ideas of which this Gospel so unmistakably bears the impress. Unhappily, the immense difficulties of Talmudic studies do not allow us, and perhaps never will allow us, to arrive at a like result with regard to the theological antecedents of the Pauline Epistles.

On the other hand, we must point out as a model of clearness, of demonstration that leaves no loophole for doubt, of positive results which force themselves on the acceptance of all who are not blinded by the spirit of party, the magnificent chapter treating of the Apocalypse. We particularly recommend as a specimen of logical force completely overwhelming, the lucid and brief statement of the motives which have induced modern interpreters to read with their predecessors of the second century the name of *Nero Caesar* in the apocalyptic number 666.

It is pleasing also to review in company with so competent a guide the personal teaching of Jesus on the Kingdom of God or of Heaven. It gives one a clearer idea of how it is that the Christian principle, by virtue of its intrinsic religious worth, is so vastly superior to the successive orthodoxies which have claimed to give its sole legitimate explanation, and why, if it is true that Christianity in our day is to be greatly simplified by casting off its mediæval accessories of ritual, sacerdotalism, and dogma, it has yet lost none of its salutary power to direct human society in the path of justice, and the individual Christian in that of a faith which is rich in consolation and in hope.

ALBERT RÉVILLE.

Erasme, Etude sur sa Vie et ses Ouvrages. Par Gaston Feugère. (Paris: Hachette et Cie, 1874.)

The Life and Character of Erasmus. By the Rev. Arthur Robert Pennington, M.A. With a Preface by the Bishop of Lincoln. (London: Seeley, Jackson & Halliday, 1875.)

If there were any single clue to the complexities of Erasmus's character, any one principle capable of reconciling the seeming inconsistencies of the man who has been alternately embraced and repudiated by Romanist and Protestant; at one time almost passionately claimed as a devoted son of the Catholic Church (for does not M. l'Abbé Richard innocently take for true gospel Erasmus's witty story of a visit which he pretends was vouchsafed him by St. Francis?), and at another fiercely denounced as the prime author of the great schism which cost the Church her fairest provinces; at one time hailed as the champion of reform, and at another reviled as a concealed Protestant, wanting the courage of his opinions; and then again regarded as an entire sceptic, laughing at everything, and having no fixed opinions of his own—we might easily agree with M. Feugère in looking for that principle and that clue in his devotion to the cause of letters. That was, indeed, one of the ruling passions of his life, and fully

explains how the man who was never tired of exposing the ignorance and superstition of the monks, who had thrown doubts on almost every tenet of the Church, and spoken not too respectfully of the Popes themselves, might yet, with the most perfect consistency, refuse to identify himself with those who, in whatever respects they might appeal to his authority and example, seemed to him only likely to involve the world in fresh troubles, and to substitute a new tyranny for the old one. M. Feugère himself, however, warns us against attempting to give to Erasmus's character a unity which it does not possess, and unless we are willing to see in him a certain weakness of fibre which made him, while "bold in words," yet often "timid in his conduct;" a vanity not offensive, but which never permitted him to lose his self-consciousness; a nature full of reserves and hesitations; a wonderful dexterity in extricating himself from false positions, and turning against his adversaries their own weapons; a delicacy of organisation which made him peculiarly sensitive to annoyances of all kinds; a desire to keep on good terms with all parties and give offence to none, which made him long halt between two opinions; and, moreover, a sceptical rationalising turn of mind, which loved better to raise difficulties than to solve them, to deny or at least doubt than to affirm; and unless further we study him, with all these failings and merits, in his relation to the time in which he lived—a time when in a special degree "to be weak" was "miserable;" and when the rising waves of revolution were sure to show no mercy to the man of compromise and conciliation—we have made no approach to understanding him. All this, indeed, M. Feugère sees clearly enough, and no one who accepts his guidance will be in danger of missing any important feature in the character of his hero. There is but one point which perhaps he might have emphasised a little more strongly. We do scanty justice to Erasmus until we recognise in him as fundamental that solid goodness, that thorough soundness of heart, which led him so greatly to prefer the practical teachings of the New Testament to the dogmas whether of Rome or of the Reformation, which made him love next to learning—nay, even before it, those *bonos mores* which the reviving Paganism of the Italian Renaissance threatened to overwhelm—which the conduct of the Protestants did not seem to him always calculated to promote.

Was Erasmus a sceptic? In the philosophical sense of the word, certainly not. He never attacked the foundations of human knowledge, never even approached them. He never raised a doubt as to the supernatural origin of the Christian religion. His scepticism was precisely that of the man of letters, who, by the study of the Greek and Roman moralists, has learned that the Church enjoys no monopoly of goodness, and that truth is truth whether it is found in the writings of heathens and heretics, or proceeds from the most orthodox lips. But it was also the scepticism of the rationalist. In a later age Erasmus might have been found carrying his doubts to

much more fundamental questions of divinity. For him it was going a good length to raise questions about the Trinity, transubstantiation, and original sin. M. Feugère agrees with those who suspect Erasmus of Arianism, and despite his protestations sees "an affinity between his mind and a doctrine which, denying the unity of substance in the three Divine persons, and so suppressing the supernatural side of Christ's nature, has always proved so seductive to human nature."

It is time, however, to give some more particular account of this new contribution to the study of the life and work of the great leader of the Renaissance. M. Feugère writes as a Catholic—a very liberal one—but he neither repudiates Erasmus as an apostate and a traitor, nor endeavours to reconcile all he said and did with the character of a faithful son of the Church, and with the strictest orthodoxy. Of the man himself his estimate is eminently fair, kindly, and discriminating. He apologises for his not having taken the sacrament on his death-bed, on the plea that he died in a city where the exercise of the Catholic religion was prohibited, and defends the expression addressed to his sorrowing friends—"Your tears might make me think you did not believe in the resurrection of the dead"—as an affectionate reproach inspired by the most delicate feelings. He will not admit with Bayle and others that Erasmus was the forerunner of Luther, and remarks, quite truly, that his exegesis tended not to Lutheranism, but to rationalism. He defends his attacks on the corruptions of the Church, arguing that the Church had always tolerated satire directed against the human and variable elements in her constitution, and acknowledges his services in the secularisation of morals, which, under the influence of scholasticism, had become a confused mixture of Aristotle and St. Augustine. He reminds us that the famous *Sancte Socrates, ora pro nobis* was anticipated by Abelard, who placed Socrates among the saints; and that Dante, while refusing to open the gates of Paradise to Virgil, yet saved him from the hell into which he had no scruple in hurling popes and cardinals of the Holy Church. Evidently, however, he does not regard Erasmus as an altogether safe ally; he complains that by his procedure the faith itself was disturbed and menaced, compares him with Bayle, Montaigne, Lessing, Voltaire, and confesses that he hardly knows whether he has to do with a friend or a subtle foe who makes no open attack, but like a fine sharp point darts hither and thither, and wounds without being seen. Erasmus is treated here as theologian, reformer, satirist, moralist, man of letters—in all these characters the criticism upon him is just and discriminating; the lights and shadows are skilfully disposed, and the works chosen as illustrations examined with taste and discernment. Only in one respect is the book a disappointment; and the author must thank himself if by the prominence which he gives, in his preface, to the name of Voltaire, he raises an expectation which he does not fulfil. A comparison more elaborate and full than has

yet been drawn between two men often named together, and presenting so many interesting points of resemblance, is a task which there is evidence in this book that he is well qualified to execute.

The second is the most valuable and original part of this work. The first is a tolerably full sketch of Erasmus's life, in which, however, I have not observed that anything new is contributed to our knowledge of the subject, while, on the other hand, one or two old blunders are perpetuated. The author follows some other biographers in fixing the date of Erasmus's ordination at February 25, instead of April 25 (had he but consulted the calendar!), in calling his elder brother Antony instead of Peter, and in keeping him five years with the Bishop of Cambray, instead of sending him on at once to Paris. Had he been more familiar with Knight he would scarcely have changed Erasmus's friend Bullock (Bovillus) into Charles de Bonelles, and it is scarcely fair to quote Hallam as having allowed his patriotism to lead him astray in his notice of Oxford in the fifteenth century, when what Hallam really says is that Erasmus's praise is evidently much exaggerated, and himself speaks of it as "that most barbarous universality." These, however, are small matters, and take nothing from the merits of this very careful and artistic study of the life and works of Erasmus.

Of the second work named at the head of this article—which only reached my hands after the above was written—it is not necessary that I should say much. Compared with other recent lives it does not seem to possess any very noticeable feature, except, of course, the episcopal preface. Appearing, however, under this sanction, and as it regrets the rationalistic spirit which pervades the works of Erasmus, and mourns over his sympathy with the Arians, it will probably recommend itself to those who are accustomed to measure all things by the standards of the English Church.

ROBERT B. DRUMMOND.

Worksop, "The Dukery," and Sherwood Forest. By Robert White. (London: Simpkin, Marshall & Co., 1875.)

THIS is a compact and useful volume, well got up and ornamented with several really beautiful woodcuts of forest scenery. Its antiquarian merits are not of a high order; but when Domesday Book and such like matters are not under consideration, and when the author can consent to forget the remote ancestors of the great people who shoot pheasants, sit at Quarter Sessions, and keep foxhounds around him, he is always interesting and instructive. The study of genealogy is worthy of all respect. What Sir Francis Palgrave used to call "the inherent prerogative given by the ancestral blood" is not likely to be forgotten in a country which is calmly but surely sweeping away all social distinctions which do not rest on the facts of nature; but pedigree details are not a profitable subject for any one to write upon who has not made original investigations on a much more extended scale than can have been attempted here. If the pages devoted to Lovetot, Clinton, Talbot,

and Furnival had been occupied by facts of a strictly local nature, the book would have gained in interest, and we should have lost nothing whatever, for these family matters have been given before in much greater detail by Collins, Thoroton, and Hunter. On home concerns Mr. White is full of information and writes really well. The description of the parish church, a fragment of the old Augustinian Priory, contrasts most favourably with many works of much higher pretension. The author evidently loves his subject, and has devoted much time and labour to making out the well-nigh obliterated details of those parts of the building which perished in the storm of the Reformation, or have been modernised, spoilt, and for historical purposes ruined, by recent restoration. It is common enough to hear loud complaints of the havoc made in our historical buildings by the cupidity of those who came into possession when the monasteries lapsed into lay hands, and of the mad doings of Puritans we have heard far more than there is any evidence to warrant; but few people tell, as yet, what the church-restorers of our own time have done, and are still doing. The people who protested against the wantonness of the sixteenth and seventeenth centuries were not listened to, and the time has not come at present for those who revered the memorials of the past which time had spared to gain a hearing. Mr. White makes no reflections on the manner in which Worksop Church has passed through the scathing fire of restoration. It may be that he feels that he must tell so much if he spoke at all, that silence is best. We never saw it in its unrestored state, but from what is to be seen now it is evident that the work was done in a spirit sufficiently ruthless. The new masonry is hardly distinguishable from the old, for the old work has been so scraped and cut down that nearly all signs of antiquity have passed away, and it requires a painful effort to convince oneself that the Norman work before us is really Norman, and not what it seems to be, a successful modern imitation. Mr. White says nothing of these things, but there is sufficient in his pages to guide any one who has had experience of the wild work of church restorers, to a true understanding of what has happened. Such passages as the following indicate that much most needless destruction of architectural evidence and interesting associations must have taken place.

"There were evident traces of the former existence of this screen previous to the late restoration of the church."

"On the west side of this door was a stoup . . . until the time of the late restoration of the fabric."

"Formerly some Decorated windows were inserted in the south aisle, but these have now been replaced by others according with the original design."

Sweeping away holy-water stoups is now, whatever it may have been at the time of the Reformation, a mere act of Vandalism, without the excuse of overwrought religious feeling on the one hand or superstitious reverence on the other. The destroying of windows inserted in the Decorated period to make room for modern impostures intended to look like something of an earlier time

is still less to be pardoned. How could the architect, in whose office the working drawings were turned out, know what the old windows were like which had given place to those which he destroyed. Our forefathers built with infinite variety, and it is next to certain that whatever he copied, his imitation would not be like the lost original. But there is a deeper reason than this: these Decorated windows had a history. Their insertion was not due to chance, or the restless desire for change which now causes so much of the fairest work of the old time to be violated. They were put in because the taste for rich and therefore dark stained glass had become prevalent, and the older openings if so filled would not have let in a sufficient body of light. Thus they marked a change of feeling in architecture, a step in the history of art.

An important feature in Mr. White's book is the number of facts it contains bearing on the social life of the past. All this is well done—so well indeed, that we wish that there was much more of it.

Here is a passage, taken at random, which illustrates the feelings of our forefathers with regard to cruelty and diet:—

"At the beginning of the last century the parish authorities (of Worksop) had a bull-ring made on the Lead Hill, to enable them to comply with a by-law in the rolls of the Court Leet and Baron of the Lord of the Manor, that 'no bull shall be killed and sold in the market of Worksop without having been first baited in the bull-ring.'"

The object of this strange rule was a double one. Firstly to afford a manly amusement for the people, and secondly because there was a superstition that bulls' flesh was unwholesome unless the animal had before his death been tortured by dogs. A similar vulgar belief is yet prevalent among sportsmen and game-dealers as to the flesh of the hare. A coursed hare is a more valuable present, and fetches a higher price at a game-shop than one that has died by shot or snare.

The article on the ancient history of Sherwood Forest, contributed by the Rev. J. Stacey, is excellent. We wish he would enlarge it into a history of that celebrated and picturesque domain. The papers on the geology and zoology of the district are also remarkably well done, but the less that is said about the chapter which treats of Robin Hood the better.

We have noted some trivial errors which it may be well to set right in a second edition.

The confirmation bull of Alexander III. to Worksop Priory (25) is not dated at Agnani, but at Anagnia, that is, Anagni, a small town thirty-seven miles east-south-east of Rome. (*Mon. Ang.* vi. 120.)

Alban Butler, the author of *The Lives of the Saints*, is spoken of as a Jesuit (p. 74). This is an error. He was a secular priest.

Robert Pierrepont, first Earl of Kingston-upon-Hull, was not killed "before Gainsborough" (p. 157), but at some as yet unidentified point on the River Trent, between Gainsborough and the Humber. (*Vicar's God's Arke*, 1646, p. 7; *Lloyd's Memoires* p. 435; *Whitelock's Memorials*, ed. 1732, p. 72.)

EDWARD PEACOCK.

Lives of the Engineers. By Samuel Smiles. New and Revised Edition. (London: Sampson Low & Co., 1874.)

MR. SMILES has written a series of books which are extremely interesting not only to the engineer but to the general reader. They have been for some years before the public, and have deservedly met with much success, which will be increased by the present cheap edition. Among engineers the *Lives* are now and then rather unjustly criticised as being like historical novels, though, indeed, the resemblance to good historical novels is striking enough, for each life has the charm of a novel with an interesting hero, whose story is painted with a background rich in historical detail. Mr. Smiles has a true instinct, leading him to choose those details only which add life and reality to the picture. No one can feel surprised that the life of Watt or George Stephenson should be interesting, but there is something remarkable in the charm which leads a reader amused and instructed through two hundred pages treating of John Rennie, even although it be known at the outset that John Rennie was an excellent engineer.

Mr. Smiles is a true artist. If his principal figure is a really great and noble one, he concentrates his light upon it and the background sinks into insignificance. Where the proportions of his hero are less colossal the setting is so charming as to give dignity and beauty to the entire scene. Moreover, so far as I know, the historical details and statistics are accurate, and must have been gathered with great labour, while, although the books in no way pretend to be scientific treatises, yet the engineering knowledge displayed is very considerable, and I have come upon no blunders.

Here and there, it is true, one cannot help suspecting that the hero did not fight all the fight single-handed, that besides Achilles there were many chiefs who fought before Troy, and that even following these lesser captains there were thousands of good men and true who all helped to win the town; but the writer of A's biography, must not be too severely judged if he forgets to tell us quite all about the other letters of the alphabet, and there is no conscious unfairness to be traced in the *Lives*. Moreover there is a natural tendency to give merit to those who have much already, and great wits, great captains, and great engineers all alike bear, and perhaps ought to bear, the honours earned by the lesser men around them.

Mr. Smiles never falls into the error of deifying his hero—he paints a very living, fallible man; he dwells indeed with relish on his difficulties and his failures, for does not the charm of the story consist in these? We know the end, success, already. It is the difficulty, the struggle, which comes home to us.

Watt's life is a sad one, but it teaches a most useful lesson to those who think that an invention springs full limbed and armed for conquest from the inventor's brain. The material difficulties, the financial difficulties, the moral difficulties, to be overcome before the simple idea of a

separate condenser could bear its fruit in the perfect steam-engine are admirably told by Mr. Smiles, and notwithstanding the ultimate success the tale is sad. One lesson should be laid to heart. It is impossible to read the story without feeling that we owe the steam-engine to the patent laws quite as much as to James Watt.

The story of George Stephenson forms a great contrast to that of Watt.

Watt was an *inventor*; any engineer can put his finger on half-a-dozen real inventions which were all Watt's own. It would be very difficult to lay hold of one real invention due to George Stephenson alone; but Stevenson was an *engineer*. What he laid hand to, worked: he improved the neighbours' clocks and their clothes as a boy. Then an engine was put up in his neighbourhood, which failed in its duty. George Stephenson tinkered at it, lengthened this and shortened that, and then that engine pumped the pit dry. The locomotive was not his invention. I am even heretic enough to have doubts about the steam-blast, but I have no doubt that George Stephenson is the man who made locomotives of real use. I have my doubts whether the introduction of the railway system was wholly due to one man, strong through he was, but I feel sure that the roads he laid were enormously better than any made by his predecessors. Then there is a good-humoured strength about this giant which makes him an admirable hero.

In fine, Mr. Smiles has not written a series of scientific essays on the engineering improvements or inventions made by each man. Such essays would have interested few; but he has written with excellent feeling and taste a series of stories about our great engineers, and in these stories he has displayed sound engineering knowledge, much historical research, and thorough sympathy with his subject.

FLEEMING JENKIN.

NEW NOVELS.

A Passionate Pilgrim and other Tales. By Henry James, jun. (Boston: J. R. Osgood & Co.; London: Trübner, 1875.)

Eglantine. By the Author of "St. Olave's." In Three Volumes. (London: Hurst & Blackett, 1875.)

Jocelyn's Mistake. By Mrs. J. K. Spender. In Three Volumes. (London: Hurst & Blackett, 1875.)

Out of Society. By Mrs. Pulleyne. In Three Volumes. (London: Chapman & Hall, 1875.)

Robert Forrester. By Mary Thompson. (London: Longmans & Co., 1875.)

THE volume at the head of our list is a series of careful studies in Nathaniel Hawthorne's manner. This is not one of those cases of unconscious influence, common with young writers, who reproduce imperfect echoes of authors who have touched their imagination and lingered in their memory, and who believe themselves original in so doing. Mr. James, on the contrary, is fully aware of what he does, and has set himself at Hawthorne's feet with the entire trust and admiration which we may suppose to have been exhibited formerly by the pupils in the school of a great and original painter.

He has his reward too, for he has caught much more than the mere trick of style, by no means difficult to imitate, and has succeeded more nearly than any other writer we have met in entering into Hawthorne's psychology, with its half morbid and entirely weird conception of life. We incline to think "The Madonna of the Future" the most artistic of his tales, though that which gives the title to his book is most fully worked out, and is very subtle in treatment, recalling here and there the "Septimius" of his model. There is one blot in the book, the material ghastliness of the ending of one story, the "Romance of certain Old Clothes," which is more like Poe than Hawthorne, and which, we think, the author will feel on reflection would have gained in impressiveness by the omission of the last detail, and the substitution of a mere look of frozen terror on the dead face. The incident as it stands mars the whole conception of Perdita, with which it is entirely out of keeping.

Eglantine makes no advance, but rather retrogression, in its author's literary work, for it is by no means so good a novel as any of its three precursors. There are tokens throughout of too much facility in mere production of copy, and too little pains in reducing that copy to symmetrical form, to say nothing whatever of artistic conscientiousness in detail, which is not atoned for by the occasional introduction of clever sentences and paragraphs. The story, if it may be so called, is an autobiographical monologue, with but little interest, since the only attempts at special delineation of character depict types which are tediously common in the modern novel, such as the gracious and insincere matron of society, and the mature young lady who affects gushing childishness. And in these days of realistic painting it is not too much to ask even a lady author to be correct in details meant to give local colour and finish. The daughter of a great scientific philosopher of wide general learning, as the narrator of the story is supposed to be, would not again and again cite the "differential calculus" as the tremendously abstruse subject which her father's distinguished visitors habitually discussed with him. They would be just as likely to discuss the rule of three. Nor would she include Gibbon's *English History* as forming along with the *Decline and Fall* part of the favourite reading of her model coastguardsman. At least, it was inconsiderate, if such were the case, not to make the learned Mr. Leslie seize on the book, hitherto unknown to bibliography, and give it to the reading public, which would only too gladly welcome such a discovery. It may be carpishly minute criticism to say that the St. Bees hood, which the model Broad Church parson of the book wears (and of which the author, who attempts Dutch painting, makes a good deal), is not purple, but a wonderful combination of red and white; but that a writer who has evidently a turn for marketing and cookery, with a hearty relish for her victuals, should give as a proof of the utter imbecility of her gushing lady that young person's belief that eggs are, or ought to be, sold by the pound, strikes us as showing very little grasp of the economical bearings of the subject. Would it surprise her to hear that more

than one American Legislature has recently enacted that all eggs are henceforth to be sold by the pound, and that the average dozen must turn a given weight, on the ground that the present system of selling by mere number, irrespective of size, is unfair to the purchaser, and a permanent discouragement to careful breeding, since no advantage is now gained in the market by the farmer who brings the finest and heaviest eggs for sale over his competitor who looks to quantity alone? Several other questions, social and religious, are settled in the book just as decisively, and with exactly the same amount of intelligent understanding as this one; and we would cheerfully give all the judgments, and the long-winded reasons for their formation, in exchange for a little more life and movement in the somewhat wooden puppets of the tale.

Jocelyn's Mistake derives its interest almost wholly from its central figure, which is a very good study of character. Mrs. Spender has not sought to devise novel situations for her plot, and has contented herself with using materials which have served many authors before, but she has employed them better than usual. The main situation in the book, for example, is not very different from that in a once popular story, *Emilia Wyndham*, yet there is no likeness at all in treatment, so that the sense of triteness does not strike the reader. Mrs. Spender's English is unusually good, and she has learnt the art of working her opinions on men and things into the web of her story, instead of merely intercalating homilies, after the fashion of too many of her sisters, with the certainty of having them skipped by the judicious reader, who desires, in the emphatic language of a schoolboy, uttered in the present critic's hearing, "more story and less jaw." The *Jocelyn* of the book is very skilfully drawn; an impetuous, wilful, passionate, imaginative woman, in whom the perceptive faculties are far more matured than the reflective, who feels but does not reason, and who is from temperament what Frenchmen call *tête montée*, and Americans "high faluting," in season and out of season. The chief success of the book is the manner in which the author conciliates the sympathies of her readers in favour of the very defective heroine, and makes them understand how she could win and retain the affections of two men of exceptional mark and power, though of different types, and that without her having brain enough, with all her imagination and fluency, to appreciate the best qualities of either. One particularly happy touch, quite true to nature, is that where *Jocelyn* spoils her application for the post of governess by springing on her hobby at a chance word of her proposed employer, and delivering a lecture then and there on the development of Woman. More, we think, might have been made of the contrast between the fiery and courageous heroine and her vacillating brother; but where it is brought out at all it is well done. Finally, the tone of the book is entirely high and sound, and though it does not belong to the small first rank of novels that will live, it rises in type and diction far above the ephemeral stories of the season.

Out of Society is a commonplace and

rather dull book, written in a style which is alternately fine and slipshod, gorgeous in adjectives and hazy in grammar. It belongs to the school of transpontine melodrama, according to which hardness, selfishness, and vice are habitual characteristics of those who move, or try to move, in refined and wealthy circles; while generosity and virtue must be sought among those who are "out of society." That a life of much ease and little responsibility is unfavourable to loftiness of aim and energy of action is doubtless true enough; but Mrs. Pulleyne must know very little indeed of modern England if she imagines that the line can be drawn as she draws it. The artisans who refuse to associate with labourers, or even to use the same houses of call, the shop-boys who rob tills to pay gambling debts, the working-men who correct their wives with iron clogs, are on the whole not more admirable citizens than Mrs. Pulleyne's aristocrats, and are real flesh and blood; while her characters, despite of the dedication of her book to a lady of princely rank, are clearly evolved from a not very vivid imagination, and do not by any means convey the impression of being studies from life and personal contact, especially as she has not mastered the somewhat intricate system of English titles of rank.

Robert Forrester is the work of a very inexperienced hand, and the best counsel for the author is to attempt a play, and to put the manuscript into the hands of some practised manager or actor, in order to see how much and what would be cut out. Curiously enough, there is a chapter in the book wherein the heroine by her frank criticisms induces a lady friend to give up novel-writing, as not possessing the necessary faculty, and being unable to see what is expedient in a book meant to win public approval. The actual story in *Robert Forrester* scarcely occupies one-fifth of the volume, and the remainder is entirely taken up with digressions, sometimes on scenery, and more often on what the characters could, should, might, ought, or would have thought or done, while their actual doings are compressible into a very small bulk indeed. Thus, in one chapter of the book, two persons engaged to two other persons, meet for an avowal of their preference for one another; and nearly twelve pages are given to a chapter which immediately follows this, whose whole contents consist of the fact that their conversation was overheard by one of the other pair, and that she did not like it. Ten words in the chapter which describes the meeting would have been enough, and this is just the place where an experienced manager would have ruthlessly cut down the copy were it a play. Nor are the descriptions of scenery vivid enough to be worth the space they occupy. We have three living novelists who can write of scenery so as to delight their readers: Mr. Black perhaps first, Mr. Blackmore a good second, and Mr. George MacDonald third, though if his admirable poetical vignettes of landscape be taken into account, he might be assigned the highest place. If Miss Thompson will read any of these writers, and endeavour to analyse their method in comparison with her own, she will probably see the cause of her failure. Her conversa-

tions, too, are often wordy and uncolloquial, running sometimes into monologue, so that compression is the chief literary acquirement for which she must strive if she is to win a fair place as a writer; and compression will wholesomely diminish gush, of which there is a little too much. The chronology, also, is rather baffling. Early in the story an M.P. is blamed for his vote on the Public Worship Act of last summer; much later on one of the characters is wounded in an Indian skirmish—and as Serjeant Ballantine is the only person who has gone to India to fight since 1874, there is a difficulty here too—and the last chapter is entitled "After Many Days," to imply the lapse of a long period. At the earliest the book projects itself into 1878, which is its only prospect of living till then. By that time Miss Thompson may, let us hope, have gained experience enough to write a better book than this one.

R. F. LITTLEDALE.

Briefe und Acten zur Geschichte des dreissig-jährigen Krieges in den Zeiten des vorwaltenden Einflusses der Wittelsbacher. Zweiter Band. Die Union und Heinrich IV. 1607–1609, bearbeitet von Ritter. (München: Rieger'sche Universitäts-buchhandlung, 1874.)

Of late years there have appeared several publications of original documents of the highest value for the understanding of the diplomacy of the period preceding and following the commencement of the Thirty Years' War. To these is now added a new collection of the same kind which is much superior to those which have preceded it, and the title of which we have placed at the head of this article. The second volume of this work has recently appeared. The contents of the first volume were of importance, but those of the second are of still greater interest, as they relate to the period 1607–9, the time when the great plans of Henry IV. for making war upon the House of Habsburg were matured, and the struggle between the Emperor Rudolf II. and his brother Matthias broke out. Herr Ritter's collection is the first to throw light on several hitherto unsolved historical problems, and to give order and consistency to a number of negotiations and incidents of which we had hitherto had only a confused perception. If we were to attempt to point out everything which is new, important, and interesting in this work, our notice would attain the dimensions of a book, for the art of compression, which is Herr Ritter's special characteristic, has enabled him to present us in a single volume with a mass of original material which might easily have been made to fill five or six similar volumes. Herr Ritter, in fact, has taken far more pains than he need have employed if he had contented himself with printing all his materials *in extenso*. The most important documents alone have been so dealt with; of others, only a short epitome has been given, or a remarkable passage extracted. Nor has Herr Ritter neglected similar publications which have preceded his own; he has compared the documents published in them with his own recension, and he takes care to draw the reader's attention to the changes which have

resulted from this comparison. In this way his remarks are of the greatest service to the true comprehension of the history. In particular, he has doubled the value of the documents which relate to the Union. He opens to us original sources of information, and adds to them a critical history of the occurrences to which they testify.

To descend to particulars, we may first select for remark the light thrown upon the relations of the Prince of Anhalt with Venice. Anhalt, who adopted as the work of his life the maintenance of the struggle against the House of Habsburg and the Catholic Church, endeavoured in the first instance to bring into existence a widely reaching alliance which might support the conflict with some hope of success. Venice was a link in this chain, and to Venice he despatched Christopher von Dohna, a man of approved dexterity in diplomacy. He was not merely to investigate the state of politics in Venice, but also to try to discover whether anything could be there effected to favour the spread of the Reformation. The conferences which Dohna with this view held with Sarpi exhibit the Venetian as the incarnate foe of the Popes, whose hatred to them was more deeply rooted than has been hitherto supposed, and who was bent on assailing not merely the Papal rule, but even the doctrines and very essence of the Catholic Church. This correspondence of Dohna, which abounds in piquant illustrations and remarks, was discovered by Herr Ritter in the Archives of Schlobitten, whither a fortunate star directed his steps. The Prince of Anhalt, strengthened in his hopes by the information brought to him by Dohna, wished to enter the Venetian service as general, and besought Henry IV. for his aid and countenance. The plan failed for many reasons, which are accurately detailed in this work, and which are of essential importance for the comprehension of the leading political characters in France and Germany.

The attitude assumed by Anhalt at the beginning of the contest between Rudolf and Matthias is sufficiently known already by means of various researches; it is also certain that his impatience for the establishment of the Union had direct reference to the strife commencing between the brothers. While the present collection serves to establish upon documentary evidence such phases of the contest as were previously known, it no less furnishes us with many entirely new details relative to Anhalt and his alliance with the Austrian party-leaders, by means of which future historians will be enabled to give a far more vivid representation of that troublous period than has been hitherto possible. We may see, step by step, from the correspondence laid before us, how Anhalt was unwilling, for the sake of any advantage to himself, to allow Matthias to gain the victory; how he afterwards made the attempt (which did little honour to his insight or perspicacity) to manoeuvre the lost territories back into the hands of the Emperor Rudolf, and how he even conceived the idea of acquiring for himself the lordship over part of the Austrian countries, perhaps over Bohemia.

One is amazed at the number of confiden-

tial agents employed by Anhalt in these negotiations, whose accounts, all of them valuable, are laid before us by Herr Ritter. One of these agents was Theophilus Richius, whom the Prince sent to the Archbishop of Salzburg in order to restrain the latter from taking any part in favour of the House of Habsburg. We extract the following remarkable passage from the account given by Richius of his conferences with the Archbishop. The latter, having declared himself favourably disposed to the request of the ambassador, thus expressed himself concerning the Jesuits:—

“But the Jesuits who meddled in politics were such pernicious persons, that he reckoned them with their scholastic principles worse than the greatest heretics; for which reason he would not admit them into schools. Such princes as received them would discover some time what they had got in them. He had as yet admitted none, and he had no intention of doing so, for they were quite intolerable, and wished to prescribe and lay down the law in political matters. The old Archduke Ferdinand, with whom he lived on most familiar terms, had once said to him, ‘the Jesuits would be a convenient set of people if they were not so spoiled with looking after little sins that he would have nothing to do with them.’”

We acknowledge that this condemnatory verdict of the Archbishop respecting the Jesuits somewhat surprised us. We may say that up to this period (until 1608) their zeal had been only conspicuous in checking the decay of learning among the Catholics, and in drawing in steadfast adherents to the Church in their schools. They had done wonders in this respect, and had thereby gained an influence over the course of politics. But that this influence should have called for so decided a condemnation from a Catholic prelate, who owed his position mainly to it, surprises us and leads us to conjecture that the activity of the Jesuits even so long ago as 1608 was pushed further than documents have hitherto led us to believe.

On turning over a few more pages, our attention is arrested by the documents concerning the Juliers succession, and a closer examination shows that full light is here for the first time thrown upon the changeful phases of the contest to which the dispute, then commencing, gave rise. We learn from the documents how by degrees the most important interests became associated with this contest, and how Henry IV. had a design of making it the starting-point of his great plan of attack upon the House of Habsburg. The two great politicians of their age, Henry IV. and Anhalt, met here with similar designs and wishes, though the latter could not rid himself of all distrust regarding his royal confederate, and in the question of the Juliers' contest did not wholly place himself on the side of Brandenburg. We see that as soon as the question of the Juliers succession came to be agitated, Henry addressed himself with greater energy than ever to the strengthening of his alliance with the Duke of Savoy, and that the Duke met him half-way. By means of this alliance France was to be put in possession of Savoy, while the Duke, in compensation, was to receive Milan. Both powers wished to wrest the latter from Spain. We learn also what was the attitude assumed by Holland at this

time, and how she was always ready to offer her assistance in the matter of a league against Habsburg.

But if we now consider the inclination of the German Union, of the House of Brandenburg, France, Savoy, and the States-General, &c., to a combined attack upon the House of Habsburg, as it appears from all the despatches of 1608-9, remembering at the same time the weakness and even powerlessness of that house, we cannot but wonder that the attack was continually postponed, and that there was perpetual recourse to fresh negotiations, in which, after all, no more was effected than by the former plans. The explanation of this somewhat puzzling state of affairs is fully given in the present work. The cause of the long delay is to be sought in Henry IV., who, with every desire to make the attack, was withheld by powerful influences and considerations. In the first place, in his Council of State, Villeroy skilfully opposed the anti-Spanish policy of Sully, thereby making a great impression upon Henry himself. In the next place, Ubaldini, the papal nuncio at Paris, lost no opportunity of disposing the King towards a policy which should unite the interests of France and Spain, and it was difficult for Henry to disregard the representations of the nuncio. Finally, what was of most weight, the Queen, Mary de Medicis, took the side of Spain. According to some highly valuable documents she seems to have become apprehensive lest the legitimate title of her children to the succession to the throne might some day be contested, and it therefore became her prime care that her son and daughter should marry a Spanish princess and prince, since such a marriage would obviate any defect in her children's title in the future. Her entreaties and tears were not without effect upon the King, and to this circumstance, as well as to the influence of Villeroy and Ubaldini above referred to, we specially ascribe the tedious and often interrupted course of the negotiations about the alliance with the anti-Spanish powers.

Notwithstanding all this, matters took a new turn towards the end of 1609, and Henry IV. sought with all his energy to set his great military designs in operation, while as a preliminary he concluded a treaty of marriage with Savoy in which he betrothed his daughter to the Prince of Piedmont. The question now arises, what were the means by which this change was effected? The publication of Herr Ritter solves this problem also. It was the rage with which the flight of the Prince of Condé and his wife inspired the King which now urged him headlong against Spain, which he suspected of having favoured the flight. Many passages in these despatches prove the King to have lost all moderation after the flight of the Princess, and that his policy was influenced by his thirst for vengeance. Even Sully allows this to be seen in a conversation with the Dutch ambassador, though he does not venture to express himself plainly.

And now, in conclusion, let us refer to a few words which help us to understand the character of Pope Paul IV., which we borrow from a letter of Breves, the French ambassador at Rome. It is notorious that the Pope sought to enrich his own family in

every possible way, and was in consequence liable to be charged with avarice. M. de Breves happily expresses his conviction of the justness of this charge in a letter to Henry IV., contradicting the rumour that the Pope had sent 500,000 thalers to the Archduke Leopold in support of the maintenance of the claims of the latter to Juliers: "Unless I err," writes Breves, "his Holiness would sooner lose all Christendom than disburse such a sum."

The above remarks may suffice to place the value of Herr Ritter's publication in its true light. No one who attempts to write the history of any of the greater European countries can afford to pass it by, as it alone offers a complete solution of some of the greatest problems of the age with which it deals.

A. GINDELY.

NOTES AND NEWS.

ANOTHER portion of the long-lost originals of the Paston letters has been discovered—those printed by Fenn in his third and fourth volumes. They were found together with a number of MSS., both of that date, and of more recent periods, which are undoubtedly part of the Paston Collection, in the house of Mr. Frere, of Roydon Hall, near Diss, in Norfolk. This find is just barely in time to be of some use to Mr. Gairdner before completing his third and final volume.

MR. HORWOOD has undertaken to edit for the Camden Society Milton's *Commonplace Book*, which was discovered last year in the library of Sir Frederick Graham, of Netherby.

WE are glad to learn that Captain Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen, intends to continue the publication of his daily synoptic meteorological charts for the third quarter—June to August, 1874. The charts are constructed from every available source for the region embraced, viz.: from about lat. 30°—70° N. and from long. 40° W.—40° E. of Paris. The cost of subscription in this country is 12s. 6d. for the three months; but as only a limited number are printed, application should be made at once to R. H. Scott, Esq., Director of the Meteorological Office, 116 Victoria Street, London, S.W.

WE are informed that in a few days an illustrated *Handbook of Norway*, by Christopher Tonsberg, will be published at Christiania for the use of travellers, which in point of fulness and accuracy will supersede all works at present existing on the subject. The high appreciation of the book in Norway is shown by the fact that the Storting has voted an annual pension of 150*l.* sterling to the author for life.

A *History of the Jews in England* is in preparation by Mr. Picciotto, who has had access to a great quantity of hitherto unused materials. It will be published by Messrs. Trübner in September next.

MR. SAMUEL TINSLEY will publish early in the coming week a pamphlet on the influence of the Court over the community under a constitutional monarch. The same publisher has in the press *Roba d'Italia*; or, *Italian Lights and Shadows*, a record of travel, by C. W. Heckethorn, and the following novels—*Sir Marmaduke Lorton*, by the Hon. A. S. G. Canning; *The Shadow of Erksdale*, by Miss Marshall; *Gold Dust*, by John Pomeroy; *A Name's Worth*, by Mrs. Allen; and *Margaret Mortimer's Second Husband*, by Mrs. Hills.

M. OCTAVE DELEPIERRE has just completed a work dealing with one of the curiosities, or rather trivialities, of literary history, under the title of *Littérature du Cento*. The object of the *Cento*, we need scarcely remind our readers, is to combine

verses from one author or from several authors so as to give each passage an entirely distinct sense from that which it bore in its original context. Horace, Virgil, Ovid, Juvenal, and others have all afforded sport to the cento-mongers, and M. Delepierre gives examples from the literature of all periods, from the book of Jonah down to the year 1817. His book cannot fail to be amusing, if scarcely profitable, reading.

It is rumoured that the author of *Ye Vampyres!* is Mr. J. Smith Latham.

THE King of Italy has presented the Cross of the Corona d'Italia to Dr. Anton Dohrn, the founder and director of the Zoological Station at Naples, in recognition of his eminent services in the cause of science and in the promotion at Naples of a taste for scientific pursuits.

THE *Allgemeine Zeitung* announces that the Chair of Chemistry, which has been vacant in the Munich University since the death of Baron Liebig, has after prolonged negotiations been accepted by Professor Baeyer, of Strassburg, who has also been appointed to the directorship of the Chemical laboratory, for which liberal grants have been made by the Bavarian Chambers. Professor Baeyer, who is one of the most eminent and efficient chemists of the day, will begin his course of lectures at the opening of the winter session.

COPPÉE is writing the articles on the Paris Salon in the *Moniteur Universel*.

HECTOR MALOT's new novel, just begun in the *Siècle*, is said by some who have seen the manuscript to be among his strongest work. He will deal, in the new book, with a world in which, as an artist, he has always shown himself at home: the world of financiers, intriguers, and parvenus, who did so much for the ruin of the Second Empire.

AT the first Inter-Collegiate Literary and Oratorical contest, held last winter in the United States, at New York, the Shakspeare prizes were carried off by two pupils of Professor Hiram Corson at Cornell University, namely, Mr. James Fraser Clark, who wrote on "the Clowns of Shakspeare," and Mr. George H. Fitch, who wrote on *Henry the Fifth*. The essays are to be published soon. Among the judges on them were the poet William Cullen Bryant, the Shakspeare-editor Richard Grant White, George William Curtis, &c.

MESSRS. DÜMMLER, of Berlin, will shortly publish a work by Dr. Carl Abel on Egyptian Grammar and Lexicology. It deals for the most part with the Coptic period of the Egyptian language. In it the author professes to define the meaning of a certain number of words, his avowed object being to investigate, by means of the language-test, the notions prevalent in ancient Egypt about Right and Wrong. Following up to their original source the history of the words explained, he proceeds to investigate how their meaning came to be derived from certain primary roots, and, as the national intellect developed, gradually assumed their ultimate and more suitable form. From the author's point of view Grammar is not a mere exposition of a few abstract notions of time, space, relationship, &c. It includes the concrete ideas contained in the Dictionary as well, and, showing them to be intimately connected with grammatical forms and notions, he attempts to prove the latter to have been created for the better expression of the former. Dr. Abel professes to have separated the Egyptian active and passive verbs, so long confounded, to have discovered several new species of passives, and traced the origin and gradual growth of all passives, and to have proved the force of vowels to change the meaning of a word, whereas vowels have hitherto been regarded as almost absolutely insignificant in the Egyptian tongue.

If "a man who says he prefers dry to sweet champagne will say anything," so will an etymolo-

gist. After having conspicuously borrowed the word *baby* from the English, only modifying it into *bébé* to suit their own ends, or, at all events, terminations, French *savants* now mean to ignore the English derivation altogether and rely upon the Syriac *babion*. Photius, the author of the Greek Schism, relates indeed in a notice of the philosopher Hermias, that this worthy had an infant son whose mother, Oodesia, used to call him *babion*, a liberty which, being a very precocious child, he resented while still in arms. This formidable infant fulfilled his early promise, if Photius is to be understood literally, by committing suicide at the age of seven years in consequence of the unusual but not unreasonable objection he felt to living in a body. Whether he really gave up the lease of his habitation at the first available period is perhaps doubtful, since the literal translation of the Greek text is "he separated himself from the living;" and his sorrowing parents may have suggested that he was too good to dwell in a mortal body, but it is, at all events, clear that a young person who objects when seven months old to being called *baby*, *bébé*, or *babion*, could never make old bones, and is now, doubtless, materialised in the form of a captious etymologist.

CAMILLO GRILLPARZER, brother of the poet, died on the 1st instant at Vienna at the advanced age of 81. The bitter expressions regarding relations to be found in the will of Franz Grillparzer, says the *Neue Freie Presse*, did not apply to the deceased, but to the children of another brother long since dead. Camillo Grillparzer was always on good terms with the poet, who in his Autobiography, which goes down to 1836, speaks of him in the friendliest manner, especially recalling the amateur theatricals in which they both delighted in early youth. Difference of disposition, however, prevented any real sympathy between the brothers in after life.

A KINDER-GARTEN has been lately established at Cracow, in the girls' seminary, under the direction of Dr. B. Jeblonski. The introduction of Dr. Fröbel's admirable system of infant training into this city proves that the Poles are beginning to appreciate the good results of German culture, and to desire a share in its advantages.

A WRITER in the *Allgemeine Zeitung* of the 3rd instant, who has evidently derived his information from the most authentic sources, quotes documents which seem to clearly disprove the identity of the mysterious Kasper Hauser with the infant son of the Grand-Duke Karl of Baden and his Duchess Stephanie, born on September 30, 1812. The evidence brought forward is of a very circumstantial character, and proves conclusively the death of the infant prince on October 10. The solution of the mystery which enfolds "the foundling of Nuremberg" must evidently be sought elsewhere.

TESTS have been abolished for the degree of Doctor of Laws in the University of Breslau.

THE *Deutsche Rundschau* for May opens with a short tale by Auerbach, called "Nannchen von Mainz," a Rhenish story. Nan was her father's pride, and since her mother's death dearer than ever to him. To give her away in marriage would in any case grieve him, but when his consent was asked for her marriage with a young Prussian who had courted her secretly, a tremendous storm was the consequence. A genial, generous Rheinlander to see his daughter wed a Prussian! But Nan was firm, and yet for her father's sake willing to bide her time. In a little the young Prussian is called out to serve in the Danish war, is severely wounded and invalided home. The father hears with astonishment of bravery or anything praiseworthy in a Prussian, and by degrees some impression is made on him in favour of the lover. Still there was indignation enough left to make a violent scene one day when Nan announced that she was going to visit her betrothed at his

mother's home, if not with her father's consent, without it. He could not, whatever his feelings were, see her go alone, and so both started on a journey from which he at any rate came back with changed feelings. He had learned to respect the Prussians, of whom, as a race, he heard it said "that their only friend was hard work." There was no more obstacle to the marriage. Probably this hatred of the Prussians existed, if not chiefly, at least in the highest degree, among Rheinlanders of lower occupation. Nan's father was a porter employed in loading and unloading the Rhine steamers. She herself, before the marriage, was a laundress on a tolerable scale. The young Prussian was a carpenter by trade. "Shipwreck," a short narrative in the same number of the *Rundschau*, is simple and touching, besides having some small interest in reference to European life in Japan. From an article on the attitude of the *Revue des Deux Mondes* towards Prussia and Germany for some years before the late war, it is clear, among other things, that the Germans greatly miss the recognition, if not homage, which was there constantly being paid to their services in science and philosophy. Ferdinand Lassalle is the subject of an article of some length, in which the precise nature of his theory of the rights of property is described, followed by a statement of his political views regarding the reconstitution of a German Empire which, now that this has been accomplished, will be read with peculiar interest, and with admiration of his foresight.

In the June number of the same periodical is a very interesting article on Heine, containing also several hitherto unpublished letters of his, beside some poems, parts of poems, corrections and alterations, which introduce the reader, as it were, into Heine's workshop, if only just over the threshold. But interesting as the article is throughout, it ends, or rather culminates, in a statement which for a moment puts all the rest in the shade. Who does not know the beautiful touching ballad

"Es fiel ein Reif in der Frühlingsnacht,"

to which Heine added the remark that it was a real popular ballad which he had heard on the Rhine? In spite of this, the authorities on ballad poetry have declined to accept it, believing it to be purely a creation of Heine's. But they are wrong, and we must either take literally the statement of his having heard it on the Rhine; or, which is more likely under the circumstances, assume that he had read the version of it in the *Rheinische Flora*, January 25, 1825, signed Wilh. v. Waldbrühl, with the note that it had been written down from the lips of the people. There the first three stanzas are the same as in Heine's version; the fourth bears strongly the mark of his hand. Wilh. v. Waldbrühl was the signature of Anton von Zuccalmaglio, whose splendid services in recovering and preserving the ballad poetry of Germany have been fully recognised. Heine published his version in 1820, and his connexion with the *Rheinische Flora* makes it all but impossible that he did not see the original publication of the ballad by Zuccalmaglio. After all it is one of those ballads so perfect in their kind, that perhaps the very last enquiry that would be made about them is as to their authorship. They contrast with other forms of poetry much as flowers contrast with animals in this respect, that no one asks their pedigree.

THE Review of the Life and Speeches of the Prince Consort, by "Etonensis," in the *Contemporary*, is so diplomatically moderate and guarded in tone that it would have been passed over as insignificant but for the uncontradicted report which ascribes its authorship to a statesman who could only write on so delicate a subject diplomatically, and therefore must be supposed to mean very earnestly indeed whatever fragments of assertion can be extracted from the mass of decorous verbiage. After all there is nothing very startling in the discovery that Mr. Gladstone thinks the

history of the "Bedchamber question" has not been written yet, that Prince Albert was too near the person of the Queen to be safely entrusted with the command-in-chief of the army, that Her Majesty discharges the business of her office with perfect competence and industry; that the personal influence of the Sovereign on public affairs depends greatly on "close presence at the seat of government," and that "the social and moral tone of the upper classes of this country" has deteriorated of late years, since the Court itself has lost the character impressed on it, partly, it may be assumed, by the Prince Consort, during the married life of the Queen; but it is true that few ex-Prime Ministers would choose to make public their sentiments on the two last heads. Lord Lyttelton writes on the Poor Laws, advocating a strict application of the Workhouse test; M. Milsand on Religion and Politics in France, advocating nothing in particular, but accusing the secular liberalism, which is the only rival of the clerico-legitimist tradition, of establishing "the lawless sway of the impulses," to the exclusion of any abiding organic growth or progress.

THE *Revue des Deux Mondes* for June 1 has two articles on "La Météorologie Forestière" and "L'Assistance publique dans les Campagnes," which furnish an indirect comment on the two previously mentioned. The institution of "bureaux de bienfaisance," which languished under the Empire, is recommended as likely to conciliate the rural districts, and as affording machinery for carrying out a much needed reform, or rather development, of the medical profession in country districts, some of the most thinly populated departments being at present provided with qualified practitioners at the rate of one to from six to ten thousand inhabitants. The effect of forests on climate, temperature, and rainfall is proved to be considerable, but M. Clavé admits that full and detailed observations are needed as a base for further speculation, though the practical usefulness of the Meteorological Commission is established by a single instance: it is observed that a wet summer does comparatively little to feed the water springs, and that a dry winter will be followed by a dearth of water, even though the summer rains were abundant; and accordingly when the rainfall in the Département de l'Oise was found, between November 1873 and April 1874, to be much below the average, the farmers were officially warned to expect a scarcity of water and had time to provide steam power instead.

In the *Fortnightly Review* Lyulph Stanley gives an account of "The Treatment of Indian Immigrants in Mauritius," based on the Report recently laid before Parliament, which it is to be hoped may help to fix public attention on a most deplorable and discreditable state of things, and one which is not likely to be remedied without peremptory action on the part of the home Government. Professor Clifford writes *à propos* of "The Unseen Universe" of human mortality, and Sir William Thomson's hypothesis of a universal, frictionless fluid, in a way that would be more instructive if the work referred to had been one requiring serious refutation. Lewis Carroll refutes some—and reproduces other—"Popular Fallacies on Vivisection."

THE same number contains a short article on "Results of the Examination-System at our Universities," by A. H. Sayce; which deals in a tone more trenchant than is common with the mischievous consequences that are arising from the present abnormal development of the examining machine at Oxford and Cambridge. Mr. Sayce gives no statistics, nor any convincing array of facts, and his criticisms wear somewhat the appearance of the disburdening of an individual mind. Those, however, who are best acquainted with the existing condition of things, though they may not acquiesce entirely in the picture that he has drawn, will attach due weight to the opinions of

one who is so well qualified to represent the higher aspects of academical life.

MR. SANDAY's article on "Marcion's Gospel" is a chapter from his forthcoming reply to *Supernatural Religion*, which is to be published by the Christian Evidence Society. He shows that, whatever was the motive of Marcion's omissions (most of which can fairly be accounted for on dogmatic grounds), the passages omitted must be by the author of those retained, as they are full of examples of his characteristic vocabulary and turns of expression; and that, as Marcion's text is of a "Western" character akin to "D," and the Curetonian Syriac, the complete work of which we have manuscripts and versions both of an "Eastern" and a "Western" type must be considerably older than Marcion in order to give time for these types to differentiate themselves, even if we reject the general judgment of critics who regard the "Western" type as decidedly the later.

In the *Cornhill* both the novels come to an end. There is something pathetic in Miss Thackeray's attempt to "see life steadily and see it whole;" but if one cannot deny that the whole is greater than its parts, the issue of the attempt does not weaken our conviction that the parts are or may be better than the whole, if so to represent the whole is a mistake. There is a very interesting account of Lazarillo de Tormes, and a curious article on life past and future in other worlds, which gives the final views of the writer as to Jupiter and Mars: the former of which he thinks is not yet come to a capacity of supporting such life as we know, while the latter is probably past it; if Jupiter ever does come to a capacity of supporting life, the author thinks life will get further on Jupiter than it will ever get here; if Mars ever came to it, he thinks life cannot have got far there.

In *Temple Bar* there is a sensible and candid article on Catherine de Medicis and her times, and one on T. W. Robertson and the modern theatre, which has a good deal of biographical interest, though Robertson's dramatic services are ludicrously overrated.

In the *Gentleman's Magazine* a narrative poem by Mr. Buchanan, in six monthly parts, "of peculiar pathos," is announced for 1876, and concludes a series of short poems by the same "distinguished poet," of which the last instalment, "a peep-show," is among the best; it contains the authors' reasons for thinking Hans Andersen a greater theologian than Calvin. There are other puffs preliminary in the preface—of Mr. Francillon's new novel "A Dog and his Shadow"—of the recollections of Mr. and Mrs. Cowden Clarke concerning Dickens, Jerrold, Leigh Hunt, Wordsworth, Hazlitt, &c.

In *Fraser* there is a reprint of Hemsterhuis' letter to Princess Galitzin on Atheism, full of refined and sober wisdom, which would have been more impressive if the author had not cherished a bizarre theory of "the moral organ." Karl Blind's paper on "Fire Burial among our German Ancestors" contains the results of a good deal of reading, as well arranged as could be expected from a writer capable of suggesting that Pythagoras means Buddhagoras. Mr. Edersheim proves that F. R. C.'s ingenious applications of the Talmud to the criticism of the Talmud are, to say the least, untrustworthy, as F. R. C. is too eager to be accurate. In *Macmillan*, the instalment of Mrs. Oliphant's book on the Convent of San Marco is especially interesting, because the writer comes more or less consciously though not willingly into competition with the author of *Romola* in treating of the execution of Bernardo del Nero and the abortive ordeals. She proves our Savonarola's principles that Bernardo deserved his death, which is enough, at least, to mitigate our judgment of his refusal to strain his enfeebled authority to maintain the legal right of the Mediceans to an appeal to the Great Council. With

out rejecting her protest against the passion for "complexity" which hinders us from apprehending Savonarola's simple straightforward faith in signs and wonders, it is surely less strange than she thinks it, that a man who had also a strong sense of commonplace reality should have been more ready to challenge a miracle against him than for him.

The following Parliamentary Papers have lately been published:—Correspondence respecting Slavery in Cuba and Puerto Rico, and the State of the Slave Population and Chinese Coolies in those Islands (price 2½d.); Reports on the Law of Master and Servant in Foreign Countries (price 3d.); Treaty concerning the Formation of a General Postal Union, signed at Berne, October 9, 1874 (price 1½d.); Report from Select Committee on Corrupt Practices Prevention and Election Petitions Acts (price 2d.); Seventeenth Report of H.M.'s Inspector of Constabulary of Scotland (price 6d.); Report from Select Committee on Turnpike Acts Continuance (price 3d.); Report from Select Committee on the Metropolis Local Management Acts Amendment Bill (price 3d.); Return of Benefices sold under the Lord Chancellor's Augmentation Act, names of purchasers, amount of purchase money, &c., &c. (price 2d.); Return of Railway Accidents during the months of January, February, and March, 1875 (price 10½d.); Further Papers respecting Laws, Ordinances, &c., relating to Monastic Institutions in Foreign Countries (price 7d.); Proposal for a Conference of Delegates from the Colonies and States of South Africa (price 1½d.); General Abstract of Marriages, Births and Deaths registered in Ireland in 1874 (price 1½d.); Twenty-first Annual Report of the Director of Convict Prisons for Ireland (price 3½d.).

NOTES OF TRAVEL.

THE French Academy of Sciences was, on the 28th ultimo, occupied with the results of the expedition undertaken, in 1871 and 1872, to Alaska by M. Alphonse Pinart, with a view of studying the ethnography and the different languages of the populations of that region—Esquimaux, Aleutians, Kolochas, Tynnels, &c. M. Jules Desnoyers, in the name of M. Pinart, presented a description of a sepulchral grotto on the southern coast of the Isle of Ounga, in which skeletons, wooden masks carved and painted, and copies in painted wood of tools and fishing-tackle, were found. The explorer conjectures that this necropolis was sacred to the interment of whale-fishers, who were a privileged class among the ancient Aleutians. M. Pinart proposes to publish vocabularies, hymns, and popular songs in the dialects of each of the indigenous tribes of Alaska, accompanying them with interlinear translations. He has already contributed the first volume of a *Library of American Ethnography and Linguistic Science* to the elucidation of these subjects, besides having supplied students of anthropology with material data in the shape of a collection of skulls, tools, works of art, drawings of costumes, &c., all of which have been sent to the Museum of Natural History in Paris.

THE Imperial Russian Geographical Society has had tidings of M. Miklucho Maklay, in the shape of a letter from that traveller dated Singapore, April 13. He states that his researches after a race of Papuan extraction in the Malay Peninsula lasted for two months, and at the outset, the rainy season being barely at an end, he was obliged to wade through inundated plains and forests, while he also suffered great discomfort from attacks of insects and reptiles. In the Semang type, a primitive and nomad race who are gradually disappearing before Malay and Chinese civilisation, M. Maklay considers he has clearly proved the existence of a non-Malayan element. He now proposes, after being absent from Russia for some

years, to return thither for the purpose of publishing the results of his travels in New Guinea and other parts of the East Indies.

THE possibility of creating an inland sea to the south of Tunis and the province of Constantine has attracted the notice of the Italian Geographical Society at Rome. A commission, under the guidance of the Marquis Antinori, has been deputed thither to investigate the possibility of cutting a canal across the narrow neck of land separating the Bay of Tunis from the *chotts* or depressions to the south. It was necessary also to ascertain the probable depth of the lake, and to see from a careful examination of the levels whether the inundation would not be more wide-spread than was thought, and so cause unexpected damage to property. Other points touching upon the commerce, industries, and natural history of the adjacent countries were to be also included in the programme of the commission, which is directly affiliated to the council of the Italian Geographical Society, who have already received satisfactory intelligence from the expedition respecting its chance of success.

SOME of the Norwegian papers announce that the Chambers have voted a sum of 4,800*l.* towards a scheme for the prosecution of deep-sea investigations between Iceland, Spitzbergen, the Faroe Islands, and Jan Mayen Island. Operations will be conducted as far as possible on the model of the *Challenger's* researches.

At a recent meeting of the Upper Rhine Geological Society at Donaueschingen, an interesting paper was read by Professor Knop of Karlsruhe on the gradual sinking of the level of the Danube at Immerdingen, and on the numerous facts which seem to prove that the Aach is a portion of the Danube and not an independent river. Near Immerdingen the stream diminishes in depth and in the velocity of its current, and it is conjectured that at this point it sinks into the fissured soil, and again recovers its level and speed at Aach, where it supplies the mass of waters which issue from a cauldron-like depression in the rock, and have hitherto been regarded as the source of the Aach. If Professor Knop succeeds in demonstrating physically and chemically that the two streams are identical, he will have proved the interesting fact that the Danube under the name of Aach swells the mass of the Rhine, and thus communicates directly with the German Ocean.

AMONG the various mineral substances used as building materials found in Algeria the most remarkable is the translucent alabaster, or so-called onyx, of Ain-Tekbalet, in the province of Oran. The quarries of Filfila, near Philippeville, yield several varieties of marble, of which one is comparable with the finest specimens from Carrara. Magnificent *brèche* is found at Chenonah, near Cherchell, several species of white, grey, black, yellow, green, and red marbles are met with in other parts; and lastly, green serpentine occurs at the Oned Madrage. At Cap de Fer, in the Gulf of Stora, porphyry is found, a specimen of which, the pedestal of Marshal Bugeaud's statue, may be seen at Algiers.

The alfa fibre is without doubt the most important vegetable production of Algeria. It grows spontaneously over vast tracts of country where cultivation of any description is impossible. Ten million acres are said to be covered with this plant, from which a quantity of paper-making material may annually be collected equal to three-fourths of all the rags used and sold throughout the world. There appears no limit to the number and variety of manufactures in which paper, if tolerably cheap, may be made to replace more costly materials. Opticians use it for telescopes, shoemakers and hatters turn it equally well to account; excellent casks have been made of it; and, but for its cost, it is said that it would be largely used in shipbuilding.

THE new and commodious hotels at Nicolaieff,

which Consul Stevens describes in a recent report as springing up daily, are not likely to attract many tourists thither, if the account given of the municipal arrangements is a strictly accurate one. The most ordinary adjuncts of a civilised town, such as sewerage, waterworks, gas, and paving, to say nothing of police, are conspicuous by their absence. The state of the streets in wet weather is absolutely dangerous, cabs have established ferries to cross them at 1½*d.* a lift over, and a facetious local journal suggests the substitution of lifeboats. The vast, wide, lonely, dark streets at night, abounding with savage and hungry dogs and with robbers of the worst kind, make locomotion still more precarious, and such inhabitants as are compelled to move about after dark must carry arms as a protection against both man and beast. And yet the commercial prosperity of the place is remarkable, land and buildings having more than quadrupled their value five years ago. The discovery by many that Sebastopol cannot achieve commercial importance at the best for years to come, and then only in connexion with the export of coals, has had much to do with this rapid improvement. With the opening of the Fastov-Inamenka railway, the line to Kherson, and those which will link it more directly with the Azoff, it is impossible to calculate the magnitude Nicolaieff will assume in another five years. A new trade will thus be opened out with the Mediterranean and England, in commodities which hitherto the want of transport made it impossible to bring to a point of shipment.

THE *Geographical Magazine* for June contains the best obituary notice we have seen of the late Admiral Sherard Osborn. It is written, evidently, by one who combines an intimate and accurate knowledge of the eventful life of the late admiral with a warm admiration for his sterling English qualities. Some interesting details respecting the Arctic Expedition are furnished in the next article, in the course of which the author remarks that it is unfair and misleading to say that the present expedition is going out with greater advantages than any preceding one, as the vessels draw more water, have not such good provision for warming, and have less interior stowage, while the scales of provisions and clothing are practically identical with the most recent of those in past times. A lively sketch of the salt farms of the Loire and the sardine fisheries off the coast of La Guérande, from the pen of Mr. H. St. John, follows; and among a variety of minor papers we must notice a brief article respecting Dr. Nachtigall, the well-known African traveller, accompanied as it is by a carefully and judiciously compiled map of Central Africa, north of the third parallel of north latitude. Among the reviews, one of the last report of the Great Trigonometrical Survey deserves mention for the unusually varied and general interest of the subject matter.

CHARLES DE RÉMUSAT.

FRANCE has just lost one of the most brilliant and most sympathetic representatives of the literary and political movement of 1830. M. Charles de Rémusat died at seven o'clock on the morning of June 6, of rapid inflammation of the lungs. He had attained his seventy-eighth year on March 14 last. Though the son of an imperial chamberlain and prefect, and of a lady bound by the ties of friendship to the Empress Josephine, he yet found himself drawn towards the liberal party by the natural bent of a lofty and generous intellect. He at first engaged in the study of the law, but soon turned towards literature, philosophy, and politics, and wrote in several of the newspapers and reviews which appeared between 1820 and 1830, the *Lycée Français*, the *Tablettes Universelles*, the *Revue Encyclopédique*, the *Courrier Français*. This mental flexibility and manifold activity won for him from M. Roger Collard that eulogy that concealed a criticism below the surface: "Rémusat is in everything the first of amateurs."

He was at this time on the staff of the *Globe*, that brilliant review founded by Dubois in 1824, which waged unsparing and successful war with the Restoration. Here he found himself in the company of Duvergier de Hauranne, Guizot, Jouffroy, Cousin. While with the first three he devoted himself to politics, and took his post without renouncing his independence of spirit in the ranks of the so-called doctrinaire party, he entered upon studies in philosophy by the side of M. Cousin, yet without submitting to his imperious authority. His life was thenceforth devoted almost wholly to these two fields of activity. He brought to each the same prudence, inclining to timidity, but also the same elevation of thought, the same warmth of heart. Having been elected deputy in 1830 by the town of Toulouse, where his father had been prefect, he sat at first on the Right from a reaction against the advanced wing of the Liberal party, which did not draw a sufficiently clear line of demarcation between itself and the Revolutionary party; but when the disturbances had been repressed and order re-established, he passed over to the Left Centre, where he joined with M. Thiers in demanding a more liberal and more active policy.

He was for a brief space Minister of the Interior in 1840 when M. Thiers became Prime Minister, and he distinguished his short tenure of office by the speech, very impolitic it must be confessed for a friend of constitutional liberties, but of a high order of eloquence, in which he advocated and carried the solemn transportation of the remains of Napoleon from St. Helena.

During the eight years that followed he offered a relentless opposition at once vigorous, graceful and sensible, to M. Guizot's barren policy. The Revolution of February, 1848, again threw him into the arms of the Right, for it was ever in the nature of his mind, prone to moderation and capable of calm wisdom rather than of enthusiasm, when the ship heeled over in one direction to throw his weight on the other. Without sufficiently distrusting the recollections and the heirs of the name of Napoleon, he even for a moment showed himself favourable to the Prince President; but he speedily divined his ambitious projects, and offered him an opposition which the blindness of the Montagnards and, soon after, the Coup d'Etat of 1851, rendered unavailing.

Throughout the whole of the period of the Empire, M. de Rémusat held aloof from politics, and devoted himself wholly to his literary and philosophical labours. He made no noise about his opposition to the imperial government, but he was inflexible in his attitude of disdainful, sarcastic, and almost contemptuous isolation. Even in 1870, on the occasion of the changes inaugurated by the Ollivier ministry, he only gave those efforts his half-ironical goodwill, and I still remember with what wise scepticism he expressed his fears as to the impossibility of an absolute government continuing to live by becoming liberal.

The Revolution of 1870 and the misfortunes of France caused the return of M. de Rémusat to public life. He was summoned by M. Thiers to undertake the Ministry of Foreign Affairs, in which he showed a clearness of intellect undiminished by the lapse of years. The failure of his candidature at Paris was one of the causes of the fall of M. Thiers. Being afterwards elected in the Haute Garonne, he continued faithful to himself, and contributed to the utmost of his power to the establishment of the Republic, in which he saw, not the political ideal, but the only practical solution in the present state of France.

The most brilliant period of M. de Rémusat's literary activity falls between 1840 and 1860. He was one of the most fertile and most competent contributors to the *Revue des Deux Mondes*, and some of his most important books, especially *L'Angleterre au XVIII^e Siècle*, are reprints of a series of articles. He was elected member of the Academy of Moral Sciences in 1842, and of the French Academy in 1846. Among his works may

be mentioned—*Essais de Philosophie* (1842); *Abélard, sa vie et ses œuvres* (1845); *Passé et présent* (1847); *St. Anselme de Cantorbéry* (1853); *Bacon* (1857); *La Philosophie religieuse* (1864); and his two last books, *David Hartley* (1874), and *L'Histoire de la Philosophie Anglaise de Bacon à Locke* (1875).

As may be perceived, M. de Rémusat gave his preference to England as the subject of his studies. He loved the solid and practical spirit of English philosophers and statesmen. He loved, too, their readiness to accept the teachings of experience, to yield to the demands of public opinion, and to the tendencies of their age. His mind was always open to novelties, but remained ever inaccessible to all impulses which exceeded the bounds of moderation. Exquisitely polite, and kindly in manners and in all the relations of life, he carried into the domain of mind and of ideas the same correctness and the same grace. Faithful to the eighteenth-century spirit of free thought, he yet showed no want of imagination, no anti-religious passion. He detested fanaticism, irreligious fanaticism as well as its opposite. I do not hesitate to say that of all the eminent men whom the France of the eighteenth century has produced, M. de Rémusat was the most completely, the most profoundly liberal.

He leaves two dramas in verse unpublished; one of them, *Abélard*, of which Sainte-Beuve has spoken in his *Port Royal*, contains poetic beauties of the highest order. G. MONOD.

GERMAN LETTER.

Gotha: June 3, 1875.

It is rightly desired in Germany to publish every document, every notice, which may serve to illustrate Goethe's life, for while with regard to others we assume that their best is deposited in their works, and that, too often, the faults of the man must be forgotten in the virtues of the poet, we only feel capable of grasping the full beauty and greatness of this genius, when we seek to understand the unity of his love and his life, his action and his thought. Fresh revelations of Goethe's youthful life in Frankfurt are, naturally, particularly welcome, and such are afforded by the *Letters from Goethe to Johanna Fahlmer*, edited by L. Ulrichs. (Leipzig: Hirzel.) They, of course, contain little of interest to the general public. The poet makes distinguished mention of this young lady among his sister's friends in *Wahrheit und Dichtung*. She was five years older than he was, came to Frankfurt in 1772, returned to Düsseldorf in the following year, and brought about the friendship between Goethe and the brothers Jacobi, who were the sons of her elder step-sister. Being again at Frankfurt in 1774, she was the confidante of Goethe's love for Lili, and afterwards became the second wife of his brother-in-law. The Frankfurt letters are, indeed, for the most part only disjointed exclamations, hastily jotted down, but for that very reason they afford a direct insight into the tumultuous working of this fiery spirit. The few letters from Weimar in the years 1775 and 1776, on the other hand, are valuable because in them new circumstances and moods are quietly and deliberately portrayed to the distant friend. Some short letters from a daughter of Schlosser are also added, in which a friendly and appreciative mention of Goethe's wife may be noticed.

A remarkable contrast to these is presented by the letters written at the same age by Schiller from Bauerbach, Mannheim, and Dresden. It is hardly possible to imagine two young poets whose lot in life and whose bent of mind were more dissimilar. A great number of these letters have been made known to the world in *Schiller's Correspondence with his Sister Christophine, and his Brother-in-law Reinwald*, edited by W. von Maltzahn. (Leipzig: Veit.) Reinwald was a librarian at Meiningen, a learned, able, and worthy man, but an unbearable hypochondriac in needy

circumstances. Schiller had earnestly advised his sister against the marriage, and was afterwards obliged, for her consolation, to carry on a secret correspondence with her. He remained, however, ever the same to her in friendliness and helpful care until the end. His sister Christophine was in all respects like the poet, her portrait showing very pleasing features in spite of a large mouth. Womanlike, her brother's ideality became in her a deep duty which displayed itself in the most self-sacrificing surrender to an unamiable man, and in inexhaustible cheerfulness and enjoyment of life even to extreme old age. She was also like her brother in the following trait. In the year 1845, that is, when an old lady of eighty-eight, she showed a friend a small steel engraving, with the remark: "My work for this summer will be to copy this sheet; it should, however, be three or four times larger, for one generally learns most so." This desire for learning, which verifies the dictum of Solon, strikingly recalls the restless striving and working of the great poet.

We have, almost at the same time, received two biographies of a poet lately deceased. A countryman of his gives, in the first volume of the *Posthumous Works of Franz Reuter* (Weimar: Hinrichs), a short but lucid sketch of the Mecklenburg poet Adolf Wilbrandt's life and personal characteristics. It is, indeed, well to try to fix the likeness of a remarkable man immediately after his death, for experience teaches that trustworthy tradition is for the most part lost when his contemporaries have died out; but a fitting exponent is not always to be found immediately. Thus, in a book by O. Glagau, *Fritz Reuter and his Poems* (Berlin: Grote), we find many notices relating especially to the youth and family life, for which we are grateful; but the author's criticism, regarded from the ethical and aesthetical points of view, is unripe and superficial, and a satisfactorily many-sided presentment of the poet remains the task of the future. The writings now published by Wilbrandt will be useful for such a work: more especially the letters by Inspector Bräsig, from a conversation-paper edited by Reuter in 1855 and 1856, in which the most original and complete creation of the humourist appears in its first inception. Otherwise, the works of his earlier years are of no importance. It was a hard lot which threw a student of three and twenty into a dungeon as a demagogue and traitor, from which he was only restored to life after many years, sick in body and soul. The saddest consequence of this was that the rich and joyous genius of the unhappy man was crippled in its natural growth, so that he could no longer find a firm footing in study and industry, and was given up by his father as a drunkard and ne'er-do-weel. Thus it is all the more wonderful how the man worked himself up out of this grief and misery, and has from the fullness of his rich and noble nature produced the most glorious results, for which a whole people is grateful. He is the author of works in the hard plain dialect of the Lower German peasants and artisans, in which the healthiest morality and the most ardent piety are united with the most splendid humour, and which are not only a joy and consolation to the aristocracy of culture, but to the poorest and simplest, beautifying and deepening the lives, especially of the latter, in earnestness and cheerfulness. His *Ancient History of Mecklenburg* will not, in spite of its pleasing introduction, fulfil the varied expectations that have been formed of it; it is a satirical representation of political circumstances, as they now no longer, and, it may be hoped, have long ceased to exist in Mecklenburg. Hence, only Mecklenburgers will understand the bitter truthfulness and genial humour of these wonderful stories, and will be grateful to their poet for these also. The volume closes with a few simple and striking poems of the year of the war 1870.

A second part has appeared of *The New Plutarch, Biographies of prominent Characters in History, Literature, and Art*, edited by R. Gottschall

(Leipzig: Brockhaus), containing Robespierre by R. Gottschall, Maria Theresa by Ad. Beer, and Cavour by O. Speyer. The life of Cavour is admirably written. This man's character and work are delineated with vigour and animation, in all their greatness and originality. The biographer of a contemporary statesman has on the one hand a great advantage in that he need not paint the historical background exhaustively, a task which in a popular exposition requires peculiar powers. On the other hand, it will be difficult for him to guard his judgment from the injustice to which differences of party views and of national character may lead. This is particularly the case with a German in regard to his estimate of religious questions. The saying repeated by the great Italian even on his death-bed, *Libera chiesa in libero stato*, is at most understood by a German in another sense from that which it bears in the South, while his attitude towards the church is, even if he be a Catholic, essentially different. To him the great stress laid by Cavour upon dying within the pale of the church would, in the case of so great a mind, be hardly intelligible. An ineffaceable difference in the character of the Germans and Romans appears in this, that the one places his religion above all in the inward relation to God, in faith; the other in an outward relation to church and worship. All the more do we feel bound to acknowledge that in this respect also Herr Otto Speyer has rightly and impartially represented the opinion and policy of the great Count. We cannot, alas! pass over in silence the fact that the publisher Gottschall has in the life of Robespierre supplied a contribution in no way worthy of praise. One would, at least, have expected from a publisher who is also a poet, that he would have been led to a correct judgment of this caricature of a man by an artistic abhorrence of his subject; but the style and the descriptions in this biography are careless and colourless, and the hollow phrases of the Dictator about virtue and freedom so greatly impress the author, that he sees in this sanguinary pedant a great apostle of democracy whose festival speeches "have stamped the seal of intellectual significance upon the Revolution." The strangest thing is that such things can still be written after Heinrich von Sybel's *History of the Revolutionary Period*. It would be superfluous to commend the eminent characteristics of this excellent work, the first part of the fifth volume of which is now ready. It treats of the time of the Congress of Rastatt, the fall of the old system in Italy and Switzerland, the campaign in Egypt, and the constitution of the second coalition. The complicated relations of European politics are unravelled with wonderful clearness; the spread of the Republican propaganda, with its union of perfidious phraseology and brutal force, the peculiar characters of the determining personalities—Napoleon, Thugut, Nelson, and others—are portrayed with fine intuition. In this part also of the great work one sees the eminent men and their deeds come out clear and distinct from the mythical haze in which astonishment and hatred have veiled them fold on fold. Especially remarkable in this respect is the criticism on the Egyptian expedition, which Herr von Sybel defends on convincing grounds against the reproach of adventurous action; while the characteristics of Paul the First of Russia form a masterpiece of historical portraiture. All through the fine union of ideal sentiment and critical acumen which distinguishes the Bonn professor is maintained. The volume ends with an extremely sagacious enquiry into the murder of the envoys at Rastatt, which at length affords a certain solution of this gloomy riddle, and proves Count von Lehrbach to have been the author of the murder. If Herr von Sybel, notwithstanding the facts so carefully collated by him, suggests a misunderstanding according to which the above-named diplomat had not exactly intended the murder, but only the ill-usage, of the French envoys, it must, on the other hand, be observed that the in-

vestigation before the court-martial makes such an assumption scarcely possible. For it cannot well be admitted that the two officers of the Szekler Hussars interested in the matter would have been promoted to be general and major if their subordinates had been guilty of so great a misunderstanding entailing so many consequences.

The son of the celebrated historian, the Professor of Philology at Marburg University, Ludwig von Sybel, publishes a very attractive dissertation on *Schliemann's Troy* (Marburg: Elwert). It is undeniable that a large number of the public share the belief in which Herr Schliemann began his excavations, that we could, from the information in the Homeric songs, fix the site of the citadel of Priam and the great tower of the Trojans, as easily as we could the situation of Sebastopol from a history of the Crimean War. There are even among the learned many to whom this view is not wholly foreign, as the articles of M. Vivien de Saint-Martin in the latest numbers of the *Revue Archéologique*, for instance, prove. The narratives of the Homeric singer are used very much in the same manner as a modern staff report. It is, therefore, very right that Herr von Sybel should first of all seek to make it clear that we have to form our conception of Homer, not as an historian, but as a poet. It is, indeed, correctly brought forward in opposition to the belief spread abroad by Schliemann himself, that the antiquities found in no wise correspond to the cultus depicted in the *Iliad*. The positive assertions of the author with regard to the newly-discovered town are less satisfactory. He holds it to be the historical Iliion, which arose in the time of Kroisos. This explanation seems to me to account neither for the mass nor for the character of the remains, which both point to a remoter age. It is not credible that here, in the midst of the Hellenic colonies, the culture of the Bronze age should have maintained itself up to the fourth or fifth century, and as little that such heaps of ruins should have accumulated here in that century. It seems to be beyond all doubt that these remains, weapons, and utensils, belong to an older population related to the Hellenes, which dwelt here before the Aeolo-Achaian emigration, and which we may perhaps best name Dardanian. That the highest stratum immediately under the Hellenic ruins particularly exhibits rude and strange forms, is explained by the lasting occupation of this district by barbarous nations in the seventh and sixth century. Herr von Sybel has only touched these questions in a cursory manner; he has, on the other hand, fully and skillfully elucidated the significance of this treasure-trove in its bearings on the history of art, and more especially the character of this earliest Indo-Germanic ornamentation.

Archaeology may expect new light from another side, from the domain of mythology. Herr Wilhelm Mannhardt has written a book upon *Wood and Field Worship* (Berlin: Bornträger), the first part of which treats of the tree-worship of the Germans and their neighbour-races; he promises us the second part, *Graeco-Roman Agrarian Cultus elucidated by North-European Tradition*. The work before us gives fresh proof of the indefatigable scientific industry with which the author collects from old and new literature whatever comes to hand in the way of mythical tradition, and it is intelligible that surprising results should be obtained by such comparisons. The most disconnected knowledge of the customs of long extinct nations is often illuminated by a still existing superstition, and the general picture of antiquity stands out clearly from the collation of a hundred mutilated and blotted forms of dead religious intuition. Whether the author has found the right expression for the meaning of mythical forms is doubtful to me: while but a short time since a goddess was recognised in every white woman, Herr Mannhardt carefully avoids giving any particular divine appellation, and speaks at most of a "daemon of vegetation." This reaction seems to me to go

too far, but it is a guarantee that we shall obtain the tradition pure and undisturbed by hypothetical additions. We learn how the country people still regard the nature amidst which they live, and certain fixed intuitions which still live under the dominion of Christianity stand out in clear and distinct relief. To this it should only be added that these intuitions had in pre-Christian times taken plastic form and personality. As the agreement of the Germanic and Slav customs with those of the Greeks and Romans is often surprising, we may expect very interesting conclusions from the above-mentioned second volume.

It will gladden the friends of archaeology to hear that a specification of the antiques now extant in Rome is to be published from papers left by Professor Matz, to whom a friendly notice has been devoted in this periodical. It is a catalogue of all the works not brought together in large collections, but scattered about the villas, palaces, courts, gardens, and streets of the city. The completion of the undertaking was only hindered by his great work upon Roman Sarcophagi, and the Director of the Institute has now commissioned a young countryman of the deceased, Herr von Duhn, of Lübeck, to revise and edit the catalogue on the spot.

With regard to modern art, the *Catalogue of the Exhibited Paintings and Drawings obtained in the year 1874 for the Berlin Museum from the Collections of Herr Barthold Suermondt*, by Dr. T. Meyer and Dr. W. Bode (Berlin: Berg and Holten), is worthy of mention. The careful biographical notices, the accurate reproduction of the signatures, and the literary index, render this catalogue a useful auxiliary to any one engaged upon the pictorial art of the Netherlands.

The first half of the second annual issue of the excellent publication edited under the title of *Artistic Handicraft* by Bucher and Grauth (Stuttgart: Spemann), has appeared in thirty-six numbers. The German-Italian Renaissance in furniture, weapons, and utensils receives particularly ample consideration; but neither the Gothic nor the Rococo is wanting; the coloured copy of oriental materials is very pretty, and the antique is at least represented by a Greek bronze vase and a Pompeian mosaic.

There is little to report in regard to poetry. A novel by Paul Heyse appears in the *feuilleton* of the *Cologne Gazette*, the action of which is chiefly laid in artistic circles. As it cannot be intelligently read in this form, one must await the end. Adolf Wilbrandt has collected his last year's novelettes into one volume. Among these careful and delicately executed works, I must single out *Our Legal Conscience*. Its substance is briefly this:—A young husband asserts that women have no legal conscience, and makes a bet with his wife that she will, within fourteen days, perpetrate a breach of the law; she, on that very day, deals in paving-stones as ownerless property, is annoyed by fictitious judicial proceedings, and contrives in the end to get herself out of the difficulty. I mention the little story, not because of its importance, but because it belongs to a style which is scarce among us—that of the humorous. Wilbrandt is a native of Mecklenburg, who has lived many years in South Germany, and it is not the first time that his recollections of his native country have given a pleasant humorous colouring to his delineation.

I would rather in the lovely month of May have spoken of new poems, of songs of love and spring, but our lyric Parnassus is ill appointed: most of the poets of the elder generation have ceased to sing, and there is no young underwood. Theodor Storm takes a peculiar position among known lyric poets. A fifth improved edition of his *Poems* (Berlin: Paetel) has just appeared. Storm is, as a novelist, a much read and much esteemed writer; as a lyric poet he has but slowly become known, perhaps not in spite of, but because of the fact that his songs are full of pure and real poetry. He is entirely wanting in that moral

phraseology, that generally comprehensible rhetoric, which makes so many commonplace poets the theme of the multitude, at least for a short time. These verses will, however, be a lasting ornament to our literature; one proof of this is, that many of them are now extensively known and valued, even where the name of the author is not held in consideration. There is hardly a strophe in this collection that is not written with true feeling, and at the same time with clear intuition, to which are added warm sensibility, deep natural feeling, and, finally, an uncommonly harmonious utterance. The expression is often original and, as it were, newly coined, but never ornate; indeed it sometimes has the simple heartiness of national songs, as in the verses:—

"Meine Mutter hat's gewollt,
Den Andern ich nehmen sollt," etc.

The contents of these poems are as rich as a full human life. The tones of yearning and pleading are rarer than in other lyrics, the expression of true love for a beautiful and tender wife and grief for her death more frequent, while ever above the impressive laments over the transitory nature of all that is earthly, rises the manly earnestness of thought. The fate of his country—Storm is a native of Schleswig-Holstein—has also personally affected the poet. After the unhappy result of the struggle for freedom in 1848, he was forced into exile, and was only recalled to his native city after the deliverance from the Danish yoke in 1864. Some of his finest songs are devoted to anger against the oppressor and mourning for his lost home; but, to point out at the same time the limits of his talent in his own words:—

"Wir können auch die Trompete blasen
Und schmettern weithin durch das Land;
Doch schreiten wir lieber in Maientagen,
Wenn die Primeln blühen und die Drosseln schlagen,
Still sinnend an des Baches Rand."

A great sensation is being made in Berlin by the starring performance of the Court actors from Meiningen, which has gradually attracted the attention of the rest of Germany. The Meiningen stage is a small Court theatre, the management of which, astutely limiting its operations, has given up the opera and concentrated all its strength on the cultivation of the drama. The art-loving Duke, a near relation of the Royal house of England, is still more closely connected through his third wife, who is an actress, with dramatic art, in which he takes the deepest interest, and the original manner in which he himself manages his theatre has given a far-reaching importance to the German stage. Dramatic art in Germany has since the first decade of the present century undergone a rapid decline. The large houses that have been built everywhere have greatly contributed to this. Being constructed with a view to the requirements of great operas, they are far too capacious for the drama, the finer accents of speech are lost in these spaces, the tempo gets slower, owing to the long waves of sound, and the actor is committed to an immoderate expenditure of gesture and motion in order still to produce an effect from a distance. Hand in hand with this goes a régime of virtuosi, which severs isolated leading parts from the context, and distinguished actors labour upon single parts, phenomena analogous to some in England. To this is generally added great carelessness in study, the interest, at almost all theatres, being rather directed to the continuity of the plot of a new piece than to the careful performance of details. Against these faults must be set the pains taken by the Meiningen theatre to preserve so-called historical truth by the most careful costume put together with painful consciousness, also to bring together aids to a more accurate characterisation in dress, in arrangement, in looks and gestures, and here there is too much of a good thing. It further endeavours by most carefully concerted acting, especially in the *scènes d'ensemble*, forcible changes of tempo, and a sedulous system of study, to obtain results

which shall, up to a certain point, be independent of the talent of a single actor. They have, owing to this realism, succeeded not only in Shaksperian pieces, but also in those of the later German poets, in producing effects the legitimacy of which one cannot for the most part deny, and which occasionally give life to the beauties of the poetry in a way of which the Germans had hardly a notion. It is to be hoped that this peculiar method of representation, which, moreover, follows an English model in its careful *mise en scène*, and the performances of the Théâtre Français in its best days in the careful elaboration of the dialogue, will bring about a reaction at other German theatres. The good effects are already noticeable in the Theatre Royal at Berlin. How great is the interest with which this recreation is pursued among us may be inferred from the fact that the Emperor William heard Kleist's *Herrmannschlacht* two days running, at the Theatre Royal, and then at the Meiningen performance, and gave his opinion with much energy on the relative advantages of both methods of acting.

CORRESPONDENCE.

THE LATE SIR GOLDSWORTHY GURNEY.

June 7, 1875.

In the obituary notices of my friend, the late Sir Goldsworthy Gurney, his chief claim to the gratitude of posterity—the discovery of the steam-jet as a means of enormously increasing steam-power, of ventilating mines, &c.—has been generally overlooked in favour of several minor claims, such as the invention of the Bude light, the oxyhydrogen blowpipe, &c. This has probably arisen from the mistaken notion that G. Stephenson discovered this power. But Stephenson never claimed to have done this, though Mr. Smiles, in his *Life of Stephenson*, claimed it for him. Stephenson, indeed, had previously discharged the waste steam through a pipe in the funnel, but it was Gurney who thought of so forming and placing the pipe that the cone of

discharged steam should expand exactly to the breadth of the funnel, and lift the entire column of air and send it forth at the full rate of the discharging steam; thus producing the draught which was the one absolute and otherwise impossible condition of working locomotives at high pressure, and consequently at high speed. Should any of your readers be curious about the evidence and details of this, perhaps the most important discovery of recent times, they can consult Sir Goldsworthy Gurney's *Account of the Invention of the Steam-Jet or Blast, and its application to Steam-boats and Locomotive Engines.* C. PATMORE.

ON WENTWORTH'S UNPUBLISHED SPEECH.

4 Gordon Street, W.C.: June 7, 1875.

The *Daily News* of the 5th instant contains an article on the recently discovered speech of Wentworth, which is fair and candid in its appreciation of the inferences to be drawn from the new evidence, especially in pointing out that a change had already taken place in December, 1628, in the point of view from which Wentworth regarded questions in dispute between the Crown and the people. He looks upon these now from the royal, and not from the popular side. On the other hand, the writer sees in the frankness with which Wentworth expressed his opinions, a strong proof that he was not a vulgar turncoat.

In both these inferences I entirely concur. But the writer has, I think, omitted to consider circumstances which go far both to diminish the extent of the change, such as it was, and to explain how it came about.

In the first place the opposition which he sees between Wentworth's resolution in the preceding session "to vindicate our ancient liberties," &c., and his later declaration that he who "ravells forth into questions the right of a king and of a people, shall never be able to wrap them up again with that comeliness and order in which he found them," does not involve any direct contradiction. In the one place Wentworth maintains that it is good both for king and people that men shall not be forced to pay loans and imprisoned without having any trial whatever, or any chance of being heard in their own defence. But though he speaks strongly on this point, and wishes that there may be a law compelling the judges to liberate a prisoner when no cause is shown, he is remarkably careful not to "ravell forth into questions the right of a king and of a people," giving his opinion that circumstances may arise when the King would have to override the laws whatever they might be, and refusing to associate himself with those who wished to take up the Petition of Right if the Lords refused their consent to it, and hinting that he would be no party to any attempt to push it on if the King refused his consent to it. The only pressure he consents to put upon the King is the exercise of the undeniable right of refusing subsidies. His position is not unlike that taken by Bacon in his early conflict with Elizabeth, of which Mr. Spedding has given so lucid an account.

If, however, the speech of December has its roots in principles professed in March and April, there has plainly been a development on one side and a drawing back on the other. In any explanation of this the mere fact of accession to office must count for something, involving as it did a far greater change in point of view than is implied in crossing over nowadays from the Opposition to the Treasury benches. But in addition to this, circumstances had occurred which were certain to produce a profound impression upon Wentworth's mind. His words about "ravelling forth into questions" have a direct application to that which had taken place in the House of Commons after the granting of the Petition of Right, and which might possibly take place again in the coming session. In declaring that the King had no right to tonnage and poundage without a Parliamentary vote, the Commons

had doubtless spoken in accordance with a fair interpretation of old Acts of Parliament. But those Acts had been interpreted in another way by the judges, and apparently to escape this difficulty the Commons had fallen back upon the assertion that the levy of these duties was forbidden by the Petition of Right, a statement which I believe to have been absolutely without foundation. But whatever may have been the legal value of the opinion of the Commons, a decision in their favour would have amounted to a political revolution. A deficit of 120,000*l.* or 140,000*l.* in a revenue of 600,000*l.* at the most, meant the necessity for the Crown to capitulate without reserve. The Commons would be absolute masters of the situation, might not only dictate the policy of the executive as they do now, but might—as they had in fact already done by absolving merchants from the payment of these duties—set aside a judicial decision by the simple resolution of a single political assembly. At the same time they had announced their determination to prohibit all utterance of religious opinion diverging from the Calvinistic standard, a determination which admits of some justification under the special circumstances of the time, but which was not likely to be satisfactory to Wentworth.

If Wentworth may be fairly believed to have been repelled by the late proceedings of the Commons, he may also be fairly believed to have been attracted by the recent proceedings of the King. When this speech was delivered in York, Charles had already made up his mind to withdraw his extreme pretensions about tonnage and poundage, and had issued that declaration prefixed to the Articles of Religion which, whatever its value may have been, was plainly intended as a compromise.

Such are the circumstances under which Wentworth spoke. He was, no doubt, as the writer in the *Daily News* says, “clearly on the path which led him, once a prisoner in the cause of resistance to forced loans, to aid the exaction of ship money when that exaction suited the ends of the ‘sovereign Judge of us all.’” But, unless I am mistaken, what I have now said will show that in attaching himself to Charles he may very well have been actuated by a belief that the high view which he took of Charles’s authority was the right one. In fact, this view, though pushed to extremities by Wentworth, was very much the same view as that previously taken by Bacon, and not altogether unlike that subsequently taken by Cromwell in the days of the Protectorate. If any one wants to see that view in a modern dress he will find it expressed in Mr. F. Harrison’s recent work on *Order and Progress*. The modern writer has, of course, before his eyes limitations which Wentworth would never have thought of; but in his distrust of the incapacity of a representative assembly for the direct work of government, he touches the feeling which seems to me to have been the mainspring of Wentworth’s career.

SAMUEL R. GARDINER.

PEPPYS’ DIARY.

23 Sussex Place, Regent’s Park :
June 7, 1875.

Mr. Bell says: “Will Mr. Bright assert that, in learning the cipher, he did not use Mr. Smith’s labours as the key?” I most emphatically assert that in learning the cipher I did not use Mr. Smith’s labours as the key. I obtained my knowledge of the cipher quite independently of Mr. Smith, and from quite a different source.

Mr. Smith received his knowledge of the cipher from the late Lord Grenville. There is an interesting letter stating that fact in the *Illustrated London News*, written shortly after Lord Braybrooke’s death, more than twenty years ago, by Mr. Ralph Neville-Grenville.

I gained my knowledge of the cipher from a book in the Pepysian Library, containing, among other ciphers, one by Shelton, which is the cipher used by Pepys, not that mentioned by Lord Bray-

brooke in the *Life of Pepys*, “known by the name of Rich’s system,” which has several letters different from Pepys’ cipher. I only gave the book about three weeks ago to Professor Adams, of Cambridge, who wanted it in order to decipher a valuable MS. by Newton. If I had used Mr. Smith’s labours as the key, I might have fallen into the same mistakes with him.

Mr. Bell says that he claims the book, *minus the mistakes*, as his copyright, on the ground that he paid for the exclusive right of printing it for a term of years. The only answer necessary for that statement is the old proverb, *Caveat emptor*.

MYNORS BRIGHT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 12, 3 p.m.	Fourth Summer Concert, Crystal Palace (Mdlle. Krebs).
3.45 p.m.	Botanic.
4 p.m.	Physical: Mr. W. Whitehouse on “The Electrical Conductivity of Graphite;” the President on “The Time required for the Double Decomposition of Salts.”
8 p.m.	<i>Zampa</i> at the Gaiety.
8.30 p.m.	Her Majesty’s Opera, Drury Lane: Production of <i>Lohengrin</i> .
MONDAY, June 14, 8.30 p.m.	Geographical.
TUESDAY, June 15, 7.45 p.m.	Statistical: Mr. T. A. Welton on “The Effect of Migrations upon Death-rates.”
8.30 p.m.	Zoological: Papers by Professor Owen, Messrs. G. E. Dobson and G. Gulliver, and the Rev. S. J. Whitmee.
WEDNESDAY, June 16, 1 p.m.	Horticultural.
7 p.m.	Meteorological.
THURSDAY, June 17, 4 p.m.	Zoological.
5 p.m.	Zoological Gardens (Davis Lecture): Mr. P. L. Sclater on “Pheasants and their Allies.”
6 p.m.	Philosophical Club.
7 p.m.	Numismatic: Anniversary.
8 p.m.	Linnean. Chemical.
8.30 p.m.	Royal. Antiquaries.
FRIDAY, June 18, 3 p.m.	Mr. Charles Hallé’s Recital, St. James’s Hall.
8 p.m.	Philological: Mr. H. Jeune on “Manx;” Mr. C. A. M. Fennell on “The Triple Gradation of A in Gothic.”

SCIENCE.

The Methods of Ethics. By Henry Sidgwick, M.A., Lecturer and late Fellow of Trinity College, Cambridge. (London: Macmillan & Co., 1874.)

THIS treatise is a valuable contribution to the discussion of ethical questions in this country. Whatever value may be attached to the results arrived at, moral science cannot but profit by such a full and careful collection of the *ἐνδοξα* of the most popular systems, and such an impartial exposure of all the *ἀπορίαι* that rise from comparing them together. Mr. Sidgwick has produced a not unworthy imitation of those preliminary discussions of opinion with which Aristotle prefaces his constructive philosophy. This praise must, however, be limited by the remark that, though his knowledge of ethical philosophy is wide and accurate, his view of all but the English writers seems to a certain extent external and unappreciative. The method he has adopted of criticising the systems of morals not individually, but in large classes, has led him to assume too easily the adequacy (with one important exception) of the prevailing English classification of doctrines, and to force all systems into it by a somewhat Procrustean process. The result

is, that the full meaning of negative or ascetic theories, like those of the Stoics, is not discerned, that although Kant has been carefully studied, the bearing of his restatement of the moral problem is only partially apprehended, and that Spinoza and the later German writers are almost entirely neglected.

The purpose of Mr. Sidgwick is indicated by his title. He finds that all schools of moralists have spent their efforts too much on establishing their first principles, and too little on showing the results of the development and application of them:—

“The modern Epicurean reasons closely and scientifically when he tries to persuade us that it is useless to aim at anything but pleasure; but when we are persuaded, so far at least as to be strongly interested in learning his theory of pleasure and its conditions, we are disappointed to find his treatment become suddenly loose and popular. The Intuitionist spends unnecessary words in convincing us that we have moral intuitions; but when we ask him ‘what then are the rules that we intuitively know?’ his answers seem almost wilfully vague. What Descartes writes of the older books which his teachers set before him may be applied to most orthodox treatises on Ethics: ‘Ils élèvent fort haut la vertu, mais ils n’enseignent pas assez à la connaître.’”—P. 13.

Mr. Sidgwick therefore attempts to examine not so much the logic by which principles are established, as the logic whereby systems of duty are developed in conformity with these principles. For the purpose of this examination he however finds two things necessary—first, an assumption as to the general nature of the subject-matter of ethics; and secondly, a classification of the different specific views of that matter on which systems have been founded. The assumption is that there is something objectively right and reasonable, something “which Reason prescribes and urges us to do either absolutely or as a means to an end apprehended as ultimately rational,” or, in other words, that Reason is capable of supplying a motive for action. This assumption at once involves the denial of the doctrine which seems to be held by many writers of importance, that desire is always for pleasure, and even that, in Mill’s language, “we desire a thing in *proportion* as we find it pleasant.”—

“On this view,” says Mr. Sidgwick, “the notions ‘right’ and ‘wrong’ would seem to have no meaning except as applied to the intellectual state accompanying volition; since, if future pleasures and pains be truly represented, the desire must be directed towards its proper object. And thus the only possible method of Ethics would seem to be some form of egoistic Hedonism.”

Exception might perhaps be taken to the statement that even egoistic Hedonism would be possible if Reason were reduced to the rôle of a spectator. For even Egoism supposes that Reason can supply a motive for action, in so far as it determines the desires of special pleasures by the general idea of the self as a permanent subject to be satisfied. And thus already in this system there is room for that division between the special desires and the rational principle of action which is expressed in the words “right” and “wrong.” Mr. Sidgwick, however, adopts Butler’s way of meeting the difficulty. He points out the confusion involved in saying that we always act with a view to pleasure, because we are

always said to do our pleasure or what pleases us even when the result of our act is pain. Such language, he says, expresses only "the determination of the will in a certain direction." The natural appetites, and again the social affections, must exist in us ere we can have pleasure in their gratification, and hence they cannot be in the first instances desires for pleasure. We cannot have the pleasure unless we desire the object in the first instance for itself. Hence it is no abnormal phenomenon that the moral end prescribed by reason should in the first instance have to be sought for itself, and that the pleasure of virtue should only be obtained on the express condition of its not being the object sought. "It is merely another illustration of the psychological law which is exemplified throughout the whole range of the desires."

What seems to be wanting in this explanation is a clearer distinction between the desires of a self-conscious and rational being and the appetites of animals. In a rational being it is scarcely possible that pure appetite—appetite quite undetermined by the thought of self and of an object—should exist. As so determined, appetite becomes the desire of an object, which may be regarded as an end in itself if we identify ourselves with it, or may be regarded as a means to pleasure, as an end, if we do not. In the latter case, however, there is a peculiar contradiction between the primary extra-regarding desire and the secondary desire of pleasure, of which the "fundamental paradox of Hedonism" I shall say something afterwards. In all cases, however, desire, so far as it is determined by the rational nature of man, implies a sense of defect of that to which, at the same time, the self is regarded as necessarily related, and without which its existence is incomplete; it implies, in short, self-identification with an object. Hence, whether the object be pleasure or no, the attainment of it, or any step to it, must have a pleasure in it, and we can say that the martyr in undergoing his pains is, equally with the selfish voluptuary, doing what pleases him. For pleasure, so far as it is determined by reason, is the attainment of an object with which the self is identified.

Mr. Sidgwick, in the second place, proceeds to classify the systems of morals. If it be allowed that there is something that reason prescribes, that something must either be an act or acts to be done, or it must be an end to be sought. Hence we find moral systems divisible into those that are guided by the idea of Right or an absolutely prescribed law, and those that are guided by the idea of the Good or an absolutely prescribed end. The former are generally called Intuitionist, and the latter might be called Utilitarian systems, though the name has usually been employed in a more limited sense. The ends conceivable as absolutely prescribed are the perfection or the happiness, either of the individual or of mankind. But this list may, according to Mr. Sidgwick, be considerably reduced. Perfection is either wholly or partly virtue, and hence to regard it as the absolutely prescribed end is equivalent to the adoption of that form of intuitionism in which the acts prescribed to be done are

all brought under one general principle. For it is almost a matter of indifference whether we put this absolute principle in the form of a law to be observed, or of an end to be sought. (In fact, Kant states his principle in both forms.) Then, again, the difference between the system based on the idea of the good of the individual and that based on the idea of the good of mankind, is only worth taking into account when that good is defined as happiness or greatest pleasure. For even perfect benevolence may from one point of view be regarded as *φιλανθρία*, since the benevolent man regards the good of all as his own. And "Egoism, if we merely understand by it a method that aims at self-realization, seems to be a form into which almost any ethical system may be thrown, without modifying its essential characteristics." We have therefore only three systems to examine: Egoistic Hedonism, Intuitionism, and Utilitarianism, the last name being confined to the system based on the "greatest happiness" principle.

On this classification it may be remarked that, though Mr. Sidgwick holds that the very notion of morality implies action with a view to ends determined by reason, yet he does not mean by this that in the conception of man as a rational or self-conscious being is already involved the conception of the end of his action. He has only partially apprehended what Kant means when he says that reason should will nothing but itself. What the expression suggests to him is simply that there is an intuition or unreflected judgment of reason that a certain end should be sought or a certain act should be done. He does not indeed, like Hume, regard reason as a mere formal power, that is, a mere power of calculating what should be done to attain the ends which are fixed for us by passion and desire. Yet, on the other hand, he does not conceive reason as constituting a motive and determining an end for itself—a motive and an end which we can perceive to be involved in the very nature of the rational being as such. Some passages seem to point to such a conception, but all that is clearly stated is that we as rational beings feel immediately and intuitively that some course of conduct should be followed, or that some end should be sought. What Mr. Sidgwick falls back upon therefore is something like an instinct, though it be an instinct of reason. Reason, in short, is conceived, not as producing any content from itself, but as taking up and stamping with its approval some of the matter presented to it by passion. And the immediate judgment thus given by reason is not seen to be involved in the nature of reason, but is taken as a fact which we cannot further explain. It is this way of looking at things that causes the weakness of the assertion of reason as a principle of morals by the Intuitionist school in this country; and Mr. Sidgwick, even in his idea of "philosophical" Intuitionism, does not seem to get beyond it.

The first system that presents itself for examination is Epicureanism, or Egoistic Hedonism. Without directly discussing the truth of the principle, Mr. Sidgwick asks whether, and under what conditions it will be possible to frame a complete and self-consistent system of rules in accordance

with it. The method generally, though not universally, employed for this purpose by Hedonists is empirical, but there are several presuppositions necessary to its success. It presupposes, in the first place, that all pleasures and pains have a definite quantitative relation to each other; that, as Paley says, "pleasures differ only in duration and intensity," and that the intensity is capable of being balanced against their duration. Further, it presupposes that we are capable of measuring the quantity of pleasure; and this, again, seems to involve that we carry with us in our consciousness some kind of ideal standard or measure of pleasures and pains that is not greatly affected by the changes of life. Lastly, it implies that we can, by aid of deliberate forethought and calculation, add to the number of our pleasures. For it has been maintained by some, that the habit of introspection and calculation itself is destructive of the pleasure it would secure, and by others, that there are many, and these the highest, pleasures which cannot be had except on condition that our desire is for other objects than pleasure. There is much subtle observation and criticism in Mr. Sidgwick's remarks on these different points. Perhaps, however, he has not quite clearly stated the initial difficulty of a calculus of pleasures. Speaking e.g. of the modes in which the Hedonist may explain away the preference of some pleasures as qualitatively superior to others, he suggests that in these cases it is "not the feeling itself that is preferred, but something in the circumstances under which it arises;" and that "if we separate in thought any state of consciousness from all its objective circumstances and conditions, and contemplate it merely as the transient state of a single subject, it seems impossible to find in it any other preferable quality than that which we call pleasantness, as to which the judgment of the sentient individual must be taken as finally valid." No one need dispute such a truism; but how, we may ask, is it possible to make a pleasure taken in this abstraction the subject of a judgment at all? If I abstract from all the circumstances that give character to a pleasure, I may be able to say "I feel more pleasure now than I felt a moment ago," but I cannot say *what* pleasure I feel without bringing back these circumstances. As "transient states of a single subject" I cannot characterize pleasures at all. My judgments in regard to pleasure must, therefore, be judgments not simply that pleasure A is superior to pleasure B; but that the pleasure given by this object is superior to the pleasure given by that object. This seems a simple point; but it appears to me that the principal errors in Mr. Sidgwick's reasonings about the *summum bonum* are caused by his not seeing it, or, at least, not seeing all that is involved in it. Our judgments upon pleasures, then, are judgments with regard to certain relations between objects or circumstances and the sensitive subject. Are there such permanent relations? Mr. Sidgwick points out the difficulties into which we fall when we try to find them. How is it possible to construct a scale of pleasures that holds good at all times? The "felicific" quality of objects (to use a word coined by Mr. Sidgwick) is constantly varying. Food to the starving man will outweigh

all other objects put together, while to the satiated it sinks to zero. If we make the instant feeling the criterion, we find our standard varying with every hour of the day and every state of the body. And again, taking greater periods of life, the standard of age is different from that of youth, not merely from experience, but from change of susceptibility. Lastly, Mr. Sidgwick points out that besides the natural changes that take place independently of choice, there are great changes which a man may produce in himself. If we say the pleasures of culture or virtue are the greatest, we have to add that a man must become cultured and virtuous in order to feel them. The only way in which we can bring back all these variations to rule is by adopting some ideal type of humanity, and maintaining that all the pleasures of men are unreal and transitory, tainted with pain, or at least ending in pain, except so far as they conform to this standard. But such an ideal standard can never be empirically verified. For what would be pleasurable to this ideal character must be more or less painful to every actual human being, and the greatest possible pleasure of men, such as men actually are, would be something very different. If, therefore, we set up such a standard, we must set it up independent of the calculus of pleasure, and we can prove its reality only by showing that it is involved in the idea of man's nature as a rational or self-conscious being. If we can show this, we may then fairly conclude with Plato that every pleasure that is not in harmony with this standard is incomplete and illusive, since it involves a contradiction of man's nature with itself. But we can reach this conclusion in no other way.

With regard to the "fundamental Paradox of Egoistic Hedonism," the paradox that we cannot attain the greatest pleasure if we directly aim at it, Mr. Sidgwick's language is somewhat hesitating. He seems to allow that the pleasures that are connected with the highest moral and religious consciousness cannot be reconciled with the calculative spirit of Egoistic Hedonism. For in that highest form of spiritual life there is involved an absolute self-sacrifice or self-devotion—or perhaps we might rather say an identification of self with the life and interests of others, that makes the calculation or even the thought of the pleasure, an act will bring to the individual sensitive subject impossible. But "the pitch of exaltation and refinement necessary to attain to this is rare," and "it cannot be said that what are commonly known as the pleasures of virtue or of benevolence, or of religion, are out of the reach of the rational egoist as such." A real harmony between the objective extra-regarding impulses, which do not aim at pleasure, and self-love or the desire of pleasure, may be attained, Mr. Sidgwick thinks, by a sort of "alternating rhythm of the two impulses in Consciousness." A man, for instance, finding time burdensome to him, may occupy himself with scientific investigation, or with a benevolent enterprise, calculating that he will soon begin to take an interest in it, and that out of that interest sufficient pleasure will come to put salt into life again. In this way Rational Egoism may be self-limiting, and may attain

its end the better for not directly aiming at it.

It may be questioned whether this explanation really meets the difficulty. A limitation of the application of the highest principle of action is really equivalent to its abandonment as the highest principle, unless that by which it seems to be limited can be shown to be but another form of its manifestation. To admit such an independent sphere for desire is to admit that the desires are not to be transformed by the moral principle. It is to return to the point of view of ancient ethics, and to forget the lesson taught by Stoicism and Christianity, that man's natural life must die in order to revive again in the higher life of spirit, or, in other words, that the passions require to be not merely regulated but transformed and moralised. He who occupies himself with an object in order that he may gradually come to take an interest in it, is really illustrating on a small scale that dying to self or sacrifice of inclination through which the higher life is born. And if he follows this course with an indirect view to that pleasure, which for the moment he disregards, he is simply preparing for himself a moral struggle between the desire for pleasure, and the rival impulse, which he has called into existence. To a limited extent such stimulation of desire with a view to the pleasure of its satisfaction is possible without self-contradiction in the case of the animal impulses, though even in their case it has a corrupting effect. In the case of social and benevolent affections, and of the higher tendencies in general, it must end either in the victory of the interests awakened over the desire of pleasure, or, failing this, in the moral torture of a life (such as was perhaps to some extent the life of Chateaubriand and Byron) that can neither be content without higher interests, nor frankly abandon itself to them.

Intuitionism, the second of Mr. Sidgwick's three classes of systems, appears, according to him, under three different forms according as the intuitions are regarded as individual ("this act is right or wrong"), as particular ("this class of acts is right or wrong"), or universal. Popular intuitionism seems to fluctuate between the first and second forms of doctrine, philosophical intuitionism between the second and third. The first form is dismissed by Mr. Sidgwick with the remark that it would reduce all ethical science into a process of generalising the individual judgments of moral sense, and would make it for practical purposes superfluous. But we see that the individual judgments of common sense are usually defended on the ground of their conformity to general rules. Mr. Sidgwick subjects a number of the axiomatic media of common sense relating to the principal virtues, such as justice, benevolence, truth, &c., to a careful examination, and shows that they cannot be made precise and definite, so as to satisfy the requirements of science without losing that popular assent which gives them their authority. He shows that before a close inspection they often reduce themselves to tautology, or else involve consequences that are absurd, and that at best they are vague and indefinite, and incapable of being used to

solve any difficult problem of ethics. Perhaps, however, he does not attach sufficient importance to his own remark that the popular morality of rules does not supply us with a principle whereby the rules may be co-ordinated with each other, and whereby also they may be made specific. Now it is obvious at once that in the absence of such a principle popular morality must at once have the opposite sins of too great generality and too great specification. It must be too specific in so far as it states as absolute commands what at best are rules of limited application. For there cannot be two absolutes in morality, and if there are more commands than one, contradiction must arise, unless the differences can be brought back to a unity of principle. On the other hand, such a morality of rules must be too general and vague without a principle to guide in their interpretation, and it leaves room for great arbitrariness in the subsumption of acts under them. This defect the Casuists attempted to remedy by indefinitely extending the code: but as their additions were guided by no one principle, they rather increased the difficulty than removed it.

The impossibility of getting a system of Ethics out of the ordinary rules recognised by common sense brings us with Mr. Sidgwick to philosophical intuitionism, which seeks to discover a unity of principle to which all morality may be reduced, and from which its special laws may be derived. Mr. Sidgwick thinks that, with a little interpretation, he can find in Clarke and Kant such a principle, or rather two complementary principles, one negative and limitative, the other positive, which form the basis of all morals. The first, the principle of Equity, is that I, as an individual, can only judge to be right for myself what I judge to be right for all persons in similar circumstances. The second, the principle of Benevolence, is that whatever I judge to be intrinsically desirable, and which therefore it would be reasonable for me as an individual to seek for myself, I must judge it right or reasonable to seek for all men. Further, Mr. Sidgwick holds it intuitively evident that the ultimate object of desire, that which is "intrinsically desirable," must in all cases be pleasure, and therefore maintains there is no real opposition between Intuitionism and Utilitarianism. It is only by intuition that the first principle of Utilitarianism can be established, and on the other hand, the final end to which Intuition points is only the greatest possible pleasure. In short, the pleasure which each one as a natural being seeks for himself, he is taught by Intuition of Reason to seek equally for all mankind. On this view I shall only make two remarks.

In the first place it seems to me that the principle of Equity as Mr. Sidgwick states it, is on his own showing superfluous and even tautological. To say that I must judge that only to be right for myself which I have judged to be right for all others, has no meaning unless I have first given a definition of right apart from its universality. And if right be, as Kant says, "to act so that the maxim of one's act is fit for law universal;" then we cannot begin by supposing something to be right before we

have determined it to be "fit for law universal." Now Mr. Sidgwick has not at this point reached any other determination of right than its "objectivity," or, what is the same thing, its universality. Kant avoids this tautology (though only to fall into another) by supposing that you cannot universalise a wrong action without contradiction; but, as Mr. Sidgwick rightly remarks, he is here committing much the same error as those who "suppose formal logic to be a complete criterion of truth." Universal stealing is not contradictory except on the supposition of the validity of the rights of property.

The second principle, the principle of Benevolence, presupposes that something is intrinsically desirable to the individual; and, as this something is found to be pleasure, it presupposes also the solution of the problem of Egoistic Hedonism. Reason only teaches us in this principle to desire the same end as natural egoism, not from the point of view of the individual, but from the point of view of humanity. Reason is thus conceived as suggesting no motive, and not even as altering the content of the motives of desire, but simply as universalising them. It is not seen that the determination of the desires, first by the idea of self, and then by the idea of a self that is social, that finds itself in losing itself in the life of others, must entirely change the character of these desires. But if there is any significance in the Kantian thought which Mr. Sidgwick seems to accept, that a moral life is one in which reason is its own motive, the beginning of such a life must involve the negation and sacrifice of the impulses and desires in the imperfectly rational form in which they appear in us at first. In other words, the absolute Stoic negation of passion is the *first* word of morality. The mere universalising of desire, leaving desire what it is in the natural man, would not produce any higher ideal than Carlyle's universal "Paradise of Pigswash." And if the last word of morality be the reconciliation of desire and duty, yet this reconciliation can only be reached through the reconstitution of desire in conformity with the spiritual nature of man and as its manifestation.

It must not, however, be supposed that Mr. Sidgwick is unaware of these difficulties of a consistent Utilitarianism. For example, he points out that it is impossible to construct an absolute code of Utilitarian morality, "unless we can show that there is some final perfect form of society towards which the progress of human history is tending." The Utilitarian has always two questions to consider: on the one hand, what will produce the greatest happiness to men, such as men are now; and, on the other hand, what changes of character will make men fit for a greater happiness; and it is not clear to which of these ends he should most devote his efforts, or in what proportion he should divide his efforts between them. In relation to the last of the two ends indeed his course must be very tentative and uncertain, unless guided by an ideal of a "perfect form of society," and such an ideal would require for its determination, according to Mr. Sidgwick, a

"science of sociology" which has yet to be constructed. It is difficult, we may add, to conceive how this science can be constructed, unless there be found in the rational nature of man some more positive principle of determination than Mr. Sidgwick has admitted, a principle which must gradually transform the natural impulse into harmony with itself. For such a principle of permanence through change, turning that change into progress, will scarcely be found where Mr. Sidgwick seeks it in pleasure and pain as mere "transient states of the single subject," seeing that such transient states are in themselves utterly indeterminate, and, to use Kant's expression, "for us as thinking beings as good as nothing."

Space will not permit us to follow Mr. Sidgwick further in his discussion of Utilitarianism. But I cannot end a criticism inevitably directed so much to points of difference without expressing admiration for the Socratic spirit of free discussion, and readiness to admit and search into every difficulty, which pervades his book.

EDWARD CAIRD.

SCIENCE NOTES.

PHYSIOLOGY.

Mechanism of Rumination.—The structural peculiarities of the stomach in ruminant animals are thoroughly well known, and the process of rumination itself has been repeatedly studied. The act of regurgitation, however—the most essential and characteristic of the entire series of phenomena—has never been adequately explained. Flourens believed that a portion of the softened contents of the rumen was introduced between the lips of the oesophageal groove, moulded into a bolus, and propelled into the gullet by the force of muscular contraction; the reversed peristalsis of the oesophageal walls conveying it up into the mouth for mastication. This view was shown to be incorrect by Colin, who found that closure of the lips of the oesophageal groove by sutures did not prevent regurgitation. The phenomenon, indeed, takes place so suddenly, and depends on so complex a series of co-ordinated movements, that mere inspection could never have sufficed for its complete elucidation. By applying the graphic method to its study, however, Toussaint, working in the laboratory of Professor Chauveau, has succeeded in fully explaining it (*Archives de Physiologie*, Mars-Avril, 1875). He finds the efficient cause of regurgitation to be a sudden rarefaction of the air in the thoracic cavity, brought about by a contraction of the diaphragm coincident with closure of the *rima glottidis*. A certain quantity of the semi-fluid contents of the rumen is thus sucked up into the funnel-shaped orifice of the gullet, whose subsequent contractions convey it up into the mouth. No bolus, strictly speaking, is formed. The only indispensable condition for the satisfactory accomplishment of the act is that the food contained in that part of the rumen which adjoins the oesophageal opening should be in a pulpy state owing to sufficient admixture of water. When a small orifice had previously been made in the trachea, the diaphragmatic contraction no longer sufficed of itself to produce a vacuum; it was assisted by a simultaneous outward and upward movement of the ribs. Finally, the author proves that the thoracic vacuum is the sole force concerned in the act of regurgitation; the rumen and reticulum remaining passive during its accomplishment.

Influence of certain Compounds on the Germination of Seeds.—Nearly eighty years ago it was asserted by Smith and Barton that camphor had power to hasten germination; a similar property

was subsequently attributed by Goeppert to chlorine, bromine and iodine. These statements have been put to the test of experiment by Heckel (*Comptes Rendus*, 3 Mai, 1875) and found to be correct. The seeds of *Raphanus sativus*, exposed to the action of pure water, began to germinate after an average interval of eight days; similar seeds, kept moist with iodine water, germinated in five days; with bromine water in three, with chlorine water in two days. The monobromide of camphor was found to exhibit even greater energy than either of its constituents taken separately, or than a simple mixture of bromine and camphor; germination occurring after a mean interval of thirty-six hours. No explanation of this singular property is suggested. The alkaline borates and silicates were found to retard germination, even in relatively small proportions; stronger solutions checking the process for an indefinite period. Arsenious acid and the soluble arseniates prevented germination altogether by destroying the embryo.

Localisation of the Vasomotor Centre.—It was proved by Pfliüger, some twenty years ago, that the vasomotor nerves run in the anterior roots of the spinal nerves, and that electrical stimulation of the spinal cord, after its separation from the brain and medulla oblongata, causes visible contraction of the arteries in the mesentery of the frog. This phenomenon is ascribed by most physiologists to irritation of vasomotor fibres contained in the cord, but originally derived from a centre situated in the medulla oblongata. This localisation of the vasomotor centre rests chiefly on the ascertained fact that in warm-blooded animals the systemic blood-pressure rises as high after irritation of sensory nerves when the cerebro-spinal axis is divided above the medulla, as in animals whose nervous centres are intact; while if the cord be cut *below* the medulla oblongata, such irritation no longer causes any increase of arterial tension. Nussbaum (*Pfliüger's Archiv*, x. 6, 7) finds that in frogs, after complete removal of the brain and medulla oblongata, mechanical, chemical, and electrical stimulation of afferent spinal nerves invariably determines reflex contraction of the arterioles in the web and mesentery, and that this result no longer follows if the cord has been previously destroyed. He concludes, accordingly, that the spinal cord possesses an independent authority over the systemic arterioles, and that the medulla oblongata, far from being the exclusive seat of vasomotor government, contains only the upper end of the governing centre.

Influence of Season on the Skin of Foetal Animals.—Dönhoff (*Reichert und Dubois-Reymond's Archiv*, i. 1875) calls attention to the fact that the obvious difference between the fur of animals in summer and in winter is associated with an equally striking difference in the texture and thickness of their skin. Thus, for example, the average weight of an ox-hide in winter is seventy pounds; in summer, fifty-five pounds; the hair in winter weighs about two pounds, in summer about one pound; leaving fourteen pounds to be accounted for by the proper substance of the skin. These differences are quite as decided in foetal animals as in adults. Calves born in winter have a longer and thicker coat than those born in summer; moreover, there is a difference of more than a pound in the weight of their skins after the hair has been removed. Similar facts may be observed in the case of goats and lambs. That these differences are not to be ascribed to any corresponding change in the diet and regimen of the parent animals, is proved by the fact that they are equally manifest in the young of individuals kept under cover and on the same food all the year round.

Influence of Curare on the Quantity of the Lymph and the Emigration of Colourless Blood-Corpuscles.—If the blood of a frog poisoned by curare be examined on the second or third day of immobility, it is found to contain no

leucocytes; these, however, reappear as the power of voluntary movement is restored, and gradually resume their customary proportion to the red corpuscles. This observation was made by Drozdoff, who attributes the phenomenon to a specific poisonous action of the drug on the colourless corpuscles; he found that the addition of a minute proportion of curare to a drop of blood, after its removal from the body, speedily arrested the amoeboid movements of the leucocytes, and rendered their protoplasm granular. Tarchanoff, working under Ranvier's direction (*Archives de Physiologie*, Janvier-Février, 1875), repeated Drozdoff's experiments, the results of which he partially confirms, while explaining them in a very different way. The gradual disappearance of leucocytes from the blood of the curarised frog is an undoubted fact; but the phenomenon cannot be ascribed to any specific action of curare upon protoplasm. The addition of curare to drops of blood in the moist chamber yielded results which were by no means constant; some samples of the drug speedily destroying the colourless corpuscles, while others appeared in no way to influence their vitality. What then is the cause of their disappearance (which is never really absolute) from the circulating fluid? They migrate into the perivascular spaces, and accumulate in the lymphatic sacs and serous cavities. This emigration is associated with a considerable transudation of the fluid constituents of the plasma, so that, *pari passu* with its increasing poverty in leucocytes, the blood is observed to contain an abnormally large proportion of red disks. Both processes may be accounted for by the paralyzing effect of the drug upon the vasomotor nerves; the arterioles are everywhere dilated, the intravascular tension lowered, and the blood-current uniformly retarded. Exactly similar phenomena may be produced by destroying the cerebro-spinal axis, and so paralyzing the vasomotor nerves. But why does the lymph, after its escape from the vessels, accumulate in the serous and lymphatic cavities? Why does it not make its way back into the current of the circulation? For this there are two reasons: first, the paralysis of the voluntary muscles, whose contractions are largely instrumental in the onward propulsion of the lymph; secondly, the arrest of the lymphatic hearts. As the effects of the poison pass off, these causes cease to operate, and the exuded constituents of the blood return to their normal home within the vessels.

MICROSCOPICAL NOTES.

In the Public Health Report (No. 11, New Series), Mr. Simon stated that Dr. Klein has discovered the microphyte concerned in producing enteric fever, and we understand the researches will be published in the course of this summer, accompanied with illustrative drawings. For some years past the extent to which certain medical authorities have pushed the doctrine of specific diseases has been a stumbling-block to naturalists acquainted with the variability of species, and the various forms assumed by microfungi. It is, therefore, satisfactory to find Mr. Simon observing in the above-named report—

"as among the most hopeful advances of modern preventive medicine, that some diseases, which in the sense of being able to continue their species from man to man, are apparently 'specific,' seem now beginning to confess in detail a birthplace exterior to man, a birthplace amid controllable conditions in the physical nature which is around us, a birthplace amid the common putrefactive changes of dead organic matter."

He adds, that in the common septic ferment, or in one not separate and distinguishable from it, "there reside powers of disease-production as positive, though not hitherto as exactly defined, as those which reside in the variolous and syphilitic contagion."

The students of the minute organisms suspected of causing disease have much to hope from the continuous improvement of their optical apparatus.

The new one-eighth of Powell and Lealand, of which we have before spoken, is a decided advance in accuracy of correction, and if, as there is some reason to expect, the glass-makers can succeed in producing a material rivaling the refracting powers of the diamond, still further progress would be within the reach of skilful optical artists. An aluminium glass is spoken of as likely to fulfil the requisite conditions.

M. MÜNTZ states that there are certain distinctions to be noticed in the actions of chemical and organic ferments. The living ferments he finds exert their maximum effect between 25° and 40° C., while the chemical ferments are most active at a considerably higher temperature, in which life is manifested with difficulty. He finds the fermentation of milk, urine, and other substances in which living organisms operate, is arrested by the presence of chloroform, while purely chemical fermentation is not stopped by that agent. Somewhat misusing the word "anaesthesia," he informs us that beer-yeast thrown into that state, and kept in it for several hours, does not appear, after the chloroform is withdrawn, to recover the power of acting with its usual energy on saccharine matters. The lactic ferment he finds less sensitive, but killed by prolonged contact with the anaesthetic. (*Comptes Rendus*, May 17, 1875.)

AMONG the "Proceedings" of various societies reported in the *Monthly Microscopical Journal* we notice that Dr. J. Gibbons Hunt has exhibited to the Academy of Sciences, Philadelphia, an amplifier consisting of a "concavo-convex lens with its concave side turned towards the eye," and placed at some distance from its objective, at the end of a sliding adjustable tube. By moving the tube, he said, a want of complete correction in the objective could be compensated. This is Dr. Pigott's "Aplanatic Searcher" made with a single lens instead of the two which he employs. Dr. Hunt admitted that working up a four-tenth's with his amplifier to 800× did not give as good results in histological investigations as could be obtained by using Powell and Lealand's immersion one-sixteenth, and A eyepiece. He said he had not been successful with Dr. Pigott's apparatus.

SOME years ago Dr. Wallich presented to the Royal Microscopical Society a cabinet of slides, and a folio volume of drawings, made during many years of important study. To render this collection really useful it is necessary that Dr. Wallich himself should furnish some notes and references, and we are glad to learn that he is likely to do so in a series of papers for the Society, which will appear in the *Monthly Microscopical Journal*. A considerable number of these slides throw light upon questions which the Challenger Expedition will bring into prominence, and especially upon the curious and not yet explained connexion between cocospheres and foraminifera, such as Textularia and Globigerina, many of which are covered with cocoliths in various stages of growth. A recent examination of some of these objects was much facilitated by the unusual penetration given by Zeiss of Jena to his F dry objective, equivalent to one-fourteenth.

MR. WENHAM's reflex illuminator for high powers is likely to come into more extensive use, now Mr. Slack, in a paper read on June 2 before the Royal Microscopical Society, has pointed out that most of the difficulties experienced in trying to employ it with covered and balsamed objects may be eliminated by using small angled objectives, or cutting down the angles of larger ones by moveable stops. The false light that obstructs clear vision when the cover or the balsam gets illuminated as well as the object, is for the most part extremely oblique, and can be shut out by diminishing the angle of the objective. Powell and Lealand's immersion one-eighth, with a stop reducing the aperture to about 90°, gives admirable results.

MR. STEPHENSON, treasurer of the Royal Microscopical Society, exhibited at the last meeting of that body (June 2) a very convenient scale of measurement for angular apertures, ruled on white paper. Two circular spaces are marked as the positions of two of Child's night-lights, or other convenient objects, and the objective to be tested is moved on a vertical line until both flames, or other test objects, are brought into view. The angle of aperture is then read off by simple inspection of the degree marked at the point reached by the front lens of the objective. The objective should be mounted on a little carriage, and the image of the lights can be conveniently viewed by holding a pocket lens behind the back combinations.

MR. CHARLES STODDER exhibited some time ago to the Boston Natural History Society a slide, showing the nature of the contents of a mastodon's stomach, which had been received by J. G. Hunt from Wayland, New York. Dr. Hunt detected confervoid filaments, numerous small black bodies which he supposed to be spores of mosses, a fragment which apparently belonged to a rush, pieces of woody tissue and bark of herbaceous plants, and carapaces of Entomostraca. The animal had apparently taken his last meal from mosses and boughs of flowering plants growing on the margin of a stream or swamp. (*Proc. Boston Soc. of Nat. Hist.*, vol. xvii., part i.)

IN the same publication there is an account of the re-discovery of the locality of the so-called "Bermuda tripoli," well known as rich in diatomaceous forms. Dr. Christopher Johnson finds it to be near Nottingham, on the Patuxent, Prince George's County, Maryland. He identified specimens sent to him by Mr. P. T. Tyson, State Geologist for Maryland, as being the same material which he had received in 1854 from Professor Bailey as "Bermuda tripoli." This earth contains beautiful forms of *Helopsetta*, *Coccinodiscus*, *Craspedodiscus*, *Aulacodiscus cruzi*, and *Eupodiscus Rodgersii*.

THE *Monthly Microscopical Journal* for July states (without reference to the original authority) that Professor Leidy, of the United States of America, has recently found the common house-fly to be afflicted with a thread worm about a line in length which takes up its abode in the creature's proboscis. From one to three worms occurred in about one fly in five. This parasite was first discovered in the house-fly of India by Carter, who described it under the name of *filaria muscae*, and suggested that it might be the source of the Guinea worm in man.

THE functions of the frontal ganglion of *Dytiscus marginalis* are elucidated by M. E. Faivre in a paper which will be found in *Comptes Rendus*, May 31, 1875. After detailing a variety of experiments, he states, as a result of his researches, that "the frontal ganglion specially presides over the movements of deglutition, determining not only the contraction, but also the dilatation of the pharyngeal sphincter, while it reacts at the same time by the recurrent nerve on the cardiac sphincter. The action of this nervous centre may be excited by impressions from back to front or the opposite. It associates together by means of its connexion with the encephalon, acts of prehension, mastication, pharyngeal deglutition, and ingestion of food to the stomachs and the intestine. The sub-oesophageal ganglion is the centre under the influence of which it reacts with the most energy. In fine, the frontal ganglion, distinguished by special functions from all other nervous centres of the ganglionic chain, is allied to them by its essential properties, and as we may be assured by its structure also."

THE same number of *Comptes Rendus* contains an account of experiments by M. V. Feltz on the poisonous action of putrefied blood. He found that dogs in whose crural vein he injected blood which had putrefied and reached a stage in which

bacteria and allied organisms disappeared, produced loss of appetite, vomiting, bilious diarrhoea, and other bad symptoms. Four out of six died, but not until ten or twelve days had elapsed. In another set of experiments he employed the powder of old putrefied and dried blood mixed with water. Two out of three dogs died, and as in the former case, their blood showed septicemic characters, with deformation of the red corpuscles. The bacteria, &c., present in these cases appear to have developed from germs that had survived the putrefaction and desiccation.

In the already cited number of *Comptes Rendus*, M. A. Béchamp, replying to some remarks of M. Gayon on the spontaneous changes that occur in eggs, says that certain microzymes occurring in eggs are so small that not less than eight thousand millions would be required to fill the space of a cubic millimetre. The millimetre is 0.039 of an English inch, or in common fractions rather less than one-twenty-fifth of an inch.

MEETINGS OF SOCIETIES.

ROYAL SOCIETY OF LITERATURE (Wednesday, May 26).

SIR CHARLES NICHOLSON, V.P., Bart., in the Chair. A paper on "The Petrarch Collection at Trieste, with Notes on the Centenary Edition of the *Africa*, and the inedited Writings of Petrarch, published by Signor Hortis, of Trieste," was read by Mr. C. H. E. Carmichael, M.A., who represented the Society at the Petrarch Festival at Padua. In the course of his paper, which was illustrated by an exhibition of photographs of the principal scenes of the Festival taken at the time, Mr. Carmichael gave an account of the very valuable Petrarch Library, containing MSS. as well as printed texts, and plates and drawings, collected by Domenico Rossetti, of Trieste, and bequeathed by him to the Municipality. The catalogue of this collection, carefully compiled by Dr. Attilio Hortis, Civic Librarian, was presented to the Society by Mr. Carmichael on behalf of the Municipality. The Centenary edition of the *Africa*, by the Abate Corradini, of Padua, was next adverted to, and the Society's attention drawn to the photolithograph of a contemporary fresco portrait of Petrarch, attributed to Guariento, whose history Mr. Carmichael gave from the details furnished to the Centenary edition by Count Giovanni Cittadella, President of the Padua committee. Finally, Mr. Carmichael described the inedited writings which Signor Hortis has brought together, and made the occasion of an interesting monograph, as an additional contribution to the literature of the Petrarch Festival. In the discussion that followed, Sir Charles Nicholson, V.P., and Mr. Vaux remarked upon the historical interest of the well-authenticated contemporary portrait of Petrarch, and upon the value of these commemorations of great names in literature and art, so well carried out in Italy.

ZOOLOGICAL SOCIETY OF LONDON (Thursday, May 27).

PROFESSOR GARROD delivered the sixth lecture of the course at the Society's Gardens, his subject being "Camels and Llamas." These animals constitute a very distinct section (*Tylopoda*) of the ruminating ungulates. They have no horns, a long cleft hairy upper lip, and peculiarly formed feet. The camels, which are natives of the Old World, have a dorsal hump, and the foot forms a broad fleshy pad, only divided in front and terminated by two marginal nails. The llamas of the eastern hemisphere have no hump, and their digits are separated throughout. In both genera the navicular bone is not fused with the cuboid as in the other ruminants, and the blood corpuscles differ in shape from those of all other known mammals, being oval instead of circular. The conformation of the stomach is characteristic; it is divided into

three well-marked compartments, of which the first possesses two groups of deep hexagonal cells, the orifices of which are capable of being completely closed. According to the concurrent testimony of travellers, these cells are used as a reservoir of water, enabling the animal to traverse arid wastes without drinking. In camels which have died in this country no water has been found, but it is easy to understand that the fluid-storing power may fall into abeyance when it is not necessary for the welfare of the individual.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, June 1).

S. BIRCH, LL.D., F.S.A., President, in the Chair. The following papers were read:—I. "On Ancient Metrology." By F. R. Conder, C.E.—In this paper Mr. Conder indicated the confused and contradictory state of our present knowledge of the subject, and proceeded to establish an absolute metrical base, identifying the barley corn, which the Hebrew writers state to be the unit of length and of weight, with the long measure barley corn and with the troy grain. The grounds of identification were (1) actual measurement and weight of full-sized grains of barley at time of harvest; (2) determination of specific gravity according to statements made in Hebrew literature; (3) actual dimensions of ancient Jewish buildings; and actual weight of a Babylonian talent now in the British Museum, which corresponded to Mr. Conder's determination of 960,000 troy grains within one *per mille*. The remarkable double division of the Chaldee metrical system, which is both decimal and duodecimal, was then explained, and shown to apply to measures of length, area, capacity, and weight. The origin of the troy ounce, the diamond carat, the Spanish ducat, and other existing divisions, is traced to the early system employed by the Phœnician traders. Appended to the paper was a tabular statement of the comparative weights and measures of the ancient Greeks and Hebrews. II. "On the Egyptian Shawl for the Head, as worn on the Ancient Statues of the Kings." By Samuel Sharpe.—The writer showed that the head-dress with apparent folds and lapets could be formed out of a square yard of striped calico, arranged in a peculiar manner; and, to prove the truth of his statements, an actual shawl thus folded was exhibited to the Society. III. "On an Assyrian Inscription in the Vatican Museum." By E. Richmond Hodges, F.R.G.S.—This inscription, which has hitherto been unpublished, is in a very mutilated condition, and the commencement is missing. It appears to commemorate the foundation of a city and the receipt of tribute; it also mentions the tribes of the Nakli and Sapiri; but through the imperfect state of the monument its date and history cannot be ascertained.

Miss Amelia B. Edwards exhibited and described a collection of water-colour sketches made during a journey on the Nile from Cairo to the Second Cataract. The views were chiefly of Egyptian and Nubian temples, and more especially of a small rock-cut Speos of the period of Rameses II. at Abou Simbel, which was discovered by Miss Edwards' party on February 14, 1874, and which is in perfect preservation. The decorations and inscriptions of this Speos were given in detail. With the sketches was also exhibited a fine funeral stele in painted sycamore wood, period of the XXII. Dynasty.

ZOOLOGICAL SOCIETY OF LONDON (Tuesday, June 1).

DR. GÜNTHER, F.R.S., in the Chair. Mr. Sclater remarked upon some rare monkeys and other mammals now living in the Society's collection. Sir Victor Brooke read a paper on the African buffaloes, of which he recognised three species as distinct—namely, *Bubalus caffer* from the south, *B. pumilus* from the west, and *B. equinoctialis* from

the east of the continent. Mr. C. G. Danford read an exhaustive memoir on the Wild Goat of Asia Minor (*Capra aegagrus*), of which he exhibited a fine series of horns. Those of the male reach a great size, one pair shown measuring no less than 47 inches along the curve. The females have small horns about twelve inches long, and have no beard. Papers of more exclusively technical interest were read by Messrs. Dobson, Angas, Cambridge, Druce, and Layard.

LONDON ANTHROPOLOGICAL SOCIETY (Wednesday, June 2).

H. B. CHURCHILL, Esq., Vice-President, in the Chair. A paper by Samuel Wake, Esq., was read on "The Aborigines of Western Australia," and illustrated by the exhibition of nets, waddies, boomerangs, &c., of Australian manufacture. A second paper, by A. H. Kiehl, Esq., F.L.A.S., was read on "The Inhabitants of Java." These papers treated of the physical peculiarities, dress, or rather personal adornments, food, treatment of women, beliefs, superstitions, manners and customs generally prevailing among the natives of Australia and Java, in both of which countries, it may be noted, circumcision is practised, although the inhabitants differ much in other particulars, the Javanese being much the more civilised, living in substantial bamboo and even stone houses, using canoes with outriggers and sails, and cultivating rice, cocoa-nuts, bananas, and fruit trees, while the remains of ancient sculptured temples show a greater amount of civilisation to have existed in their country in former days than now. C. H. E. Carmichael, Esq., M.A., F.R.S.L., then communicated some interesting facts respecting the little-known race of African dwarfs named Akkas; and the evening was concluded by a paper from the President (Dr. Charnock, F.S.A.) on the Thuringenwald.

ZOOLOGICAL SOCIETY OF LONDON (Thursday, June 3).

In the seventh lecture of the course at the Society's Gardens, Professor Flower, F.R.S., treated of elephants. Few animals are better known, and none perhaps are more thoroughly isolated from all other existing forms, than the two recent species of elephant, *E. indicus* and *E. africanus*. The former has been domesticated from the earliest ages; the latter was trained by the Carthaginians and was well-known to the Romans, but in modern times it is only lately that African elephants have been brought alive to Europe. In the general structure of these animals the most striking feature is the trunk, which is really a vast prolongation of the nose and upper lip. The walls of the skull are swollen by great air-cells, so as to give room for the attachment of the muscles. The tusks are true incisors, and the molars, which are three in number on each side of each jaw, move forward in succession, only one being in use at a time. As one tooth is thus worn away its place is taken by the one next behind it, which gradually forces out the remaining stump. Although now standing completely alone, the elephants had many relatives in geological times. Every transition may be traced from the mastodon, in which the grinding-teeth were much like those of other animals, to the mammoth, which was nearly allied to the living Asiatic species. Thus the elephants are the survivors of a more numerous family, and they are themselves likely soon to become extinct.

LINNEAN SOCIETY (Thursday, June 3).

DR. G. J. ALLMAN, President, in the Chair. The President nominated the following gentlemen as Vice-Presidents of the Society for the ensuing year, viz.—Mr. G. Bentham, F.R.S., Mr. G. Busk, F.R.S., Dr. J. G. Jeffreys, F.R.S., and Dr. J. D. Hooker, F.R.S. The following papers were read: 1. On the Barringtoniaceae, by J. Miers, F.R.S.

The purpose of this paper is to show that the *Barringtoniaceae* constitute a distinct natural order, forming an extremely natural group with peculiar and uniform characters, differing from the *Myrtaceae* in their alternate leaves without pellucid dots, and in the nature of their inflorescence and fruit. They are trees, frequently of large size, rarely low shrubs, all delighting in running streams, some growing in estuaries or along the seashore. The author describes the characters of the order in considerable detail, and gives the diagnosis—in many cases redrawn from actual examination—of each genus and species. The number of genera he makes to be ten. The paper is accompanied by drawings illustrating the floral and carpological characters of each genus. 2. Note on the Occurrence of Fairy Rings, by Dr. J. H. Gilbert, F.R.S. This paper was founded on the observations made by the author and Mr. Lawes on their experimental plots at Rothamsted. After some particulars as to the effect of various manures in changing the proportion of different kinds of vegetation, especially Grasses and Leguminosae, the author suggests that the determination of the source of the nitrogen in the fungi that constitute the "fairy rings," which frequently make their appearance on the plots, would throw some light on the much disputed question of the source of the nitrogen of the Leguminosae. It is remarkable that although, according to published analyses of various fungi, from one-fourth to one-third of their dry substance consists of albuminoids or nitrogenous matter, and 8 to 10 per cent. of mineral matters or ash, of which about 80 per cent. is potassium phosphate, yet the fungi develop into "fairy rings" only on the plots poorest in nitrogen and poorest in potash. The questions which appear still to require solution are these:—(1) Is the greater prevalence of fungi under such circumstances due to the manurial conditions themselves being directly favourable to their growth? or (2) are the lower orders of plants—in consequence of other plants, and especially grasses, growing so sluggishly under such conditions—better able to overcome the competition and to assert themselves? (3) do the fungi prevail simply in virtue of the absence of adverse and vigorous competition, or to a greater or less extent as parasites, and so at the expense of the sluggish underground growth of the plants in association with them? or (4) have these plants the power of assimilating nitrogen in some form from the atmosphere, or in some form or condition of distribution within the soil not available, at least when in competition, to the plants growing in association with them?

FINE ART.

MESSRS. GOUPIL'S GALLERY.

THE well-known Parisian art-publishing firm of Goupil and Co. have established themselves at 25 Bedford Street, Strand; and they have opened as a picture-gallery the handsome range of rooms at the rear of the premises. According to the current fashion, this is made a paying exhibition; but one may safely assume that the pictures are, in fact, a dealer's stock. Here, therefore, is one more of those commercial speculations in foreign art with which London has of late been so greatly overrun. We cannot thank Messrs. Goupil for displaying to us *all* the paintings thus selected from their ware-rooms—saleable and unsaleable—good, bad, and indifferent: we should much have preferred it if the excellent ones had been made into an exhibition, and the others left to take their chance of a purchaser through the ordinary channels of trade. Certain it is, however, that there is a minority of the pictures extremely good; and the collection generally acquaints us tellingly with one of the main influences now swaying continental art—that of Fortuny and his style. The works of this class are executively ingenious and dexterous to the last degree, and display a quick observation and ready

command of nature, without prepossession in favour of any one element of subject-matter, design, or presentment, rather than another. What they lack is distinction and elevation, breadth, and, above all, repose. They are full of variety, vivacity, and sparkle; brightness of colour, without much harmony; common nature in the personages, without either comeliness or immediate expression; impulse, without passion; reality, without significance; sumptuousness, without refinement. They are, in the fullest sense of the word, *fashionable* works. We speak of the prevailing tone of these productions, not intending to derogate from the great merits of some of them—still less from the pre-eminent genius of Fortuny himself, who appears to us (from a rather restricted acquaintance with his paintings) to have been one of the most singularly gifted executants of recent, or indeed of any, time.

In the present exhibition there is one work by Fortuny, *A Spanish Bull-Fighter*; a masterly sketch, pairing with the one, of which we spoke lately, at the French Gallery in Bond Street. The work at Messrs. Goupil's represents the Bull-fighter making his salute to the plausive spectators, and has of course less of action and excitement than the companion subject. Other specimens to which our preceding general remarks will apply, more or less fully, are—*On the Sands at Yport*, and *On the Coast, Yport*, by Charnay; *The Clever Dogs*, lion-clipped performing poodles in a Moresque Spanish building, apparently one of the courts of the Alhambra, a surprisingly clever picture of its kind, by Agrasot; *The New Dress*, by Capobianchi, hardly less clever, but a piece of pitilessly over-dressed art-millinery, adapted to please the least tasteful of the luxuriously idle class; *A Seller of Arms*, and *La Siesta*, Algerine subjects, by Villegas; *The Chat in the Woods*, modish women of about the year 1830, lolling in lush grass under a brilliant sun, by Boldini; *A Lady reclining on a Sofa*, by L. Rossi. The *Jesters of De Beaumont*, which was exhibited a year or two ago in the Paris Salon, shows something of the same influence, but has more direct affinity to some other painters; it is a talented piece of grotesque.

The famous picture by Gérôme, of Frederick the Great playing the flute with furious zeal on his return from hunting—named *Rex Tibicen*—is here; the picture which was hung in Paris last year, and to which the médaille d'honneur was awarded. It is accompanied by three other examples of the same master: *Oriental Women fetching Water*, an ordinary specimen of a hand always too skilful to be ordinary; *The Caravan*, crossing the Egyptian desert: *An Arab and his Dead Horse*, also a desert-subject, in which the horse's head seems disproportionately (or at any rate disagreeably) big. *A Sketch from Life* is a truly excellent Meissonier, and comparatively speaking a large one: it shows once again that the practice of working on a minute scale has not bereft this consummate painter of his command of a free and even an offhand touch. The subject is an artist drawing a French soldier of the Revolutionary period, clothed in a white uniform with blue facings, and wearing the tricolour cockade. Five other soldiers, varied and highly appropriate in pose and expression, are in the group; also a stolidly-staring dog, an "ugly customer" to any obnoxious intruder. Another Meissonier (of much earlier date, 1857) is named *The Standard Bearer*, in a costume of about the opening of the sixteenth century; this likewise is a choice example. There is a minute and unimportant Delaroche, *Hérodiade*; an ordinary Millet, *The Shepherdess*; *La Malaria*, by Hébert (this is, if our memory serves us, a duplicate of a highly-reputed work in the Luxembourg Gallery), and other works by the same painter; Jules Breton's bold but rather commonly handled picture, *On the Cliffs*, from the Paris Salon of last year; and Corot's ever-fresh and elegant *Souvenir d'Arleux du Nord*. The *Florentine Concert*, by Sorbi, is a

remarkable little painting, with Dantesque costumes and clear-cut form and colour, in full daylight without shadow; well drawn and executed, and the expressions good, and all in uniform keeping. What spoils the work is the artist's liking for bright tints, without colourist feeling, or any toning down. Suchodolski is striking in *The Burial of a Monk, Isle of Capri*; a multitude of Carthusians under the canopy of heaven, in a glorious late twilight, carrying tapers which scintillate momentarily the clearer in the gathering dusk. This is one of the most impressive pictures in the gallery, with a good deal of consentaneous and even of individual subject-matter. If a certain conventionality of manner is not allowed to become confirmed into a taint, this painter should do something to be remembered. Another picture that strikes the eye, and lingers upon it, is *The Child's Dream*, by M. Maris; a singular piece of execution, in flat and faint tints well combined, and, like its theme, intangible in feeling and suggestion.

We can only name in addition—Boughton, *The Siren*, a pleasing modern pastoral; Bouguereau, *The Storm*; Hamman, *The Bad Book*, a young indiscreet detected by her mother, in costumes of about 1780; Cortazzo, *The Needlewoman*; Bellecour, *La Siesta*; Bonnat, *A Turkish Barber*; Goupil, *Une Citoyenne*; Munkacsy, *The Bad Husband*; Emile Breton, *A Lock, Sunset*; Jacovacci, *Eglise des Frari, Venise*; P. Rousseau, *Dogs*; Jacque, *The Shepherd*; Troyon, *Return from the Meadows*; J. Maris, *Dutch Downs, The Town of Amsterdam*.
W. M. ROSSETTI.

THE ELGIN MARBLES.

SOME surprise has been caused by a report in the *Levant Herald* (May 26) to the effect that of the sculptures which Lord Elgin had removed from Athens and had got as far as Cythera (Cerigo) when the ship went down, a considerable portion (five out of seventeen cases) was still visible under water at the depth of sixteen fathoms. This information, it appears, has been communicated by a Mr. Makoukas, of Cerigo, to the Archaeological Society of Athens, and it is hoped that the Greek Government may lend a hand in recovering these precious treasures. Such is the story, and already the question is being discussed as to the legitimate ownership of the marbles. Meanwhile, it may be well to bear in mind that this is not the first occasion on which wonderful treasures have been seen at the bottom of the sea; and further, that in an appendix to the Report of the Commission appointed by Parliament with reference to the acquisition of the Elgin marbles in 1815, it is expressly stated that "all the cases were finally recovered and none of the contents in any way damaged." The work of recovering them did not end till the third year after the shipwreck, and it is not likely that a laborious and expensive task of this kind carried so far would have been left so incomplete as the statement of the *Levant Herald* implies. It is, of course, always possible to suppose that Lord Elgin had been deceived by those whom he employed at Cerigo, the more so since the work of removing the sculptures from Athens had been done, not under his personal superintendence, but by a paid agent, Lusieri, from whom he may not have received such a list of the objects embarked at Athens as would enable him to check them on their arrival here. Should the report prove correct it will, apart from the value of the objects, add another incident to an already remarkable story. When, in 1799, the young Earl of Elgin was appointed ambassador at Constantinople, he had working for him in Scotland an architect, Mr. Harrison, by whom he was persuaded of the immense importance of obtaining accurate drawings and models of the ancient buildings and sculptures in Athens. Thinking it a matter of national interest, he made a representation to the Government, but failed to induce them to take it up. On his way to Constantinople he

met Sir William Hamilton in Sicily, who, entering heartily into his plans, obtained for him from the King of Naples leave to engage for his service the painter Lusieri, who was then being employed by the King. Lusieri, with two architects, two modellers, and one figure-painter, followed Lord Elgin to Constantinople, and they were soon sent to Athens. For nine months they were not admitted to the Acropolis, even to make drawings, without paying the fee of five guineas a day. When, however, the English had succeeded in driving the French army out of Egypt, a change of feeling took place at the Porte, which Lord Elgin was not slow to profit by, and by degrees the number of workmen employed by him rose to from three to four hundred. To get rid of the opposition which was constantly being raised by the local authorities, a firman was obtained ordering the governor of Athens to see to it that no obstacles were put in the way of Lord Elgin's artists and workmen, who were to be allowed to make scaffoldings, casts, drawings, and excavations, and also, if they wished, "to remove any pieces of stone with old inscriptions or figures on them." To a Turk this last clause was a sufficiently accurate description of the finest sculptures in Athens, and Lord Elgin took it in that sense, as did also the governor of Athens. The selection of objects to be removed was left entirely to Lusieri, Lord Elgin having as yet never been in Athens, and being led in the matter solely by the idea that everything which an artist of high character like Lusieri might select would, when once in England, be of national importance. The difficulty was to get the objects to England, with French ships in the Mediterranean. Besides, one ship, as has been said, had gone down at Cerigo. In 1803 he was recalled from Constantinople, and on his way home visited Athens for the first time, leaving instructions to Lusieri to continue the work. In 1805 we find him a French prisoner in Paris, where one morning, on account of the doings of his agent in Athens, he was seized by a common *gendarme*, taken out of bed, and placed in close confinement, contrary to all usages of right in war, and simply to satisfy the grudge which certain Frenchmen of high position bore him for the success of his operations. He had been a prisoner apparently since 1803, but previously had been allowed to live with his family in Paris. It was not till 1812 that Lusieri was able, after many serious difficulties, to send to London eighty cases containing the results of his labours; and when they arrived here new obstacles presented themselves. Lord Byron exhausted the vocabulary of Billingsgate in denouncing the Earl, whose chief crime consisted in his being a Scot. But worse than that, Payne Knight, then the leader of taste in these matters, declared the sculptures to be poor stuff dating from the time of Hadrian. Fortunately a very different view of their value was taken from the first by some artists of reputation, particularly Benjamin West and Haydon. A paper war ensued. Meantime the costly operation of moving and erecting coverings for such large sculptures had to be performed four separate times, till finally they found a temporary resting place in Old Burlington House, and were there thrown open to inspection. Here Visconti, to whose judgment in regard to ancient art all bowed, paid them a visit and was highly enraptured. No less deeply impressed with their grandeur was Canova, who came to see them afterward. Two memoirs by Visconti and a letter from Canova were now republished by the indefatigable Earl, who was equally determined that his sculptures should become national property, and that he should in the process recover something like his expenses. So far was he successful that in 1815 a committee of the House of Commons was appointed to consider the purchase, and, after hearing a great deal of evidence, recommended it at the price of 35,000*l*. Then came the discussion in the House of Commons, in which there was no lack of cheap moral

indignation. An amendment, for which thirty voted, as against eighty-two for the motion, was proposed, to give Lord Elgin 25,000*l*., and to keep his collection in the British Museum at the disposal of either the then or any future Government of Athens. Lord Elgin reckoned his expenses in forming and preserving the collection up to its acquisition by the nation at 74,240*l*., by no means, one would think, an overstated sum. For the balance between this sum and the 35,000*l*. paid to him, he obtained the position of a Trustee of the British Museum, and was allowed to hand down this distinction to his heirs.

A. S. MURRAY.

FREDERICK WALKER, A.R.A.

THE death of this estimable painter, which occurred on Saturday, June 5, closing some years of illness, is a loss to our art. Mr. Walker was a young man; had years and health been granted to him, he might have done almost anything he chose in the way of execution. We remember his early appearances as a woodcut designer: the very first of his drawings was, we believe, a little lamp-lit interior, with a ragged street-boy and two young men, one of them lighting a pipe, published in *Once a Week* some dozen years ago. We remember also how rapidly he progressed from painstaking crudity to a most uncommon degree of skill, in which the equable balance of intention, expression, draughtsmanship, composition, colour, atmosphere, handling, and what not, was truly observable. In selection of subject-matter he was simply and solely artistic; never doing anything which had deep or inventively concerted meaning, or which drew upon the powers of elaborate thought or narrative combination. He painted the things that are seen with the eye; and required you to appreciate them in the picture just as they would have to be appreciated in actual life. A widow-lady going down the steps of an old family-house, and looked at by a navvy, or boys bathing, or old pensioners in their town-cinctured garden, or gipsy women and children, or a man ploughing—all these, as one sees them in nature, appeal to one somehow or other, as appearances and on their own showing, without antecedent or consequent, foreground of future or background of past: on the same basis do they appeal to you in Mr. Walker's pictures. They possess their significance, but not anything is presented to you for the purpose of having its significance analysed, or with an added freight of meaning and ingenuity from the artist's own resources. Sometimes the subject was left by Mr. Walker so felicitously to itself, with nothing beyond save delicate and right art, as almost to have a certain Grecian character: the very simplicity of the fact and its presentment reached up towards the typical or archetypal. It may be that in coming years the name of Walker will be linked in memory and in art-associations chiefly with that of Mason, also lately deceased, and prematurely, though he was far older than Walker. There was some analogy in their art, both being contented with anything as a subject and a suggestion, and both working it out for its primary visual and hence artistic impression. Mason was more a painter of landscape than of figures, and Walker more of figures than of landscape; but each relied principally upon the combined effect of the two. Mason also had unquestionably more of the poetically idyllic, or directly beautiful in form and arrangement: yet Walker was capable, we think, of making quite as decisive a mark in the art of his time, with equal opportunity.

W. M. ROSSETTI.

THE restoration by Herr Mock of the tapestries and frescoes of the Town Hall at Cologne has been successfully completed, and the Grand Hall was re-opened for the inauguration of the new Ober-Bürgermeister on June 5.

NOTES AND NEWS.

AN excellent new purchase has just been made for the National Gallery. It is a head-and-shoulder portrait of a Venetian patrician, painted in oil on panel by a Milanese hand, and in singularly perfect preservation. The picture is small life-size, and the attitude nearly full-face. The sitter wears a red cloak, showing a blue undersleeve at the left wrist, with a close black cap and black stole of office; on his left thumb is a turquoise ring, and in his right hand a pink. In the background is a landscape of low hills. The colour and quality of the piece are admirable, and the head a masterpiece of grave and accurate portrait design; the nose thin and somewhat aquiline, the chin long, the mouth somewhat wide and depressed at the corners, with thin lips beautifully cut and drawn, the grey eyes looking somewhat downwards to the left. There is no clue by which the name of the sitter can be identified. But the painting may, from internal evidence, be referred with certainty to the hand of Andrea di Solario, and probably to the period of his residence in Venice after 1490. The National Gallery already possesses a striking portrait by this master, but one in a much less pure state than the picture just bought. The nation is to be heartily congratulated on the acquisition.

FROM the report recently made by the Trustees of the National Portrait Gallery, we learn that during the past year the collection has been enriched by six donations and ten purchases. The most valuable and interesting of the donations is the small portrait of Sir Walter Scott, by Landseer, which was exhibited at the Royal Academy last year. It was purchased for 800 guineas at the general sale of Landseer's works, and presented to the national collection by Mr. Albert Grant. The other donations are:—A marble bust by Mr. Durham of Charles Knight; a chalk drawing by Sir Thomas Lawrence of Samuel Rogers the poet; a portrait in oils, by an unknown artist, of Margaret Douglas, Countess of Lennox, niece of Henry VIII., mother-in-law of Mary Queen of Scots, and grandmother of James I.; a portrait by Hayes of Agnes Strickland, historian of the Queens of England and Scotland; and a likeness, by an unknown hand, of Anne Clifford, Countess of Pembroke and Montgomery, A.D. 1589–1676. This last painting, which represents the countess at the age of eighty-one, was formerly in the collection of General Fox, and was presented to the gallery by Mr. George Scharf, Keeper and Secretary to the Board of Trustees. The purchases include the following portraits:—Edmund Burke, "painted in the school of Sir J. Reynolds;" Warren Hastings at the age of seventy-nine, by Sir Thomas Lawrence; Lord Chancellor Loughborough, afterwards Earl of Rosslyn, by William Owen, R.A.; Lord Nelson, by L. F. Abbott; Lord Chancellor Thurlow, "probably painted by Richard Evans, in the studio of Sir T. Lawrence;" John Zoffany, R.A., by himself; Miss Mary Russell Mitford, authoress of *Our Village*, by John Lucas; and three plaster casts by Brucciani, from effigies in Canterbury Cathedral, of Edward the Black Prince, King Henry IV., and Queen Joan of Navarre, second wife of Henry IV. These casts are to be converted into bronze by Messrs. Elkington, of Birmingham, by means of the electrotyping process.

The Trustees complain much of want of room for the advantageous display of the portraits, and suggest different modes by which additional space might be secured for that object.

MR. SEWALL BARKER's collection of pictures was sold at Christie's on Saturday, as was also the small collection of Mr. Edward Storr. The first came from Manchester; the second from Liverpool.

Among Mr. Barker's water-colours was a well-known work of Duncan's—*The Lifeboat*; it sold for 357*l*. Among the oils were—*Fishing* .

Wales, by Creswick and John Phillip (304*l.* 10*s.*); *The Soldier's Return*, by J. Faed, R.S.A. (168*l.*); *Up the Hill*, by J. T. Linnell (278*l.*); *Harvest-time*, by P. Nasmyth (131*l.*); *Ordeal by Water*, by P. F. Poole, R.A. (141*l.*); *A Woody Landscape*, by Constant Troyon (168*l.*).

Mr. Storr had only twenty-five pictures. *The Proposal*, by T. Faed, R.A., fetched 262*l.* 10*s.*; a *River Scene in the Tyrol*, by Nasmyth, 236*l.*; the *Scotch Fair*, by J. Phillip, 735*l.* A William Müller—*The Noonday Meal*: a view near Gillingham—sold for 1,627*l.* 10*s.*; *Across the Common*: a breezy day, by David Cox (painted in 1852), 1,155*l.*; and Sir Augustus Calcott's *View near Southampton Water* (exhibited at Burlington House last winter) for only 60*l.* 18*s.*

THE sales of old decorative furniture, on Saturday, were interesting. There was fine French marqueterie and buhl of the periods of Louis XIII., Louis XIV., Louis XV., and Louis XVI., and there were several good specimens of Italian cabinets. Among the china sold on Thursday and Friday were a set of three jars and covers, and a pair of beakers (Dresden) painted with Chinese figures and bouquets of flowers, 16½ inches high, the centre jar 22 inches, from the collections of the late Mrs. Dent and Mr. W. Angerstein. The price realised was 409*l.* 10*s.* A Vienna cabinet, painted with classical figures in brown, after Angelica Kaufmann, 115*l.* 10*s.* A pair of very fine flat-shaped Old Chelsea vases, from the Countess of Portsmouth's collection, sold for 440*l.* A pair of beautiful dark blue and gold oviform vases, painted with allegorical subjects and pastoral figures and medallions of birds, 750*l.* A fine pair of cassioles (Sèvres) of old gros bleu, 693*l.* A pair of fine tulip-shaped vases, painted with Cupids in medallions, on green ground, by Dodin, richly gilt, 970*l.* The Barberini vase, the fifth made from that known as the Portland vase—and a perfect specimen of Wedgwood—fetched 294*l.*

Mrs. NOSEDA has just published an etched portrait of Miss Fowler, the now well-known actress of comedy. The work is by Mr. Percy Thomas, and is harmonious and graceful in arrangement, and fairly good as a likeness. Firmer modelling in the cheek, and a more generally decisive touch, would have raised it to a higher level among the few good etched portraits.

THE administration of the Louvre has suffered a very great loss by the death of its general secretary, M. Frédéric Villot, which took place on May 27, after a long illness. M. Villot is chiefly known to foreigners by his admirable Catalogue of the Louvre, the first edition of which was published in 1848, and the eighteenth last year. This laborious work, which was for the time in which it was written a perfect monument of research and learning, not only drew attention to the vast treasures that it enumerated, but likewise gave an impulse to this branch of knowledge, so that it is not perhaps too much to say that the excellent catalogues now offered to the visitor and student of most of the great galleries of Europe are due in a large measure to M. Villot's initiative. During the siege and Commune of Paris his responsibilities were overwhelming, and it was greatly owing to his effective system of surveillance and wise precautionary measures that the treasures of the Louvre were preserved intact through that terrible period. M. Villot was sixty-six years of age at the time of his death. "Art loses in him," says the *Chronique*, "one of its oldest adepts, and the Louvre an old and faithful servant."

THE death is also announced of the eminent archaeologist the Abbé Cochet, Director of the Museum of Antiquities at Rouen, and member of the Committee of Historic Works. The Abbé Cochet is known by his numerous works on French archaeology, among which may be cited *La Normandie Souterraine*, *Les Sépultures Gauloises*, &c., *Le Tombeau de Chilpéric*; and also by his constant contributions to reviews and journals.

MR. A. C. MERRIAM, of Columbia College, New York, sends us the details of a very thorough examination which he has made of the pottery in the Cesnola Collection of Antiquities from Cyprus, with reference to the points of resemblance between it and the pottery obtained by Dr. Schliemann from Hissarlik. The results, however, do not differ from those repeatedly put forward in these columns on the occasion of Dr. Schliemann's discoveries. Of course the argument has now a wider basis in proportion as the Cesnola collection in New York is more extensive than the collections of Cypriote pottery in European museums on which it was formerly founded. But when all is done—when A is proved equal to B, while B is only assumed to be equal to C—it cannot be said that the question is settled, though no doubt it is advanced an important step.

THE death is announced at Rome, on May 30, of the well-known engraver Aloysio Juvara, at the age of sixty-seven. In 1868 Juvara received the second gold medal of the Berlin Academy, and besides this, he had obtained seventeen other medals in recognition of his artistic skill. His plates of the *Madonna della Regia*, and of Mancinelli's *S. Carlo Borromeo*, are among his best compositions.

THE *Levant Herald* announces that the Turkish Government is about to send Aristokles Effendi, an *employé* in the Department of Public Instruction, to Crete on a twofold mission, of inspection of all the schools in the island, and of archaeological enquiry to guide future excavations on the sites of ancient cities.

"THE Political Value of Art to the Municipal Life of a Nation" is the title of a well-written lecture recently delivered at the Free Library, Liverpool, by Mr. Philip H. Rathbone, honorary secretary of the Liverpool Art Club, and since published. By a somewhat far-fetched interpretation the old Greek legend of Antaeus gaining fresh strength in his struggle with Herakles each time he kissed his mother earth is made by the lecturer to apply to Art, which "in all ages has been the truest exponent of a nation's life, and has ever risen refreshed and renewed when it has appealed to the heart and faith of the people among whom it dwelt. Thus, in Greece the artist worked for and accepted the criticisms of the common people, and Cimabue's *Madonna* was carried with shouts of joy from all classes to its resting-place. In mediaeval Italy, indeed, the patriotism and religion of the nation were embodied by means of art on the walls of its churches and townhalls, which thus became vast picture-galleries to which the people resorted when stirred by noble aspirations and solemn feelings. In the Netherlands, also, art owed its greatness simply to the patriotism and enterprise of the municipalities, for in this Italy and the Low Countries, so different in other respects, resembled each other, "their belief in and devotion to their municipalities." It is easy to see whither all this argument tends. If such was the influence of art in former times, ought it not to be the aim of the philosophical politician in England at the present day to endeavour to embody the national sentiment in the enduring form of art?

"I cannot but think," says the lecturer, "that if in Liverpool we were fortunate enough to be able to associate the life of our town with a noble and impressive figure, as that of Athens was associated with the figure of Pallas Athene—a being whom we could imagine grieving over our sorrows and gathering up into her capacious heart the hopes, fears, aspirations, and affections of six hundred thousand of our fellow-townsmen, that we should be lifted up into a higher and broader sphere and partake in a grander and nobler life than any individual could ever dream of pretending to."

Doubtless; not Liverpool only, but the whole nation would be the nobler for such a figure. But where shall we find the Phidias to create it? Taine's doctrine that the work of art is determined

by the conditions that produce it—"L'œuvre d'art est déterminée par un ensemble qui est l'état général de l'esprit et des mœurs environnantes"—is true so far, that the work of the artist is often forced to take a wrong direction when the "ensemble" is unfavourable to its free growth, but no amount of favouring circumstances ever produced a great work of art. We see this strongly exemplified in Germany at the present time. The great heart of the nation has been stirred by its glorious achievements in war, and it would willingly embody its thoughts and its triumphs in great and noble works of art. But in spite of all its strivings the numerous war-monuments that have been designed and erected have proved for the most part miserable failures. The *tout ensemble*, one would imagine, was favourable enough, only there is no great artist to take advantage of it. And is it not the same in England? We are still waiting for the great teacher to arise in art, as in other matters, and until that time arrives Liverpool, it is certain, will get no Pallas Athene to preside over her Exchange. Is she quite sure, indeed, that such a figure would really represent her national life with its turmoil, jobberies, and money-making desires? Meanwhile it is a worthy undertaking to decorate her Council Chamber with mural paintings, as we stated last week is proposed to be done, and we trust the result gained by the artist, whoever may be chosen for the work, may prove the full value of the favourable conditions that are thus offered for the display of his powers.

A NEW catalogue of the Suermondt collection of pictures gained last year by the Berlin Gallery has been lately prepared by Dr. Julius Meyer, the director, and Dr. Wilhelm Bode, the assistant director, of the gallery. This new catalogue, unlike such works in general, deals almost too ruthlessly with established names. Thus, out of five Rembrandts that formerly appeared in the catalogue, it only allows of one being genuine, setting aside even the St. Jerome in the cave, etched by Vliet, as a copy from an original that has disappeared. In like manner, a celebrated picture, hitherto assigned upon strong evidence to Franz Hals, is set down as a copy by Dirk Hals, and other pictures are transferred without hesitation from masters to pupils; indeed, the searching criticism of Dr. Julius Meyer, which is well known as never taking any fact upon trust, has done much to lessen the commercial value of the great art collection recently acquired by his nation, although it has placed its real artistic worth upon a surer basis.

"L'AFFAIRE Frédéric van de Kerkhove," as the strange complexity arising out of the exhibition of the works of the youthful Fritz van de Kerkhove has got to be called, has not as yet excited much attention in England, although the Belgian and one or two of the French papers have been occupied with it for months past, and have been led under the excitement of "a cause" to indulge in the most bitter personal attacks and recriminations. The last development of this eventful history is the gift by the father, Jean van de Kerkhove, of 2,000 fr. to the town of Bruges, this being the proceeds of the exhibition of his son's works at Brussels. The donor stipulates that the sum, "given in the name of his son Fritz, *artiste peintre*, shall be inalienable, and shall be placed in security by the town of Bruges, and the interest devoted to the distribution of clothing to the poor children of the communal schools." The difficulty arising out of such a gift is apparent. Several members of the town council, while admitting the generosity of the donor, were of opinion that it could not be accepted unless the authenticity of the works that had produced the sum in question could be proved; but others considered, on the contrary, that the question was not one of art or authenticity, but simply of finance, and that the donation ought to be accepted in the interests of charity and education. This opinion carried the day by nine votes against one. Seven

members of the council, however, declined to even appear to sanction the disputed works by their presence. In fact, as will be seen, the affair becomes every day more and more complicated, and it is doubtful whether it will now ever be satisfactorily settled. At first it only bade fair to be a nine days' wonder, but various artifices and the noise of violent partisans have contrived to keep up the excitement, and we are even threatened with an outburst of it in England, for it is proposed to exhibit the disputed works over here, when no doubt the loud trumpeting of the poor child who is supposed to have painted them will be renewed.

We received an indignant remonstrance a short time ago from the *Journal des Beaux Arts* for having spoken of the Kerkhove affair as a "complete deception." Perhaps this was a hasty judgment, but after reading the inflated panegyric and verbose declamation of the Brussels journal, we can only say we find our opinion confirmed. The spirit of the unfortunate Fritz, if there be any truth in his story, had indeed need to pray, Save me from my friends.

AN interesting collection of engravings and etchings belonging to Mr. James L. Claghorn, President of the Fine Art Academy of Philadelphia, has been recently exhibited in that town. The collection is particularly rich in works by the old German masters, including Martin Schongauer, by whom there are several rare examples; and Albrecht Dürer, represented by the complete series of the Life of the Virgin and other plates. Of modern masters we may mention—Léopold Flameng, Jacquemart, Daubigny, Rajon, Meissonier, Fortuny, and John Sartain, a Philadelphia artist not quite so well known to fame as the others on this side of the Atlantic, but who has executed several excellent works.

AN equestrian statue of Norodom I., King of Cambodia, has lately been completed by the French sculptor, M. Eudes, and successfully cast in bronze. It represents the Eastern monarch in the uniform of a French general of division, wearing the cross of the Légion d'Honneur and several Cambodian orders. It is intended to exhibit it for a short time in the Champs-Élysées before it is sent out to Panopim, the new capital of the Cambodian states, where it is to be erected.

MUCH interest has been excited by M. Alex. Bertrand's paper on the bronze vase of Groechwyl. This vase was found twenty years ago in the canton of Berne, in a tumulus dating from a period anterior to the occupation of Gaul by the Romans. It is ornamented with a mask in relief representing a winged Diana wearing a diadem on which a bird is seated, while from each side of the diadem extends, in a horizontal direction, a large-headed serpent supporting a lion. The work on this vase is unquestionably Etruscan, and its presence in the tumulus of Groechwyl is a proof of the commercial relations existing in the second or third century between Helvetia and the Italian towns.

THE *Portfolio* of this month contains a thoughtful and interesting criticism of the drawings by Albrecht Dürer in the British Museum, written by Mr. Comyns Carr. The collection of Dürer's drawings in the Museum is, with the exception of the celebrated Albertina collection at Vienna, the richest and largest in existence, and it is impossible to overrate its importance in studying the mind and work of the great German master. Mr. Carr is surprised that Dürer's biographers have not made greater use of this material. It certainly escaped the industrious Heller; but Dr. von Eye was well acquainted with the British Museum drawings, and besides Mr. Scott, who catalogues them, Mrs. Charles Heaton has given a history of the big folio in which they are contained, derived originally from the Imhof family collection, and a somewhat detailed description of all the more important drawings in her Life of the artist. No doubt

Mr. Carr intends to continue his study, for he has not yet mentioned several of the more remarkable of these works; for instance, the careful drawing of the Rhinoceros, executed for the cut that long served in natural histories for a representation of this animal. The other articles of the number are—a biographic account of Etty by the editor; an article on Gérôme, by René Ménard, accompanied by an illustration; technical notes, and the usual National Gallery notice. Sir Joshua's charming heads of angels in the National Gallery, and an etching by Chattock after Constable, are the other illustrations.

THE STAGE.

LA GRAND'MAMAN AT THE THÉÂTRE FRANÇAIS.

Paris : June 3, 1875.

M. CADOL's reputation as a writer of plays bears some resemblance to that of the Messrs. Erckmann-Chatrian as writers of romance. It was won, like Erckmann-Chatrian's, by qualities negative rather than positive. *Les Inutiles* offended nobody, and taught a very pretty moral, in an accepted way. In France, mothers took daughters to see it—in England, daughters could have taken mothers. M. Cadol did not show himself as a very original observer, nor as a very brilliant writer. He was a safe man, in a country where the happy safety of second-rate talent is not so frequent as in our own.

And being a safe man, and writing fair French, and having all the knowledge of the stage which many years' study of its ways and needs could impart, and having moreover succeeded once, very well, with the public, his new piece, *La Grand'maman*, seemed to M. Perrin a piece which might well enough be given at the Français so long as Emile Augier was occupied in attuning himself ere giving forth, as it is his pride to do, just that note which is most in concert with the France of the moment. To do this—to strike the right note strongly—to say well and definitely what others are thinking vaguely—is one of Emile Augier's characteristics. It is perhaps, of all others, the *cachet* of his work. M. Cadol's work has no particular *cachet*. It is good average work: not very individual.

The story of *La Grand'maman* is hardly of a kind to tell in detail. It concerns itself with a grandmamma's efforts to see her grandson married to the woman of his choice; and the efforts have need to be difficult, since the alliance of the grandson is rendered less attractive than it should be, through the disagreement of his father and mother and the scandal which their intended separation arouses. The young man (Armand) is all that is honourable; the grandmother all that is sweet; but her son-in-law and her daughter—the parents of Armand—have so behaved that they are a barrier to the young man's successful marriage. It turns out, eventually, that neither was quite so bad as the other was minded to think; and so, reconciliation being possible, and the husband having unexpectedly imperilled his life—or hurt his wrist—in a duel in defence of his wife's honour, it is decided that man and wife shall go together to beg the hand of Alice for Armand, and the curtain falls on the successful result of this edifying appeal.

But it is not the husband and wife that interest us the most, either in the piece of M. Cadol or in the acting at the theatre. M. Febvre and Mdlle. Madeleine Brohan represent these persons: M. Febvre with less than his usual impulse; Mdlle. Brohan with the wonted coldness of her grace. Nor is the girl of any definite value to the piece. As a French daughter, she has nothing to do; but that is a fate to which Mdlle. Reichenberg is pretty well accustomed; having now been for many years the chosen representative of *ingénues* so colourless that Mdlle. Tholer herself could hardly make them paler. But the quiet and accustomed charm which one does look for in a performance of Mdlle. Reichenberg's, is somehow wanting to this. The success of the

piece is due, as everyone admits, to the acting of Mdlle. Arnould Plessy and of M. Pierre Berton. Both artists will ere long leave the Théâtre Français—Berton going to the Vaudeville to re-enter the Français at a later date, when difficulties now existing there shall have been removed; and Mdlle. Arnould Plessy retiring upon the ample honours and moderate emoluments of a stage career of forty years. Pierre Berton makes *une belle sortie* with the effect produced by the fire, impulse, tenderness, and chivalry of his acting in this piece; and Mdlle. Arnould Plessy (who remains until next April) shows in this piece at all events, as she will doubtless do in those already familiar ones in which she will elect to say farewell, that she retires in the fullest possession of her powers and leaves a particular place which there is actually no one to fill. This is a good thing for her reputation, and for our remembrance of her art. For young women's parts Mdlle. Arnould Plessy has, of course, long been quite unfitted; for even such a buxom matron—always a little worldly—as the heroine of *Tartuffe*, she has ceased to be suited: but as the representative of an old woman whom Time has dealt with kindly, giving her much experience, perhaps much trouble, but at least some compensating memories—Mdlle. Arnould Plessy has only now arrived at the perfection of her means, and these rich means she uses now with such an infinite variety and such ingenious truth that the spectator watching her performance seems no longer in presence of conventional modes of expression, however accomplished, but of new phases of human character, quite novel revelations of intimate human joys or troubles. And it is that—together, as I said, with the excellence of Berton—which makes the interest of *La Grand'maman*.

FREDERICK WEDMORE.

WE hear that M. Charles Monselet is about to make—and somewhat late in life—his first appearance as a writer for the stage. He has written a short play, in which Mdlle. Reichenberg, of the Théâtre Français, will have a character out of her common line.

WE hear that a new piece by M. Gondinet will be played at the Paris Vaudeville in September, for the first appearance there of M. Pierre Berton.

WE hear that Mr. Irving will not act in the country this summer, after the closing of the Lyceum Theatre. Before the close of the London season Mr. Irving will give, in a London drawing-room, a reading for a charity.

MDLLE. DELAPORTE is now in London, giving a few private representations, principally in large houses. It is as the heroine of a new play of Sardou's that she will make her *rentrée* at the Gymnase, next winter.

M. EMILE AUGIER is engaged, we hear, upon a new drama.

MDLLE. SARAH BERNHARDT has a bust of her sister in this year's Salon.

CRITICISM has by no means had its last word with reference to the work of Dumas *filis*, and the *Dame aux Camélias*—an English version of which was produced at the Princess's on Saturday—will some day come to be pronounced to be neither the indecent nonsense which some declare it to be, nor a piece so profoundly moral as M. Dumas himself believes it. But discussion is closed for the moment by the wholly altered situations in the English version prepared by Mr. Mortimer, for in this version the heroine would appear to have been always blameless, and the hero, instead of throwing himself away upon the original Marguerite, is respectably in love with a young woman who has nothing wrong about her, except consumption, and whose devotion to her art of the theatre is a lesson to unoccupied girls. The work, as work of art, is necessarily maimed, since the action loses much of its motive. In the original,

the father's objection to the match on many grounds—and above all on the ground that whatever became of his son, it must spoil the future of his innocent daughter—was at least a natural thing, and it was at least conceivable that Marguerite should yield to his persuasions. But in Mr. Mortimer's version the old man's objections are less reasonable, and the young woman's scruples more entirely chivalrous. To be the sister-in-law of an actress will hardly in our day involve that social ruin which the characters fear. Thus the motive of much of the action is, as we said, weakened. But the strong scenes remain, or have for the most part been delicately handled. Of these, a great actress and a good actor could still make much. It is true that Mr. William Rignold is often a good actor: in *Two Orphans* he was an unequalled representative of robust villany. But as Armand—they give him a new name in the new version—as Armand he is out of place. Nor is Miss Helen Barry competent to deal with such a character as Marguerite. She is earnest and vigorous: at times even sympathetic. But in this part she displays little of the variety, the invention, the illustrative by-play which the character requires. She has force, without finish. Her performance of the tempted wife in Mr. Boucicault's *Led Astray* was more artistic and satisfactory. Of the remaining characters, few are adequately acted. The free and easy supper party, in the first act, is on the whole the best realised. The gentleman who in the next act sustains the part of the hero's father, and comes to supplicate the heroine to make her lover miserable so that the lover's sister may be married prosperously, is unequal to his task. Reality and intensity remain to be given to the performance. If these be given, Mr. Mortimer's adaptation—which is quite as good a one as circumstances will allow—will have a better chance, and the success secured may be equal to that very creditable one of the *School for Intrigue* at the Olympic.

To praise Mr. B. Rowe and Mr. Arthur Sullivan, it is not necessary to abuse opera bouffe, and least of all is this necessary when their new little piece, *The Zoo*—at the St. James's Theatre—contains such a song as that of the "simple little child:" a song which has much of the spirit of the much derided opera bouffe. The merit of Mr. Rowe and Mr. Sullivan, in this their most recent performance, is that they try to see the funny things in common English life, and a day at the Zoological Gardens supplies them with a subject, as good perhaps, perhaps even better than that which other musicians and librettists have found in German Courts or in Spanish America. Musicians must judge of the quality of the music; the rest of the public may amuse themselves in settling the question of how near the dialogue approaches to wit. Mr. Carlos Florentine, Mr. Edgar Bruce, Mr. C. Steyne, Miss Henrietta Hodson, and Miss Gertrude Ashton are engaged in the piece, to the satisfaction of an audience which has already laughed at the mock heroics of *Tom Cobb*.

THERE is to be a morning performance of *Sweethearts*, at the Prince of Wales's Theatre to-day: of course with Mrs. Bancroft in her accustomed part. Mr. Theyre Smith's comedietta, *A Happy Pair*, will also be played; Miss Ellen Terry and Mr. Bancroft being the performers.

THE same evenings on which *La Grand'maman* is played at the Théâtre Français, there is played there a fanciful comedietta by the poet Théodore de Banville. It is called *Gringoire*. The scene is laid at the time of Louis XI., but M. Théodore de Banville's contribution to our knowledge of that monarch's character does not profess to be of profound value. It falls a little short of the studies of Sir Walter and of Casimir Delavigne. Coquelin plays the part of the ungainly hero, to whom Louis is kind. Maubant with dignity, but without subtlety, represents Louis Onze; and

Mdlle. Reichemberg has no other task than that of looking very naive in the character of Alice, whom Gringoire finally weds.

THE Gaiety has continued its performances of light French opera, and the Criterion has given every evening, with the aid of its Brussels company, M. Vogel's opera, *La Filleule du Roi*.

MISS FOWLER gains in confidence. She is to play Lady Teazle for Mr. Coleman's benefit on June 30. Recent comedy performances by the actress have given her some right to essay the part.

THE new version of *Madame Angot* now played, and to be played for the brief remainder of the season, at the Royalty Theatre, serves its purpose of introducing to us Mme. Dolaro as Lange. Mme. Dolaro's performance is distinguished from that of many of those who have gone before her, by her possession of genuine comedy power—a thorough understanding of the requirements of her art.

M. FRANCISQUE SARCEY has begun, in his feuilleton, what he calls his "théorie des expositions et des dénouements au théâtre." As he begs his readers' most respectful attention, and good-naturedly hints that his papers will be worth preserving, and that the value of the first will be fully understood when we have read the last, we shall abstain for the present from commenting on a work, frankly written, as he avows, not for the general public, but for "un petit nombre de jeunes gens, d'un tour d'esprit philosophique, qui se plaisent à creuser un sujet et à savoir les raisons des choses."

THE Odéon Theatre has not satisfied the authorities in the matter of the pieces it has recently been playing, and M. Duquesnel, if he desires to retain the subsidy which the theatre has hitherto enjoyed, will have need to be on his guard. For many months last year, a troop of dogs—adding, doubtless, to the vividness of the stage picture—were among the chief attractions of his house. The Odéon has now just closed for the season.

At the Théâtre Français the *Fille de Roland*—M. Henri de Bornier's poetical drama—continues, about three nights in each week, its successful career. It bids fair to detain in Paris until after Midsummer the artists—Maubant, Mounet Sully and Sarah Bernhardt—who are engaged in its performance.

MDLLE. AGAR has just concluded a long tour through the French provinces, in which she has been more successful than she was last year in London in interesting her audience in the works of classics so old-fashioned as Racine and Corneille. Speaking of Corneille by the by, a paper has gravely suggested that a theatre should be erected in Paris for the exclusive performance of his works, which are calculated, it avers, to encourage patriotism and some other virtues in which modern Parisians are more notably deficient.

THERE are three important theatrical portraits in this year's Salon. The least good is that of Mdlle. Bernhardt, this time by an artist of no great note. There is a strong portrait of Mounet Sully, while Bonnat's skilfully treated picture of Mme. Pasca is among the works most spoken of in the whole exhibition.

MUSIC.

LAST Saturday Hérold's *Pré aux Clercs* was performed by the French company at the Gaiety. This very charming specimen of the light French opera was first produced at the Opéra Comique in Paris on December 15, 1832, only about a month before the death of its composer. Though the libretto is inferior in merit to some others of its class, it nevertheless presents good opportunities

both to composer and actors. Its performance by the excellent company of which mention was made last week in these columns was simply as perfect as it could be. In mentioning the singers, the place of honour is due to a *débutante*, Mdlle. Emma Breton, who undertook the part of Isabelle. In the first act this young lady was evidently suffering severely from nervousness, but she nevertheless sang her first air, "Souvenirs du jeune âge," with such taste as to call forth hearty applause from the audience. Her song "Jours de mon enfance" which opens the second act, was even more successful; and the plaudits she received seemed to set Mdlle. Breton quite at her ease, and enable her to prove that she could act quite as well as she could sing. The young lady is a valuable addition to the already strong company. Mme. Naddi was an excellent Marguerite, and Mdlle. Marie Albert was also capital as the saucy and vivacious Nicette. The gentlemen were without exception so good that it is almost invidious to signal out any for special notice; yet we must say a word in praise of M. Borrás as Cantarelli, master of the revels, of M. Herbert as Mergy, and of M. Joinnisse, whose delineation of Girot, the innkeeper of the Pré aux Clercs, was truly comic. But, as was remarked last week, the great strength of the company is its excellent *ensemble*. It is not too much to say that the whole cast contained not one part inadequately represented. The orchestra, too, was most satisfactory; and particular mention ought to be made of the violin *obbligato* in the song "Jours de mon enfance," which was most artistically played (though on a very indifferent instrument) by M. von der Finck. This evening Hérold's *Zampa* will be produced, when M. Tournie will make his first appearance.

THE third of the summer concerts at the Crystal Palace took place last Saturday. The orchestral works performed were Mozart's symphony in E flat and the overtures to the *Midsummer Night's Dream* and *Semiramide*. The instrumental soloist was Herr Wilhelmj, who gave a very fine rendering of the first movement of Beethoven's violin concerto, with a cadenza of truly extraordinary difficulty written by himself. By giving merely a fragment of an important classical work, Herr Wilhelmj confirmed the impression produced by his unwarrantable mutilation of Rubinstein's concerto at one of the recent Philharmonic concerts that his artistic feeling is by no means on a par with his wonderful execution. A miscellaneous selection of vocal music was given by Mesdames Sinico-Campobello and Patey, Mr. Sims Reeves, and Signor Campobello.

At the sixth Philharmonic Concert, at St. James's Hall on Monday evening, Herr Alfred Jaell brought forward Raff's pianoforte concerto in C minor, which was recently performed by Dr. Bülow at the Crystal Palace, and noticed on that occasion in these columns. It is, therefore, needless to speak of it now; that Herr Jaell, who is an old favourite in London, did it full justice it is almost superfluous to add. The symphony—happily there were not two—was the "Eroica," and the rest of the programme consisted of Benedict's Festival Overture, composed for the opening of the Philharmonic Hall, Liverpool, the overture to the *Fretschütz*, and vocal music by Mdlle. Thekla Friedländer and Mr. Santley.

MDME. STOLZ, whose admirable singing in Verdi's "Requiem" will be fresh in the memory of our readers, has just been engaged for the Italian opera at St. Petersburg.

A MILANESE paper announces that among the manuscripts left by Donizetti there have recently been found at Bergamo two operas with French text, one by Scribe, entitled *Le Duc d'Albe*, the other, in one act, by Gustave Vaez, entitled *Deux Hommes et une Femme*. These two works are unpublished, and have never been represented. The libretto of *Le Duc d'Albe* is to be translated into

Italian, and the opera will be produced at Bergamo next season.

M. GEORGES BIZET, the composer of *L'Arlésienne* and *Carmen*, a son-in-law of Halévy, and one of the most promising of the younger generation of French composers, has just died in the thirty-seventh year of his age.

THE Royal Philharmonic Academy of Rome is preparing a grand concert, at which Mendelssohn's *St. Paul* and his octett for stringed instruments are to be given.

THE lower orchestral pitch has just been introduced at the Stadttheater in Leipzig. The necessary expenses of the alteration have been borne by an enthusiastic amateur residing in the town.

HERR CARL KREBS, the father of the well-known pianist Mdle. Marie Krebs, celebrated at Dresden on the 1st inst. the twenty-fifth anniversary of his appointment as Capellmeister to the King of Saxony.

ADOLF HENSELT, the distinguished pianist, has had the misfortune to suffer a compound fracture of the arm.

CALISTHENICS, DRILLING, and DEPORTMENT SIMPLIFIED.

By DUNCAN CUNNINGHAM.

This book is highly recommended by eminent medical gentlemen. It is intended more especially for Female Teachers and Parents who are desirous that the children under their care should possess a strong mind in a healthy body.

The engravings are beautifully executed; the explanations extremely simple; and the words and music specially adapted to instruct and attract the young.

A handsome edition in superior binding at 3s. Very suitable for presentation to Governesses and Female Teachers.

HAUGHTON & CO., 10 Paternoster Row.

IMMEDIATELY, PRICE SIX SHILLINGS.

QUEEN MARY: A DRAMA.

BY

ALFRED TENNYSON.

MR. TENNYSON'S WORKS, AUTHOR'S EDITION, in FIVE VOLS. Cloth gilt, 6s.; half-morocco, Roxburgh style, 7s. 6d. each. Vols. I. and II. now ready.

HENRY S. KING & CO., 65 Cornhill, and 12 Paternoster Row, London.

THE GREVILLE MEMOIRS.

The Fifth Edition now ready, in 3 vols. 8vo, price 36s.

A JOURNAL OF THE REIGNS OF KING GEORGE IV. AND KING WILLIAM IV.

BY THE LATE CHARLES C. F. GREVILLE, Esq.,

Clerk of the Council to those Sovereigns.

Edited by HENRY REEVE, Registrar of the Privy Council.

London, LONGMANS & CO.

NOTICE.—WILL BE READY FOR DELIVERY JUNE 16.

THE NEW WORK BY THE AUTHOR OF "THE GREAT LONE LAND,"

A KIMFOO:

THE HISTORY OF A FAILURE.

By Major W. F. BUTLER, C.B., Author of "The Wild North Land," "The Great Lone Land," &c. One Vol. demy 8vo, with Map. Price 16s.

London: SAMPSON LOW, MARSTON, LOW & SEARLE, Crown Buildings, 188 Fleet Street.

THE LIFE AND EPISTLES OF ST. PAUL.

By THOMAS LEWIN, Esq., M.A., F.S.A., of Trinity College, Oxford, Barrister-at-Law

Author of "Fasti Sacri," "Siege of Jerusalem," "Caesar's Invasion," "Treatise on Trusts," &c.

SECOND EDITION, MUCH ENLARGED, AND ENTIRELY RECAST.

With numerous Illustrations, finely Engraved on Wood, Maps, Plans, &c. Two Vols. demy 4to, 2l. 2s.

From the Times, December 25.

"The first glance tells us that the book is one on which the leisure of a busy lifetime and the whole resources of an enthusiastic author have been lavished without stint. . . . On all the literary materials subsidiary to his work Mr. Lewin has bestowed not less admirable labour than on its artistic illustration, and he states in the Preface that it is upon the least conspicuous part of his subject—namely, upon its chronology—that his greatest pains have been bestowed. . . . This work is a kind of British Museum for this period and subject in

small compass. It is a series of galleries of statues, gems, coins, documents, letters, books, and relics, through which the reader may wander at leisure, and which he may animate with his own musings and reflections. It must be remembered throughout that this delightful and instructive collection is the result of the devotion of a lifetime, and deserves as much honour and recognition as many a museum or picture-gallery which has preserved its donor's name for generations."

London: GEORGE BELL & SONS, York Street, Covent Garden.

LETTERS FROM INDIA AND KASHMIR.

One Volume, Illustrated with 90 Engravings.

"Thoughtful and amusing letters. . . . The most explanatory account of India which we have yet seen."—*Spectator*.

"Written with admirable taste. This volume is a beautiful specimen of typography, and the illustrations are models of their kind. We can but recommend our readers to get the book, and judge its merits for themselves."—*Academy*.

"Charmingly illustrated."—*Athenaeum*.

"This very pleasant and interesting volume is distinguished in an unusually high degree by vividness of description, intelligence, common sense, and lively humour."

Indian Home News.

"There is a freshness, combined with an obvious truthfulness, in the book before us which claims unqualified praise."

Standard.

"We would not wish for a better *cicerone* than the author."

Illustrated Review.

"Keen observation, good sense, and good humour."

Illustrated News.

"A literary phenomenon."—*Oriental Magazine*.

"Most pleasant letters."—*Art-Journal*.

"A well-written and amply illustrated record of the journey."

London: GEORGE BELL & SONS, York Street, Covent Garden.

SATURDAY, JUNE 19, 1875.

No. 163, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Dramatic Works of Molière. Rendered into English by H. van Laun. Vol. I. (Edinburgh: William Paterson, 1875.)

THERE can be but few students of letters whose interest was not excited at the announcement of a proposed translation of Molière by M. van Laun. It may be doubted whether, with the exception of François-Victor Hugo's translation of Shakspeare, any enterprise of equal magnitude has been undertaken for very many years. The instances are indeed parallel in one very important point. There is no need to insist on any differences in mental or literary altitude which may exist between the two poets; but it will hardly be deemed that Molière is in one sense as much the typical French writer, as Shakspeare is in another sense the typical author of England. We do not of course mean to imply that Molière well exemplifies the real *differentia* of French character, but that it would be impossible to find a better exponent of the conventional type of Frenchman which has been, wrongly or rightly, accepted by all Europe for two centuries. Those who are well acquainted with French history and French literature will of course demur to the correctness of the estimate expressed by this acceptance; they will (looking backwards and forwards, and taking the *Moyen de Parvenir* and *Mademoiselle de Maupin* for the lighter shades, and Agrippa d'Aubigné and Charles Bandelaire for the heavier), construct for themselves a very different ideal of French nature. But none of us can deny that the skipping, grinning, shrugging Frenchman was the recognised representative of his nation all over Europe from 1660 to 1789, and that if we want the national reduction of this foreign caricature we must look to the pages of Molière. Work thus saturated with national peculiarity at once deserves and defies translation, and we can hardly persuade ourselves to utter anything else than a *Macte virtute* to M. van Laun for the hardihood which he has shown in undertaking such a gigantic task; a task, by the way, for the successful performance of which his previous achievement in translating M. Taine's book did not offer any guarantee whatever.

For it need hardly be said that of the requirements of a translator of Molière, a mere knowledge of French is the very least. One may confidently demur to the statement (made in the prospectus of this edition), that "great difficulty is frequently experienced in understanding Molière, from his language having become antiquated through the lapse of more than two centuries." The

language of 1875 is far less different from that of 1653 than is the latter from French only half a century earlier. And besides an initial knowledge of the language, the translator requires an intimate acquaintance with English idiom, a thorough familiarity with English comic literature, and above all a delicate taste, to enable him to judge when literal translation is appropriate, and when it must be exchanged for paraphrase.

In most of these respects M. van Laun's performance will take very high rank. As regards mere faithfulness of translation, it is astonishingly correct. We have read the volume through with the utmost care, often comparing it scene for scene with the original, and always referring to the latter whenever there seemed to be the slightest hitch in the version. We may here record some of the very few mistakes which we have found in the course of this scrutiny.

In the first place M. van Laun has translated *L'Etourdi ou les Contretemps*, *The Blunderer or the Counterplots*. Now, *contretemps* undoubtedly does sometimes mean "counterplots," but this rendering is here quite inappropriate, as a passage in the play itself shows. In act i. scene 5 Mascarille says to Lélie:—

"Vous êtes si fertile en pareils contretemps,
Que vos écarts d'esprit n'étonnent plus les gens."

This is translated, "You possess so many counterplots that your freaks no longer astonish anybody," which is nonsense. The meaning clearly is, "You are so good at unseasonable tricks that, &c." Another curious blunder in the same play occurs at p. 49 (act iii. scene 4). Here Léandre is made to say "I come off cheap because I trusted myself to your hypocritical zeal." This is an obvious contradiction. The French is:—

"Et que m'étant commis à ton zèle hypocrite,
A si bon compte encor je m'en suis trouvé quitte."

That is to say, "And that, though I trusted myself to your zeal, I have yet got off so cheaply." In a somewhat difficult passage (*Dépit Amoureux* ii. 1) M. van Laun has rather shirked the difficulty. The original has:—

"D'autre part il vous veut porter au mariage,
Et, comme il le prétend, c'est un mauvais langage."

Here the last line is a little obscure. It would seem to mean "the proposal, as he makes it, is an awkward one," i.e., "if he means to marry you as a man to some girl, when you are really a girl, it will be awkward." M. van Laun's rendering, "On the other hand he commits a blunder by urging to marry some young lady," is probably right in intention, though awkward in expression.

But there is really no necessity to pursue the task of verbal criticism any further in this direction. It may be taken as granted that the translation in this respect is unusually immaculate. To come to a scarcely less important point, we cannot speak quite so favourably of M. van Laun's choice of language for his version. Generally speaking, it is almost of more importance that a translator should be thoroughly and critically familiar with the language into which he is translating, than that he should have a complete knowledge of his original. Now although the language of this translation is unimpeachable in its grammatical correctness

(at any rate, the mistakes we have detected are very few), it is not equally happy as regards lightness and appropriateness of style. For instance, Lucile (*Dépit Amoureux*, iii. 9) has called Mascarille *coquin*. He replies, *Bon! me voilà déjà d'un beau titre honoré*, which M. van Laun translates, "That is all right. I am already honoured with a fine title." This has all the awkwardness of a schoolboy's *construe*, and similarly stiff renderings abound. The title of this very play is rendered the *Love-Tiff*, which will strike any Englishman as absurd. As M. van Laun was acquainted with the excellent rendering *Lovers' Quarrels*, it is odd that he did not use it. Again, *Les Précieuses Ridicules* is turned into *The Pretentious Young Ladies*. Here, not to mention the dropping of *ridicules*, M. van Laun has been misled by the absurd use of the term "young lady" in modern slipshod English. Surely *The Finical Misses* might have occurred to him.

But we have now done with the ungracious task of fault-finding, and can afford to turn to the merits of the book. Of these there is, indeed, no lack. The plan of the edition is excellent. Besides writing a modest prefatory life, M. van Laun has prefixed to each play an introduction, containing all necessary information respecting its sources and circumstances, and has added to each an appendix of peculiar interest. These appendices contain full extracts from the plays in which English playwrights have done themselves the honour to "convey" Molière's good things. Many of them are naturally taken from works which are not to be found in everyone's library, and are consequently of great interest in themselves, as well as valuable as contributions to the singular *History of Dramatic Theft in England* which will have to be written some day. They give evidence of most praiseworthy study on the translator's part, and we are only sorry that more marks of this study are not visible in the translation itself. The illustrations, which consist of six etchings by Lalauze and of a welcome copy of the famous *Carte de Tendre*, are a remarkable feature of the book. The impressions in the example before us have unfortunately suffered from careless or unskilful printing, which has a good deal affected the details. But the portrait of Molière which serves as frontispiece, and is different from the one generally current, is extremely fine. Of the others, the illustrations to *Le Cocu Imaginaire* and *Don Garcie de Navarre* deserve special notice, the figure and costume of the Prince in the latter plate being admirable. Indeed, M. Lalauze's excellence as an etcher of costume, had one not known it previously, would be sufficiently established by this volume. His illustrations present a most striking contrast to Johannot's well-known vignettes, excelling them as far in care, in finish, in solid artistic merits, and in absence of exaggeration, as they fall short of them in spirit and comic "business."

It might, indeed, be plausibly contended that, as far at least as this volume is concerned, absence of exaggeration is in doubtful keeping with the text. Hazlitt has spoken of "the exaggerated manner of Molière." Now, if we take the dramatist's

work as a whole, we must declare this charge unfounded. It is one of Molière's chief glories that, at any rate in his maturer work, he refrained completely from the exaggeration which is in many ways so natural to comedy. In particular, he may safely defy the charge which has been often, and not unjustly, brought against our greatest English comic dramatist. It has been said, and very truly, that Congreve's determination to be witty is so great that he makes his fools say cleverer things than any ordinary wit could devise, and that he sacrifices everything to the keeping up a *feu bien nourri* of good things. From this great fault Molière, when at his best, is quite free, as also from the kindred but far worse error of making his personages incessantly speak in character. Everyone knows how wearisome is the way in which many dramatists harp upon one peculiarity of each part, as if they were afraid that their readers were likely to forget it. We cannot often charge Molière with this blunder. But it was only gradually that he succeeded in arriving at this freedom, and in more than one of the pieces which this volume contains there is not a little reason for Hazlitt's complaint. The absence of real exaggeration in such apparently extravagant pieces as *Monsieur de Pourceaugnac* and the *Comtesse d'Escarbagnas* is remarkable. But in the dramatist's earlier work the rule of not too much is by no means so well observed. Lélie's blunders in *L'Etourdi* are repeated with a most "damnable iteration," and beyond the bounds of all probability. The same is the case with the fits of jealousy in that *essai pâle et noble* (as Sainte-Beuve with ingeniously-married epithets calls it) *Don Garcie de Navarre*. M. van Laun's translation of this latter play is particularly good, and his indications of the passages which Molière, after its failure, worked into other plays are interesting and useful. *Sganarelle*, and *Les Précieuses Ridicules*, being avowed farces, might seem likely to show this exaggeration more strongly, but they certainly do not. It is indeed difficult not to agree with the well-known exclamation which discovered *la vraie comédie* first in the colloquy of Cathos and Mascarille; nor will anyone, we think, echo the more than usually paradoxical opinion of Victor Hugo, who is here said on trustworthy authority to consider *L'Etourdi* and *Le Dépit Amoureux* Molière's two best plays as to style. A foreigner's opinion on style must always be perilous of utterance; but we do not fear to record ours in this instance, even in opposition to such a champion. We shall look with great interest for the continuation of M. van Laun's labours. Should he succeed in correcting the defect which we have noticed, and in attaining an easier and more flexible style (an attainment which would seem to be rendered easy by the solid basis of study which he has manifestly laid), his performance cannot fail to be a most important addition to the literature of translation. It must be remembered also that his task will become easier as he goes on. *L'Avare* and *Tartuffe*, *Le Misanthrope* and *Les Femmes Savantes* lend themselves more readily to translation than trifles such as *L'Etourdi*, because their interest, and consequently their manner, is

less provincial, less extravagant, and less forced.

We should add in conclusion that the get-up of the volume is in most respects all that can be desired for an occupant of the library. It is, however, certainly a pity that the usual plan of placing a running heading of act and scene at the top of each page has not been adopted. The absence of this convenience makes reference a work of needless trouble.

GEORGE SAINTSBURY.

Mémoires Posthumes de Odilon Barrot.
Tome 1^{er}. (Paris: Charpentier, 1875.)

ODILON BARROT was born on July 19, 1791. His family was originally from Gévaudan, and his father, a barrister practising before the Parliament of Toulouse, sat as deputy, first in the Convention, and afterwards in the Corps Législatif of the Empire. Odilon entered the legal profession at an early age, and at twenty-three was admitted to plead before the Council of State and the Court of Cassation. The son of a member of the Convention, he naturally belonged to the liberal party, which under the Restoration made common cause with the Bonapartists for the purpose of opposing the reactionary and clerical tendencies of the restored Legitimists. In this quality he took part in a great number of the political and religious trials by which the reigns of Louis XVIII. and of Charles X. were distinguished. His copious and easy eloquence, his profound knowledge of law, the political influence which he had won by his boldness and energy, allied to a scrupulous respect for legality, the active and uncompromising share which he took in the Revolution of July, all marked him out to play an important part under the monarchy of Louis Philippe. He was at first invested with two confidential posts—that of Commissioner during Charles the Tenth's journey from Rambouillet to Cherbourg, and that of Prefect of the Seine, but was summarily thrust aside when the Government under the influence of Casimir Périer and Guizot adopted a policy of avowed reaction. Thenceforward throughout the entire reign of Louis Philippe he was the head of the Constitutional Left, i.e., of the whole Opposition, for the little group of the Republican Left was only a feeble minority from which the Government would have had nothing to fear if it had but undertaken in time a few indispensable reforms. As head of the Left Odilon Barrot took part in the famous coalition which in 1838–1839 caused the fall of the Molé ministry; paved the way against his own wish for M. Guizot's accession to power; opposed M. Guizot without intermission during the long and fatal period throughout which he continued in name or in fact Prime Minister of Louis Philippe; organised the so-called "Banquet" campaign in favour of electoral reform; and so contributed to the fall of the Government which he had helped to found, and of which he was one of the most zealous partisans.

The Republic once established, Odilon Barrot ranged himself with those who sought to reduce its consequences to a minimum, and even to impede its march. He was one of the most ardent supporters of Prince

Louis Napoleon's candidature for the Presidency of the Republic; he became one of his ministers, and in this post he was one of the originators of the deplorable Roman expedition. Speedily enlightened as to the ambitious views of the Prince-President, he could only retire from power, and sorrowfully await the Coup d'Etat, which put an end to the Republic, and to all his hopes of a Government which should be at once strong and liberal. He protested unsuccessfully against the violation of the law. Thenceforward he lived in retirement, following with anxious eyes the slow reawakening of liberal ideas. The Revolution of 1870 found him in the ranks of those thoughtful and honourable men who, like M. Thiers, M. Duvergier de Hauranne and so many others, saw in the Republic not an ideal realised at last, but the only form of government suitable to the France of their day. The object of universal esteem, he was naturally marked out for the post of President of the reconstituted Council of State. He was not long able to fulfil his new functions, and died on August 6, 1873.

Though he did little but overturn a Government, and has associated his name with no important work, Odilon Barrot never ceased between 1830 and 1850 to exercise considerable influence over the political affairs of France. Few careers have been so barren of results as his: he contributed to the fall of Constitutional Monarchy, which was in his eyes the best form of government; he contributed by the Roman expedition to the revival of the clerical spirit in France, although he was an earnest partisan of the separation of Church and State. Yet few careers have been equally laborious, and, despite its faults, equally honourable. He had no conspicuous ability, but he was thoroughly honest at heart, and the value of his testimony as a spectator or actor in events is enhanced by the fact that he had not ability or imagination enough to colour and embellish what he saw. Lamartine gives a touch of poetry to whatever he relates, Guizot invests every theme with nobility and greatness, Thiers sows his wit broadcast; Odilon Barrot leaves events and the actors in them unadorned and in their real proportions. They do not gain thereby.

The first volume of his *Mémoires*, reaching to the year 1848, has just appeared under the editorship of M. Duvergier de Hauranne, his friend and the partner of his parliamentary struggles. In 1851, after his resignation, and after the death of an only daughter to whom he was deeply attached, in fulfilment of a wish expressed by her Odilon Barrot undertook to write his *Mémoires*. The whole of the first part, relating to his childhood and youth down to the year 1830, seems to have been written at this time; and the reader is conscious of an animation and a flow in the narrative which are not to be found in the later portions. This is the happy period of Odilon Barrot's life; it is the time of the revival of the liberal spirit, of the literary and artistic movement which was the glory of the Restoration; it is the time of his marriage, of the birth of his daughter, those years of enthusiasm and hope which we so love to recall in the de-

cline of life, and after the disillusionments that it brings. The account of the reign of Louis Philippe seems to have been written at a later date, and with a hand on which years lay heavily. While in the first part the writer's pen is light, his style animated and occasionally brilliant, and we find a number of lively and characteristic anecdotes (see the account of the departure of Louis XVIII. in 1815, pp. 26-28), of interesting political reflections (pp. 18-24), of cleverly drawn portraits (pp. 14-18), the second part is heavy and colourless; the interest only revives with the Revolution of February, 1848. I do not consider Odilon Barrot alone responsible for this inferiority of the second part of his book. Events count for much. The Restoration was a time of life, of struggle between rival principles, of action in the true sense. Then eminent statesmen came upon the stage, important laws were passed, important reforms and political acts effected. The reign of Louis Philippe is altogether different: paltry struggles, not of principles but of men, a home policy limiting itself to avoiding or to repressing popular outbreaks, a foreign policy limiting itself to avoiding war, statesmen without ideas whose energy was spent in a passive resistance to all reforms—such is the story of this reign of eighteen years, the work of which is defined by a pamphleteer in the words, cruel but only too well-deserved, "Rien, rien, rien!" While reading Odilon Barrot's narrative one can understand the truth of the terrible exclamation uttered by Lamartine in 1847, "La France s'ennuie." A narrative less dull, less languid, less empty of ideas and interesting facts, would have been less truthful.

Odilon Barrot brings out admirably the radical vice of Louis Philippe's government: it was a personal government with the forms of constitutional government. Surrounded by mediocrities who were never anything more than his instruments, Louis Philippe, a man of keen and shrewd intellect, but narrow, infatuated, and enfeebled by age, thought he could use parliamentary mechanism to ensure on all occasions the triumph of his will by force of intrigues, of petty tricks, of paltry devices of kingcraft. He was long successful, till the day when the springs of the machine became too tightly stretched and broke. The country, which had no part in the management of affairs, had ceased to take an interest in the duration of a government which was satisfied with mere existence without action, and which did not trouble itself to satisfy any of the country's needs. It allowed Louis Philippe to be dethroned without having desired his fall, and the Republic to be established without having wished for its advent.

All this is admirably rendered in the *Memoirs* of Odilon Barrot. He abstains from formulating any criticism on the men and events of the reign of Louis Philippe. This criticism comes with so much the greater force from the facts themselves: it was the reign of mediocrity. The Opposition itself was as feeble as the Government. Nothing can be more lamentable than the story of the Coalition and of the Banquet campaign.

Odilon Barrot shows conclusively that in the Coalition he acted in good faith and thought he was doing a public service, but was the dupe of M. Guizot; he shows no less clearly that in the Banquet campaign he thought he was acting for the best and wished to strengthen the monarchy, not to overturn it, and that the King's obstinacy did all the mischief. But is it not the first and foremost duty of statesmen to foresee the consequences of their acts? When the two most important acts of their political life are followed by such results as these, their ill success is in itself a sufficient condemnation. I do not speak of what followed, of the Presidential election and the Roman campaign, in which Odilon Barrot showed even more unmistakably his want of practical sense and political penetration.

He was before all an orator, like most French statesmen of the present century. Professors or lawyers, they are wanting in the first qualification of the statesman—experience and the business sense. They are theorists and rhetoricians; and their very theories rest in the majority of cases not on ideas, but on phrases. Odilon Barrot repeats in his *Memoirs* his famous theory on the temporal power of the Pope considered as a guarantee of the separation of Church and State. "The temporal and the spiritual," he says, "must be united in some one place in order to be separated everywhere else." What is this but a phrase without sense, or, better still, a play upon words? What is the statesman who is the personification of the reign of Louis Philippe, M. Guizot, but an admirable orator? He was master of France for seven years: what did he create during that time; what heritage has he left us? Models of political eloquence—at least if the end of political eloquence is to win votes, not to effect the triumph of practical ideas.

Such is the great weakness of the statesmen of the time of Louis Philippe. This part of the *Memoirs* of Odilon Barrot is filled wholly with parliamentary struggles and quotations from his speeches, for to this the political activity of the men of the period is confined. Odilon Barrot was a man of generous, noble, and sensitive soul, of cultivated intellect, endowed with uncommon legal knowledge, a brilliant orator, but statesman he was none. His *Memoirs*, a work in which thoughtfulness, sincerity, an almost childlike simplicity are conspicuous, enable us to pass a thoroughly just judgment on his period, on his contemporaries, and on himself.

G. MONOD.

The Childhood of Religions; embracing a Simple Account of the Birth and Growth of Myths and Legends. By Edward Clodd, F.R.A.S. (Henry S. King & Co., 1875.)

SOME time ago Mr. Clodd published a little book called the *Childhood of the World*, in which the results of scientific research into the early history of man were clearly and simply summarised for the use of children; and the fact that four editions of the work have already been required shows how real was the need of some such treatise, and how successful was Mr. Clodd's endeavour to supply that need. The present volume is

supplemental to that part of the former work which touched on the early religious beliefs of mankind; but if its title should lead anyone to expect from it any historical account of the first beginnings and gradual development of religious ideas; he would, on reading it, be disappointed. The time has not yet arrived at which such a treatise, at least for the use of children, would be possible; and the author, without discussing the vexed question of the origin of religious belief, is content, after detailing the various legends of the creation and of primitive man, to describe the childhood of the most prominent religions now existing outside the pale of Christianity. Thus, without any pretence to original research, but with dependence throughout on the best modern European authorities, he gives short, simple, and clear accounts of Hinduism, Buddhism, Muhammadanism, and of the religions of the Parsees and Chinese; prefacing the account of Hinduism by a brief description of the old Aryan civilisation and belief.

Some people have been surprised that the pride of the Greeks prevented their acuteness from discovering anything in other nations but barbarians; and the Chinese are not seldom laughed at for a similar mistake; but only those who have had to make the attempt know how hard it is to create among Englishmen of ordinary education an intelligent interest in Oriental subjects, or in the history and religion of non-Christian and non-European peoples. The task Mr. Clodd has set himself, to interest the young in such subjects, is a very bold one; and we venture to doubt whether many children will read this book except as a lesson book; but it ought to be welcome to a larger class, to those, viz., who without time for special research wish to know something of the thoughts of earnest thinkers on the highest and deepest problems which humanity has to solve. So correct and impartial, so clear and attractive a sketch of the great religions prevalent among the majority of mankind, has not yet been written; and those who do not intend to study the subject for themselves may carry away more information from this short work than they would from many a more bulky volume. As might have been expected in so rapid a sketch, there are some statements open to criticism, and requiring qualification; but on the whole the impression conveyed to the class of readers for whom the book is intended will doubtless be a correct one, and should anyone wish to pursue any particular branch of the subject further, he will find in the appendix useful lists of authorities.

The style is very charming: there is something in the author's enthusiasm, something in the pellucid simplicity of his easy prose which beguiles the reader along; and the point of view from which strange systems and their authors have been judged is very admirable. Here and there that loving sympathy with the "broken light" of systems other than our own, which is, it may be hoped, becoming less rare, has led the writer to throw a *couleur de rose* around them which they do not strictly deserve: this is not, however, the result, so far as I have noticed, of overpraise or of incorrect description; but of the omission of some

parts of those systems repugnant to our sense of elegance or of truth.

In a more strictly scientific work this would scarcely be excusable, but it was perhaps impossible in a popular treatise like the present one, with its inexorable limits as to space, to attempt more than a rapid description of the more favourable and interesting features of the great religions passed in review. To have pointed out in any detail all their absurdities and crudities would have been to double the size of the book, and entirely to destroy its charm.

A Dr. Dryasdust might have produced a more learned volume, but it is not often one finds a book which carries out more entirely the idea of a great writer who says that "our subtlest analysis of schools and sects must miss the essential truth, unless it be lit up by the love that sees in all forms of human thought the life and death struggles of human hearts." T. W. RHYS DAVIDS.

The Land of the North Wind: Travels among the Laplanders and the Samoyedes. By Edward Rae, F.R.G.S. (London: John Murray, 1875.)

THIS, as the author observes in his dedication, is his first and only book, but seeing that it is so well and pleasantly written, let us hope that further travel may result in further productions from the same pen. The lone country of the North Wind has evidently disgusted Mr. Rae, who shows no intention of revisiting it, but there are other regions to which he might proceed, even if only for the benefit of an interested public, supposing the "Doctor" or some other congenial friend were found willing to accompany him, for it would appear that Mr. Rae gets on better with a travelling companion than without one. Indeed, it may be doubted whether he would have sailed into the "eye" of the wind alone, or whether, if he had done so, the world would have been any the wiser. In this instance he has however made the very best of two unexciting, but withal pleasant journeys, to very unfrequented regions, and all who read his interesting book will follow him from beginning to end with unmixed pleasure, although they may not be stimulated by it to a desire to go and do likewise.

Mr. Rae gives a description of two journeys to the north: the first journey commences with an interview with the midnight sun on the deck of a little Norwegian boat between Oxford and Altenfiord, of which he "saw the marvellous light flooding the valley," wherewith his "soul was filled and he was satisfied;" he proceeds on this occasion through Norwegian and Russian Lapland forests to Torneo, descending the Muonio river and shooting the Muonio *Koski* or rapids, from whence he takes boat to Stockholm, touching at several Finnish ports in the Gulf of Bothnia. Starting again in the spring of 1874 from Granton, Mr. Rae and his friend weather the North Cape, and do not set foot on land until, passing up the White Sea and into Dvina Bay, the s.s. *Norden* arrives safely at Archangel.

The first nine chapters, devoted to the first trip, conduct us among the Lapps, of whom Mr. Rae gives us a specimen in his

guide "Jones," whose appearance is thus described:—

"His figure as he steps on in front, with a kind of lounging waddle, is irresistible. . . . His face it would be useless to try and describe. . . . When we make Jones laugh, we can hardly look at him and remain in our saddles too. . . . Jones is short. . . . On his head he has long matted hair, which he keeps in a dark Laplander's cap with red and yellow ornamentation. His feet are in reindeer-skin, bulgy, peaked shoes, bound tightly round his ankles; his legs in tight reindeer leggings, and a homespun rough whitish coat, with a great collar about nine inches deep, covers him from head to knees. His belt of strong dark skin is about eight inches deep, and girds him tightly round his body a little above the knees. His countenance is of an orange tan colour, and the general effect is that of a Norwegian Chinaman."

"In those [Ostro- and Westro-Bothnias] parts the Antients have placed, besides the Laplanders or Scritofinni, the Cynocephali, Busii, Troglodytes, Pygmies, Cyclops, and some others," therefore, Mr. Rae's lengthened acquaintance with, and study of, Jones enables him on page 57 to state it as his opinion, out of which he shall not be persuaded by learned men, although on page 52 he advances the same opinion modestly and only tentatively, that while Jones, like all Laplanders, is not a man of war, he must unquestionably be a Troglodyte by descent.

This part of the book is enriched with felicitous quotations from a "*History of Lapland*," written by John Schefferus, Professor of Law and Rhetorick at Upsal in Sweden, and printed in England at the Theater in Oxford MDCLXXIV., "who would not be 'persuaded' either by Olaus Magnus, Scaliger, Petrus Claudius, Saxo Grammaticus, or by any other learned men, that the Laplanders come from the Tartars, but concludes that 'it remains that they are of the race of Finlanders and Samojedes,' the name of both the latter people being the same, the Laplanders calling themselves in their own tongue *Sabmi* or *Same*, and the Finlanders *Suomi*. The same worthy Professor denies that the Tartars or Tatars came up from the south, but he nevertheless classifies the Lapps with the Finns and Samoj(y)edes, *Sabmi* or *Suomi*. Now, the latter are undoubtedly a people from the Sayan mountains in the Altai range, who were driven from thence by the Turks at a period prior to the times of Nestor, who was the first to acquaint the world with the Samoyedes. Castren (*Altäische Völker*, 1857) supposes that they were expelled from Asia during the power of the Huns and other Turk races. We find these people even now occupying vast tracts from the Altai along the Ob and Yenesei rivers and their affluents, and skirting the Arctic Ocean from Taimur Bay and the Turukhan region in Yenissei to the river Mezen, in the province of Archangel. At the same time we find tribes analogous to the Finns along the mid course of the Volga to the west of the Ural, who have evidently emerged from Siberia along the great northern route, and all through Russia they may be traced to the southern shores of the Baltic and into the country called Finland or *Suomenmaa* after the race itself. The conclusion, then, is obvious, that the Lapps or

Lapps, the Samoyedes and Finns are all of one common Ugrian stock, and a comparison of their language shows their common origin. The authorities who may be referred to on this point are—Georgi, *Beschreibung aller Nationen*; Klingstädt, *Historische Nachricht von den Samojeden*; F. F. Müller, *Der Ugrische Volkstamm*, Büsching, Strahlenberg, and others; and last, but not least, our friend Dr. O. Donner, of the University of Helsingfors, whose Glossary of Ugrian-Finnish terms is a very valuable contribution to philology. Another very comprehensive work, which may here be referred to, is Dr. Friedrich Müller's *Allgemeine Ethnographie* (Vienna, 1873). It is quite as likely that the Laplanders, Samoyedes, Tungus, Ostyaks, and others are the polarised members of the several tribes who shifted westwards, establishing more or less southern bases of habitation (as, for instance, the Magyars), as that, "as their sequence would show," those littoral tribes migrated along the coast from Manchuria. Mr. Rae lays down this latter theory very positively. We are inclined to ask him, as he has been among the Esquimaux, whether he would not extend it to the Arctic regions of America, so completing his "sequence," and arguing in proof of the existence of a North Polar continent, or at least of unbroken circular communication round the North Pole, "beyond the elevation of the Pole 73°," in spite of the two Swedish professors of 1600, with their "instruments and necessities" by which they came to an opposite conclusion.

It is owing to the North Wind not having been tempered to "Jones" that "he is not a man of war," that he has remained as he has long ago been described by Tacitus, and later by Warnefrid (*De Gestis Langobard.* lib. v.) along with his brethren the Scritofinni, "in point of sagacity almost on a level with the brute creation," and that "he lives" (as Mr. Rae finds he does even now) "on the raw flesh of wild animals, using the hides for his clothing." This applied to the Troglodyte Finns of remote ages as it more strictly applies at present to the Laplanders and Samoyedes alone; but we are told also by Tacitus of those "brute beasts" that "nothing could equal their ferocity, nor was there anything so disgusting as their filth and poverty," and much more on their condition of life which, with reference to Northern nomads, and their present state of fearless freedom and contentment, awakens a sentiment akin to that expressed by Seneca in commendation of poverty, "*Quanto hoc majus est, promittitur perpetua libertas, nullius nec hominis nec Dei timor.*" It is positively asserted of those people—the Yurak-Samoyedes—that they were warlike; always warring with their neighbours, as they did with the Russians when the latter first came in contact with them in 1600. These Troglodyte Yuraks are troublesome customers to this day, being still heathen, and having preserved, it is said, all their old characteristics.

Mr. Rae will have it that the Samoyedes as a people are distinct from the Finns; "the sounds of the language," he observes, "are certainly in some few cases Finnish, but in others Russian and Lapp, and very

possibly Chinese. The very costume" he continues to say, "of these Samoyedish races is Chinese—the *malitsa*, its collar and sleeves, each with a border, and with the single modification of closeness to suit the climate; the loose boots with rounded peaked fronts, and, in the case of the women, even the pigtails." We suspect there is less of seriousness in all this than of sly drollery. We would nevertheless observe that the Samoyedes and the Finns have a great deal more in common than a few words; the Finn boor's boot is the very facsimile of that of the Tatar; it is peaked and turned up at the toe, and like the Tatar's boot which is made to be worn with a galash, usually cast off at the threshold of a mosque, it has no thick sole. The language of the Finns and that of the Mordva Chuvash Cheremiss and others on the Volga is the same, although differing largely. The writer has himself tested this. As regards the "pigtail" of the maids—it is the common mode of *coiffure* in Russian villages from east to west and from north to south—it is particularly on this point that Mr. Rae's waggery crops out to the prejudice of his authority. If the Samoyedes have a *malitsa* which resembles a Chinese garment, the Finns have the armless jacket of the Greeks, and although the Finns cannot pretend to any relationship with that people, they yet possess another link or two which would seem to indicate a Greek origin (!) in such words as *Kolton* for house, *Hevonen*, *Hevoist* for horse, &c., and several others. Mr. Rae has seemingly as plausible grounds for tracing the sequence in Manchus, Tungus, Yakuts, Ostyaks, Samoyedes, and Laplanders, the latter being finally Europeanised Chinese—as he might have on the same principle in tracing the line of descent of all nations from the Asiatic to the American continent—but there is equally good ground for assuming that the Finlanders migrated westward from the Altai, leaving their sediments dispersed in Russia and passing on to Scandinavia after some contact somewhere in the South with the Greeks, of whose language and dress they preserve even now some vestiges.

It is very amusing to find from Mr. Rae, after what we have quoted from Tacitus on the uncleanness of the Scythians and others, that the Samoyedes declined to have dealings with him and his companion on the score of the reputed untidiness of Germans, for whom they were taken. This is a prejudice which they have doubtless imbibed through the Russians, who are known to call all foreigners *Nemtsi* or Germans, and *pagan* in the adopted sense of unclean or filthy.

We would ask Mr. Rae why he took the trouble to index his chapters? Why he pits the mispronunciation of certain individuals against the authority of a Russian dictionary, calling a *telega* a "*tcheléga*"? Why, having accepted the generous offer of an excellent map of Finland, he annexes to his book a map which is execrably bad as regards the river and lake systems of Finland? And why, finally, does he propound views on the seemingly inevitable Central Asia question?

We sincerely hope that Mr. Rae's travels have been as remunerative to him in drink-

ing cups, belts, skins, and other relics (he wrongly supposes the elk to be extinct), as his account of his expedition will prove most profitable in the way of entertainment to his readers. He displays so great a genius for writing, that it were a pity if he did not follow up his present success. He would have proved an invaluable companion to the Arctic explorers, and although not strictly scientific, he might have produced a very graphic and lively account of the enterprise. His present book, there is hardly room for doubt, will prosper as it deserves, notwithstanding that he makes a near approach to buffoonery, and that many of his passages are skits on the conventionalities, usages, and observances of civilised society.

ROBERT MICHELL.

The Historians of Scotland Vols. V. and VI. *SS. Ninian, Kentigern, and Columba*. (Edinburgh: Edmonston & Douglas, 1874.)

THE Scottish antiquaries have placed us under fresh obligations by presenting to us within the compass of two moderately-sized and convenient volumes the lives of the earliest evangelisers of Pictland. For those of Ninian and Kentigern we have, up to this time, relied mainly upon Pinkerton. For Columba we went, whenever we could, to Dr. Reeves, and it is with no little satisfaction that we welcome in this series a reprint of the masterpiece of that accomplished scholar. Our good friend the Bishop of Brechin is quite at home in a subject like this, and we congratulate him on his work. He will forgive us, we are sure, for stating, *in limine*, that we should like to have seen in his treatment of the lives of Ninian and Kentigern, an imitation of Dr. Reeves' manner of dealing with the spelling of mediæval Latin.

Before we make some general observations on the subject-matter of these volumes, we must caution the student against putting too high an historical value on mediæval hagiology. It professes to record miracles, and to these, historical facts are, for the most part, subservient. The imitations and amplifications which occur in such biographies are of the most marked character. The verbiage is similar, the facts show very little variety. Of still less value is the information contained in the lectures in the service books. These accounts are contracted to the very verge of meagreness, and are so altered in the process that their pedigree can scarcely be traced; and yet they must not be altogether rejected, because they contain, in many instances, minute fragments of truth derived from evidences of authority which have now disappeared. But we must not be too hard upon such materials. They do not profess to record history any more than the Scriptures science. They tell us more of religious feeling and domestic life than they do of the annals of the country, and we may be thankful for such information, limited though it be. Still we must beware of quoting as grave historical facts incidents culled from lectures and legends, unless they are confirmed by evidence of a far more indisputable character.

The earliest of the lives in these volumes.

and unfortunately the least valuable, is that of Ninian. We know the least about the person whose biography would have been the most interesting. The author of this Life, Aelred of Rievaulx, was essentially a book-maker. In this instance he had access to an earlier work on the same theme, which seems to have been an expansion of the brief notice of Ninian by Beda, with a complement of miracles. Aelred expands still more, but he adorns as he expands. We cannot help thinking that Aelred when he wrote had prominently in his mind the Life of Wilfrid by Eddi. The similarity of the incidents in the two biographies is very remarkable. Both saints go to Rome, and are scholars there. Both are consecrated abroad. Wilfrid has a master and patron in Dalfinus at Lyons, Ninian in Martin at Tours. Both bring masons home with them and build fine churches of stone. Both educate young noblemen, convert kings and peoples, work miracles, and lead much the same kind of missionary life. How, we may ask, did Aelred become interested in Ninian? He had, we know, Scottish predilections, but Aelred, besides, was a native of Hexham, and Hexham in the eighth century was connected with Whithorne in a very remarkable manner, which requires to be still further explained. The earliest Life of Ninian was probably only a development of the extract from Beda which Aelred puts as a kind of text at the head of his narrative. It is not unreasonable to conjecture that this proceeded from the Hexham scriptorium, and we need not be surprised therefore at detecting occasionally the presence of the mantle of Wilfrid, which was used to cover other saints as well as the apostle of Whithorne.

Next, perhaps, in chronological order, although it occupies the third place in this series, is Adamnan's well-known Life of Columba, so often reprinted, but never reprinted enough if it be only to give a wider circulation to the learning with which Dr. Reeves has adorned it. Adamnan's Life is a work of undoubted antiquity and authority. Columba died in A.D. 596, and this biography, compiled really by two Abbots of Hy, gives us all that was known of the great Saint in his own monastery during the first century after his decease. It is superfluous to say that the work, with a few drawbacks, is one of great historical importance.

The last of the three saints whose lives are before us is Kentigern, or Mungo, as he was called, the founder of Glasgow, and the inheritor of Ninian's place and work. He is said to have died in 608, at the patriarchal age of 185, *pax* Mr. Thoms. But whatever his age was, his life represents missionary work in the sixth century. It found its chief chronicler in Josceline, a monk of Furness, in the twelfth century, who had the use of an earlier Life written in the Irish language. Josceline's work contains some facts of interest, enveloped in a cloud of miracles. The monastery of Furness was intimately connected with the bishops and missionary work on the west coast of Cumberland and Scotland.

We may regard these three biographies as representative lives, just as we may look upon the three persons whom they commemorate as representative men. It was after the

pattern of such Christian worthies as these that thousands of good men tried to fashion their lives. This will account in some measure for the similarity of incident and language with which mediæval hagiology abounds. Through chronicle and legend and hymn every occurrence in the past history of the saints was familiar to the monastic mind. Hence repetitions in those to whom repetition was delightful. It is not in Scotland only that the same influences are observable. All religion is essentially imitative. Monasticism was so within a narrower circle.

In Ninian, Columba, and Kentigern we have the flower of the early missionaries in the north. They were plain, rough men, half sailors, half landmen, fitted exactly for the wild tribes among whom they went in and out. They all clung, it will be observed, to the West coast, a testimony to the sympathy and influence of the neighbouring Christianity of Ireland. The places which they chose for their homes mark not only the character of the missionaries but the perils which were near. Iona is seagirt; Whithorne, the white house, overlooking the Solway, was probably whitened by art to be a seamark during the day, while it bore a watchfire by night; Glasgow is the most inland of the three, but the great city on the Clyde has through its noble river a swift access to the ocean. Sites like these were suited for safety as well as asceticism. The sea, too, was the highway along which these missionaries usually journeyed. Their little boats were always ready in the nearest cove, and in them they sailed in every direction. With every nook and cranny on the Cambrian coast they were familiar; they braved the storm-swept slip of sea which separated them from the Isle of Saints; they knew every passage and current among the Hebrides; they sailed as far north as Iceland. With few wants and a noble spirit of devotion, they did a work which men more delicately trained could never have achieved. From their stations on the sea they pierced the main land in every direction, leaving permanent traces of their presence among men as simple-minded as themselves, and retreating from the face of danger as silently and as suddenly as they came.

The presence, or the influence, of these early missionaries may, no doubt, be traced by the dedication of many a village church, or chapel, or well, along the western coast of Scotland and England. Of these the Bishop of Brechin has wisely given us a list. The number may be increased by the mention of others, which are in the middle of Yorkshire. The church of Topcliffe on the Swale has Columba for its patron, and in the neighbouring minster of Ripon there used to be preserved in great honour the staff which the same saint gave to Kentigern. At Copgrave there is a well dedicated to St. Mungo, to which, even in modern times, popular belief has ascribed those healing virtues with which the name of Mungo, or Kentigern, has always been connected. The country, also, in this part of Yorkshire is full of ancient sculptured remains, among which are one or two examples of the mysterious "spectacle ornament," which has hitherto been supposed to be peculiar to

Pictland. How did such memorials of the early Christianity of the North find their way into Yorkshire? Why should not Kentigern and Columba have visited that county themselves? The British See of York was in their day defunct, and the Saxon archiepiscopate had not yet been established. In coming so far South, they were intruding into the province of no other hierarchy. What more probable than that they visited Yorkshire at a time when it had no missionaries at all? If Wilfrid, when he won back for the Northern archiepiscopate the sites of the old British churches, had revived their old dedications, we should, no doubt, have had much stronger evidence of the presence of Columba and Kentigern. But it was against his principle to do honour to the British Calendar, and so a new stream of saints flowed from Rome into Yorkshire.

But it is not in England only that Ninian and Columba and Kentigern are forgotten. Their own country practically knows them not. Time was when their names were great throughout the length and breadth of Scotland, and relics of all kinds traditionally connected with its great Evangelisers were looked upon with veneration. Visit Whithorne now, and the white house of old is not even a beacon to the mariner on that rough coast. Iona at the present day is nothing better than the plaything of scampering tourists. At Glasgow only is there any sign of stirring life, but here the old religious associations of the place have been almost swallowed up and lost in the multitudinous growth and expansion of a great modern city. Still, with all honour be it spoken, the church in which the successors of Kentigern worshipped, and which was erected in his honour, is the only great temple in Scotland that was spared during the reforming crusade of the sixteenth century. And more than this; the men of Glasgow have shown by their judicious restoration and adorning of the shrine of Kentigern that modern intolerance, which is rampant enough around them, has not closed their hearts to the just claims of their old founder upon their thankful remembrance.

JAMES RAINE.

The Fern Paradise: a Plea for the Culture of Ferns. By Francis George Heath, Hon. Sec. of the Park Preservation Society, &c. (London: Hodder & Stoughton, 1875.)

It has often been disputed what was the language of Paradise, but if Mr. Heath has caught its echoes aright it must have been high-flown and rather slipshod English. The author seems to have thought that he could make the most of a small subject by employing in its treatment the biggest words he could find, and accordingly we have sesquipedalian epithets applied to plants a foot or two high, and an amount of "tall talk" which would be less out of place in describing the Andes than in recording the beauties of a Devonshire lane. The lady-fern is declared to embody "the majesty of gracefulness;" the common polypody "is positively refreshing and invigorating to look at" with "its glorious wealth of magnificent

fronds;" the broad buckler fern is alternately "majestic," "magnificent" and "lovely," and as to the words "grand," "grandeur" and "grandly," it is scarcely too much to say that they are to be found upon nearly every page of the book. Mr. Heath is exuberantly enthusiastic in the praises of his favourite plant, and has fallen into the common error of thinking that word-painting is within the compass of any one who is susceptible to the charms of Nature and has an English dictionary at command. Lest our readers should suppose that our criticism is too severe, we subjoin an early example of our author's picturesque style of description, which is neither better nor worse than much that follows it:—

"Peer at low tide into yon dark and dripping cavern which yawns upon the sea! The bright sunshine that dances upon the rippling waves pauses at the cavern's mouth, as if not daring to penetrate its gloomy depths. But just one tiny gleam of light has ventured to cross the threshold, and sparkling on the dripping water, it flashes through the opaque blackness a kind of electric light. As the water falls, drip! drip! into the pool below, the light increases, and then—oh glorious sight!—you see at the side and on the roof of this lonesome sea-cave the beautiful sea-spleenwort (*Asplenium marinum*), hiding its roots in the cavern-walls, and spreading out its bright green and shining fronds, that they may luxuriate in the dark humidity of its chosen retreat."

The first five chapters of the book are occupied with descriptions of scenery similar to the foregoing; and about fifty-three pages—nearly a fifth of the whole volume—are either absolutely blank or have only such headings as "Down a Green Lane!" or "What is a Fern?" on them.

The latter portion of the volume treats of fern culture, and gives some account of the various English species of ferns. This is fairly well done and contains some really useful matter, but throughout it is infected with the same taint of verbosity, and an occasional error—such as *Asplenium viridi* (four times repeated)—rather shakes our confidence in the author's knowledge of his subject. Mr. Heath has written so well upon English peasant life, that his previous success compels us to judge him by a standard different from that which would be applied to a beginner, and, while giving him credit for the best intentions, to pronounce his performance a failure. The truth is, the book is not wanted. All the information which an ordinary collector and cultivator of ferns needs is already to be found in the cheaper manuals in common use; and the best features in Mr. Heath's book—viz., its paper, type, and binding—are just those which necessarily add to its cost and place it beyond the reach of those for whom especially it purports to be written.

CHARLES J. ROBINSON.

A Brief Memoir of the Lady Elizabeth Fitzgerald, known as the Fair Geraldine. By the Rev. James Graves, A.B., &c. (Dublin: Printed at the University Press, by M. H. Gill, 1874.)

THE meaning of the sixteenth-century sonneteers is one of the most difficult questions in our literature. Are they in earnest, or are

they making believe? Are they literal, or are they metaphorical? Is their life in their work, or are they merely showing off their fine phrases and cadences? Perhaps as many wild and foolish and absurd things have been said about Shakspeare's Sonnets as on any literary subject. The first, chronologically, of this mysterious race—Wyatt's sonnets, the earliest written in our language, raise no such difficulties—is Surrey. What was his relation to his Geraldine? Was he really the captive of her beauty, or did he merely amuse himself with protesting he was so?

One thing is certain: Geraldine existed. No ingenuity can dissolve her into a myth. Critics may prove to their own satisfaction that Laura was only a name, and Beatrice a mere phantom; that Stella lived only in the land of ideas; that Shakspeare's brunette was the Church, "black but comely." We may mention, in passing, our wonder that no one has discovered that Mrs. Wordsworth was a purely mythic creature, since her husband, whose evidence surely is valuable, explicitly speaks of—

"Her eyes as stars of twilight fair;
Like twilight's too her dusky hair;
But all things else about her drawn
From Maytime and the cheerful dawn."

Surely this Mary is Eos herself? Helen of Troy is quite grossly substantial by the side of her. But to return: we say, whatever may be done with those other ladies, the Fair Geraldine cannot be disposed of in this manner. For, in fact, as Mr. Graves notices in the volume before us, "Surrey's 'Description and Praise of his Love Geraldine' records nearly all we know, beyond a few dates, of her early life." Mr. Graves does not mean that the famous sonnet is the only record of her early life; but that it summarises what is known of it—that her family was of Tuscan descent (so it was believed), that she was born in Ireland, "her dame of Princes' blood," that from tender years she was brought up in England, that at various times she inhabited or visited Hunsdon, Hampton, and Windsor. Nothing can be more definite; nothing more accurate. In fact, the exactness is something excessive, if one regards the sonnet from a poetical point of view. It would have satisfied a Tyrwhitt or a Nicolas. But, her existence necessarily allowed, it has been urged that she was a mere child when Surrey penned his worship of her, and so there could be nothing in it—a view that does not bear investigation. It is a fact that she was married to Sir Anthony Browne in 1543, four years before the poet's untimely end, she being then sixteen years old. Mr. Graves considers, quite rightly we think, that the above-mentioned sonnet was written just after her marriage. Again, we are reminded that Surrey was himself married in 1535, four years before he first saw the Lady Elizabeth, and this brings us to the central difficulty. Is the married poet to sing of no other beauty than that of his wife? Must he, like "Araphill" Habington, laud and praise nothing else? Is he unfaithful, if he recognises what is fair and bright elsewhere? Certainly, if so, poets' wives are of all women most unfortunate. But no one who understands the case would

pronounce a harsh judgment. There is love, and love—love forbidden to the married poet as to all who have vowed to cleave only to some chosen one; and love that is in no discord with the truest marital allegiance. But it is a question of the utmost delicacy, and somewhat intricate; there is no space here to discuss it. We will only quote some remarks of Burns that, though not expressed with sufficient care, are closely pertinent:—

"Conjugal love," he writes to Thomson (see Letter CCCIII. in the Globe edition of his works), "is a passion which I deeply feel and highly venerate; but somehow it does not make such a figure in poesy as that other species of the passion, 'Where love is liberty, and nature law.'"

Musically speaking, the first is an instrument of which the gamut is scanty and confined, but the tones inexpressibly sweet; while the last has powers equal to all the intellectual modulations of the soul."

We must add, from Lockhart's *Life of Burns*, that it has "been insinuated," and it is "false," "that, in spite of some transitory follies, he ever ceased to be a most affectionate husband." That the fair Geraldine's beauty did really attract Surrey, we for our part believe.

The value of Mr. Graves's book is irrespective of the question. It is interesting to have gathered together what can be discovered concerning the lady, though Dr. Nott reaped his field so well that they who come after can only glean. She was married twice—to two widowers—two double widowers, i.e. to men in their third widowhood—to Sir Anthony Browne, as has been mentioned, some forty-four years her senior, in 1543; and to Edward Lord Clinton, afterwards Earl of Lincoln, fifteen years her senior, probably in 1552. She died in 1589, no children surviving by either marriage. Mr. Graves gives an excellent autotype copy of the portrait at Carton, and, what helps the imagination scarcely less, a facsimile of a letter partly in the handwriting of the fair Geraldine herself. It is a triumph of penmanship—one can almost see her shaping so finely every stroke—but his lordship, at whose dictation it was written, perhaps found the pace too slow, as the latter lines are scribbled off by himself in a very different style.

Wharton, in p. (9), should of course be Warton. There seems some mistake in p. (11), for from the quotation given from Sir Henry Gates' MS. copy of Wycliffe's translation (should not Wycliffe's, by the way, be Wychliffe?) it would seem that the second marriage took place in 1551. Perhaps the Duke of Leinster is right in suggesting, as the note informs us, that Sir H. Gates' entry is not strictly contemporary.

J. W. HALES.

POSTHUMOUS PAPERS OF GENERAL VON BRANDT.

Aus den hinterlassenen Papieren des Generals der Infanterie Heinrich v. Brandt. (Berlin: Mittler, 1875.)

STUDENTS of the inner history of the Grand Army had reason to be grateful for the *Memoirs of General von Brandt*, published soon after his decease, and edited with filial care by his son. Certain episodes and leading personages in the Napoleonic wars had

never before been so clearly painted. To these interesting volumes we owe, for example, the truest knowledge we possess of the political effects of French rule as contrasted with that of Prussia in Poland, and of the cause of that singular unpopularity of the latter which the Roman Church is now dexterously using in her present struggle with the State in Posen. To them we are indebted, above all, for the light thrown on those important scenes in the Peninsular War in which Suchet played the chief part. Had the *Memoirs* never appeared, this section of the great European war drama would have remained unwritten in history except from the semi-official chronicle in which the principal actor relates his own share; and the very fact that the Duc d'Albufera was a Frenchman telling his own exploits would have dimmed their importance in the eyes of the less observant.

Brandt's *Memoirs* were kept back during the author's lifetime, for the obvious reason that so severe a critic of Prussian policy could hardly have held high place in the Berlin official world; but the delay interfered but little with the interest which must attach to the notes of a keen and impartial eyewitness of some of the most remarkable scenes in all modern history. And the general was something more than an observant soldier, gifted with the faculty of collecting true impressions of the events in which he shared, and the industry to note these down while they were fresh. He had the higher power of generalising from the facts of past history for future lessons; and the "Aphorisms" which form the latter half of the volume before us are an interesting testimony to the prescience and professional knowledge of the man who combined the practical teaching of hard service under Napoleon, and Napoleon's most favoured marshal, with subsequent training in that peace school of the Berlin military world, which took its origin in the lectures of Scharnhorst, and culminated more than forty years after the professor-hero's death in the unrivalled achievements of Count Moltke. He who wrote in 1859, "We are on the turning of the tide of a new era of tactics; and the victory may be adjudged beforehand to the State which grasps this truth and acts in just accordance with it," was evidently no common critic. This aged general who prophesied again at the conclusion of the campaign of 1866 that the next war would find Prussian soldiers opposed to rifles superior to their boasted *Zündnadelgewehr*, was plainly one of the most penetrating observers among the best-informed staff in the world, and though rendered unfitted then by his years for field duty, by no means past doing service to his country with his pen. The shrewd reflections on modern tactics which follow such preliminary remarks as these will richly repay the student of military art, and enable him, remembering that the distinguished author died two years before the late war, to judge exactly how far great practical experience and long study of theory could have enabled any one, however gifted, to fully forecast the sort of military revolution which 1870 was to bring in.

We are, however, here concerned rather

with the biographical reminiscences that fill the first part of this volume, scattered through an obituary notice prefixed to the *Aphorisms*. This notice is due to the care of the great Historical Section of Count Moltke's bureau, in which the author's son, Colonel von Brandt, long laboured; and we can scarcely be wrong, therefore, in assigning to his pen many of the personal particulars here communicated of his father's busy life. But from the father's own notes plainly come such graphic touches as the account given of Poniatowski's forebodings of evil before the fatal day of Leipsic. Brandt was one of the deputation of officers from the regiments of his own country who waited on the gallant Pole to offer the congratulations of the whole corps on his being raised to Marshal's rank. But they found their chief depressed rather than elevated by his new honour; and he answered their greeting with the gloomy words:—"Our clock has run down; I hope for nothing more; we are fighting only for honour's sake, and it is well for him who carries it with him to the grave." Three days later the speaker's corpse was found in the muddy waters of the Elster, pierced by the fatal shot that had ended the career of one of the most faithful followers Napoleon ever had, in victory or defeat.

At Leipsic Brandt may be said to have ended (save for one brief episode long after) his active field-service; but his unwearied energy lasted through the forty years of peace that followed his transfer from the Polish to the Prussian service in 1816. Certain essays on the military art made him respected by his superiors, in spite of the drawbacks attaching to one who had for many years followed the eagles so detested in Prussia; and when the Berlin authorities determined to give their cadets a special knowledge of French, Brandt was selected as the proper person to instruct them in a twofold sense, teaching their own country's warlike annals in the tongue that was as familiar to him as his own. "When I have once found out," was his description of his own design, "exactly how much they know, I shall begin to teach them practically from the Seven Years War downwards, combining the matter with the tongue, and accustoming them thoroughly to express their thoughts in French." "You are right," was the answer of his superior, the well-known Valentini. "Do not keep on the old track, but put new blood into the work. There is much that sticks and stands fast with us still, and we cannot be watchful enough;" words which imply that the old spirit of military pedantry, against which Scharnhorst so long vainly struggled, had not been wholly extinguished in the days of his triumph over prejudice and routine.

Promoted now as major on the staff, Brandt was brought into communication with the most eminent of the survivors of the War of Independence, with Marshal Gneisenau especially, to whom Prussia owed so much of the glory generally associated with the name of Blücher. At their first interview he seems to have won the veteran's respect by the frankness with which he expressed his difference of view as to the value of constant practical work in the field. Brandt was always of opinion that too long

a continuance in this without time for thought or study was apt to leave soldiers unfitted for the highest posts; and he did not hesitate to press his point. "You are paying me no compliment, certainly," said his superior good-humouredly, "nor Blücher either, who had but that very sort of training throughout his military life." "But then we are not all of us born Scipios," was the ready answer of the Major. And they evidently parted on good terms, for when Gneisenau soon after took the command of four whole corps of the Prussian army, mobilised to watch the frontier during the Polish insurrection against Russia, Brandt appeared on the scene as one of the most trusted of his staff. His portrait of Gneisenau is as interesting as any of the better-known sketches in his *Memoirs*, and fully justifies the high estimation in which later historians hold that general:—

"He may be compared with the chiefest leaders of any age," is Brandt's deliberate judgment, "for the readiness of spirit with which he could grasp situations, decide on the counsel of the day, look at affairs from the practical side, and conduct them with energy. His detractors might say [there is some reference here, no doubt, to certain well-known criticisms of Müffling's] that there was too great lightness in his view of things; but certain it is that he could execute most happily the particular task of the hour, and so his name will be handed down in connexion with the triumphs of a mighty age. And if it be true, as Greek philosophers have asserted, that the soul has much to do with the corporeal form, the Marshal must have had a very noble soul; for he was a knight of fine presence, with a truly manly countenance, an imposing form, and fine brilliant eye. In bodily appearance he outshone all the various marshals of different nations I have seen, including Soult, Massena, St. Cyr, Suchet, Ney, Diebitsch, and Paskievitch. If some of these surpassed him in certain details of leadership, he was superior to all in nobility of soul and greatness of spirit. And he completely solved one of the most difficult of problems. To have first brought into unity, and then guided to victory, under the most difficult conditions, an army intended to play a secondary part, made up of different nationalities, and led by a self-opinionated set of generals, speaks eloquently of his earnest devotion and great circumspection, and of no less knowledge of men than tact in managing them."

With this just and eloquent description of a great countryman we must part from Von Brandt's last writings, merely remarking that the maxims he wrote in his old age on modern tactics and the influence of the rifled weapons upon them, are as clear and fresh as those observations on Spanish guerrilla warfare, or the breakdown of the requisition system in the great march on Moscow, which have made his *Memoirs* of such deep interest for military men. His one command in the field was against the Polish insurgents of his own native province in 1848, when his capture of the town of Xions, the headquarters of Dombrowski then, as recently of Ultramontane resistance, was conducted with a rapidity, success, and moderate expenditure of life, which caused Prussian writers to declare it a model for the operations of a military commander in civil war. Few men have ever combined to the same extent the qualities of practical soldiership, political knowledge, and skilful portrayal of character. And since these are displayed hardly more in his elaborate autobiography

than in this comparatively trifling work, published at first only in the pages of a periodical, and long little known outside the profession; it would be a thing much to be regretted that it should be wholly lost to English readers. CHA. C. CHESNEY.

SCHOOL BOOKS.

How to Parse. By the Rev. E. A. Abbott, D.D. (Seeley).—Annotated editions of English classics have of late been more in request than books on English grammar. Useful as such editions are in stimulating literary taste, their value as instruments for teaching the language should not be overestimated. They must often fix the attention on involved constructions and archaic forms, and are therefore fitted chiefly for those who have learnt grammar pretty thoroughly in English or in some other language. It ought to be clearly understood that the study of irregular or antiquated English cannot supply the elementary problems which constitute the disciplinary value of the first steps in learning a dead or a foreign language. We have, therefore, every reason to welcome, from an experienced teacher like Dr. Abbott, an attempt to recast the elementary grammar and analysis which has, as yet, been imperfectly appreciated in higher education, and has hardly been made attractive enough in schools of a lower grade. The book may be divided into three parts—easy parsing, difficult parsing, and the explanation of irregularities. In the earlier part of the book (some six months' work, according to Dr. Abbott) we meet with hardly a technical term except *subject*, *object*, *relative*, and *antecedent*. It is clearly recognised that the mechanical aid of inflexions which makes Latin parsing a half-unconscious process is no longer available in English. Accordingly the discovery of subject and object and the parsing connected with the relative are not merely indicated, but enforced and illustrated in as many ways as possible. And the details of parsing are those suggested by common sense. Thus, instead of being asked the gender, number, person, and case of a relative, we have three columns headed *antecedent*—*subject of*—*object of*. Again, where a participle is under discussion, the first question asked is, What can it be altered into? and the pupil is expected to write down an equivalent clause, beginning with a relative or a conjunction. By easy steps of this kind a schoolboy is led to the really difficult parts of English parsing, where more subtle distinctions and a larger number of technical terms are required. The directions for parsing an infinitive are by no means simple, but any omission would be fatal to clearness. They are worth quoting, both to show the freedom with which Dr. Abbott treats his subject, and to illustrate the real discipline that can be obtained from it.

"I. Of what class, (1) subject or object, (2) adverbial, (3) adjectival.

"II. Subject or object of what verb.

"III. If complementary, (1) state the partial subject or object, (2) if adverbial, replace by a preposition and verbal noun, (3) if adjectival, state noun qualified."

The exercises are written with a good deal of care; they invariably consist of continuous narratives, and do not betray too clearly that they were compiled to illustrate rules. A supplement containing more of them would be welcome. The latter part of the book deals with the explanation of difficulties and irregularities, in poetry as well as in prose. To these explanations Dr. Abbott's second title—"an attempt to apply the principles of scholarship to English grammar"—is especially relevant. We cannot do better than quote his own description of his method:—

"First, ascertain the *regularity* from which the *irregularity* in question has deviated.

"Secondly, ascertain the cause of deviation, whether it be (1) desire of brevity, (2) confusion of two con-

structions, (3) desire to avoid harshness of sound or construction."

The explanations of *so as to* (204), it is rare for a man to starve in this country (402), are good illustrations of the application of these principles. We doubt, by the way, whether Dr. Abbott is right in his treatment of the so-called preposition *considering*, which he assumes to come simply from its use as a present participle. Was not *considered* a participle absolute, like the French *excepté, y compris*, the original form, converted by a misunderstanding into *considering*? It should be added that the book contains chapters on Spelling and Punctuation, and a short sketch of the history of the language. It cannot fail to make the study of English more attractive as well as more systematic; it has all the brightness and clearness of an enthusiastic teacher fresh from the classroom.

M'Leod's Analysis of Sentences (London and Glasgow: Collins) is a careful exposition of the subject, with abundant exercises. Mr. M'Leod claims credit for several improvements on previous books, among others for an arrangement for making children thoroughly understand the various positions that noun sentences may take in complex sentences. That this should be really a novelty in English grammar almost passes our belief; it is familiar enough to every schoolboy who has learnt his Kennedy's Latin Syntax. The strong point of the book is its diffuseness; only one difficulty is approached at a time. On the other hand, the author fails from not perceiving, as Dr. Abbott has done, how parsing and analysis really run into each other; e.g., the real difficulties connected with the relative and the verbal nouns are only slightly touched. So, again, the nominative absolute has only an incidental mention in a note. We regret to see that the author has followed some other writers in an extraordinary use of the term "Indirect Object." He makes it include the italicised words in the following sentences: "He saw the soldiers fighting," "He made a fire of coals," "They elected him Emperor." A boy ought not to come away with the impression that these words all played in their respective sentences the same part as *me* in "He gave me a book."

Humboldt's Natur und Reisebilder, edited by Dr. Buchheim (F. Norgate), contains a number of interesting extracts from two most attractive books, with explanations of the numerous technical terms and allusions. The chief fault of the work is that one finds scattered up and down the notes translations of detached words and phrases, many of which seem to present no difficulty that could not be overcome with a little thought or by reference to the dictionary. It can be of no use to tell a schoolboy who can read Humboldt at all that *Jugendalter* means youth, *üppige Fülle* luxuriant abundance, *Luftströme* currents of air, and so on. If we might venture to lay down for writers of school-books one or two rules as to notes on words as distinguished from notes on the subject-matter, we should say—first, seldom, if ever, give the English equivalent of a word, except in the case of a rare word or technical term; next, if you must give the equivalent, explain how it got its meaning, or say something interesting about it; and, lastly, remember that the ideal note is one which starts a train of thought for a pupil, and leaves him to finish it for himself. We have noticed one or two oversights: a German mile is taken as equal to four ordinary English miles, not, as is really the case, to four geographical miles, or rather more than four and a half in common measure. Again, *Floetz* is described in words which are at least unsuggestive, as "a term applied to secondary strata, of which two sides are parallel, and which extend over a large space." A reference to Lyell's *Elements* would have produced a very interesting note. But most of the illustrative notes are good and clear, and must have cost much labour; so that, while we protest against the scraps of trans-

lation, and hope to see them replaced in another edition by something more *zweckmässig*, we cordially recommend the book to schoolmasters in search of an entertaining and improving reading-book for the middle or higher forms.

WE have received from Messrs. Hachette several of their French series. M. Roulier's *Charterhouse First Book of French Composition* is intended for beginners who know a little accidence, and have not begun to work systematically at syntax, and contains an ample supply of exercises on some of the commonest difficulties they encounter in the attempt to turn English into French. The author has wisely preferred simple continuous pieces to detached sentences, and has at the same time avoided attacking more than one difficulty at once. To each written exercise he has appended a *viva voce* exercise bearing on the same points. We should be inclined in practice to invert the order, and make the *viva voce* exercise serve as an introduction to the other. M^{me}. de Witt's *Derrière les Haies*, edited by P. Bussy, is a charming story of the war in La Vendée, which is sure to be popular. The notes, excepting a few historical ones, are very poor—*en serrant les poings*, clenching his fists; *vires de joie*, mad with joy; *tricotait*, was knitting; *leur reconnaissance*, their gratitude; *générait*, would impede, and so on—correct, but unnecessary. *The Children's Own French Book*, by P. H. Brette and G. Masson, is an excellent selection of easy stories, with a full vocabulary. Many of these are from Berquin, author of a famous collection of children's stories called *L'Ami des Enfants*. The only doubt we feel as to the utility of a book of the kind arises from the fact that stories written for French children are sure to be idiomatic, and therefore hard to English ones. We wish the accomplished editors had taken the liberty of rewriting some of them in what we might call a transition style.

A French Grammar at Sight, by D'Oursy and Feillet (Clifton: Baker. London: Simpkin & Marshall), is based upon the principle that in most of the difficulties met with in French grammar, there are two, and only two, courses open to one. The idea is ingeniously worked out, and the book might be used with advantage to supplement an ordinary grammar. But it requires careful revision. It is stated, for example, that adjectives ending in *in* change it into *igne* for the feminine: entirely ignoring *voisin, divin, latin*, in fact all that come from the Latin *inus*. Again, in the formation of the plural of compound nouns, it is said that in words formed of two substantives both take *s*, no notice being taken of the fact that it is only true when they are in apposition. Under the same head nouns compounded of a substantive and a verb are set down as taking *s* at the end of the noun, a statement which applies only to words which, like *passé-port, porte-feuille*, have to be used as a single noun, and not to a word like *abat-jour*. The concord is discussed of the past participle of reflective verbs, without any reference to the case of the governed reflective pronoun. The subjunctive, again, is very inadequately treated.

FRENCH conversation books seem to be as popular as ever: De Fivas' *New Guide* (Lockwood) has reached its twenty-sixth edition, and Grandineau's *Le Petit Précepteur* (Hodder & Stoughton) its forty-fifth; while Contanseau's *Middle Class Series* (Longmans) adds another to the list, and Messrs. Masson and Brette have revised Richard and Quélin's *New Dialogues* (Hachette). De Fivas has the advantage of indicating the *liaisons*, and giving other helps to pronunciation.

H. W. EVE.

NOTES AND NEWS.

IN the present day when Russian works to be translated are many, and Russian translators are scarce, an English version of Colonel Prijevalsky's *Mongolia and the Country of the Tanguts*, being the

result of three years' travel in Eastern High Asia, will be received with great interest. Such a volume, it may be two such volumes, are in progress for the coming autumn season. The translator is Mr. Delmar Morgan, a gentleman of high attainments as a Russian scholar; and the attractions of the work will, in all probability, be greatly enhanced by Colonel Yule's annotations, together with some interesting illustrations of Urga and the neighbourhood, and of Mongolian types never before published.

THE second volume of Professor Corssen's work on the *Language of the Etruscans* will be published shortly.

MR. D. K. CLARK, C.E., has undertaken for Messrs. Lockwood and Co. a new edition of Simms' standard work on Tunnelling, which has long been out of print. He proposes to give an account, with illustrations, of recent great works of the kind, including, among others, the Mont Cenis and the St. Gothard tunnels; with the new methods of boring, new machinery, &c.

PROFESSOR MADVIG has collected in one volume, which will appear at Leipzig in the course of the present month, his minor philological writings, originally published as *Programmes* of the University of Copenhagen and hitherto almost wholly unknown out of Denmark. They are said to form a general system of the philosophy of language.

MR. J. E. H. GORDON, of Caius College, Cambridge, is writing one of the Indian Science School Series books for Messrs. H. S. King and Co.

THE Early French Text Society means, we are glad to hear, to publish a *Bulletin* with full descriptions of the best French MSS., and the different texts (and their dialects) of the same work. We have long wanted such a thing for our English MSS., but our official men of the type of Paul Meyer and Gaston Paris—who are the only ones that can do the work—have hitherto kept their knowledge out of type.

PROFESSOR STENGEL, of Marburg, has obtained funds from the German Government to found a seminary for the Romanic and English philology, and a special library for it at Marburg. He is procuring the necessary English books for the purpose. He and other professors of the Romanic and Teutonic languages jointly, hope that all the other German universities will soon follow the example of Strassburg, and separate the two branches of learning. Either Romanic or Teutonic is by itself quite enough for one man to do justice to, and strive to attain eminence in.

THE Hunterian Club promise the issue of their overdue books next month.

THE Ballad Society has nearly ready the Sixth Part of Mr. William Chappell's edition of the Roxburghe Ballads.

THE seventh report of the Deputy-Keeper of the Public Records in Ireland has just been issued. The most noticeable transfer of documents from the custody of Sir J. Bernard Burke, Keeper of State Papers, into the Public Record Office, was that of the Minutes of Proceedings of Trustees for the Encouragement of the Linen Manufactures in Ireland, from 1711 to 1828. The minutes are contained in 139 folio volumes, and, considering the great share which this manufacture has had in the development of the country, such records of the first systematic steps taken by public authority for its regulation and improvement should possess a high interest for the historian and economist.

AMONG recent acquisitions for the Egerton Library of Manuscripts in the British Museum the following are most noteworthy:—Yates's History of St. Edmund's Bury, printed with MS. additions by John Bowyer Nichols, including original letters. Schemes of Nativity, principally of English noblemen and distinguished persons, partly by John Partridge, the almanac maker;

Minutes of Proceedings of the Royal Society and Society of Antiquaries, by E. Mendes da Costa, 1787-1789, &c.; Catalogue of works in the Cotton Library connected with English topography; Professor Ward's Notes on Horsley's Britannia, copied by Richard Gough; Papers relating to the Company of Leather-sellers of London, 1685-1696; A Letter of G. Vertue to Robert Harley, Earl of Oxford, on the picture by Holbein of the family of Sir Thomas More, and notes on the Life and Works of Holbein; Original Letters of C. Niebuhr, Raff. Morghen, F. von Gentz, F. P. G. Guizot, A. Canova, and F. Rückert, 1774-1839; Lists and Genealogies of the Nobility of England, by J. Benard, dedicated to Charles IX. of France, 1569, with paintings and in original binding; Papers from the Office of Trade and Plantations relating to the English Settlements in America and the West Indies, 1627-1699; a transcript of "The suddaine Turne of Fortune's Wheel; or a conference betwixt the Pope, the Emperor, and the King of Spaine," by John Taylor (the water-poet), 1631; Visions, &c., of Joanna Southcott, 1794-1813.

THERE is an Irish missal belonging to Corpus Christi College, Oxford, distinguished in one respect from nearly all other MS. religious volumes—namely, in the size of the writing and the absence of that regard for economy of space which is so marked a feature in them. Its date is of the twelfth or thirteenth century, and the original wooden cover in which it was bound, black with age and polished by use, still remains attached to its pages. From century to century the book has been handed down enclosed in a leathern wallet, once apparently highly ornamented, and furnished with straps to sling over the priests' shoulders. This wallet is still preserved, though time and service have frayed the straps, and nearly obliterated the lines with which its sides were adorned.

M. PAUL MEYER, editor of *Romania*, and Professor of Romance Philology at the Ecole des Chartes, has been nominated by the Collège de France to the Professorship of the Languages and Literature of the South of Europe, vacant by the death of M. Edgar Quinet.

DR. H. BREYMAN, Lecturer on the French Language and Literature in the Owens College, Manchester, has been appointed to the newly-founded chair of Modern Philology in the University of Munich.

MR. E. W. ASHBEE, F.S.A., is about to issue facsimile reproductions, by the lithographic process, of a selection of early printed plays and interludes, and of short tracts principally illustrative of Shakspeare and the Drama. Among the books to be thus reproduced are: *The Taming of a Shrew*, *The True Chronicle History of King Leir*, three Interludes from unique copies in the collection of the Duke of Devonshire, *Kemp's Nine Daies Wonder*, *Tarlton's Jests*, *Kind-Hart's Dreame*, and *Maroccus Extaticus*. The impression is intended for private circulation only, and will be limited to one hundred copies.

THE French Academy has awarded the Jouy prize to M. Alphonse Daudet for his novel entitled *Fromont jeune et Risler aîné* (ACADEMY, December 5, 1874). This prize, which is now awarded for the first time, was founded "to crown the best study of Parisian manners published within the year." The Academy of Inscriptions has awarded the Gobert prize to M. Lecoy de la Marche for his work on *Le Roi René* (ACADEMY, February 6, 1875).

WE omitted last week to notice Mr. George C. Brodrick's article in the current number of the *Contemporary Review*, entitled "The Universities and the Nation." The writer is acquainted from personal experience with the course of academical reform at Oxford during the past twenty years, and he treats his subject from the historical rather than the speculative point of

view. It is, no doubt, desirable that the public should learn the general effects produced by the rejuvenescent activity infused into the Universities by the Commissions of 1850 and the reforms of 1864; and it is also possible that the report of the late Commission may be misunderstood by outsiders, ignorant of the vast amount of educational work at present achieved at Oxford and Cambridge. To this task of narration and exposition Mr. Brodrick has devoted himself, and the Oxford reformer of a past generation appears in the popular character of an optimist. The unfavourable features of the Commissioners' Report of last year are dexterously concealed, and an intimate knowledge of the University is used to develop into undue prominence the more progressive aspects of the educational system. After laying various unctions to his soul, Mr. Brodrick becomes more conservative than his friends; declares in favour of the retention of headships and fellowships pretty much as they now exist; has no suggestion to offer by which the Universities may maintain, or rather regain, their position in the vanguard of learning and research; and concludes that both the management of the College revenues and their disposition is almost beyond criticism. He looks with much favour upon the Cambridge scheme for the despatch of missionary lecturers into the great towns of England, and generally advocates all those petty schemes of movement rather than of progress which are diverting the Universities from their supreme function of study, and tend to exaggerate yet more the present evil of over-teaching and over-examination which has already distorted the normal development of academical life. In short, Mr. Brodrick has managed to put himself in complete harmony with that reactionary feeling which is now in vogue; but as a contribution to the work of reform, which he himself recognises to be close at hand, this article will not be of much value.

THE French papers announce that Prince Richard von Metternich is preparing his father's Memoirs for publication.

THE second volume of Karl Biedermann's *Germany in the Eighteenth Century* has just appeared, and contains an extremely valuable account of the life and mental development of Lessing from the early days when the first tokens of his genius as a reformer appeared in the dramas entitled *The Jew* and *The Freethinker*, till the period of his latest effort when he produced *Nathan the Wise*, to the merit and splendid results of which work a German critic pays the following just testimony:—

"The influence of this piece on our religious opinion has become incalculable. In the first place, the emancipation of the Jews in Germany is attributable to it. That which Lessing established as desirable in confidential conversation with his friend Moses Mendelssohn, was prepared in Germany by the herald Nathan, and has after a hundred years' interval become the law of the land."

Lessing is too little known in England. The pioneers of intellectual freedom here might well take some hints from the policy of that bold phalanx of Jewish writers of the eighteenth century who, goaded to madness by the oppression to which their race was subjected throughout Germany, have in a great measure succeeded in melting down the then apparently solid rock of Christian orthodoxy by the solvent of their acrimonious wit.

THE New Shakspeare Society hopes to issue next week Mr. P. A. Daniel's revised edition of *Romeo and Juliet*, and Dr. Nicholson's reprint of the Quarto and Folio of *Henry V.* Dr. Nicholson's lamented illness from overwork has stopped the progress of his Parallel-Text edition of the *Henry V.* Quarto and Folio, with full collations and notes.

DR. E. KÜLBING, of Breslau, has undertaken to re-edit for the Early-English Text Society the

romance of *Bevis of Hampton* from all its MSS., with an account of its French original—if M. Firmin Didot will allow it to be seen for more than two hours—and its versions in Icelandic and other European languages.

THE Norwegian Storting has made a grant of 60,000 specie R.D. for the augmentation of the salaries of the national school teachers—a measure which coincides with the liberal spirit expressed in the public addresses delivered at the recent meeting of the Scandinavian Universities at Upsala, when Archbishop Sundberg, in his inaugural speech, drew attention to the importance of raising the status of teachers as well as the standard of the requirements demanded of them. The meeting at Upsala, which took place on June 4, was attended by upwards of 1,000 alumni of the Scandinavian universities, who had come from Denmark and Finland, as well as from various parts of Sweden and Norway.

THE German papers announce the death of Eduard Mörike, the friend of Bauer, Strauss, and Vischer. Mörike, who was born in Würtemberg in 1804, made his first appearance as a poet in 1838, when he published a collection of lyrics, which were followed in 1846 by his "Idylls on the Lake of Constance." Some time after the publication of his "Hützelmannlein," "Mozart on his way to Prague," &c., he brought out his translations of Anacreon and Theocritus, which may be classed with the best of their kind.

MR. PETE BOBORYKINE, a Russian novelist and journalist, and the author of an interesting article on "Nihilism in Russia" which appeared in the *Fortnightly Review* for August, 1868, has reprinted at Florence, from the *Rivista Europea*, an essay entitled "Del Criticismo Russo." It contains a great deal of useful information about the school of literary criticism founded by Bielinsky, and carried on by Dobroliubof and Pisaref—all writers who died young, before they had time to complete their work—as well as about the other Russian critics of various parties, the "Nihilistic" movement, and the present state of the critical element in Russian journalism. As an author who has been not unfrequently attacked, Mr. Boborykine writes at times with some little asperity, but as a general rule his statements are marked by moderation and good sense.

Supernatural Religion has now reached a sixth edition, and the author takes advantage of it to revise the work "throughout," to "examine a great many of the references," and to add an extremely able preface in answer to recent criticisms. Dr. Lightfoot naturally gets the chief share of his attention, and it must be confessed that the tables are successfully turned upon the Cambridge divine. The author complains that the object of his work has been misapprehended, his point having been to show that the exceptional evidence required to overcome the antecedent improbability of the New Testament miracles is not to be obtained. Merely probable references, therefore, to the four Gospels cannot come into court, nor even the admitted existence of earlier Gospels, since we know nothing of their authorship or of the authority to be attached to them. Nothing is said, however, of the evidence of the Pauline Epistles; and since the same critical method which would reject the witness of the Gospels would equally oblige us to accept St. Paul's testimony to the historical character of the Resurrection, orthodox Christianity need not disquiet itself overmuch. The most glaring errors of scholarship have been corrected in the present edition, but enough remain to convince the careful reader that the author's excellence as a scholar is not equal to his excellence as a theologian and critic. The charge brought against him of copying lists of references without verification is shown to be groundless, and Dr. Lightfoot's ingenious advocacy of the pseudo-Ignatian Epistles is well disposed of. After the clear statement of the case in the preface, most readers will feel con-

vinced that the martyrdom of Ignatius took place at Antioch rather than at Rome. The author has also clearly exposed the extraordinary inference drawn by Dr. Lightfoot from the silence of Eusebius; but it is a pity that he has been unable to deal with the latter's article in the May number of the *Contemporary Review*, in which he assumes that "The Martyrdom of Polycarp" is a "contemporary document" (!), and that Polycarp was a disciple of the Apostle St. John. This, however, is rendered more than doubtful when we compare Irenæus (*adv. Hæc.* v. 33. 4) with Eusebius (*H. E.* iii. 30); and while we may not agree with the author of *Supernatural Religion* in regarding Polycarp's Epistle as wholly spurious, the existence of interpolations in it admits of little question. The strong bias which disfigured *Supernatural Religion* on its first appearance is still unfortunately present in the new edition. Thus the reference in the Clementine Homilies to St. John ix. 1-3, is still denied, the Ebionising Hegeippus is appealed to as an authority "of great value," while his younger contemporary Irenæus is dismissed as valueless partly because of "the late date at which he wrote;" and the mention of the first two Synoptics in the missing commencement of the Muratorian Canon is called a "conjecture." Certain additions, too, may still be advantageously made to the book. The account of the Quartodeciman controversy, for instance, occupies a disproportionately small space; Justin Martyr's ignorance of St. John's Gospel may be more fully demonstrated; and the author has not noticed that six MSS. of Eusebius have *λόγιον* instead of *λόγιον* in the passage quoted from Papias in relation to the Gospel of S. Mark.

FROM a paper by Mr. E. Rehatsch in the last number of the *Journal of the Bombay Branch of the Royal Asiatic Society* we learn that in that city there are many fortune-tellers, who sit with a book called a *Fānāmāh*, and unveil the future at very low charges. The evil eye is an important part of their operations. The Prophet is said to have believed in the evil eye, "which causes a man to enter the grave, and a sheep the kettle." The theory of the Orientals on this subject is that a kind of poison exists in the constitution of some men which issues from their eyes when anything pleases them. He who was supposed to be endowed with this unpleasant gift was to be isolated from mankind, and an allowance of food made to him "in order to prevent the necessity of his looking for a livelihood and committing mischief." The same paper gives particulars respecting Mohammedan amulets, talismans, geomancy, &c. Certain verses of the Koran were believed to cure certain diseases.

UNDER the title of *Apuntes Bibliográfico-forestales*, Don José Jordana y Morera has printed at Madrid an extensive annotated list of Spanish books, maps, &c., relating to woods, trees, meadows, hunting, fishing, &c. The edition is for private circulation only.

THE May number of *Det nittende Aarhundrede*, which we are rather late in noticing, is unusually full of important articles. Professor A. Steen concludes his able dissertation on "The Immeasurable in the Physical and in the Spiritual World." Dr. Hans Höffding contributes a critical examination of the Philosophy of Herbert Spencer. Dr. Georg Brandes commences a delightful study of Shelley, full of exquisite and searching criticism, and illustrated by translations, very ably rendered in Danish prose. The "Ode to the West Wind" is analysed with special minuteness. We shall return to this paper when the essay is complete. We notice one small, but not unimportant blunder. Dr. Brandes justly remarks that Wordsworth's hymn "To a Skylark" is finely typical of the spirit of the poetry of the Lake School, but in translating the famous line—

"A privacy of glorious light is thine"

"at Rige (a kingdom) of straalende Lys er dit," he misses the whole force and beauty of the anti-

thesis. Viktor Rydberg continues his "Roman Emperors in Marble," and Dr. Larsen his dialectic with the theological faculty.

THE death is announced of Ivar Geelmuyden, Rector of the College of Bergen, a prominent politician, and the author of the principal Anglo-Norse dictionary. He was born in 1819.

THE French "Slavophile," M. Louis Leger, has just published a new volume of essays entitled *Etudes Slaves* (Paris: Leroux). The chief Slavonic peoples are represented—Bohemia by M. Palacký, Poland by the comic poet Frédro, Servia by a sketch of its language, but the greater part of the volume is devoted to Russia. Accounts of the author's travels are interspersed with literary subjects; a visit to the catacombs of Kiev, to the Tartar schools of Kasan, to the fair of Nijni-Novgorod, and an excursion on the Volga are related in a very entertaining style, and with real humour. We think, however, that the author might have employed the pronoun of the first person rather less frequently; is it not a countryman of his own who said "The I is hateful"? Mr. Ralston's works on the songs, &c., of the Russian people are introduced to the French public; and the history of Slavonic studies in Russia has furnished M. Leger with an interesting but too brief chapter, teeming with curious facts bearing on the literary and scientific relations of the Russians with the other Slavonic peoples.

AMONG the curiosities added last year to the British Museum we noticed a little while ago the very extensive collection of watches illustrating the various phases through which the art of watchmaking had passed, formerly belonging to Sir Charles Fellowes. The dates of the specimens, of which there are eighty-seven, vary between 1520 and 1720. In reference to this subject we quote the following curious note by the antiquary Bishop Kennett, which, so far as we know, has not yet been printed from the Lansdowne MSS. It was probably written at the close of the seventeenth century:—

"John Chamberlayne, Esq., in Petty France, Westminster, has a venerable picture of his great grandfather, with a long beard, gold chain and furred gown, with this inscription:—Sir Thomas Chamberlayne of Bestbury in Gloucestershire, ambassador from England to the Emperor Charles the fifth, to Philip the second of Spain, and to the king of Sweden in Flanders. He married a lady of the house of Nassau, and from thence also he brought the first coaches and the first watches that were seen in England. He was born in the reign of Edward the Fourth, and died in the reign of Elizabeth. The first watch so brought over is now in the hands of Catherine daughter of Thomas Chamberlayne, Esq., of Adlington in Gloucestershire, wife of Charles Cox, Esq., a judge in Wales."

WE get the following little glimpse of public affairs during an exciting period from a letter found among some family correspondence lately purchased for the British Museum:—

"Dear Lady Ishams letters allways give me pleasure, that of the first instant more particularly to find the Peace which is so loudly clamor'd at here is better liked in the country, the House of Lords and Commons were both debating on it till 12 a clock on Thursday, the Duke of Grafton and Lord Temple were Personall in there abuse of Lord Bute who said he would treat it as it deserved with contempt. Mr Pitt was brought to the House ill of the Gout was ushered in with a loud hush, Mr Best that gave me the account went out to see who they were and found the lobby full of Gentlemen, not a shabby person. Mr Pitt spoke three hours and twenty-five minutes, some times sitting, and was forced to drink a dram, and severall times ready to faint, went thro' all the articles, found great fault till he came to that relating to Canida which he said was better than he could have asked, or almost hoped to have obtained. He left the house when he had don speaking. Mr Townsends who resigned the night before surprised both sides, he spoke very well and strong in support of the Peace, the discontented were much disappointed as they were in greet sperits, thinking he would have joined y^e,

but he knew better how to get what he wanted, tho' the minority was so inconsiderable. I am told the lord major intends to begin the attack again to-morrow, &c. . . .

"The Attorney General is to marry Miss Jonson, sister to Lady Becham, I believe you have seen them with me, they are both handsome. The Attorney is said to be very much in love, they are to be married at X'mass. . . .

"ANN HALSETY.

"Brook Street, Decr the 14th 62."

The Attorney-General spoken of in the last paragraph was Charles Yorke, who married for his second wife, on December 30, 1762, Agneta, daughter of Henry Johnston, Esq., of Great Berkhamstead, Herts. The sad circumstances connected with his sudden death in January, 1770, immediately after his appointment as Lord Chancellor, will be well enough known to our historical readers.

NOTES OF TRAVEL.

SOME of the Russian papers make mention of a caravan of two hundred horses having arrived at Krasnovodsk on the Caspian from Khiva, bringing 150 Persians and 3 Tekkes who had been made prisoners by Khivan Turkmen, and restored to liberty by the Khan, at the request of the Governor of the Caucasus. An *aul* or settlement of Yomuds had taken the opportunity to leave Khivan territory and take up their quarters in the Russian Transcaspien province on account of the greater quiet and security there prevalent.

PREPARATIONS are being rapidly pushed forward in the court of the Tuileries for the approaching Paris Geographical Congress. With a view of exhibiting a typical collection of products from one of the French colonies, a selection of teas, coffees, ebony and textile fabrics from Guadeloupe will be shown. Austria, Germany, Denmark, the Netherlands, and Russia have arranged to contribute to the Geographical exhibition. On the recommendation of the Academy of Sciences of Stockholm, the Swedish Government has appointed a commission and voted a sum of money in the interests of their exhibitors. It is probable also that the Secretary of State for India will depute Colonel T. G. Montgomerie, R.E., F.R.S., of the Great Trigonometrical Survey, to Paris, with instructions to exhibit a selection of the admirable maps prepared by his department. The Indian Surveys are the greatest in the world, as regards both the accuracy and extent of their operations, and it would be an anomaly if they were unrepresented at such an important meeting.

THE official *Turkestan Gazette* publishes a letter from Samarkand stating that Russian goods have this year become much more plentiful in Bokhara than before, and that certain firms have made pretty large ventures of goods. Russian traders, nevertheless, still complain of the high duty levied by the Amir on all their merchandise.

No. VI. of Petermann's *Mittheilungen* contains an article by Admiral von Wullerstorf-Urbain on the drift of the Austrian Arctic vessel, the *Tegethoff*, while imprisoned in the pack-ice between Novaya Zemlya and Francis-Joseph Land. As the course taken by the vessel was a resultant of a combination of the forces of the currents and winds, modified by the presence of inert masses of ice and the proximity of land, so he contends that the direction of the prevailing current is what might be expected from the influence of the Gulf Stream on one hand and the large Siberian rivers on the other. No land having been seen to the east of Francis-Joseph Land, and the lead having given a depth of 325 mètres, make it probable that there is a large expanse of frozen sea eastward, and that Francis-Joseph Land really forms a portion of the Spitzbergen group. The Admiral concludes with a practical exhortation to Arctic travellers to endeavour to attain their objects step by step, the fulfilment of an extensive

programme of operations being in all cases extremely improbable.

DR. NACHTIGAL'S return to Germany has been commemorated by numerous public and private demonstrations of respect and sympathy. In his native town of Stendal the preparations for his festive reception were in progress long before his arrival, and at Berlin the Imperial Geographical Society entertained him at a grand banquet on June 2. In the course of the address in which Dr. Nachtigal replied to the laudatory and congratulatory speeches by which he had been welcomed, he gave a *résumé* of his travels from the moment when, in 1869, he started from Tunis, where he had held the post of physician to the Bey, and proceeded through Tripoli to the Court of Bornu, in order to present to the Sultan the gifts designed for him by the King of Prussia. Dr. Nachtigal referred with gratitude to the favourable reception given him by the Sultan, on his arrival in the summer of 1870 at Kuka, the capital of Bornu, where he remained till 1873, by the request of that monarch, until the war then raging between Bornu and Wadai had come to an end, and his progress through the country had been rendered somewhat less dangerous. After briefly describing the various ways in which he had endeavoured to turn to good account his enforced residence at Kuka, by making excursions into contiguous districts and neighbouring states, he narrated the result of his adventurous visit to the lands of the bloodthirsty Wadains, his escape from the snares set by the Sultan of the country, and his success in penetrating far beyond Wara into regions never trodden by any European but himself. More fortunate than his countrymen Vogel and Von Beurmann, Dr. Nachtigal has escaped with life from the boundaries of the Wadai-lands, and has now, at the comparatively early age of forty, returned to his own country with restored vigour after having endured for years the perils and privations of Central African exploration under its most exceptionally severe form.

NOTES OF A TOUR IN THE CYCLADES AND CRETE.

VII. *Naxos and Ios.*

WE were now (April 2) about to enter on the third portion of our expedition, that is, to visit the southern Cyclades, and the neighbouring Sporades. Accordingly, having hired a tolerably large and partly decked boat, which would safely make the voyage to the outlying islands, with three sailors to manage her, we started in most lovely weather, a continuance of which our boatmen augured from the porpoises (*δαλφίνες*) which were playing about us. It was a dreamy, hazy day, and for some hours, during which we were becalmed and had to use our oars, the heat was great; late in the afternoon a fresh breeze sprang up, and sped us on our way towards Naxos. As we approached the northern extremity of Paros, a long line of mountains rose in front of us from the water, while the main chain of that island lay behind; in one part the coastline retires, and forms the deep and safe harbour of Naussa, with sloping ground about it, and a town in its recesses: in ancient times this was a "closed" harbour, the entrance having been defended by chains or other barriers. The town of Naxos, which lies on the north-western shore of that island, was visible for some time before we reached it, but the object towards which we were directed to steer was a conspicuous monastery of St. John Chrysostom on the hillside above. In the central chain of the island two peaks, both over 3,000 feet, especially attracted the eye—towards the north that of Coronon, and in the centre that of Zia; both which names, like many others in this island, have an ancient sound; possibly the latter may be a corruption of Dia, one of the classical names of Naxos. A youth in the town the next day, with a touch of pedantry which is not un-

common among Greeks, called it to me "the mountain of Zeus" (*τὸ βουνὸ τοῦ Διός*). We landed first on the island of Palati, which is separated from the mainland by a channel about fifty yards wide, having been formerly joined to it by a mole, of which only parts now remain, as it has been broken by the sea. At the highest point of this little island, which rises gradually toward the open sea, on which side it falls in precipices, are the remains of a temple, supposed to have been dedicated to Dionysus, who was the patron god of Naxos. Some steps at the entrance of the temple have been excavated, and at the opposite end there are drums of white marble columns, the marble not being of the purest kind—not Parian, that is to say, but such as is still found in Naxos itself. But what makes the ruins remarkable is the portico, which stands erect, and is a very conspicuous object. The monolithic piers are from twenty to twenty-five feet high, and the entablature which they support has two large bosses projecting from it; these three stones stand alone, everything else having fallen. From the idea that they formed part of a palace, the island is called Palati. The view of the town is picturesque, as seen through this stiff frame, and the white marble is beautifully contrasted with the blue of the sky.

In front of the little port stands an ancient mole, corresponding to that which reaches to the island, and between this and the shore the water was so shallow that we had some difficulty in making our way through it. When at last we landed we were surrounded by a crowd, with a rudeness very unusual among Greeks, and to escape them we made our way round the outside of the town, but some followed us far into the country. On our return we asked for the fountain of Ariadne, and were shown a remarkable source at the back of the town, covered in with a large erection of masonry, in the flat roof of which are two openings with marble about their mouths for buckets to be let down, and the extensive pool may be seen some distance below. All the antiquities here are associated with Dionysus, and even the wine is called after him; this is white, and agreeable to the taste, though slightly resined.

The town of Naxos, though unimposing in its appearance, has an especial interest as the former head-quarters of Italian influence in the Aegean. After the conquest of Constantinople, at the time of the fourth Crusade, the Venetians found it convenient to allow individual nobles of their own body to hold certain parts of the Eastern territory that fell to them, as fiefs of the Republic. In some such relation, though very undefined, to Venice, Mark Sanudo held the office of Duke of the Archipelago or of Naxos, having been invested with it by the Latin Emperor of Constantinople. He rebuilt the ancient town of Naxos, constructed the mole, and erected a tower in the citadel; then, having confined the city to the Latins, he obtained a bishop from the Pope, and built a cathedral. The government continued in his family, and in that of Crispo, which was related to it, until 1566, when it was finally brought to an end by the Turks, after having existed 360 years. Though the Dukes were in reality independent, they were always supported by Venice for the sake of commercial influence. Their occupation was a great curse to the natives. At the time when the duchy was established, these islands were in a prosperous condition; but by the Venetian monopoly of trade, the seizure of lands by the conquerors, and other forms of oppression, they were gradually ruined. We are apt to be dazzled by the splendour of Venice, and occasionally roused to admiration by the grandeur of her policy; but her treatment of her dependencies was systematically selfish, and her influence in the East has been second only to that of the Turks in its injurious effects.

The following morning we made our way towards the upper town through steep and tortuous streets; and, passing through a gateway, entered the Venetian *Castro*, the original city of Sanudo.

This forcibly reminded me of the small Italian towns of the Riviera; in some places the projecting buildings almost met above one's head, and it would have been literally possible to shake hands across the street; in other places the way for some distance was arched over. We saw numerous pieces of Hellenic marble, and over one house a fine coat of arms was carved, which, as we were informed, was that of the Barocci family. The inhabitants of this quarter, though they speak Greek and consider themselves Greeks, are of the Latin Church, and of Italian extraction, being descendants of the original occupants. One family is that of Sommaripa, whose ancestors for a long period were the rulers of Paros. Historic names are not uncommon in these regions; two days before, in the Roman Catholic quarter of Syra, I asked a youth to lend me the rattle with which, according to custom, he was expressing his aversion to Judas Iscariot, and on it I found his name inscribed—Manuel Palaeologus. The people whom we met looked superior to any whom we had seen elsewhere in the islands, especially the ladies, who wore black gauze veils. The boys, too, were goodlooking; and their pale complexions and light hair and eyes rendered them a great contrast to the Greeks. There is a Lazarist and a Capuchin church, and the Archbishop is not a native, but sent from Rome. The highest point of the town is occupied by a heap of ruins, where a fort—probably that of Sanudo—seems to have stood; from this the view was fine over Myconos, Delos, Rheneia, Tenos, and Syra to the north; Paros to the west; and Sikinos and Ios to the south; while in front, the portal of the temple of Dionysus on its island formed a conspicuous object. Herodotus (ii. 97), with his usual keen observation of geographical features, compares the islands of the Aegean to the Nile in inundation, when the cities alone are seen above the surface of the water.

We started again on our southward course with a favouring north wind, which carried us rapidly over the blue water through the channel which separates Naxos and Paros. This was the scene of an engagement between the Athenian fleet under Chabrias and the Lacedaemonians. Naxos shows to greatest advantage in the morning light, for then the separate ranges of the interior are brought out distinctly, and all the rich land along the levels and hillsides is seen. It is not a mere rocky ridge, like Tenos, for we could see deep valleys running inwards, and giving evidence of fertile districts between the mountains on the coast and the higher peaks behind. In ancient times it was regarded as the most opulent of all the islands (Herod. v. 28), and at the present day it is very prosperous. The emery, which was already famous in Pindar's time (*Ναξία πέτρα*, *Isthm.* v. 107), is still its principal export. Tournefort, writing nearly two centuries ago, describes its abundance by saying, "the English often ballast their ships with it." On the opposite side of the strait we passed the town of Marmara, near the shore of Paros, the highest point of which island, Mount Marpessa, the seat of the famous marble quarries, rose above.

Greek sailors are usually an interesting study, and our present crew were no exception to the rule. Our headman, Captain Constantine—for this title he bore in our boat's papers, which were inspected at every island—was a strange being. A Silenus in figure, for his punchy frame was nearly as broad as long; a Cyclops in face, for he was one-eyed and very ugly; distinguished rather for grasping and cunning than for virtue: he nevertheless was good at his oar, an excellent sailor in an emergency, and thoroughly well acquainted with the winds of the Aegean and the shores and harbours of the islands. "Plenty of sail, plenty of way" (*πολλὰ πανιά, πολλὴς ἐόρμη*) was his answer, when his companions remonstrated at the amount of canvas we were carrying. His views of the medical faculty were worthy of Molière—"When I go to the doctor, I

get ill; as long as I keep away, I am well: when I eat much, I am well; when little, I am ill." The second, Yanni (Jack), whom we surnamed "the Conspirator," was a handsome man, with soft eyes and a thoughtful expression, but silent, and gifted with a will of his own, so that, whenever a difference arose between us and them about starting or stopping or changing our course, he was always the least disposed to yield. The third, George, who had accompanied us on our expedition to Delos, was a capital good-humoured hard-working lad, whose complexion and hair betokened some negro blood. They strongly resembled the old Greek sailors in their vivacity, talkativeness, readiness in action, freedom in giving an opinion, and indisposition to obey any one leader. Many of their nautical terms were from the Italian, as *lascia* "let go" (*lascia*), *rimóni* "rudder" (*timone*), *karanti* "rolling" (*caratare*, "to balance"): others, like sailors' terms everywhere, were difficult to explain. In particular, the words for "easy" (*ia móla*) and "hard" (*ia lísa*), are very difficult of derivation; that *ia móla* is *ia móla*, as some have suggested, is impossible, and in the passage quoted from Aristophanes (*Pax*, 460), where those words are used in hauling a rope, they clearly mean "pull hard": *ia lísa* sounds very like the Egyptian boatmen's cry "Aleysah," but here again there is no evidence of any connexion.

When we emerge from the channel between Naxos and Paros, we see on our left Heracleia and several other small islands; to the south-west Anaphe lies like a shadow on the horizon; Nio (Ios) and Sikino are comparatively near in front; and to the right appear Pholegandro, Siphno, Antiparo, and others less important. Again, as we enter the strait that separates Nio from Sikino, the twin peaks of Melo are faintly visible in the far west, and at last Therasia and Santorin, the southernmost of all, complete the number. We were more and more struck by the size of the islands, and their apparent distance from one another. We are now entering the Sporades, though from the vague way in which the term Cyclades was used, these outliers are sometimes included in that group. A few generations ago Heracleia was commonly called Racia, Anaphe Naphio, and Naxos Axia, and this last form we ourselves heard used on Tenos; we observed, however, that our sailors regularly employed the correct forms. It seems almost a parallel to the prefixing and omission of the *h* in English, when we find *n* prefixed in Nio, as in many other modern Greek names, but omitted in Axia. As this word, however, signifies "the Worthy," it is probably an instance of the fondness of the Greeks for changing the form of a name so as to give it an intelligible meaning.

The appearance of Ios is very rugged, as seen from the sea; but when we turned into the landlocked harbour on the west coast, passing a small lighthouse at the entrance, a smiling view awaited us, for the sloping hillsides are formed into terraces, which are very productive, and the vegetation of which is forward owing to their western aspect. The picturesqueness of the little bay is increased by a handsome church of St. Irene, which stands on a rock above the shore, having a Byzantine cupola and an Italian bell-tower with tiers of arches—a style of building which seems to prevail in these parts: at the landing-place there are a few houses, but the town is built high above, and is reached by a steep ascent of half-a-mile. We took up our quarters at the port, and then ascended to the town, where there are a few good-looking houses, while the rest are huddled together in the same way as at Naxos. The numerous small palm-trees that we saw there remind us that the island was once called Phoenice, and that the palm was inscribed on its coins; but, as a matter of fact, this tree will grow wherever it is cultivated in the Cyclades.

It is well known that in ancient times Ios claimed to be the burial-place of Homer, and in

modern days the question of the discovery of the sepulchre has raised a warm controversy. The story, which is a most curious one, can only be briefly alluded to here. In the year 1771, when the Aegean islands were in the hands of the Russians, Count Pasch van Krienen, a Dutch nobleman in the employ of that power, who afterwards wrote a book entitled *Breve descrizione dell' Arcipelago*, containing much valuable information about the state of these countries at that period, professed to have found the tomb at a place called Placoto, on the north-eastern side of this island. The discovery was the result of a month spent in excavation, and the account of it is embellished with semi-mythical details of a sitting figure being seen within at the moment of opening, which immediately crumbled to dust. To this is added minute information relating to the objects found there, and copies of inscriptions which identified the spot. The professed discovery naturally aroused great interest at the moment, and its reality was much debated by Heyne and others, but the controversy soon died out, and was not revived until 1840. Pasch van Krienen then found a fresh advocate in the eminent traveller Ludwig Ross, while Welcker, in an elaborate essay on the subject (see his *Kleine Schriften*, vol. iii.), has endeavoured to show that the whole thing was a forgery, and this he is generally thought to have proved. The facts which remain are these: that Ross found at Placoto a tolerably circumstantial tradition remaining of the place having been excavated by a stranger; that Biörnsthall, the Swede, saw at Leghorn the packages, though as yet unpacked, in which Pasch van Krienen had brought over the inscriptions he had collected in Ios and other islands; and from that time Pasch van Krienen wholly disappears from sight; and, like a character in a child's story, was "never heard of afterwards," neither himself nor his inscriptions, until a few years ago two of the latter, including one from Ios (unfortunately, of no great importance), were discovered in the basement storey of the British Museum, where they are still.

Among these amusing elements of uncertainty one fact remains undisputed, viz., that on a stone slab which was used as a bench in front of a church of Hagia Caterina, in the town of Ios, Pasch van Krienen found a genuine inscription which he copied and published in his book; for this was seen by Ross in the same position, and though it had been greatly defaced by exposure, there was enough remaining to identify it with Pasch van Krienen's copy. It consists mainly of a long list of names; and as the introductory lines seem to contain a reference to Homer, it is Welcker's opinion that there existed in Ios a Homeric school, and that a number of its members had inscribed their names on this stone. As nearly forty years had elapsed since Ross's visit, we were desirous to know whether the inscription still existed, and with this view we enquired for the church of St. Catherine. From a dirty but civil man who offered to be our guide, we discovered that there were two dedicated to that saint, a circumstance that illustrates the extraordinary number of little churches with which this town swarms; for, as our native remarked with a tone of enlightenment, "in the Middle Ages, when persons were ignorant, the priests persuaded them that it was a pious thing to build so many churches." Some of these were simply a tiny dome supported by four walls, almost resembling the tombs of sheikhs which are seen in Turkey; but, except in some five regular churches, service is performed only three or four times a year. One of St. Catherine's shrines was in the lower, the other in the upper part of the town, but at neither of them could the stone be found; at the latter, however, a woman said that there had been an inscribed stone in the position we described, but that it had been removed by the bishop to his house, probably to preserve it. The bishop unfortunately was absent, and we could not obtain admission

into his precincts; thus, as far as we were concerned, this relic of Pasch van Krienen's investigations, like the rest, passed out of reach of discovery.

Above the highest part of the town rises a steep mass of granite, of which stone this portion of the island is composed. We found the summit blue with innumerable small irises (*Iris sisyrinchium*), and the view of the town below was curious from the flat roofs of the houses—a feature which is found in most of the islands and in Crete—and the numerous churches interspersed among them. But what most attracted our attention was Santorin, into the strange basin of which we now looked for the first time; and, softly delineated as it was, with the lofty peak of Hagios Elias behind, and in front the calm sea streaked with lines of currents, it looked to me a sort of Promised Land, after having been the subject of so many expectations. A gentleman of Nio, who came to visit us at the landing place, described how he had seen it in eruption from that point (the distance to the new crater is about twenty miles), and said that the effect was very striking. They do not feel the earthquake much here, as we should expect they would; as it is more felt at Melos, it would seem that the wave of movement passes in that direction.

H. F. TOZER.

SION COLLEGE.

THERE is now before Parliament a bill for enabling the authorities of Sion College so to deal with their property as to render it more productive, either by granting leases or by selling any portion of it. The powers for which they ask will, if granted, extend to the buildings of the College itself and the ground on which it stands, so that, in the event of the bill passing, we may before long have another example of the way in which localities are constantly being robbed of their old associations. We have seen the Charterhouse carried off into the middle of the next county. Sion College will never be so great a traveller as that, since it is to be limited to a radius of a mile and a half from its present site in its search after a new settlement. Still, should it be moved at all, it will be missed. For nearly two centuries and a half it has stood where now it stands, a sort of protest against the money-making whirl by which it has been surrounded. But now we must not be surprised to see warehouses and offices spring up on the spot which has hitherto afforded a retreat for the student and a refuge for the aged.

In 1329 William Elsing, a citizen of London, founded a hospital, which he called Elsing Spital, for the maintenance of a warden, a priest, and a hundred blind paupers. This was afterwards developed into a priory of canons regular, under the name of the Priory of St. Mary of Elsing. At the time of the dissolution of the monasteries and religious houses the priory fell into the hands of Lord Williams of Thame, Master of the King's Jewels, by whom it was converted into a residence. The churchyard became a garden, the cloisters a gallery, and the lodgings of the blind paupers stables. On Christmas Eve, 1541, the whole place was burnt down; but it was rebuilt by Lord Williams' daughter, who afterwards sold it to Sir Rowland Hayward, Lord Mayor of London. The property then passed through several hands until it came into the possession of the executors of Dr. Thomas White, Vicar of St. Dunstan-in-the-West. Fuller tells us that Dr. White, who was accounted a good preacher in the reign of Queen Elizabeth, was accused of being a great pluralist, "though," says Fuller, "I cannot learn that at once he had more than one cure of souls, the rest being Dignities." He was best known by his charities, which were numerous. In 1613 he built and endowed a hospital at his birthplace, Bristol, and by his will he left 3,000*l.* to be expended in the purchase of a house to be used as "a College of the Ministers,

Rectors and Vicars, Lecturers and Curates within the City of London and the suburbs thereof" (or, as Fuller expresses it, "to be a Ramah for the sons of the Prophets in London"), and also an almshouse "fast by the College for ten men and as many women to dwell in." He also devised real estate of the yearly value of 160*l.*, of which 120*l.* was to be devoted to the almshouse, and the remaining 40*l.* to the college. Out of the latter sum the clergy were to be provided with four dinners a-year, on which occasions their appetites were to be whetted by a Latin sermon. In pursuance of these directions Dr. White's executors purchased the premises which then occupied the site of Elsing Priory, and proceeded to adapt them to their new purpose. The library, which may now be considered the most valuable portion of the institution, was no part of the original benefaction, Dr. White having bequeathed his own library to the Chapter of Windsor, but was the sole gift of the Rev. John Simson, one of the executors. Fuller speaks very enthusiastically of Mr. Simson:—

"Now, as Camillus was counted a second Romulus, for enlarging and beautifying the City of Rome, so Mr. John Simson, Minister of St. Olave's Hart Street, London, may be said a second White, for perfecting the aforesaid College of Sion, building the Gate-house with a fair case for the library, and endowing it with threescore pounds per annum."

In 1631, eight years after Dr. White's death, King Charles I. granted letters patent for giving the College a legal existence as a corporate body, under the name of "The President and Fellows of Sion College within the City of London." It was to consist of

"all and singular the Rectors and Vicars of churches, Lecturers and Curates within the City of London and the suburbs thereof, who should have been, or thereafter be canonically instituted in any of those churches, and should for the time being have authority to preach from the Bishop of London, and be resident there and duly constituted priests."

Of these members one was to be the President, two others Deans, four others Assistants, and the rest Fellows. The almshouse, in which ten poor men and ten poor women were to reside, was to be called "the Hospital of the President, Deans and Assistants of Sion College within the City of London." The letters patent authorised the college, notwithstanding the statute of mortmain, to hold the real estate devised to it by the testator, as well as the endowment of 60*l.* bestowed upon it by Mr. Simson, which was also derived from real property. The management of the almshouse was committed to the President, Deans and Assistants of the College, who, in the following year, adopted for their common seal the device of the Good Samaritan, with the motto "Vade et fac similiter." In 1647 the library was enriched by the addition of a large number of books which were transferred to it from Old St. Paul's, but in the great fire of 1666 a considerable proportion of the books, as well as of the college buildings, was destroyed. Subsequently the premises were entirely rebuilt, and the library was soon restored to more than its former glory by gifts and legacies. It is not unnatural that what has now become such a very fine collection of books should attract more attention from outsiders than the strictly charitable portion of the institution, notwithstanding that the College, by its seal, puts the latter forward as its main feature. Of the twenty tenants of the almshouse, who must be unmarried and over fifty years of age, four are nominated by the city of Bristol, where Dr. White was born; six by the parish of St. Dunstan, of which he was vicar for forty-nine years; two by the parish of St. Gregory, where he lived for twenty years; and the remaining eight by the Merchant Taylors' Company.

We are in the habit of taking it for granted that any institution with an endowment a century or two old must have more money than it knows what to do with; but such is not the case with Sion College. On the contrary, its ordinary re-

venues have to be supplemented by annual subscriptions, not only from the Fellows, but from other clergy besides. We cannot, therefore, be surprised at the promotion in Parliament of the present bill, which, if it becomes law, will enable the President and Fellows to render the College property more productive, and to provide better accommodation as well for their very valuable library, which has quite outgrown its present quarters, as for the recipients of the charity which they administer.

CORRESPONDENCE.

BLAKE'S SONGS OF INNOCENCE.

Brompton: June 14, 1875.

I have been favoured by Mr. Pearson, of York Street, Covent Garden, with a sight of the remarkable copy of Blake's *Songs of Innocence* purchased by him last week at Messrs. Sotheby's auction-rooms, and having carefully inspected it, I wish, for the sake of lovers of Blake, to note down a few memoranda concerning it.

First of all, this is one of the original copies issued in 1789, before the companion series of *Songs of Experience* was projected or contemplated. This is evident from the fact that three songs, "The Schoolboy," "The Little Girl Lost," and "The Little Girl Found"—afterwards relegated to the later series—here appear as *Songs of Innocence*,—making the total number of pages thirty-one, instead of twenty-seven, the usual number.

Secondly, this copy is printed off on both sides of the paper, with inestimable advantage to the

symmetry, harmonious appearance and general artistic effect of the book. This is a peculiarity I have never seen in any other copy except in two leaves only of the beautiful copy of the Two Series in the Print Room of the British Museum—those, viz., containing "Holy Thursday," "Nurse's Song" and "The Echoing Green." All the ordinary copies are printed only on one side of the paper.

Thirdly, this copy is one of extraordinary beauty in regard to the colouring. Since I first edited Blake's *Songs of Innocence* for Mr. Pickering in 1866, I have seen many copies, but none to equal or approach this. It was executed for Samuel Rogers, the author of *The Pleasures of Memory*, to whose taste and discernment this early recognition of his brother-poet is highly honourable. From his collection through a relative and representative it is derived. It is well-known that when Blake received a liberal commission, he would spare no labour to make the colouring as rich as it might be, and never does he seem to have exerted himself more happily than on the present occasion. Words are inadequate to describe the tender and delicate beauty of the tints. Each page is a picture that might be mounted and framed.

RICHARD HERNE SHEPHERD.

PYTHAGORAS.

Kensington: June 16, 1875.

In your issue of June 12 you say:—"Karl Blind's paper on 'Fire Burial among our Germanic Ancestors' contains the results of a good deal of reading, as well arranged as could be expected from a writer capable of suggesting that Pythagoras means Buddhagoras."

Allow me to observe that I did not make this suggestion. I simply alluded to a theory which had been started by others. Since Schlegel suggested a Hindoo origin for a Pythagorean doctrine, and since Colebrooke tried to show that the Indians were the teachers of the Greeks in philosophy, especially of Pythagoras, there have been other writers who endeavoured to make out a close connexion between Buddhistic and Pythagorean doctrines: some going so far as to emit the hypothesis that Pythagoras, in his travels, received instruction perhaps from Sakya Muni himself; nay, that the very name of Pythagoras, in a Greek form, possibly pointed to the spiritual teacher of the Far East.

All that I said was this: "Pythagoras was an enemy of cremation; a fact which may go to strengthen the view of those who regard him as the Buddhagoras, or propagator of Buddhistic doctrines." This mere incidental reference to a view which I did not start should, therefore, not be treated as if it contained an "αὐτὸς ἔφα" of mine.

KARL BLIND.

AN ENGLISH VIEW OF M. DE RÉMUSAT.

Kensington: June 14, 1875.

If we desired to find a typical representative of the class of Immortal for whom clever men outside the Academy despise it, and for whom sensible men who value the Academy esteem it, we could hardly wish for a better representative than M. de Rémusat, who was a distinguished man of letters because he was an estimable man of affairs, just as if it had so happened that M. Thiers had prevailed over M. Guizot before the downfall of the Monarchy of July, he would have been a distinguished man of affairs because he was an estimable man of letters. There is something peculiarly French in the unreserved respect which is paid to such a career by all who are themselves respectable; and it may be added there was something peculiarly French in the kind of erudition to which he devoted himself after the final defeat of M. Thiers in 1840. He accumulated knowledge at first hand about Abelard and St. Anselm and English philosophers from Bacon to Locke to

bring them to the tribunal of a judgment which was an unusually favourable specimen of that class of judgments which commonly exercise themselves upon third-hand knowledge. His criticism of Hobbes, for instance, is merely a well-turned appeal to commonplace good feeling. All his books come round to the question what is an upright judicious accomplished gentleman of the nineteenth century to think of the past, and he seldom gets beyond making the question intelligible; indeed, a cynic might think that the question has been made unfruitful in order to make it intelligible. M. de Rémusat was one of the generation who made the celebrity of the *Globe*, and like most of his collaborators he knew much better how to describe the conditions necessary to national well-being and well-doing than how to set about establishing them. He was always insisting how necessary it was to reconcile order and liberty, and faith and reason, and the like, and exhausting himself in ingenious statements of the difficulties to be surmounted, and he did not quite sufficiently remember De Retz's dictum that the rights of king and people agree best in silence, which is quite as true of the yet more important rights of knowledge and piety. M. Janet in the *Revue des Deux Mondes* for March 1 regarded it as M. de Rémusat's peculiar distinction that he did not like the other members of M. Cousin's school suppress the difficulties. This is perhaps true of his philosophy of religion and psychology, where in fact he sees the difficulties so well that he is afraid to stir a step beyond first principles, and is always laying the foundation over again in a fit of serious exhilaration because he hopes that it is really almost solid, when the natural man would have desired to see the superstructure completed or restored. But in politics he never even got to the bottom of his favourite proposition that England was a much happier country than France for men of character and education who take a strong interest in public affairs. One of the fullest and most judicious of his works is on the English public men of the eighteenth century; but he never really faces the fact that Walpole led the first two Georges to make a situation for their successors which it is hardly likely those successors will occupy for ever, and which no other dynasty that respects itself can be rationally asked to accept. But though the want of thoroughness which made M. de Rémusat inconclusive on speculative subjects made him unconvincing on practical subjects, there was something instructive, or at any rate elevating, in his rare combination of knowledge and earnestness and candour. He was buried in the cemetery of Picpus as a descendant of one of the victims of the Terror, but he was almost an apologist for the French Revolution, and maintained that it would have triumphed over Pitt if Napoleon had known how to leave off. He himself was in no danger of not knowing how to leave off. He was, if possible, more anxious to reconcile thought and positive religion (mere spiritual philosophy was not enough for him) than to reconcile liberty, or rather liberalism, with public order; but he was afraid to suggest anything beyond Channing. It is characteristic of the hopefulness which went with his timidity that he thought that as a stepping-stone or as a resting-place Channing would serve.

G. A. SIMCOX.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 19, 3 p.m. *Sweethearts* at the Prince of Wales's Theatre.
 ,, Fifth Summer Concert, Crystal Palace (*Acis and Galatea*).
 8 p.m. Production of Auber's *Haydée* at the Gaiety Theatre.
 MONDAY, June 21, 3 p.m. *Asiatic*: Major H. F. Blair on "Sculptures from the North-West Frontier of India;" Mr. F. Pinnett on "The Trisula of Buddhist Sculpture."

MONDAY, June 21, 8 p.m. Seventh Philharmonic Concert (St. James's Hall).
 TUESDAY, June 22, 8 p.m. Anthropological Institute: Mr. Herbert Spencer on "The Comparative Psychology of Man;" Mr. J. Forrest on "The Natives of Central and Western Australia;" Captain J. A. Lawson on "The Papuans of New Guinea."
 WEDNESDAY, June 23, 8 p.m. Geological.
 ,, Royal Society of Literature: Dr. G. Birdwood on "Some Documents recently discovered in the India Office."
 8.30 p.m. Messrs. Ludwig and Danbert's last Concert (Langham Hall).
 THURSDAY, June 24, 5 p.m. Zoological Gardens (Davis Lecture): Dr. Pye Smith on "The Locomotion of Animals."
 6.30 p.m. Royal Society Club: Anniversary.
 8.30 p.m. Antiquaries.
 FRIDAY, June 25, 7.30 p.m. London Anthropological: Mr. C. Staniland Wake on "The Origin of the Moral Idea;" Dr. J. Kaine on "Mythology;" Dr. Blikkers, "A Glance at the Anthropological Aspect of Linguistic Metaphor."
 8 p.m. Quekett Club: Mr. B. T. Lowne on "The Histology of the Eye."
 I.

SCIENCE.

The Dialect of the English Gipsies. By B. C. Smart, M.D., and H. T. Crofton. Second Edition, Revised and greatly Enlarged. (London: Asher & Co., 1875.)

It is not impossible that at some distant day, when philology and ethnology shall have attained something like perfection, this work of Dr. Smart and his colleague Mr. Crofton will be pointed out as a curious illustration of the irregular manner in which industry was applied in these our days. For while Englishmen have gathered and garnered up crops of languages and dialects, sub-dialects and slangs, whether in the back-hills of India and the Andes, or the purlieus of Whitechapel, Anglo-Romany remained almost unnoticed as to its grammar, until Dr. Smart many years ago published what he had been able to secure in the little pamphlet which formed the first edition of the present work. And even now this book is the only one which presents the single conjugation and sole declension known to this language of happy simplicity. As regards its vocabulary, English Romany is still very imperfectly represented, both in the *Lavo-lil* of Mr. George Borrow, and in the volume before me.

The neglect which this tongue has experienced cannot certainly be excused on the ground that it is wanting in interest or value. Apart from a slight admixture in it of Greek and Slavonian—the French words adduced by Smart and Miklosich being all doubtful—it gives us a Hindi-Persian language, which, though classed by Miklosich as modern, is remarkable in this, that many of its words are really more Sanskrit than Prakrit. And when we find that one of the castes, or out-castes, of India which appears to have contributed a share towards our Gipsies, is mentioned in the Vedas, there is reason to admit that the dialect may be very old. I refer to the Dom (masc.), and the Domni (fem.), whose collective existence is set forth by the word Domnipana, all of which terms are exactly reflected in the English Gipsy Rom, Romni, and Romnipen, i.e., a male Gipsy, a female Gipsy, and Gipsydom—*d* often changing to *r*, as is seen in *doi*, "a spoon" in Hindu, which in Romany is *roi*. As the vulgar are generally con-

servators of old words, we have in the very degradation of the Indian Gipsies an apparent reason for the great antiquity of Anglo-Romany terms, most of which came from India at least five hundred years ago. Other tribes than the Doms doubtless contributed their share, for it is remarkable that there are in India two other kinds of Gipsies—the Nāts, or musicians and dancers, and the Banjari, or itinerant pedlars. It is very probable that these may have been added to the Jats described by Captain Richard Burton in his late extremely interesting letter to the ACADEMY. It is certain that in Europe they have practised the arts of palmistry, blacksmithing and tinkering, music and tumbling, or dancing, slaying animals, peddling and basket-making, exactly as is done by the Indian wanderers. When we add to a very curious and copious stock of old Indian words from various sources, a large proportion of Persian, it will be seen that the element of philological interest is not wanting to Romany. A Persian gentleman whom I often plied with it, more than once said of it: "What a strange language! all full of old forgotten vulgar Persian words, such as one hears from peasant-grandmothers." And it is remarkable that English Gipsy abounds more in these antiques than other Romany dialects, though as regards grammar it is simpler than any of them. Whether this simplicity is the result of decay, or whether it really presents some different stage or early formation of the language, is yet to be determined.

By consulting Dr. Smart's work the reader will find that Romany has no infinitive. As the abstract meaning of every verb is used in most languages as an imperative, so in Gipsy *jim* (Hindi *jāna*) becomes the imperative *jinar* (know), which is used as an infinitive. *Jinava*, "I know," is also the future "I will know," on the principle which causes certain people to say "I go to London tomorrow." With an imperfect tense for all past times—e.g., *jindom* or *jidom*—and a participle, the verb is fully equipped for all its functions. To express an active agent, *n* or *en* is affixed to the noun, thus changing it into an adjective (often formed by the addition of *ni* or *no*), to which the syllable *gro* is added, making *engro*. *Gro* is probably the Persian *gar* with the common termination in *o*. Thus when *engro* is affixed to *pir*, i.e. "walk," we have *pirengro* "a walker." *Engri*, or *engree*, in like manner forms any thing derived, e.g., *bosh*, noise, music, or to fiddle, whence *boshom-engri*, "a fiddle." *Eskro* is the common adjectival termination, which is probably a post-position like *ka* or *ki* in Hindustani, e.g., *wuk* (*yuv* or *yo*, Gipsy), "he," *us-ka*, "of him," or *us-ki*. Here we have a trace of the *s*. This is varied sometimes by the addition of *ni* or *no* to the primitive. It would be difficult to conceive a simpler language than this, yet nearly all, even of those who pretend to speak it well, make it much simpler by naively confusing *esko* and *engro*, and otherwise wronging a grammar which has been already stripped almost to the skin.

Dr. Smart has not only restored much of the old grammar, but by comparing its forms with those of a perfect dialect gives us an

idea of what has probably been lost. He also clearly explains by example the difference between pure Rommany and the broken dialect or half-English such as is commonly spoken on the roads, and such as is set forth by Mr. George Borrow in his different works, and by myself in *The English Gipsies*. For within the past generation Gipsydom has broken up with startling rapidity; the dark full blood has almost disappeared into the *posh-an-posh*, or half-breed, its old customs are well-nigh gone, the current language is a mere jargon, and there are perhaps as many men English born who can converse in pure Hindi itself as in pure Rommany. It is but two days since I listened to the lament of a gipsy woman who is now nearly a hundred years old, but still very intelligent, over the decay of her race in England, the disappearance of Gipsy faith to one another and the increasing dishonesty of "the people" to those gorgios or gentiles who allow them to camp on their lands. "It is all gone—gone!" she said. "Our people have gone with their truth." I seemed to be listening again in America to some old Red Indian speaking of his tribe. A few years ago a friend of mine found in a remote glen of the far West a venerable old chief living alone. "Where are your friends, your family, your tribe?" enquired the American. Lifting his finger with an air of great dignity and pathos, the old man exclaimed: "One."

This Indian was the sole representative of a language, and in this respect the Anglo-Rommany tongue resembles it by being often preserved as to many words by a single person. It is true that there are many wealthy and well-educated people, especially in America, who, while concealing a Rommany descent, have kept the language with great care. Many of them possess vocabularies. But with this knowledge they invariably inherit an intense repugnance to have it made public property, for if the Gipsies had a Decalogue its first commandment would be: "Thou shalt not teach Rommany to any Gorgio." This feeling was derived from India, where all the different kinds of Gipsies have their secret dialects, and is intensified among our high-class of crypto-Rommanis, who are even more averse to having their tongue made known than are the Gipsies of the tent and the road.

Dr. Smart and his colleague have very honestly given as much of the grammar as they could collect, but they do not seem to suspect that anything has escaped them; in fact, if there be a fault in this otherwise excellent book, it is the manifest and complacent faith of the writers that their resources are exclusive and perfect, and that their knowledge of the language—or at least that of their teacher—is all-embracing. This is sufficiently evident from their naïve boast that no one ever published such "deep Romanes" as they—the truth being that no one before them ever professed or pretended to teach "deep" or grammatical Rommany at all, reminding us of the little Indian boy of Harvard in the olden time, who boasted that he was at the head of his class—when he was the only one in it. They have, however, done their work well, though had they

gone a little beyond their *gürü* Bosville, they might have done better. Thus Dr. Smart has given us the Anglo-Rommany conjugation of *shom*, "I am," as (sing.) *shom, shan, see*; (plural) *shomas, shanas, sas*, which he compares with the Turkish Gipsy *isom, isan, isi, isomas, isanas, isas*, not appearing to have known that there are in England Rommanis who conjugate this tense almost exactly in the Turkish-Rommany form, e.g., *sum, san* or *sun, see*; *sumas, san* or *sun, sas* or *sus*, as I myself noted it down long ago, without a thought of Turkish-Gipsy, it being the very first conjugation ever taught me by an English Rom. Nor does Dr. Smart appear to suspect that the occasional prefix of *kam*, i.e. "will," to portions of verbs in England is not merely a chance combination of one verb with another, but much more probably the remains of a future tense similar to that found in the Continental dialects. He tells us truly that *kairdús* (he made) is a contracted form of a past participle, as *kairdo + see* (he made). I have, however, heard and noted down "*Huv* (i.e. *yuv*) *si kérdo*"—(he did it), a form which was certainly worth preserving. Nor does he mention that abstract nouns are often formed by adding *is* or *us*. It is true that he sets *os* and *us* down as Class V. of general terminations, but does this declaring that this ending, which is really of Indian origin, is apparently merely a cant form. But even cant contains much pure Rommany which has been abandoned by the Gipsies as soon as they found it was known to Gorgios—which gradual impoverishment has been a great cause of the decay of the language. It would have been worth observing that *moro* (our) sometimes occurs as *morni*, and that *tiro* (thine) occasionally takes the form *turo*. These variations should be carefully studied, since instead of being corruptions from a Turkish Gipsy source, they are more probably pure Indo-Persian. Thus Dr. Smart gives the Turkish gipsy *tam* (blind) as the original of *tamlo* (dark), and thinks that according to the common identification of opposites, *tamlo* (sunny) is a corruption of *kamlo* (sunny), when the real origin of both is to be found in the Hindu *tam* (shade or gloom). He observes the existence of this combination of contrary meanings in one word, but does not explain it as he easily might by referring to the Hindu originals. Thus in Hindu *kal* is both yesterday and to-morrow, as it also is in Rommany with the addition of the genetival *ko*, e.g. *kaliko*.

Dr. Smart has had two great impediments in his way, either of which would effectually prevent a critical analysis of the language which he discusses, the one being the narrow limit of his vocabulary, the other his full belief that all English Gipsy is contained in and was derived from the Turkish Rommany. No old-fashioned orthodox scholar was ever apparently more convinced that Latin and Greek were derived from Hebrew, and that the latter was the original tongue in Eden, than our author is that there is no Rommany save Turkish, and that Paspatis is its prophet. So far as the principal outlines of the grammar are concerned the parallel with Turkish Gipsy is not unreasonable. But when we come to the origin of Anglo-Rommany words, and the curious and often delicate sources

of their derivation, most of our aid must be derived from Hindi, Persian, and their affinities. And here Turkish Gipsy is of little aid. Thus in English Rommany we have *gudlo*, meaning "the brain, kernel, or marrow, a riot, a row, sweet, and cruel," while in Hindu the separate originals of these are very evidently *guda*, "brain, marrow, and kernel," *gudal*, "a tumult," &c., and *gur*, "molasses or coarse sugar;" *gur*, it is true, departs widely from *gudlo*, but the latter word is in other countries given as *gu'lo* and *gurlö*. The reader may possibly recall Mr. Borrow's Hungarian *gulo rai*, or "sweet gentleman."

The best part of this book, especially for the general reader, is its illustrations of the language, consisting of stories, dialogues, anecdotes, and letters. I except from these the translations from Esop's fables and the Bible, because they seem stiff and forced and foreign to the habits of Gipsy thought. It is most decidedly to be hoped that a certain Gipsy's "Remarks on Mixed Marriages," as well as his "Practical Joke," which the writer has not dared to translate, will be omitted from future editions. Their presence is probably due to some of "the infusion of fresh blood" and "zymotic activity," which, we are assured in the introduction, "have led to combined and successful efforts to obtain further facts to fill former vacancies." The readers of the ACADEMY will probably be unanimously of opinion that this particular vacancy had better remain unfilled. The danger of following implicitly a single informant is shown by the spelling throughout this book, which is such as could not have been adopted had the authors carefully sought to attain the standard which really exists. The English *o* (as in *kosht*) is but a coarse rendering of the *ā*, which assimilates to the continental Rommany and Hindu; *oo* (as in *poos, pootch*) is more prolonged than the true sound *ū*, and *aw* as a plural is less refined and less accurate than *ia* or *ya*, while *gaujo* (Gentile), even though it resembles the Turkish Gipsy, *gajo*, is generally pronounced *gorgio*, after its probable original *goraje*, i.e. "master white man." The same word is effectively found in the common English Rommany *goro* or *geero*, "a person." Apart from these trifling failings the work is admirable. It is unfortunately the lot of every pioneer to have the hardest work, encounter the hardest knocks, and get the least reward. The world is slow to appreciate the value of novelty, while the defects of the labourer are invariably apparent. I would therefore urge the more earnestly that this first attempt to preserve in its purity a very beautiful and musical dialect peculiar to England should not be judged by its few faults, but by its many merits. It has been very honestly done, with great labour—that labour which always, in philology, attends the derivation of knowledge from original sources.

CHARLES G. LELAND.

KANT AND COMTE.

Kant und die Positive Philosophie. Von Robert Zimmermann. (Wien, 1874.)

THE question whether Comte was acquainted with Kant's philosophy, or in any way dependent on the results established by the

author of the *Kritik der reinen Vernunft*, has been discussed very fully and very ably by Dr. Zimmermann in the *Sitzungsberichte der phil.-hist. Classe der Kais. Akademie der Wissenschaften*, April, 1874. Examining the statements of Littré, he shows that Comte, when he published in 1822 his first book, *Les Travaux nécessaires pour réorganiser la société*, hardly knew even the name of Kant. Yet Comte himself maintains that at that time his own philosophy was in all essentials complete. It was not till the end of 1824, when he had republished his early work under the title of *Système de Politique Positive*, that his friend, Gustav von Eichthal, the distinguished scholar and philosopher, still full of activity at Paris, drew his attention to one of Kant's smaller essays, *Idee von einer Allgemeinen Geschichte in weltbürgerlicher Absicht*, first published in 1784 (ed. Hartenstein, vol. iv. pp. 291-309). This is an essay of about eighteen pages, which has attracted but little attention in Germany, being, in fact, no more than a sketch of a possible philosophy of history, that should show how far, at different periods in the world's history, humanity had approached or receded from its highest goal, the realisation of the most perfect form of society and government. Comte, judging from a translation which Eichthal had sent him, calls that essay *prodigieux pour l'époque*; if he had known it six or seven years before, he says, it would have saved him much work; nay, after having seen it, he claims no more for himself *que d'avoir systématisé et arrêté la conception ébauchée par Kant*.

Though this recognition of Kant's merits reflects great credit on the French philosopher, it shows at the same time that Kant's real position in the onward course of philosophic thought was a complete mystery to Comte. Of Kant as the reformer of the old, and the founder of the new philosophy of the world, Comte seems never to have heard. Comte is still positive, where Kant is critical. Comte has no answer whatever to Hume, to Berkeley, to Locke. He is a Baconian, born out of due time. Since Bacon's time Locke had proved that much of what we consider as simply given in experience is subjective; that all so-called secondary qualities, colour, sound, etc., are fates of the subject, and cannot possibly belong to the object. Berkeley had extended Locke's reasoning to the primary qualities, and denied the objectivity, or, as it was called, real existence, of all external things. Those who simply decline to accept as senseless Berkeley's solution of the difficulties regarding our knowledge of things, viz., that it is due to the working of God within the human mind, must not imagine that the difficulties themselves have thus been removed. They cannot be removed, except by accepting Kant's solution. Philosophers may again sink down to the level of common sense and call that positive philosophy, only they should remember that in doing so they purposely ignore all philosophic work since Bacon. It may be that Kant in the end arrived at the same conclusions, but if he did so, it was by first accepting the challenge of Locke, Berkeley, and Hume, and by patiently removing the gigantic blocks by which those philosophers had tried

to bar the onward course of all philosophy; it was not by a mere relapse into the naïve dogmatism of experience. That dogmatism is best represented by Hobbes, who in denouncing the possibility of all theological and metaphysical knowledge, has once for all performed the task which is represented as the chief task of positive philosophy, and has shown better than anyone else that our principal conceptions pass through a theological or fictitious and a metaphysical or abstract state before they reach a positive or scientific character. The problem which the true historian has still to solve is, whether these earlier stages of knowledge were simply the result of temporary illusions, or whether they can be explained as necessary stages in the development of the human mind. The problem which the true philosopher cannot ignore is, whether by accepting the facts of our physical experience and trying by induction to discover the invariable laws by which they are governed, modern reasoners are not unconsciously relapsing into that very metaphysical stage which we thought we had left behind, admitting such conceptions as causality, invariability and law, without ever attempting to show that there is or that there can be any warrant for them in our actual experience. Kant, the German metaphysician, is in that respect far less metaphysical than Comte, the French positivist. Kant fully admits the subjective character of such conceptions as causality, invariability, and law; only while Hume, awed by the idolon of so-called objective truth, feels inclined to surrender these conceptions, as purely subjective, and therefore invalid, Kant, taking his stand on the rights of the subject as equal at least to those of the object, established their inevitability, and therefore their legitimacy, at all events, in human knowledge. Kant's philosophy has been called transcendental realism, as opposed to the crude realism of Hobbes; and if I understand rightly what is now meant by transfigured realism, I should venture to say that it was in reality but another version of Kant's philosophy.

Kant's essay on the philosophy of history, of which Comte spoke so highly, contains several ideas which may be interesting even at the present day to the students of Buckle and other writers on Sociology. I quote a few passages:—

"Whatever idea we may form of the freedom of the will, the actions of men, in which that freedom manifests itself, are, like all other events in nature, subject to general laws. History, which has to recount those manifestations, must not give up the hope that, however deeply hidden the causes of those manifestations may be, it will be possible, by taking the largest possible view of the play of freedom of the human will, to discover in it something like a regular movement. Whatever strikes us as complicated and irregular in individuals may be recognised after all, if we look at the whole race, as a regularly progressive, though slow, development of original dispositions. Marriages, for instance, and the births and deaths resulting from them, seem at first sight to be influenced by the free choice of man only, and subject to no rule according to which their number might be calculated and predicted. Nevertheless, the annual statistics published in great countries prove that they are regulated by certain natural laws, quite as much as the inconstant states of the atmosphere. . . . The question is whether,

with human beings who act without any plan, it is possible, nevertheless, to treat their history as realising a definite plan of nature. We shall only try to indicate an outline of such a history, trusting to nature to produce the man capable of working it out, as she produced a Kepler to arrange the excentric courses of the planets under fixed laws, and a Newton to explain these laws as the result of one general natural cause."

And again:—

"The means by which Nature carries out the development of all natural dispositions must be sought for in their antagonism in society, which antagonism reduces them in the end to something like lawful order. I understand by antagonism the *unsocial sociability* of men, i.e., their disposition to enter into society, and, at the same time, their determined opposition to it, which constantly threatens to dissolve society."

Most striking are Kant's remarks on war and its consequences, such as oppressive national debts, general armaments, and all the rest, which, as he hopes, will, in the end, when they become intolerable, lead by necessity to an international or amphiktyonic government. This alone, he thinks, will guarantee the necessary freedom of each individual state, and secure the greatest development of all the faculties of every citizen.

MAX MÜLLER.

SCIENCE NOTES.

Transit of Venus.—A detailed account from the French Expedition to Noumea (New Caledonia) is now given in the *Comptes Rendus*, from which it appears that the success of the party was very limited as regards the eye observations, ingress only being observed, and even that through cloud. From the situation of New Caledonia, nearly at the centre of the Earth's disc as seen from the sun, this observation is of comparatively little value, egress being the important phase for this station, which is, however, by no means a good one; though doubtless the fact of its being a French colony was an important consideration with the French government. No observation, however, will be thrown away, if made by careful observers, however far their station may be from what are, theoretically, the best points of view, and the observations made at Noumea, under peculiar atmospheric conditions, will certainly throw much light on the phenomena seen at other places. With three instruments, the limbs were sharply defined at internal contact, but with the other two alternate dark and bright portions of rings like diffraction bands were seen between Venus and the Sun; the mean of the times of appearance and disappearance of these agreed fairly well with those recorded by the other two observers for geometrical contact, a result which is in accordance with what was remarked by the observers at Sydney. The French party were joined by the Rev. R. Abbay (who was one of the observers of the eclipses of 1870 and 1871, and was on his way from Ceylon to Australia), and had thus five good observers besides their photographer. For ordinary assistants they had convicts, who worked so well that, though the expedition left France without huts or even stands for some of the instruments, everything was ready in less than a month after landing. Notwithstanding the cloudy state of the sky the photography was most successful, 240 daguerreotypes being obtained, of which at least 100 are good. Those near the egress will be especially valuable for comparison with the collodion photographs taken by Captain Abney at Thebes. It is amusing to notice that the three expeditions to Noumea, to Peking, and to St. Paul's Island attached some importance to the circumstance of the new moon falling on the day of the transit, but in Noumea they were led to believe that it always rained about that time, while at St. Paul's

Two tones are within beating distance the beats are heard also as a separate effect, disposes of the old theory of Young.

Third law, of Composition. Musical notes are heard in the ear as if they consisted of all the tones whose vibration numbers are as successive integers. It was shown that the note of a tuning-fork was composite, by presenting it successively to resonators tuned to the fundamental and octave, both of which were sounded by it. Any simple tones which belong to the harmonic series may be added to a note, and will produce only a change in the quality of tone without disturbance or beats. When composite notes are added instead, there is a difference which is inappreciable so long as the tuning is perfect. The effect of just chords thus constructed was shown on a harmonium; the full rich tone formed a great contrast to the ordinary effect of these instruments.

If the notes thus introduced do not belong to the harmonic series, there will be pairs of tones here and there within beating distance, and beats will arise. These beats of imperfect concords were illustrated by examples. It was also shown that, by using notes deprived of their fifth partials, a major third could be formed quite out of tune, which yet gave no beats.

The principal temperaments were then enumerated, viz., the equal temperament, the mean tone, the Greek, and the Arabic; this last is derived from the Greek by substituting Db for C# in the chord of A. Examples were played on concertinas tuned according to these temperaments, and the contrasts came out very markedly. The influence of the question on music was alluded to, and it was remarked that few musicians have ever heard a chord in perfect tune.

A member of the Association then remarked that De Morgan had formulated the second law on the supposition that the vibration number of the resultant tone was the greatest common measure, and not the difference of those of the primaries. The chairman pointed out that in this case there could be no resultant tone if the primaries were incommensurable, but as a matter of fact there is. Mr. Ellis observed that De Morgan's paper was written before Helmholtz's researches were known, and that the whole subject had since that time received thorough investigation.

ANTHROPOLOGICAL INSTITUTE (Tuesday, June 8).

COLONEL A. LANE FOX, President, in the Chair. —Captain Richard F. Burton, H.M.'s Consul at Trieste, read two papers on Ancient Remains in Dalmatia, viz.: "The Long Wall of Salona" and "The Ruined Cities of Pharia and Gelsa di Lesina." Salona was the Roman metropolis of Dalmatia, of which southernmost province of Austria Spalato is at present the natural, and Zara the artificial and political capital. The "long wall" was of doubtful and debated origin, and references to numerous ancient and a few modern writers on it were cited to show the obscurity in which it still remains. The author gave an account of his explorations with detailed measurements of the ancient structure, called by some "Cyclopean," and especially pointed out the great variety of stone-dressing it presented, which would afford valuable evidence in determining the style and perhaps the date of the work. His conviction that the long wall of Salona was Greek and pre-Roman rested very much upon the fact that similar constructions exist in the neighbourhood. In the island of Lesina, the two ruins visited and described by Captain Burton presented a remarkable resemblance, amounting almost to identity, to the long wall of Salona, and suggested that they were all the work of a single people, and that people not the barbarous Illyrians but the comparatively civilised Greeks. Only two lint implements had been found, and those were discovered at Salona, near Spalato. The exploration of the Dalmatian islands was attended with much

difficulty: the scarcity of water was an evil to be met, and a Slavic guide was necessary unless the traveller could himself speak Slavic, for the inhabitants all belonged to that race. The islands never having been previously explored (as far as the author was aware) by Englishmen, there was a large field of research for the antiquarian as well as the more general anthropologist. It was announced by the President that at the next and last meeting of the session, original papers would be communicated by Mr. Herbert Spencer, on "The Comparative Psychology of Man; by Mr. J. Forrest, on "The Central Tribes of Australia;" and by Captain J. A. Lawson, on "The Papuans of New Guinea."

GEOLOGICAL SOCIETY (Wednesday, June 9).

J. EVANS, Esq., V.P.R.S., President, in the Chair. Seven technical papers on palaeontological subjects were read at this meeting. Professor Owen, who was absent through indisposition, contributed a paper "On *Protrastomus sirenoides*," in which he gave his views on the evolution of the Sirenia. Mr. Miall read a paper "On the Structure of the skull of *Rhizodus*." This is a Carboniferous genus of ganoid fish, standing near to *Holoptichius* and *Megalichthys*. Mr. Hulke described a bone which was originally regarded by Mantell as the scapula of *Iguanodon*, and afterwards taken by the author for an ilium; but a recent examination of Mr. Fox's collection in the Isle of Wight had shown that it is probably a pubic bone. We are, therefore, now acquainted with all the pelvic elements in *Iguanodon*, and Mr. Hulke pointed out the relation of this pelvis to that of the ostrich. Mr. Walter Keating contributed some "Notes on the Palaeozoic Echini," in which he suggested the following classification. Dividing the order *Echinoidea* into two groups, the *Echinidea* and the *Perischoechinidea*, he subdivided the former into the *Stereodermata* and the *Echinothuridea*, while the *Stereodermata* in turn was divided into the *Endocyclica* and the *Exocyclica*. On the other hand the *Perischoechinidea* was separated into the *Tessellata* and the *Lepidodermata*. The *Echinothuridea* and the *Lepidodermata* form the group *Imbricata*. Professor Duncan described some fossil Alcyonaria from tertiary deposits in Australia and in New Zealand, and some fossil corals from tertiary beds in Tasmania.

PSYCHOLOGICAL SOCIETY OF GREAT BRITAIN (Wednesday, June 9).

MR. SERJEANT COX, President, in the Chair. Sir J. Heron Maxwell, Bart., and Mr. Epps were elected members. Mr. Sprague, of New York, was elected an honorary corresponding member. Several communications of psychological facts and phenomena were read. Mr. Serjeant Cox read a paper on "The Duality of the Mind." He said that the fact of the duplicity of the brain, first asserted by Galt, and afterwards by Dr. A. Wigan and Sir Henry Holland, was now confirmed by Brown-Séquard, all of whom deduced from this brain-structure that the mental faculties are duplex, that we have, in fact, two minds. This explained a multitude of mental phenomena otherwise inexplicable, especially Dr. Carpenter's "Unconscious Cerebration," and if true, was of incalculable importance to psychology. Many instances were narrated of total destruction of one hemisphere of the brain attended by only partial loss of mental power. An animated discussion followed, by Sir J. H. Maxwell, Rev. W. Moses, Major Owen, Mr. G. Harris, Mr. Coffin, and others. In closing the session, the President congratulated the Society on the great success it had found, and the interest taken in its proceedings both at home and abroad, and especially in its communications of psychological facts. The second session would commence in October. A vote of thanks to the President was proposed by Sir J. H. Maxwell.

ROYAL SOCIETY (Thursday, June 10).

MR. W. SPOTTISWOODE, M.A., Treasurer R.S., gave an account of his "Experiments on Stratification in Electrical Discharges through Rarefied Gases," the substance of which was as follows:—When an induction-coil with an ordinary contact-breaker is employed to produce stratified discharges in tubes containing rarefied gases, the striae are often unsteady in position and irregular in their distribution. The author's experiments led him to the conclusion that these irregularities are due chiefly to instrumental causes.

The induction-coil used was an "18-inch" by Apps, worked usually by ten or twenty small Leclanché cells. A new feature in this coil was its contact-breaker, which consisted of a steel rod as vibrator, having a small independent electromagnet for maintaining its action. When under the influence of the battery current and electromagnet it vibrated from 700 to 2,500 times per second. The amplitudes of vibration were small, not exceeding 0.01 of an inch, and to this fact, coupled with the extreme rapidity and consequent decision of make and break, was mainly attributed the steadiness of the results.

With this contact-breaker (called by the author a "high break") in action, it was observed that in a large number of tubes (especially hydrocarbons) the striae, instead of being sharp and flaky in form and irregular in distribution, were soft and rounded in outline, equidistant in their intervals, and steady in proportion to the regularity of the contact-breaker. To any sudden alteration in the action of the break (generally accompanied by an alteration in sound) there always corresponds an alteration in the striae. These discharges are those produced by breaking contact, but often the current produced by making contact is strong enough to produce a visible discharge. This happens with the ordinary as with the high break; but in the latter case the double current presents the remarkable peculiarity that the striae of one current are so arranged as to fit exactly into the intervals of the other, and further, that any disturbance affecting the column of striae due to one current affects similarly, with reference to absolute space, that due to the other.

The column, moreover, is frequently susceptible of a general motion or "flow," either forwards (from positive pole to negative) or backwards. This flow may be controlled both in velocity and direction by resistance introduced into the circuit, or by placing the tube in a magnetic field. The resistance may be introduced either into the primary or secondary circuit, and in either case the law appears to be established that, the striae being previously fixed, an increase of resistance produces a forward flow, a decrease of resistance a backward flow. A variation of three or four ohms (in the primary) is generally sufficient to produce this effect. When the striae are flowing they preserve their mutual distances and do not undergo increase or decrease in their number. Usually one or two remain permanently attached to the positive electrode, and as the moving column advances or recedes, the foremost stria diminishes in brilliancy, until after travelling over a distance less than the interval between two striae it is lost in darkness. The reverse takes place at the rear of the column. The rate of flow may vary considerably. In most cases, the true character of the discharge and the direction of the flow may be distinguished with the aid of a revolving mirror.

These phenomena may be produced with the Holtz machine, provided it be furnished with the usual Leyden jars, and a high resistance (usually a piece of wetted string) be interposed in the circuit. An increase of speed of the machine is equivalent to a diminution of resistance and produces a backward flow: a diminution of speed is equivalent to an augmentation of resistance and produces a forward flow. Hence the phenomena

of flow produced by the machine agree with those produced by the coil.

Ordinarily, if air resistance be included in the circuit, all trace of stratification disappears and the discharge is continuous. If, however, the interval of air be very small, the two kinds of discharge may be seen co-existing; a narrow column of the continuous discharge extends along the tube, and on it the striae appear to be strung.

SOCIETY OF ANTIQUARIES (Thursday, June 10).

MR. WOOD gave an account of the excavations which were conducted by him on the site of the Temple of Artemis at Ephesus. When he unwillingly abandoned the work in April, 1874, he had examined the site of the temple and of the platform on which it stood, except a portion at the east end, in which he expected to find remains of great importance. Some of the sculptures which he discovered have been for some time on view in the Elgin Room at the British Museum; but the larger portion are concealed from public inspection in the sheds which disfigure the portico, and in the basement. Among these stones there are between 400 and 500 inscriptions. Mr. Wood is very anxious to return and continue his investigations. Mr. Freshfield exhibited some stone implements found by him near the Gygean lake in Asia Minor, with views and photographs of the neighbourhood.

ROYAL ASTRONOMICAL SOCIETY (Friday, June 11).

PROFESSOR ADAMS, President, in the Chair. A paper by Mr. Knobel was read, giving some results of measures of magnitudes of stars with his astrometer, described in a previous paper, the principle of the instrument being to reduce the aperture of the telescope by means of a variable triangular diaphragm till the star disappeared. Mr. Knobel pointed out several discordances between his results and the magnitudes given by Argelander in his *Uranometria*, though those of the *Bonn Durchmusterung* agreed better. Mr. Marth called attention to approaching phenomena of the satellites of Saturn, the most important of which, however (those of Titan), would only be visible in Australia and in the United States, the period of revolution being very nearly sixteen sidereal days, so that occultations and transits of this satellite would take place at the same sidereal hour for many successive periods, and at these times Saturn would be below our horizon. Mr. Marth expressed a hope that the great Melbourne reflector might be used for these observations, and Mr. Russell promised that he would employ the 11-inch refractor of the Sydney Observatory for this purpose. Captain Abney, R.E., gave a description of his *Diaphanometer*, an instrument which he had devised primarily for measuring the opacity of photographic films after exposure to light under different conditions, and which he had since applied to other questions in photometry. In this instrument the collodion film was compared with a graduated wedge of smoke-coloured glass. Captain Abney also exhibited an ingenious form of spectroscope in which the brightness of any part of the spectrum of a star could be compared with that of the spectrum of a standard source of light, the two spectra being brought one above the other in the same field by means of reflection prisms. Some other short papers of a purely technical character followed, after which a note by Mr. Proctor on "Photography in the Transit of Venus" was read, to which Mr. Russell, Mr. De La Rue, and Mr. Christie replied, and Mr. Neison mentioned, as bearing on the question of the atmosphere of Venus (which Mr. Proctor had incidentally referred to), that Professor Lyman had observed Venus as a bright ring five hours before the commencement of the late transit.

NEW SHAKSPEARE SOCIETY (Friday, June 11).

F. J. FURNIVALL, Esq., Director, in the Chair. A paper was read by Mr. Henry B. Wheatley, "On the Originals of Shakspeare's Plots," in which an attempt was made to arrange the materials collected by a long succession of laborious commentators so as to cause them to throw light upon the poet's mode of work. The paper was divided into three parts. The first part consisted of an account of the various books Shakspeare used, and was, in fact, a catalogue of his supposed library, which must have consisted of histories, poems, plays, novels, translations of classics, travels, &c., all of which were placed under contribution in various degrees, sometimes a bright passage only being transferred from a dull book. In the second part the plays dealt with were divided into classes, and the points of likeness or dissimilarity were discussed. It was stated that the plots of only five of the plays are still untraced, but that those of some others are not certain. The third part was a *résumé* of what had gone before, more particularly in regard to the *dramatis personae*; and it was shown that Shakspeare had some authority, however slight, for his serious characters, but that nearly all his comic ones were entirely the emanation of his own brain. The prototype of Isabella in *Measure for Measure* is Cassandra in Whetstone's *Promos and Cassandra*; the germ of Portia in the *Merchant of Venice* is to be found in the Widow of Belmont in the Italian novel *Il Pecorone*, and Juliet was a character before Shakspeare made her what she is; but no one has yet discovered any hint of Falstaff, Mercutio, Gratiano, Benedick, or the host of other brilliant beings that people Shakspeare's comedies. In the discussion, Mr. Furnivall, Mr. R. Simpson, Mr. Hales, Miss L. Toulmin Smith, and Mr. E. H. Pickersgill took part.

FINE ART.

THE ROYAL ACADEMY EXHIBITION.

(Fifth Notice.)

Portraits.—This section of the exhibition includes a few of the best pictures of the year. We will take first the portraits sent by Messrs. Watts, Millais, Ouless, Orchardson, Sandys, and Cameron.

The officers of the Royal Artillery may congratulate themselves upon having obtained from Mr. Watts the portrait of *Sir Edward Sabine*; one of the most interesting and dignified treatments of an aged thoughtful face that we have seen this long while. *F. W. Walker, M.A., Head Master of the Manchester Grammar-School*, is a steady intelligent face, rather blunt of feature, well painted; a good specimen of the artist's quiet manner. The finest of all is *Blanche*, a girl of about ten years, holding a fiddle. Her face is full of meaning, and of the budding of beauty; her eyes are greyish-brown, her cheeks pink-tinged but pallid in the half-light of the room; her dress is grey, harmonising with all the other elements in the scheme of colour. The great example of Mr. Millais is *Miss Eveleen Tennant, youngest daughter of the late Charles Tennant, Esq., of Cadaxton Lodge, Neath*; which is, indeed, so striking and salient a masterpiece as no one is likely to supersede in a hurry. The painter has wrought throughout for strength and brilliancy; as shown at once in the thin silk dress of intense red, with azure beads round the neck. Miss Tennant holds a basket of ferns, and stands between the banks of a close lane, with a thick summer growth of leafage. The face, under its black hat and ostrich-feather, is splendidly handsome, dark, bright-complexioned, radiant with the perfect self-confidence of a girlhood that has known little of sorrow, and less of constraint. The frank stare in the full brown eyes is perhaps rather in excess, and, indeed, Mr. Millais has on other occasions fallen into the mistake of making his blooming young beauties a trifle brazen: still, it gives the

character for which this picture challenges as will always enjoy a celebrity of its own. The greens of the vegetation are very dark, with any direct sunlight; the handling is most neat and full of assurance. We cannot say of the other two portraits—those of a child and of an almost infantine daughter of Mr. Evans Lees, of Woodfield, Oldham—stand on the same level of work with this of Miss Eveleen Tennant; they are, in fact, rather perfunctory performances, redeemed from common place by the pre-eminent genius of the painter but not in themselves highly admirable. The younger child is the more pleasing and the less painted of the two. Mr. Ouless works much in the style of Mr. Millais; with less that is artistic and self-assertive, no doubt, less original power and skill only a little inferior. His two best portraits are perhaps *The Mayor of Newcastle Tyne* and *J. W. Walrond, Esq.*; the latter is very "speaking" countenance. *Charles Derr Esq., F.R.S.*, may remind the visitor to a certain extent of the profound and ponderous, albeit beautifully moulded, head of another great natural philosopher, Galileo; this portrait has a tendency towards the style of Mr. Watts, in combination with that of Mr. Millais. Two portraits by Mr. Orchardson are highly noticeable; the one with conspicuous ease, and an effect which might almost as well be termed slight as strong, though the strength tells out the more, as it should do. The sitters, a lady and a gentleman, are unnamed in the catalogue: the latter is represented with adjuncts proper to a virtuoso, and no doubt who ever knows the original is no whit less certain to the portrait. The sitter to Mr. Sandys has been *Mrs. Brand*; the painter has produced a singularly elaborate work, in which a good deal of floral and other accessory is introduced. There is much special character in the handsome face; so much that one is tempted to describe in detail, but this would not exactly be artistic. The gauzy black fan expanded over the crimped white habit-shirt is one of the numerous difficulties which Mr. Sandys has courted in order that he might conquer them. The other portrait whom we have mentioned along with these distinguished men, Mr. H. Cameron, bears a name so familiar to us. He is the author of a head-and-shoulders portrait of *Mrs. Strahan* (149), also a lady of advanced age; the pale face with its relaxed fleshiness, the black dress, and the white lace in the cap, are treated with most unobtrusive ability. Nothing is strained, nothing spectacular in itself; but we recognise here one of the portrait-painters worthy to reappear, in all reasonable self-confidence, the lessons of which Mr. Millais is prime exponent.

Mr. Archer exhibits several portraits, none of them undeserving of careful attention. We can only specify two: that of *A Lady in a Moorish Shawl*, a noticeable though not an absolutely attractive piece of colour-arrangement with a whitish brightness in general, amidst the very brilliant variegation of the shawl; and a peculiar change of note; and *Springtime*, *Miss Primrose*, a nice childlike and somewhat humorous-looking little girl of five or six, taken in blue and with a lace scarf, recalling the countenance of the Stuart time, holding a basket of daisies and accompanied by a large black cat. This is a very carefully completed work, of contrasting, and in some respects to its own disadvantage, with the more hurried masterpiece of Mr. Millais's child-portraiture. Of Mr. Leighton's *Robert Browning* we should have liked to speak in detail, had not this been already viewed in our columns. *The Early Part*, by Mr. Sant, is a study in white, not unreminded doubtless of a picture exhibited a few years ago by Mr. Millais. It represents three girls in white, not wholly unvaried in tint, with a white cat, cloth and white cat. The dark hair of the sitters furnishes a contrast; and some of the accessories supply pink, grey, black, and

There is considerable attainment in this work though without any particular charm. Of Sir Francis Grant's likenesses, that of *Joseph Walker*, of *Hesslewood*, Lieutenant-Colonel 1st East York Rifle Volunteers, may rank as the best: a life full-length of a noticeably handsome grey-headed man. *Mrs. H. E. Gordon*, by Mr. Leighton, does not, we think, count among the truly successful portraits. The drawing of the face shows a hand of great training and accomplishment; but the flesh has an unreal porcelain-like quality, and the very red silk dress is more startling than happily chosen. The *Venetian Girl* of this artist is a skilful and attractive study. Mr. A. Stuart Wortley is, we suppose, an amateur: his portrait of *Miss Margaret Stuart Wortley* is, however, anything but an amateurish performance, being in a marked degree solid, forcible, and broad; a work from which some artists might learn how to make simplicity dignified. We are surprised to see Mr. Lowes Dickinson's excellent portrait of *Mr. Gladstone* hung close under the ceiling: surely the treatment of this potent statesman would have been very different two years ago, and, be he in office or out of it, equity would have demanded some other reception for so well-painted a picture. We hardly know whether this portrait, or another from the same able hand, that of *Professor Cayley*, is to be preferred: both are artistic and most veracious records. The distinguished mathematician is represented writing eagerly at his desk, pausing however at the moment as if to solve one more nodus in the innumerable problems which have passed through his head for his fingers to register: a subtle smile—the half-habitual smile of a man to whom thought is the great actuality of life, and an incessant actuality—flits across the lips and eyes.

We shall deal rapidly with a number of other portraits, dividing them simply into female and male likenesses.

Storey, *Mrs. Finch*: the lady is leaning over the balustrade of a terrace, with her diminutive terrier looking through; an arrangement that has considerable "favour and prettiness." C. H. Whall, *The Artist's Mother*: able and true, and evidently unflattering. Miss F. Tiddeman, *From the Sunny South*: a nice head of an Italian or Spanish woman, a soft brunette. Perugini, *A Portrait*: a young lady of a rather old-fashioned type in face and costume, pleasantly done. M. R. Corbett, *Lady Slade*: curious-looking—partly delicate and partly odd. *A Portrait* of an old lady seated with folded hands, commendable for moderation of style. R. W. Macbeth, *Mother and Child*: for tone and realisation, one of the very best portrait-subjects in the gallery. The personages are at the pianoforte. The mother is portrayed with perhaps excessive literalism; the daughter has one arm over the shoulder of a dog. Prinsep, *Isabel*: three-quarters figure, with may-blossom, and a dark-blue velvet hat on pale yellowish hair, surmounting a pretty face. This painting shows taste, and not common management; the handling is rather too much of the textureless smoothness of Mr. Leighton. Scholderer, *Portrait of Mrs. S.*: seated figure on a comparatively small scale, with florid face, and dress of pallid tea-green, badly done. Schäfer, *A Portrait Study*: very good; an old lady who does not wear a cap, but would probably look all the better if she did.

T. B. Wirgman, *Lieut.-Col. Wirgman*: an honest good work. Wells, *The Right Hon. W. E. Forster*, M.P.: a very satisfactory portrait, in which the thoughtful laborious air of the late minister, no less than his outward semblance, is well conveyed. We like this the best of Mr. Wells's contributions; far better than the vast painting of "an infinite deal of nothing" named *11 November Morning at Birdsall House, Yorkshire*, testimonial Hunt-picture, containing *Portraits of Lord and Lady Middleton, the Hon. Digby and Mrs. Willoughby, Hon. Ernest Willoughby*, &c.—though this also could only be produced by a painter of much proficiency. Pettie, *Portrait in*

the Costume of the Sixteenth Century; Ditto Seventeenth Century. These are two likenesses of artists: the many Londoners who know Mr. Boughton will at once recognise him athwart the costume of the sixteenth century, and the rather excessive Rembrandtism of the lighting. Both works are talented; the Boughton picture being much the more noticeable of the two for effect and dexterity.

Other portrait-painters of merit more or less observable are—Miss M. S. Tovey; Miss M. Thomas; Mr. Briton Rivière (a huge canvas of sporting character); Mr. Calthrop; Mr. Richmond (*Sir Moses Montefiore*); Sir John Gilbert (*Mrs. Gilbert*); Mr. A. Morgan; Mr. Herdman; Mr. Girardot; and Miss M. Brooks (*Mrs. Montague Cookson*).

Animal Paintings.—In this class of work (besides the portrait-subjects by Mr. Wells and Mr. Rivière just mentioned, which are co-equally animal subjects) there are two pictures of extraordinary dimensions, contributed by Mr. Goddard and Mr. Heywood Hardy. Mr. Goddard's work is named *Lord Wolverton's Bloodhounds*, in full cry: it has much action and not a little impulse, but wants that touch of severity which would be needed for genuine power in such a subject treated on such a scale. Mr. Hardy's picture—*How are the Mighty Fallen*—is on an altogether higher level. This represents the carcass of a lion, grand in death as in life, on which three vultures have swooped down and are about to prey: it has the element of terribleness, without that of repulsive horror, and thus keeps within the true limits of art for its theme. The outstretched wing-feathers of the left-hand vulture are particularly striking. *The Disputed Toll*, by the same most capable painter, is an ingenious idea; the itinerant owner of a *ménagerie* passing with an elephant along a country-road, and the rustic turnpikeman endeavouring to compute what such a customer ought to pay to the trustees of the highroad. The elephant twines his trunk lightly round a bar of the closed gate: he will wait patiently as long as may in courtesy be required, but couldn't he just give it a wrench if he liked! All this is rendered by the artist with equal efficiency and quietude. *The Last of the Garrison*, by Mr. Rivière, is an episode of human drama, vigorously told in the fate of a bloodhound. In the ancient room, with its smouldering arras and splintered woodwork, testifying to volleys of attacking musketry, there is but one sign of life, or rather now of death—the corpse of the mighty-limbed hound, slaughtered but not conquered, his tongue protruded, blood near his breast, a ghastly red chink in the corner of one eye. Mr. E. Douglas sends a picture with the inscription, "*We saw, by the shepherd's hat held high, which way he had gone*"—a most unmeaning way of designating a talented and interesting work. The incident portrayed is that of a fox which, in outrunning the hounds, has come to where a flock of sheep are collected around their shepherd; the latter signals to the huntsmen where to find the outlaw. The fox looks with well-grounded diffidence at the sheep; they return his gaze ominously, closing up their ranks, but not through dread; the interloper is but too incapable now of averting his own impending fate.

The Academy visitor should make some acquaintance also with the beasts that figure in the undermentioned paintings. A. D. Cooper, *Self-Help*; a shaggy terrier at a sauceman, with vigilance in the angle of his eye. Emms, *Foxhound Whelps*, slight but clever. Noble junior, *Forgotten*; a pony in the snow, outside a public-house; the shadows of three inside toppers are visible on the blind. Ansdell, *The Intruders*; calves and a white horse nibbling at corn-sheaves, and barked at by the guardian dog. Champion, *A Sketch of a dog yoked to an (unseen) cart*. Miss Brett, *A Doubtful Greeting* of a sparrow to a snail, nicely finished. Couldery, *A Fascinating Tail*: two kittens meditating a mouse caught in a

trap, capital in expression. Miss E. Seeley, *Nobody's Dog*, very truly characterised. S. Bird, *Fetching the Warp ashore, Scheveningen*, a horse ridden with vigorous impulse into the sea. M. Fisher, *Early Summer*, a well-sized picture of cattle in a pasture. Percy Macquoid, *Finishing the Game*, a white Persian cat and white kitten at a chess-board. Treeby junior, *The Heron at Rest*, along with a kingfisher. Weber, "*No, no, you have had enough—you're greedy*:" some calves are minded to pass a gate into the farm-yard, but are resisted by a dairy-maid. There is some very skilful work in this picture: see especially the calf in front, with its stern presented to the spectator, and its narrow flanks foreshortened. *A Sketch from a French Cob*, also good. Poingdestre, *Flies*: the victims of the flies, some horses that troop together, wincing and fidgeting under the infliction, constitute the subject of this talented painting. G. A. Holmes, *Can't you Talk?*—a little girl interrogating a dog of sage and confidential aspect. W. M. ROSETTI.

ART SALES.

AMONG the works of art of the late M. Couvreur, sold recently at the Hôtel Drouot, the following were the most noteworthy:—(1) Sculptures in marble, &c.:—Set of 19 friezes and 18 lintels sculptured in bas-relief in 1508 by Alfonso Lombardi of Ferrara (1486–1536) for Alfonso d'Este, 100,000 fr.; figure of *Love lying asleep*, signed Langardi, 1,040 fr.; Large bust of Washington, 1,005 fr.; Arab coffer, dated in the year 355 of the Hegira (A.D. 966), 2,500 fr.; *The Virgin and Child*, 1,120 fr.; *Hercules fighting*, 1,680 fr.; cippus sculptured in bas-relief and representing a Bacchanal in the style of François Flamand, 2,800 fr.; drinking vase in carved wood, 1,180 fr.; large shield in repoussé steel, embossed with gold, 7,600 fr.; ditto, 8,020 fr.; ditto, 5,400 fr.; sword, 1,420 fr.; small object in repoussé steel, embossed with gold and plated with silver, 5,350 fr.; coffer of the time of Louis XIII., 995 fr. (2) Limoges enamels:—picture attributed to Jean 1^{er} Pénicaud, 1,060 fr.; ditto, by Léonard Limosin, 1,510 fr.; large oval dish, painting in grisaille on black ground, 2,430 fr.; two square pictures in grisaille, set off with gold on black ground, by Pierre Noualher; reliquary, Venetian work of the sixteenth century, 3,800 fr.; three windows representing the Nativity, 1,350 fr.; bronze group, Italian work, representing the Farnese Bull, 7,000 fr.; bronze lustre with 24 lights, 6,000 fr.; carved walnut furniture, sixteenth century, 4,100 fr.; palanquin of the time of Louis XV., panels by Eisen, 7,000 fr.; bureau, time of Louis XV., 4,050 fr.; portrait of a lady painted on enamel, by Petitot, 3,600 fr.; plaque, time of Louis XIV., 1,790 fr. (3) Pictures:—*The Liberal Arts*, five panels, by Hallé, 9,100 fr.; four "dessus de portes," by Lemoine, 4,000 fr.; 12 decorative panels, by Leriche, 2,220 fr.; *Pleasure*, by Greuze, 2,680 fr.; *Bouquet*, by Monnoyer, 2,000 fr. Total of the sale, 320,045 francs.

At the first day's sale of Millet's crayons, pastels, &c., the chief compositions sold as follows:—*Sheep-walk*, moonlight, 12,100 fr.; *Shepherd watching his Flock*, autumn effect, 10,600 fr.; *Winter. Plain of Chailly*, 8,100 fr.; *Close of the Day*, 10,400 fr.; *Woman returning from picking Sticks*, 5,450 fr.; *Shepherdess Knitting*, 4,450 fr.; *Village of Chailly*, 4,600 fr.; *Woman making Butter*, 5,500 fr.; *Beginning of the Forest of Barbizon*, 5,150 fr.; *Storm on a Plain*, 5,000 fr.; *Mid-day Rest*, 5,350 fr.; *Watching*, 12,000 fr.; *The Sower*, 4,500 fr.; *Young Girls watching Flight of Wild Geese*, 4,800 fr.; *Herdsmen calling home his Herd*, 4,100 fr.; *Cliff at Greville*, 4,900 fr.; *Fall of the Leaves*, shepherd watching his flock, 6,000 fr.; *Peasant leading his Horses to Watering*, 4,000 fr.; *Going to Work*, 4,500 fr.; *Return from Market at Evening*, 7,000 fr.; *Peasant returning with Donkey*, twilight effect, 3,200 fr.; *Dead*

Birch-tree, 3,900 fr.; *Spring Flowers*, 2,000 fr. Total of the first day's sale, 206,450 fr. Second day's sale:—*Farm-yard*, night, 14,000 fr.; *Labourers*, 10,100 fr.; *Plain of Barbizon*, snow effect, 9,100 fr.; *Thrashing Wheat*, Lower Normandy, 13,100 fr.; *Stacks and Flock of Sheep in the Plain of Barbizon*, 7,300 fr.; *Vinedresser asleep*, 6,000 fr.; *Reapers' Noonday Nap*, 6,450 fr.; *Shepherdess bringing home her Flock*, 6,050 fr.; *Peasant's Garden*, 6,000 fr.; *Shepherdess and her Flock*, sunset, 5,700 fr.; *Newborn Lamb*, 6,500 fr.; *Shepherdess knitting as she drives her Flock*, 6,220 fr.; *Path through the Corn-fields*, mid-day effect, 3,700 fr.; *The Child's first Attempts to Walk*, 4,000 fr.; *The Sick Child*, 4,500 fr.; *Sunset on a Plain*, 4,850 fr.; *Young Shepherdess seated on a Stile*, 4,100 fr.; *Peasant-girl of Auvergne watching over her Flock of Goats*, 4,500 fr. Total of the second day's sale, 224,740 fr.

THE collection of pictures formed by Mr. Woolner, the sculptor—chiefly of deceased masters of the English school—was sold by Messrs. Christie and Manson on Saturday. There were one hundred and forty-one pictures, but to many of these no great value was attached. We append the prices obtained by some of the principal works. The sale commenced with the disposal of some minor works by F. Wheatley, Samuel Scott, W. Marlow, Paul Sandby, Sir Augustus Calcott, and others. The first figure of importance reached was by the sale of John Crome's *Old Cottage* for 140 guineas, and this was followed by *Storm Coming*, *Mousehold Heath*—the same master—150 gs. Both these pictures were etched by the artist. *Ferdinand lured by Ariel*, an early work of Mr. Millais—exhibited at the Royal Academy in 1850—fetched 300 gs., while another of about the same date, *Isabella*, realised 850 gs. J. M. W. Turner's *Worcester*—the subject engraved with variations, by Thomas Rothwell—was knocked down at 400 gs. Bonington's *An Old French Water Mill* reached 300 gs. *A Village in Normandy*—one of the works of John Sell Cotman, lent to the International Exhibition of 1874—was knocked down for 135 gs. The same artist's *Château in Normandy*—shown at Burlington House this year—was sold for 275 gs.; while his *Cave of Boscastle*, Cornwall, much remarked at Burlington House this year for its great power in wave drawing, realised 550 gs. *Bruges, on the Ostend River*—a John Crome—sold for 280 gs.; *Francis the First and his Sister*, by Bonington, for 220 gs.; Turner's *Neapolitan Fisher-girls surprised bathing by Moonlight* for 500 gs.; and his *Crichton Castle* for 480 gs. Some works of John Linnell finished the sale, and for one of them—*The Last Gleam before the Storm*, exhibited in 1847 at the British Institution—the only remarkable price of the auction was obtained. It was knocked down at 2,500 gs. The collection brought a total of 8,201l.

NOTES AND NEWS.

WITH what avidity our countrymen in China seize upon subjects which recall their early life here, and remind them of the educational inheritance common to them and us, may be seen from a lecture delivered in January of this year at Shanghai, on "The *Iliad* and the recent Discoveries at Troy," by Mr. Edward C. Taintor. As a summary of what has been written in support of these discoveries, the lecture is an excellent performance. The other side receives less attention. It is disappointing also to see that the cue given by Burnouf, who found one of Schliemann's inscriptions written in Chinese characters, is not followed up by the lecturer to any satisfactory degree. The levity with which he epitomises the story of the *Iliad* and partly of the *Odyssey* is not apparently natural, but has been forced for the purpose of entertaining the audience.

THE *Times of India* states that the Eighth Annual Fine Arts Exhibition will be held at

Simla towards the end of September next; Dr. De Fabek has undertaken the duties of honorary secretary for this year.

WE have received from Messrs. Darnley and Co. a chromolithograph from an oil-painting by Mr. E. A. Waterlow. It is executed by Messrs. Hanhart; it is of the size of the original; and is likely to find favour with some admirers of chromos.

A REPORT has lately been published by M. Maurice Cottier on the position of France in the section of Fine Arts at the great World Exhibition at Vienna. This position, it is extremely gratifying to French patriotism to find, was higher than that occupied by any other country. A table has been constructed showing the medals obtained in the four sections of architecture, sculpture, painting, and engraving, and by this it will be seen that France gained the highest total of awards, although in painting Germany stands slightly in advance. The table is made out as follows:—

Medals obtained in the Four Sections of Group 25 (Fine Arts), at the Vienna Exhibition.

	Architecture.	Sculpture.	Peinture.	Gravure.	Total.
France	26	34	137	45	242
Autriche	17	18	81	10	126
Hongrie	6	4	14	2	26

M. Cottier's report is not a mere dry document as such works usually are, but an interesting and thoughtful treatise on the character and tendencies of art at the present time, on the part that it plays in the life of the nation, and its possible development in the future. Art at the present day tends more and more to be cosmopolitan and international, and France occupies the first rank in this international art. In fact, says M. Cottier, "L'art aujourd'hui est partout l'art français répandu; on le retrouve non-seulement dans son esprit, mais dans sa forme, ses moyens et son faire." This is true, no doubt, to a certain extent, but not so widely as is stated by the French critic. England, for example, is still decidedly national in its art and owes little to French teaching, and modern Belgian art, unlike Belgian thought in general, has not developed in the schools of France, but has drawn its inspiration from its own intensely national life and art of olden times.

On the question of State aid in art education M. Cottier speaks with the authority of knowledge. The State cannot, he owns, create men of talent, but it is its duty "de tout faire pour y arriver." The argument that State education stifles individual genius and only produces mediocrity, he considers unsound, for whenever an original artist arises he is sure by the very nature of his originality to rise above the crowd in which he is placed. Other countries are indeed imitating to their great advantage the very institutions that it is now the fashion in France to decry. "All epochs in our history," says M. Cottier at the conclusion of his report, "have had their impatient and discouraged spirits, but the posi-

tion that France has conquered at Vienna by her industrial and fine arts takes away all rightful ground for despairing of our country."

THE *Gazette des Beaux Arts* begins this month its critique on the Salon of 1875. It is written by M. Anatole de Montaiglon, who considers that in spite of a few fine works, that may be regarded as exceptions, "la moyenne du Salon n'est point élevée." "Ce qui manque le plus," he says, "c'est l'intelligence, sans laquelle pourtant rien ne se fait de durable." The same want unfortunately makes itself felt in most of our modern exhibitions. Everything is given us except just mind, without which no amount of dexterous painting will ever produce a great work. The Salon article is as usual profusely illustrated with the artists' sketches for their pictures, and an etching from Maillart's painting of *Thetis arming Achilles* is also bestowed. In the second article, Charles Blanc finishes his instructive discourse in the form of vases. In the third, an English humourist, namely, John Leech, is introduced to the French public. One would certainly have thought that such an introduction had taken place long ago, but M. Ernest Chesneau affirms that the name of John Leech, which has been almost a household word in English homes for the last quarter of a century, is scarcely known on the other side of the Channel. Several fac-similes from the *Children of the Mobility* are given in illustration of his artistic powers, and a long quotation from Taine's *Notes on England*, in which that eminent critic analyses minutely the French illustrations in which he finds reflected so many traits of our national character, is made to do duty instead of any original criticism on the part of the writer. The other articles of the number are—a sketch of Jules Jacquemart, under the head of "Les Graveurs Contemporains;" a third discourse on the "Tanagra Statuettes," by M. O. Ravet, and the half-yearly "Bulletin Bibliographique," very deficient, as usual, in its enumeration of English works on art.

MR. E. FROMENT has gained a third-class Salon medal for his wood-engravings that have appeared in the pages of the *Graphic*.

A CURIOUS old painting from the collection of Mr. George Ellis is at present being exhibited at the Leeds Exhibition. It represents with considerable skill and knowledge a party of Indians engaged in gold-washing in a pool. It is not known who painted the original, but an engraving of this subject by Theodore de Brug exists in an old Latin work entitled *Historia Americae*, published in Frankfort in 1560.

AN interesting attempt is being made at the present time on the Swedish coast to recover the cargo of an East Indiaman, which foundered near the fortress of Elfsborg in 1712. Thus far the diving operations are reported to have been generally successful, a large quantity of old Chinese porcelain having already been recovered in so perfect a condition that individual pieces have been eagerly sought for by collectors, and have realised high prices.

THE Louvre has bought for 12,000 fr. the statue of the Virgin recently discovered at Touraine. It is said to be a fine example of French art of the sixteenth century. The ancient vase also which we mentioned before as having been recently purchased by the Conservation des Antiques has been a great gain to the Louvre collection of antiquities. It is now considered to be of pure Greek and not of Etruscan origin, and is without doubt a very fine and perfect example of its kind. It is at present exhibited in the salle of Hellenic antiquities formed in the galleries of Charles X.

WE hear that the ancient brocade tapestry factory of Venice is being revived by the Friar Agnino. This fabric claims to have existed prior to that of Lyons, and was at first patronised by the Doges for gifts to Eastern monarchs, at which time, it is said, 14,000 hands were employed. Some

of the stuffs were of extraordinary texture and easy, but the secret of the rarest died with the inventors. It is now sought to recover some of the former splendour. Mr. Layard, minister at Madrid, has been one of the first to test the new manufacture, and has obtained a successful result to the order executed for him. The Princess Algorousky has also been supplied with a rocade tapestry worthy of its past fame. Members of the royal house of Savoy are being furnished with some of its richest patterns. The set ranges from twelve francs to one hundred francs the mètre.

The glass works of Venice and Murano are the most ancient manufactory extant. Those interested in the history of them will find it in the *Monografia della Vetraria Venetia*, 1874. They are uninterruptedly survived over the period of twelve centuries, before and since St. Benedict, who engaged Venetian artists to furnish the windows of Wearmouth Abbey, A.D. 674. In the fourteenth century this fabric roused the jealousy of France, and Parkes in his *Essais de Chimie* records that there was at that time such industrial activity in Murano as to create surprise throughout all Europe. In 1663 the Duke of Buckingham petitioned Charles II. for the renewal of a patent for making crystal looking-glasses, coach glasses, &c., which he claimed to have bought, after much expense in finding out the mystery, to as great perfection as those made in Venice, from whence, he said, they were then forbidden to be exported, unless wrought and polished.

The small island of Burano was, in bygone times, celebrated for its lace work, which, when its exportation to France was prohibited, induced the minister Colbert to enforce the expatriation of the few lace-workers in order to introduce their secret into French manufacture. Hence originated the "point d'Alençon." Two benevolent ladies, the Princess Giovannelli and the Countess Marcello, have lately formed a scheme to revive this fabric for the benefit of their poorer countrywomen. An aged woman, the last of her craft, who had survived the manufacture, but remembered and still worked at the Burano lace, was found, and by the energy of these patronesses a school was soon formed. Sixty-seven hands were engaged, but only ten at a time could receive tuition from the infirm state of the instructress. A hundred girls are now waiting to be admitted to the school. The remuneration at present offered, however, does not appear to be tempting, as it takes 150 days of five working hours each to produce a single mètre by one workwoman, and her pay is but 50 centimes (about 5d.) per diem. The demand for the first specimens has been very great. The eminent engineer, Dr. Fambri, strongly recommends the development of this industry, were it only to save the secret of the art, as no kind of manufacture exists more capable of giving sustenance to thousands with very small capital.

THE *Levant Herald* announces that the Ottoman Museum of Antiquities at Constantinople has just made a valuable acquisition:—

"Two life-size statues of Roman workmanship, which were lately found in Crete, and appropriated by the Government, arrived here the other day and have since been added to the collection in the church of St. Irene at Stamboul. According to Dr. Déthier, the director of the Museum, they are chiefly interesting as monuments of the moral and intellectual decadence into which the mass of the Roman people had fallen in the days of Nero. These statues both represent females. A tolerably legible inscription on the pedestal of one of them labels the statue as that of Claudia, the daughter of Nero by his second wife Poppea, who, though she lived to the age of only four months, was raised by an imperial edict to the rank of a deity and was honoured with temples and temples. The sculptor has, however, represented his subject as a maiden seventeen or eighteen years of age, and has endowed her with an elaborate coiffure. The second statue is thought by the learned doctor to be intended for Poppea, the

wife of Nero; but the inscription on the pedestal no longer exists, having been erased probably during the period of reaction against the brutality of Nero which followed that monarch's sanguinary reign."

THE Deputy-Master of the Mint in his Fifth Annual Report traces briefly the phases through which medallic art has passed, in this and other countries, since the Middle Ages. Some beautifully-executed autotypes of medals, illustrative of the art at different periods, are annexed to his Report, the first of which is a Syracusan coin representing Philistis, wife of Hieron II. Medals do not appear in any European country before the fifteenth century, with the exception of the gold medals of David II., issued in Scotland between 1330 and 1370. In 1439 mention is made of a gold medal of the Council of Florence, and from that time the art began to flourish in Italy. The medals were at that time modelled in wax and cast in fine sand, and generally finished with the graving tool. An excellent example by Albrecht Dürer, bearing date 1508, is among the autotypes, but the most beautiful series is that of the Papal medals, beginning with the pontificate of Paul II. (1464); many of these were designed by Raffaele, Giulio Romano, Francia, and Cellini. Next to Italy, France was in the early days of the art most remarkable for medals, but no very fine specimens were produced there before the reign of Louis XIV. The oldest known English medal was struck in 1480, and is the work of an Italian artist; but very few others are met with until the reign of Mary. One of this Queen herself by Trezzo is given in autotype in the Report. Many medals date from Elizabeth, the most remarkable one being that commemorating the defeat of the Spanish Armada, which bore the device of a fleet scattered by the winds, with the legend "Afflavit Deus et dissipati sunt;" no specimen is, however, known to be in existence. The artistic tastes of Charles I., and the works executed for the Commonwealth by the great medallist Thomas Simon, caused rapid advances in the English art during the seventeenth century. The victories of Marlborough were celebrated by some admirable medals. Since then the style has tended towards a revival of Roman types, a recent instance being the Crimean war medal, the reverse of which represents Victory crowning a warrior equipped in Roman armour. The Napoleonic medals are pseudo-classic in design, but generally creditable to French art. A large increase in the number of visitors to the Mint is to be noted, 5,064 last year as against 3,447 in 1873, the exhibition of the coins and medals belonging to the department being no doubt the extra attraction.

THE STAGE.

"A NINE DAYS' WONDER."

A Nine Days' Wonder—a new comedy by Mr. Hamilton Aidé—was brought out at the Court Theatre on Saturday night, with every sign of success. That is all that some will care to know, but there are others of us who like to enquire, a little curiously, into the cause of the success, and how far the success is deserved.

There are eight characters in the piece, not including the inevitable man-servant, who in modern comedy can hardly be considered as more human than a dumb waiter. He exists for the purpose of announcing guests with dignity and bringing in letters with grace, but his human qualities are for the most part suppressed. He is not a character, but a machine. But if kept down very strictly in comedy, he takes his revenge by getting much too fully developed in farce. Farce deals with low life, and in that he is important: comedy, with gentle life, and in that he is nothing. There are eight characters, then, but of these one is entirely superfluous, and at least two others have no necessary influence on the main theme of the play. The obviously superfluous is Mr. Brown—the curate—who does nothing but echo and support the opinions

of another. He is Mrs. Harris in the flesh at last, after years of ghostly existence in the imagination of Mrs. Gamp. The other, half-unnecessary, characters are one Mrs. Loveden, a sentimental widow; her son, a raw young soldier, whom she would fain have married to the heroine; and one Miss Tarragon, an officer of moral police, on whom devolves the duty of seeing that her code of respectability is violated by no one. I say these characters have not much to do with the main action of the play. They are introduced to lighten it—to be its comic element. But though fairly true and fairly amusing, they are not the results of profoundly humorous observation. The comic interest in the play is enough to raise a laugh—we are thankful for most things in the way of wit—but it is not equal to the serious.

The important action lies with four people: Mr. Vavasour and his daughter, and Mrs. Fitzroy and her son. And here we come to the story itself, which is the play's chief merit.

Vavasour has lived in India, and made a fortune there. His wife is dead, and he had not been happy with her. He and his one child—a daughter—are now settled happily in an English village, where his generous disposition finds a vent in asking acquaintances unceremoniously to dine, and in giving to a group of disagreeable busybodies the key of his pleasure-garden. His kindness and indulgence to the tiresome local people do not, however, blind him to "metal more attractive," and when Mrs. Fitzroy—who had refused him twenty-three years since—passes through the village he gets her to remain upon a visit at his house, and finds her as fascinating as twenty years ago. Perhaps there is some excuse for this, for she, losing youth, has gained art. Moreover, Vavasour's daughter has told him a secret: she is in love. Her lover, Christian Douglas, is a soldier, whom he does not know. But the chances are there will be no reason for opposing the marriage, and if not, Vavasour will be alone again. His feeling for Mrs. Fitzroy may, then, be indulged, and the first act closes on the indication of it. It is a pity there is nothing stronger with which to end the act than the sight of the elderly Vavasour bending over Mrs. Fitzroy, while that accomplished woman renews her affection not, as with Horace's lovers, by the enumeration of past loves, but by the warbling of a song which Mr. Hamilton Aidé has composed for the occasion.

A weak beginning, this: fit only to be the end of a scene, and not the end of an act, but the merit of the story is that its interest increases until the very close. The second act develops a difficulty which only the last words of the third suffice to solve. Christian Douglas—Kate's lover—arrives in the village, and before his claims have been considered, or his character sifted, we are treated to the usual stage symptom of hospitality—Vavasour insists on sending for his portmanteau. There are certain explanations to be made, however, before that portmanteau can with confidence be unpacked, and here is a good scene, between Vavasour and the younger man. Douglas is a poor man, but that does not matter. Douglas may possibly be illegitimate, but that is of small account. Douglas is the son of a woman who deserted him: but so much the worse for Douglas. Douglas is the son of a blackleg, but so much the worse for his mother. Douglas's father was killed in a duel by the lover of his mother, but so much the worse for everyone concerned. Douglas, though poor, sends money to the mother who deserted him. He has told all this with admirable frankness. Douglas is a very fine young man, and he shall be the husband of Vavasour's child.

So all goes well, and we have had to deal with an exemplary would-be father-in-law, and Kate's happiness is assured. But before the act closes, Mrs. Fitzroy and Christian Douglas meet, and another difficulty than those which the young man had foreseen, rises before him. Mrs. Fitzroy is his mother. And here, of course, the interest deepens;

the game is in the hands of these two, and the fortunes of Vavasour, the generous fellow, and Kate, the simple-minded girl, are practically to be decided by the action these will take. Mrs. Fitzroy, knowing only of her son's presence, but not of the cause of his presence, puts the case plainly to him, that he had better go away; for she, after a life of struggle, has come here to find "peace"—"peace:" she, armed with a rouge-pot, and Mr. Hamilton Aidé's song. In actual life the son, owing little to his mother, would probably have advanced his own claim; but in the drama, for the drama's purposes, he retires—unhappily forgetful of what his common honour owes to the girl—and he only stipulates that Vavasour shall not be kept in ignorance of the past of Mrs. Fitzroy. She kisses her son, and promises confession, and she keeps her promise. But what do you expect of Vavasour, of whose liberality you have already had occasion to judge? He forgives, of course, the faults of Mrs. Fitzroy's youth, in consideration of her charms, her gown, her rouge-pot, and Mr. Hamilton Aidé's song.

But one of the busybodies has seen the kiss between the mother and son, and it is endeavoured to arouse Kate's jealousy. Thus it is that Mrs. Fitzroy learns at last what better love her love was standing between, and that Vavasour learns the relations of Mrs. Fitzroy and Christian Douglas. Mrs. Fitzroy yields: leaves the scene of struggle; and nothing becomes her, in her whole conduct at that place, like the leaving of it. She goes away to find "peace" after all, not in the echo of an old love, but in the knowledge of sacrifice. And Douglas and Kate are to be very happy, when the curtain falls.

Action rather forced, rather strained here and there—as, not very seriously, I have tried to indicate—but, on the whole, a successful play; and a success won, in the main, not by exceptional dialogue, nor exceptional character-sketching, but by the conception and development of a story with substance and interest, and by acting of a kind not common on the English stage. Mr. Aidé is one of those novelists whom one would expect to be successful at the theatre. In his novels, as in his play, there is always a story to tell, and though this is not told with an exceptional writer's exceptional charm, it is told with what some people like much better—common clearness and definiteness—for Mr. Aidé does not pause by the way: in his novels there are no long descriptive passages without bearing on the story; and in his play, there is little dialogue without bearing on the plot. He is reticent of humour that has nothing to do with the action, and thus being without the fault is also, almost necessarily, without the merit of Mr. Albery.

The acting, as we hinted, may honestly be praised. To the secondary characters of Mrs. Loveden and Miss Tarragon, Mrs. Buckingham White and Mrs. Gaston Murray give all possible importance, without detracting from the importance of those who are meant to be more prominent: something of the mincing affectation which Mrs. Buckingham White found successful in *School* is brought by her, effectively, into her impersonation of the sentimental village gossip who divides her time between the inspection of other people's business and the praises of the gawky youth whom she would fain see married to Kate Vavasour. Mrs. Gaston Murray, on the other hand, is sharp and decisive, as Miss Tarragon. She upholds with a firm hand every virtue but charity.

Mrs. Kendal, as Mrs. Fitzroy, has a character with which pure comedy has nothing to do. There is nothing light in Mrs. Fitzroy; but Mrs. Kendal struggles to interest the audience in the woman's strange troubles and strange adventure, and putting strong work here and there into the part, she can hardly fail of success. But her delivery of such dialogue as falls to her before the scenes become emotional and exciting, is unnecessarily laboured and even artificial. She loses

no point, but, in this piece as sometimes before, fails to catch the quite easy spirit of everyday talk. But the moment stronger work is demanded of her, she is equal to the task. A face charged with the expression of changing anxieties—a voice seemingly clogged with feeling—and both these under the complete control of an intelligence on which no "necessary business of the play" is lost; it is with these means that Mrs. Kendal gains influence over her audience, and almost compels its sympathies where otherwise they would not be.

Miss Hollingshead's representation of Vavasour's daughter—for one thinks of it as a "representation" and not as a laboriously planned "performance"—is admirably natural and fresh. A little while since, Miss Hollingshead was a beginner, and criticism need not say of her, before its time, that she is an accomplished artist. She is not that, as yet; but of the *ingénue* of gentle life, she is rightly getting to be recognised as quite our pleasantest and best representative. Kate's lover—Christian Douglas—is played by Mr. Kendal with his usual satisfactory care. Mr. Hare is, of course, Vavasour, and the performance is among his most complete. The last—that of the French nobleman in *Lady Flora*—though slight, was free from the faults of that which had preceded it: the present is, as far as it goes, a good thing, wholly. Though with no great profundity, and with no great elaboration, Mr. Hare realises for you this man's character: giving you not a type, but an individual. Into some of the scenes through which Vavasour passes more work might be put, but the sketch of character and manners is crisp and true.

FREDERICK WEDMORE.

THE benefit performances which mark the close of the season at more than one principal theatre are announced. Mr. Irving's will take place on Friday and Saturday, July 2 and 3, at the Lyceum. He will on both occasions act *Richelieu*. Mr. Buckstone's benefit is announced for this day week (Saturday, June 26). *A Fair Encounter*, *A Regular Fix* and *David Garrick* will be the pieces performed, and Mr. Buckstone will, as usual, say a few words—hardly, this time, of congratulation on any artistic success of the season—and Mr. Sims Reeves will as usual sing a couple of songs.

MR. ALBERY'S *Spendthrift* is destined for short life. The comedy, it is announced, will be performed for the last time, to-night, at the Olympic. On Monday the reserve force of the *Ticket of Leave Man* is to be brought into the field.

Patient Penelope—an early pleasant little burlesque of Mr. Burnand's—is played every evening at the Strand.

MISS HELEN BARRY'S benefit was to take place last night at the Princess's, when she was to appear as Katherine in the *Taming of the Shrew*.

A FIRST piece of more than usual importance, and employing actors of more than ordinary consequence, is played now every evening at the Court Theatre, before *A Nine Days' Wonder*. It is called *Book the Third: Chapter the First*, and bears obvious signs of a French origin. But it has been performed already, we are told, upon the English stage: nearly twenty years ago, at the Haymarket. The title has reference to a passage in a novel by Le Sage which a young woman, desiring to be rid of an importunate young man, found it desirable to recite to him at full length. The young woman is acted by Miss Fawcitt, and the young man by Mr. Clayton, and the excellent spirits apparently enjoyed by both these artists communicate themselves in some degree to the audience. Mr. Kelly, who made a hit as the dull peer in *Lady Flora*, is also included in the cast.

Giroflé-Girofla has been performed at the Criterion Theatre every night this week; *La Filleule du Roi* having been somewhat rapidly withdrawn.

THURSDAY last was the day fixed for the deduction, at the Théâtre Français, of M. C. Monselet's *L'Ilote*, which we announced last. The piece is specially destined for Mdlle. Reineberg. The same night, in *Les Femmes Sans Mdlle*, Blanche Baretta—hitherto of the Odéon—to make her first appearance in the Rue Richelieu. She leaves at the Odéon hardly one actress of importance, if we except Mdlle. Hélène Petit, who was in London but a few weeks ago.

La Cagnotte has been revived at the Théâtre Royal.

THE time of year has come, in Paris, many of the theatres fall back on insignificant one-act pieces which they have had by the long time, but which they are too wise to put out in those winter evenings when fortunes are to be made by more important plays. Faithful to the summer custom, the Gymnase has given little plays by the same authors—the *brothers Clerh*: two clever young men who arrived Lyons a week or so ago, with their pocket of writings. *La Galerie du Duc Adolphe*—of these writings which they have been fortunate enough to get represented—is hardly more a means of exhibiting *tableaux vivans*. In any way many of the most popular pictures of the few years have been placed before the public. Their other piece—*Le Wagon 513*—turns out an adventure in a railway carriage, which, though laughable to see, is not very amusing to read. Lesueur has filled the thing with comic details so that the brothers Clerh—with pockets less of manuscript than when they came from Lyons—have reason to be thankful.

THE subject of giving afternoon performances at the Comédie Française is, it is said, under consideration.

Cinna was performed at the Théâtre Français on the occasion of the anniversary of the birth of Corneille. Considered by many to be the *d'œuvre* of the master, *Cinna* nevertheless appears to some to be unfitted for performance as a whole but whatever can be done for it, to save it from neglect, is of course done at the Français. In the performance of last week, M. Laroche, Dupont-Vernon, and Mdlle. Favart part. Afterwards, *Le menteur* was acted, and Delaunay, as usual, in the principal part.

THE great performance of the week at the Théâtre Français has been that of Alfred Musset's *On ne badine pas avec l'Amour*: a revival talked of long beforehand, and sure for some time to continue a subject of interest. The play was played, if we remember rightly, in the company of the Théâtre Français was in London but then with the old cast. Half the interest in the representation of which we speak, arose from the fact that Mdlle. Croizette was to replace Mdlle. Favart, and Thiron to replace Talbot. Opinions differ as to the result of the change, though they cannot differ as to its being necessary: Mdlle. Favart, who plays the part with much grace and a variety of diction, having now become unsuited to the character of Camille. In the performance of any piece by De Musset the play of face or gesture, and that is why Croizette, whose special characteristics are fire, and *aplomb*, would not at first sight be best fitted for the part of Camille. (The known critic, at all events, in duty bound suggested that the rôle should have been given to Mdlle. Sarah Bernhardt. But then, even if Sarah Bernhardt, it is possible to have Croizette, acting throughout with her insight into a part's requirements, nevertheless served her main effect for her final scene. Success, in the part of the foolish Baron, is uncontested. Our readers may not be aware that the piece submits to several alterations pronounced, in France, fit for the stage, but not in the first place written for the stage.)

y trouve"—even now says an accomplished critic, fully alive to its excellences and its charm—

"On y trouve beaucoup de décousu, et rien n'y est moins justifié que les entrées et les sorties. Or on sait que la règle des entrées et sorties a remplacé aujourd'hui l'ancienne et fameuse règle des trois unités, et les habiles vous prouveront par les raisonnemens les plus concluans qu'en dehors de cette règle il n'est pas de salut. Ils ont raison dans une certaine mesure, et la nouvelle règle me paraît beaucoup plus rationnelle que l'ancienne, quoiqu'elle procède d'une esthétique moins élevée. Malgré tout, il est certain que les pièces de Musset, quoique aussi mal construites que possible, à l'exception du *Caprice* qui rentre dans les conditions normales du théâtre, ont généralement réussi à la scène. Cela tient visiblement à la beauté littéraire de la forme, à la pureté du dessin, au charme du coloris, à l'intensité de vie, au mouvement répandus dans l'œuvre entière."

THE Norwegian poet, Andreas Munch, has achieved what must be called an equivocal success with his long-expected drama, *Fjeldsøen* (the Mountain Lake), which has at last been brought out at the Royal Theatre of Copenhagen. P. Heise has added the charm of his exquisite music to what seems to be a rather tame, thin, and ill-constructed story. The scene is laid in the south of Norway, and deals with peasant-life during the times when Christianity still strove with Paganism.

MUSIC.

"LOHENGRIN" AT HER MAJESTY'S OPERA.

THE long-talked-of production of *Lohengrin* at Drury Lane took place last Saturday. The work itself was spoken of in such detail last month on the occasion of its first performance at Covent Garden that it is unnecessary to say much about it now; but a comparison of the rendering at the two houses presents several interesting points for comment, and it is to these that in the present notice we propose to direct the attention of our readers.

Speaking in general terms, it may be said that at Drury Lane the cast was in parts the stronger, while at Covent Garden the better *ensemble* was obtained. Exactly where the one company was strongest the other was in comparison weakest; the one, so to speak, supplemented the other; and could it have been possible to combine the best features of the two in one performance, an almost perfect rendering of Wagner's great work would have been the result.

The place of honour, in noticing last Saturday's performance, is certainly due to the Ortrud of Mdlle. Titiens. Though both dramatically and musically a part of great importance, the rôle is still so secondary to that of Elsa, that our greatest operatic singer would have been fully justified, had she chosen, in declining to "play second fiddle" to Mdlle. Nilsson. With a self-abnegation as honourable to herself as it is unfortunately rare in her profession, Mdlle. Titiens accepted the subordinate part, and set a noble example by showing that she valued her art above self-glorification. The result, as might have been anticipated, was that the Ortrud was the great feature of the evening. It is only in the second act that the part has any prominence; and here Mdlle. Titiens was truly superb. The gloomy duet with Frederick, in which she was admirably supported by Signor Galassi, became in the hands of these two artists an absolute revelation; and in the scene with Elsa which follows, the lady showed herself equally great as an actress and a singer. The short solo "Entweihte Götter," in which, after Elsa has withdrawn, Ortrud for a moment throws off the mask of hypocritical servility, and appears in her true colours, was given with a power which electrified the house. No finer performance than that of Mdlle. Titiens has ever, probably, been seen upon the stage.

The next best impersonation in the opera to the Ortrud was unquestionably the Frederick of Signor Galassi, which was not only excellently sung, but most admirably acted. Signor Galassi

deserves especial praise for avoiding the so common fault of acting to the foot-lights instead of to his partners on the stage. In such passages as the narrative to the King of Gottfried's disappearance in the first act, and in many parts of the great duet with Ortrud above referred to, nine actors out of ten would address themselves to the audience, and turn their back upon the other performers. Signor Galassi, on the contrary, never seemed for a moment to forget the character he was sustaining, and he may be assured that the connoisseurs among his hearers appreciated the dramatic truth of his acting all the more that he made no concessions to them.

Of the Elsa of Mdlle. Nilsson it is impossible to speak so highly. That the lady is a most finished vocalist no one will for a moment dispute, and as regards the singing her performance left absolutely nothing to desire; but her impersonation of the character will not for a moment compare with that of Mdlle. Albani at Covent Garden. The explanation may be given in one word—hardly very flattering, perhaps, to the singer, but in our opinion the simple truth which ought to be told. There appears to be far too much self-consciousness about her acting. We should be very sorry to do Mdlle. Nilsson an injustice; but the impression produced on us was that she thought more of the effect she was making than merely of the truthful presentation of the character. As an example of this may be mentioned the scene of the bridal procession in the second act. According to Wagner's minutely careful stage-directions, Elsa ought to come on the stage at the eighteenth bar of the music, and pass very slowly across to the cathedral, standing still from time to time while the chorus "Gesegnet soll sie schreiten" is being sung. As it was, Mdlle. Nilsson never appeared on the stage till just at the conclusion of the chorus; and, as the absurd result, they were singing "Heaven bless her! how beautiful she looks!" when she was not in sight at all. In many Italian operas nonsense of this kind would be of no consequence; but it is otherwise with Wagner, in which every note and every line has its dramatic significance. It is impossible not to suspect that Mdlle. Nilsson did not choose to be on the stage unless she was singing or acting; but if so she certainly might with advantage have taken a lesson from Mdlle. Titiens, who in the first act has to be on the stage for three quarters of an hour without a word to say, and with nothing to do but to look fierce. It would be unjust, however, not to add that in the great duet with Lohengrin in the third act Mdlle. Nilsson was most excellent. Here both acting and singing were superb; but on the whole her conception of Elsa failed to satisfy us.

Signor Campanini as Lohengrin sang better than Signor Nicolini, but did not act so well. If there was none of the supernatural element about the latter, there was (if the bull may be allowed) even less about the former. Fancy a Knight of the Holy Grail with an eternal smile on his face! On the other hand, Signor Campanini's singing of the part was charming. It was truly delightful to hear the sustained cantabile passages given without that wretched *vibrato* which is the bane of most of our public singers; and a better performance of Lohengrin's farewell to the Swan in the first act, and of such passages as the "Athmest du nicht mit mir die süßen Düfte" in the third—to name but two out of many which might be instanced—could not be wished for.

As King Henry, Herr Behrens, though at times somewhat rough, was very satisfactory—an enormous improvement on the unfortunate gentleman to whom the part was allotted at the other house; and Signor Costa, though neither in voice nor in declamatory power equal to Signor Capponi, was a fairly efficient Herald. The chorus was on the whole much better in tune and more effective than at Covent Garden, and the *pianos* and *pianissimos* were far better attended to. On the other hand, the orchestra was horribly coarse. Wagner's

scoring is so full that the greatest delicacy is required in many parts from the players in order not to overpower the voices. Unfortunately one of Sir Michael Costa's chief characteristics seems to be love of noise; and the brass instruments throughout the evening blared away with an effect that was simply distressing. An excellent musician who was present, and who heard the work for the first time, remarked that "he never heard such a hideous noise as Wagner's orchestration in his life." That the fault, however, lay not in the orchestration but in the playing, and therefore in the conductor, whose duty it is to see that it is subdued, was clearly proved at Covent Garden, where the very same passages, given with the necessary refinement, produced indeed the effect of richness, but never of noise. As it was, listening to the orchestra on Saturday evening was nothing less than a musical martyrdom. At Covent Garden one could hear how Wagner's accompaniments ought to be, at Drury Lane how they emphatically ought not to be, played.

Another defect in the performance was that Sir Michael Costa, whose sympathies are certainly with Italian rather than with German music, took some of the *tempi* very decidedly too slow. This was more especially the case in the great scene of Lohengrin's arrival in the first act, and of the introduction to the third act. Both are expressly marked by the composer to be beaten two in a bar; and in both, if we are not mistaken, Sir Michael Costa beat four. The dragging of the time which resulted utterly ruined the effect, especially in the exciting climax of the chorus in the first act, which aroused such enthusiasm at Covent Garden. Here, on the contrary, it became simply tedious.

The "cuts" were on the whole judiciously made, but there were one or two striking exceptions. The worst were the omission of an important passage in the first finale, and the suppression of a part of the charming bridal music in the second act. On the other hand, a considerable part of the male-voice chorus, "In Früh'n versammelt uns der Ruf," nearly all of which was omitted at Covent Garden, was restored, to the great advantage of the scene.

The *mise-en-scène*, though less gorgeous than at the rival establishment, where a speciality is made of this department, was nevertheless thoroughly satisfactory, and some of the stage-business was more in accordance with Wagner's directions than at Covent Garden. The scenery, by Mr. Beverly, was singularly beautiful, especially the view of Antwerp Cathedral in the second act.

In one respect Wagner's music gives a most valuable lesson to our singers. Those who will do justice to it must set their art above themselves. Here are no opportunities for applause at the entry of the prima donna, or after a solo; and on Saturday, as before at the other house, all such attempted interruptions of the performance were resolutely put down. Would that all our vocalists would learn that operas are not written solely to afford them opportunities for display, but that they must consider themselves merely as the servants of art—the vehicles for its interpretation. The more genuine the artist, the less self will be thought of; and no better illustration can be given of this than the Ortrud of Mdlle. Titiens of which we have just spoken.

Ebenezer Prout.

If the performances of French opera at the Gaiety of which we have spoken in recent numbers are not financially successful, it will be a shame and disgrace to our London public; for every fresh opportunity of hearing them confirms the opinions already expressed as to the remarkable effect of their *ensemble*. The novelties recently produced have been Auber's *Domino Noir* and Hérold's *Zampa*. The former work not only contains some of its composer's most charming music, but has also the advantage of one of M. Scribe's best libretti. The adventures of the young nun who steals out of her convent to attend

a masked ball, oversteps her time, and is locked out all night, are set forth with such dramatic art that the piece would be worth seeing, even were every note of the music cut out, when it is so admirably acted as at the Gaiety. The part of Angèle was sustained by Mdlle. Priola, whose rendering of Marie in *La Fille du Régiment* we noticed a fortnight since. Not only was her acting all that could be desired, but her singing was most charming, though (like most of the company) she is unfortunately addicted to too great use of the *tremolo*. Her song in the first act, "Le trouble et la frayeur," and still more the great scena "Ah quelle nuit!"—in which, after getting safely back to the convent, she recounts the night's adventures—were most excellently given. As her companion, Brigitte, Mdlle. de Vaure was also very satisfactory, especially in her couplets in the third act, "Au réfectoire, à la prière;" while the secondary female parts were effectively given by Mmes. Henault, Gayda and Pennequin. Of the gentlemen, M. Barbet, who has little to sing but a great deal to speak, proved himself a most accomplished actor in the part of Juliano; his great merit is the perfect naturalness of his manner. M. Laurent was a very good Horace, though his acting is perhaps slightly more conventional than that of some other members of the company. M. Sujol was very amusing as Lord Elford, the English nobleman who speaks such bad French; but the most remarkable piece of acting in the opera was that of M. Joinnisse as Gil Perez, the *concerge* of the convent. The whole conception of this difficult part was masterly, truly comic yet never degenerating into farce. His song, "Nous allons avoir, grâce à Dieu," was given with such unction, and accompanied with such extraordinary facial expression, that a repetition was inevitable; and though at the Gaiety the demand for an encore is (happily) very rarely acceded to, it was impossible this time to resist it. M. Joinnisse is certainly a very finished artist. Both band and music were, as usual, quite up to the mark, and the whole performance was a musical and histrionic treat of a very high order. The performance of *Zampa* on Saturday last attracted the largest audience of the season. A new tenor, M. Tournié, made a most successful appearance as the hero, and was well supported by Mdlle. Cordier, Mdlle. Henault, and Messrs. Barbet, Borrès and Joinnisse. We must defer a detailed notice of this performance till a future occasion. This evening a welcome novelty is announced in Auber's *Haydée*.

THE fourth Summer Concert at the Crystal Palace last Saturday brought to a hearing the Pastoral Symphony of Beethoven, Hérold's overture to *Zampa*, and Sullivan's "Overture di Ballo" as the orchestral works. Mdlle. Krebs was the pianist, and played Mendelssohn's Capriccio Brilliant in B minor, and a Rhapsodie Hongroise by Liszt. The soloists were Mdlle. Blanche Cole and Mr. Edward Lloyd, and the Crystal Palace choir sang Mendelssohn's "Hear my prayer" and Schumann's "Gipsy Life." Owing, probably, to the wretched weather, the attendance was but small. To-day Handel's *Acis and Galatea* will be performed on the great orchestra, the Handel Festival Choir taking part in the choruses.

MRS. ELIZABETH BEESLEY, a pupil of Dr. Bülow, whose brilliant *début* at the New Philharmonic Concerts was recently noted in these columns, gave a *matinée* at 18 Queensbury Place, Cromwell Road, on Wednesday afternoon. We were unable to attend, and can therefore only say that the programme was one of great interest, including among other pieces Rheinberger's Sonata, Op. 77, for piano and violin, performed on this occasion, if we are not mistaken, for the first time in this country.

A CONFERENCE was held at Marlborough House by the Prince of Wales on Tuesday last for promoting the establishment of free scholarships in connexion with the new National Training School

of Music at South Kensington. A letter from Mr. Freaque was read, offering to give the building for the new schools, and the offer was accepted with thanks. The Lord Mayor promised to call a meeting on the subject at the Mansion House.

WE mentioned in our Music Notes of last week the discovery of two unpublished operas by Donizetti. The current number of the *Revue et Gazette Musicale* now states that the whole of the music of both is already familiar to the public, having been subsequently incorporated with other works.

A BIOGRAPHY of Boieldieu, by Arthur Pougin, entitled *Boieldieu, sa vie, ses œuvres, son caractère et sa correspondance*, has just been published by Charpentier in Paris.

HERR JULIUS SCHUBERTH, the head of the great music-publishing firm of Schubert and Co., Leipzig, died on the 9th inst.

THE last number of the Leipzig *Signale* contains in a letter from its Vienna correspondent some excellent remarks on the interruption of operatic performances by ill-timed applause, which opera-goers and singers in this country would do well to take to heart. Speaking of a recent performance of *Don Juan*, after saying that the chief performers were repeatedly applauded and recalled, the correspondent adds:—

"The disturbing effect of this cannot be described. As the succession of the scenes does not permit of an actual pause, and the conductor continues to beat time, there not only result the most wonderful absurdities in the action, but a part of the music is quite lost. This would be just the opportunity for the singers to show that the earnestness of their task stands higher than the vanity of the individual *ego*. But after moments of the highest excitement follow the most elegant curtsies, and the still more disturbing re-entry from the side-scenes, and all illusion is gone, we become angry and think it is a mere farce. Had the singers tact enough to give no heed to the siren-call of the galleries, they would certainly on that account be not less but more esteemed, and in any case the consolation would be left to them of being applauded to their heart's content after the fall of the curtain."

VERDI, whose arrival in Vienna was expected on the 5th, has not visited that metropolis for thirty-two years. His third opera, *Nabuccodonosor* was performed there in 1843 under the personal direction of the composer. Although a stranger to the Viennese public since then, Verdi has retained his hold of their sympathies in consequence of the frequent and successful performance at the Court Opera of his later works, *Ernani*, *Rigoletto*, *Il Trovatore*, *La Traviata*, *Il Ballo in Maschera*, &c.

G. LEOPARDI, a composer at Verona, has brought out a *pièce de circonstance* in the form of an amalgamation of the melodies of the Italian, Prussian, and Austrian national anthems. The allied sovereigns have sent him tokens of their approbation of this compilation, to which it would perhaps be invidious to assign the conventional appellation of *pot pourri*.

FRANZ LISZT, who has lately been the King of Holland's guest at Loo, has received an order, and a writing-desk worth 24,000 marks, as proofs of the esteem of his royal host.

A PERSONAL friend of the composer sends the *Neue Freie Presse* the following interesting criticisms by Verdi on Wagner's works and on German singing:—

"The conversation turning upon Wagner, Verdi remarked that this great genius had rendered incalculable service to melodramatic art, owing to his courage in emancipating himself from the traditional antiquated forms. 'I also,' said he, 'have attempted to blend the music with the drama, certainly in *Macbeth*, but I could not myself write the *libretti* as Wagner does. Wagner surpasses all composers in the wealth of colouring in his instrumentation, but he goes too far in the form as in the manner. At first he successfully combated the realistic, but later on, he got farther from ideal poesy through ex-

aggeration, and fell into the very fault, the last of ameliorating which he had originally proposed to himself. Thus the uniformity which he so victoriously attacked once more threatens to rule him."

With regard to German singing Verdi observed:—

"There is certainly no want of voices in Germany; they are almost fuller in tone than the Italian. The singers, however, regard song as a gymnastic exercise, trouble themselves little with the formation of the voice, and aim only at obtaining a large repertory in the shortest possible time. They give themselves no trouble to bring a beautiful shading into their *scena*, their whole endeavour is directed towards bringing out this or that note with great power. Hence the song is no poetical expression of the soul, but a physical struggle of the body."

WE understand that the Duke of Beaufort has consented to become President of the Musical Artists' Society.

THE appointment of Succentor and Director of Musical Instruction at Eton College has been offered to Mr. Joseph Barnby. His acceptance of this position will not interfere with his public engagements in London.

"THE Harp-King of the North," as he was called, Antoine Edouard Pratte, has just died at Odensnäs, in Sweden, in his seventy-seventh year. He was born in Bohemia, but was brought to Sweden when a very young boy, and began to play the harp at a little theatre of national nettes. He was considered one of the best harpists in Europe, and his talent as a composer—shown in several concerted pieces for the harp, melodies with orchestra and choir, with one grand symphony, "The Night of Storm"—was very considerable.

LITERATURE.

Queen Mary. A Drama. By Alfred Tennyson. (London: H. S. King & Co., 1875.)

It is impossible for any admirer of Mr. Tennyson to approach without mistrust a drama by the great lyric and idyllic poet, and especially a drama on such a subject as Mary Tudor. Mr. Tennyson has made the English language richer by lyrics ranging through every tone of music, from the cradle-song to the death-song, from "silver sails all out of the west," to those lines about dying eyes and the glimmering casement, that Edgar Poe never tired of repeating. The "Lotos-eaters" contains all the magic of an earthly paradise in short; "Fatima," once for all, utters all passion of love, and outside these there is an unequalled wealth of melody and of colour in "The Dream of Fair Women," and the "Morte d'Arthur," as of unapproached clearness of spiritual vision in the ninety-fifth poem of *In Memoriam*. With such works behind him, works so admirable and lonely in their beauty, and yet so personal, so little dramatic in character, it is perilous for a poet arrived at that age when the Muse is wont to murmur to her votary,

"Nous n'irons plus aux bois,
Les lauriers sont coupés,"

it is perilous to wander further afield in search of strange laurels.

Mr. Tennyson has not accustomed us to look for drama from his hands, and among other reasons for mistrust, the blank verse which he has made his own is not the verse best suited to the rapid utterance of the stage. He is known to be a student in the best school of dramatic verse, the school of Shakspeare and Marlowe; but even so, for him to adopt another measure, and change his natural note, is a dangerous experiment. Add to this that he is now ruling among the second generation of men who have listened to his verse, and the second generation of a poet's hearers is always captious and hard to please, and has given its first love to the singers contemporary with its own youth. Mr. Swinburne has the ear of modern lovers of modern drama, and it is difficult to avoid the temptation to fruitless and irritating comparison between his Mary, like his *Félice*

"swift and white,
And subtly warm and half perverse,"

and Mr. Tennyson's gloomy fanatic in love and religion.

This last thought, of the historical character of Mary Tudor, brings us to what we cannot but think is the one, the fundamental misfortune of Mr. Tennyson's play,

the misfortune that prevents it, in spite of all its skill, and manifold beauty of various passages, from pleasing as a whole. It seems so like an impertinence to say that the subject chosen by Mr. Tennyson for a tragedy, the life and death of Mary Tudor, does not contain the stuff of a tragedy at all, that one is compelled to quote the highest English authority on one's side, the authority of Mr. Matthew Arnold:—

"What, then," says Mr. Arnold, "are the situations, from the representation of which, though accurate, no poetical enjoyment can be derived? They are those in which the suffering finds no vent in action; in which a continuous state of mental distress is prolonged, unrelieved by incident, hope, or resistance; in which there is everything to be endured, nothing to be done. In such situations there is inevitably something morbid, in the description of them something monotonous. When they occur in actual life they are painful, not tragic; the representation of them in poetry is painful also."

This criticism might have been written expressly for the history of Mary Tudor. A monotonous and continuous mental distress, the distress of jealousy, of lovelessness is only broken for a moment by hope of child-bearing. The suffering finds no vent in action, unless the cutting of Philip's picture out of its frame be action; the pain is unrelieved by incident, unless the burning of Cranmer may be considered as a relief.

True, there is a kind of progress and development in Mary's distress, from the mere distress of "the ugly princess," to the jealousy that is born twin-sister of her love, and thence to almost the condition of the "blood-maniac" whose language is charged with images from the stake and the block, ending in the trance where pain ceases to be conscious in the fine scene of the fifth act, part of which we quote. The Queen has been singing, and Alice, a much less pleasant confidante than Guinevere's little maid, says, "Your Grace hath a low voice."

"Mary.

"How dare you say it?

Even for that he hates me. A low voice
Lost in a wilderness where none can hear!
A voice of shipwreck on a shoreless sea!
A low voice from the dust and from the grave."

(Sitting on the ground.)

"Alice.

"Good Lord! how grim and ghastly looks her Grace,
With both her knees drawn upward to her chin.
There was an old world tomb beside my father's,
And this was opened, and the dead were found
Sitting, and in this fashion; she looks a corpse."

To this crouching and unconscious position of the savage buried, the monotonous misery of her life brings the Queen. Her pain is querulous and cruel: "Queen Mary gwoes on a burnin' and a burnin', to get her baaby born;" as one of the Oxfordshire Gossips says in her dialect, and the mind wearies of the ceaseless complaints. Pole, delicately drawn as the scholar-priest compelled by fortune and feebleness of will to cruelty, grows querulous too, and Philip is peevish:—

"I am sicker staying here

Than any sea could make me passing hence,
Tho' I be ever deadly sick at sea.
So sick I am with biding for this child.
Is it the fashion in this clime for women
To go twelve months in bearing of a child?"

The reader also grows "sick with biding for this child," yet such "biding" was an

essential part of the sorrow, we cannot say the tragedy; of Mary Tudor. Only a French play-writer imagining things "not dreamed of by the rabidest gospeller," things more absurd than parody can surpass, could get dramatic passion and incident into the story of this Queen. Mr. Tennyson, we are compelled to think, has done everything in his play but this; he has developed characters of great subtlety with masterly touches, has rendered the historical spirit and tone of the time:—

"The world is like a drunken man
Who cannot move straight to his end, but reels
Now to the right, then as far to the left,"

has shown the resistance excited by cruelty—

"They swarm into the fire
Like flies—for what? No dogma,"

—has relieved the horror of Cranmer's burning by the indifferent tattle of his gossips, but he has not made a tragedy where tragedy there was none to make.

Mr. Tennyson has criticised his own play when he makes Lord Howard say of Mary:—

"Her fierce desire of bearing him a child
Hath like a brief and bitter winter's day
Gone narrowing down and darkening to a close."

There is no room for sympathy in the record of the narrowing and darkening. The whole weight of all the world's forces seems to crush the wretched and frail protagonist of a cause neither romantic nor successful, that has pleased neither the gods nor the girls.

To turn from the effect of Mr. Tennyson's drama, as a whole, to the admirable execution of parts, to the elaboration of the minor characters, is to be relieved from necessity of hinting disappointment. Elizabeth is perhaps the most prominent and masterly portrait, where most are masterly:—

"A Tudor
Schooled by the shadow of death, a Boleyn too
Glancing across the Tudor."

There is much humour in her unqueenly readiness to flirt, in her puns, and her flash of energy and thunder of speech, when she hears of Mary's mortal illness:—

"God's death! and wherefore spake you not before?
We dally with our lazy moments here,
And hers are numbered."

Gardiner's brutal temper, and difficulty in swallowing papal claims, are carefully indicated. He scolds, and, so to speak, "proctorises" the crowd:—

"Gardiner. 'What is thy name?'
Man. 'Sanders.'
Gardiner. 'What else?'
Man. 'Zerubbabel.'
Gardiner. 'Where dost thou live?'
Man. 'In Cornhill.'
Gardiner. 'Where, knave, where?'
Man. 'Sign of the Talbot.'
Gardiner. 'Come to me to-morrow.'"

The blustering Lord Mayor, the sonneteer Wyatt, the feather-head Courtenay, Howard divided between country and church, Cranmer consoling his remorse by the thought that Joan of Kent was a witch—are all figures that live. As to the gossips, Tib and Joan, their likes may be met any day at Carfax, talking of cows and white pease, as they did in Mary's time. The tempest of Church and state, all change of faith from transubstantiation to protoplasm, sweep by and do not change the peasantry of Oxford-

shire. We shall quote part of the gossip's talk, wherein the curious may detect a mastery of dialect equal to that shown in the "Northern Farmer":—

"Joan. 'Why it be Tib.'

Tib. 'I cum behind, gall, and couldn't make tha hear. Eh, the wind and the wet. What a day, what a day! Nigh upo' judgement daay loike. Pwoaps be pretty things, Joan, but they wunt set i' the Lord's cheer o' that daay.'

Joan. 'I must set down myself, Tib; it be a var waay vor my owld legs up vro' Islip. Eh, my rheumatizy be that bad howiver be I to win to the burnin'.'

Tib. 'I should saay 'tweer ower by now. I'd ha' been here avore, but Dumble wur blow'd wi' the wind, and Dumble's the best milcher in Islip.'

Joan. 'Our Daisy's as good 'z her.'

Tib. 'Noa, Joan.'

Joan. 'Our Daisy's butter's as good 'z hern.'

Tib. 'Noa, Joan.'

Joan. 'Our Daisy's cheeses be better.'

Tib. 'Noa, Joan.'

Joan. 'Eh, then ha' thy waay wi' me Tib, ez thou hast wi' thy owld man.'

Tib. 'Ay, Joan, and my owld man wur up and awaay betimes wi' drie hard eggs for a good place at the burnin'; and barrin' the wet, Hodge 'ud ha' been a-harrowin' o' white peasen i' the outfield—and barrin' the wind, Dumble wur blow'd wi' the wind, so 'z we was forced to stick her, but we fetched her round at last. Thank the Lord therevore. Dumble's the best milcher in Islip.'

Joan. 'Thou's thy way wi' man and beast, Tib. I wonder at tha', it beats me! Eh, but I do know ez Pwoaps and vires be bad things; tell 'ee now, I heerd summat as summum towld summum o' owld Bishop Gardiner's end; there wur an owld lord a cum to dine wi' 'un, and a wur so owld a couldn't bide vor his dinner, but a had to bide howsomiver, vor, "I wunt dine" says my Lord Bishop, says he, "not till I hears Latimer and Ridley be a-vire;" and so they bided on and on till vour o' the clock, till his man cum in post vro' here, and tells un ez the vires has tuk holt. "Now," says the bishop, says he, "we 'll gwo to dinner;" and the owld lord fell to's meat wi' a will, God bless un; but Gardiner were struck down like by the hand o' God avore a could taste a mossel, and a set him all a-vire so 'z the tongue on un cum a lolluping out o' 'is mouth as black as a rat. Thank the Lord therevore.'

In parting with Mr. Tennyson's play, it is necessary to say something of the structure of his verse. He has rightly refrained from the polished and musical style that is his own, the cadences that he first introduced to English poetry. He does not imitate the natural roughness and the archaisms of Elizabethan art, but employs a plain verse, with occasional half lines for the more emphasis. Often it would be hard to guess that Mr. Tennyson is the writer, only in a curious speech of the Second Alderman there comes a familiar touch, and at the same time a slight obscurity:—

"Did you mark our Queen?

The colour freely played into her face,
And the half sight which makes her look so stern
Seem'd through that dim dilated world of hers
To read our faces."

Queen Mary is full of various interest and insight; it shows powers unguessed at, and as yet scarcely to be appreciated. This is too early a day to guess at its future place and rank in English poetry and among the works of Mr. Tennyson. A. LANG.

Histoire de Napoléon I^{er}. Par P. Lanfrey. Tome V. (Paris: Charpentier, 1875.)

THE history of Napoleon has often been written, but never yet, perhaps, in a really impartial manner. The very day after his fall the great Emperor found many detractors, detractors as violent as his admirers

were enthusiastic. Walter Scott may pass for one of the former. Though he cannot be reproached for the severity of his judgment, there is no doubt that at the present day no one in England would accept that judgment without reservation.

In France, where at times opinion changes so rapidly, the fall of the great Emperor in 1814 was hailed as a deliverance by the large majority of the nation, but less than one year of the Restoration sufficed to give him back a popularity that rendered his fatal return from Elba possible. After 1815, under the Second Restoration, the liberal party was neither clear-sighted nor truthful when, in opposition to the reactionary spirit of legitimacy, they set up the legend of a revolutionary Napoleon, parading the principles of '89 throughout Europe, in the track of his soldiers' steps. The influence of this legend—the type of which is embodied in the figure of Napoleon in the little hat and grey overcoat placed by Louis-Philippe on the top of the Vendôme Column—made itself felt through a long succession of years, and traces of it are found even in the most eminent historians.

It would certainly be impossible to find anywhere a more sagacious writer than M. Thiers, or one with a mind more free from bias and less easily led astray. In many passages of his *Consulate and Empire* he inveighs against the injustice and follies of the Imperial régime with remarkable vigour, and yet now and then it seems as though he had been under the influence of the legend which had nursed his childhood. Military tactics, moreover, always exercise a great spell over him; the military genius of the great commander dazzles and fascinates him; he delights in describing his plans for a campaign or, if necessary, in guessing them. He leaves such subjects with regret, and when forced to speak of politics he hurries over the ground, hastens to express blame as if to ease his conscience, and appears anxious to return to what he is permitted to admire, namely, the military conceptions of the unrivalled captain. M. Lanfrey belongs to a different school. He has not been so unwise as to attempt to rewrite the military history of the First Empire after M. Thiers. He gives to the events of the war their proper place, the great place they must necessarily occupy in the treatment of such a subject, but dwells far more than his illustrious predecessor on the political and economical history of the Empire. Judging it by the light of liberal principles as well as of modern events, he blames and condemns more frequently and more severely than M. Thiers. This is no reason for numbering him among Napoleon's systematic detractors; he is not one of those who question his military genius. Quite the reverse; on that point he does him the fullest justice. An entire chapter of his new volume is devoted to Wagram—a battle which, though it certainly did not result in a victory as complete and decisive as that of Austerlitz or Jena, was yet a glorious triumph, and a triumph due to the wisdom, consummate prudence, and undeniable skill of the Emperor in preparing his movements and concentrating his forces.

On the other hand, M. Lanfrey does not belong to the *Chauvins* who see no merit out of France, and who, unable to bring themselves to attribute any to their enemies, explain their country's reverses by such meaningless words as fortune and fatality. He does full justice to Wellington's genius; and if he lays stress upon the faults into which the French generals fell in the campaigns of 1809, 1810, and 1811 in Spain and Portugal, he does so with no intention of lessening the glory of their great adversary. It is impossible to read these chapters of his book without asking what would have happened had Napoleon, after the Peace of Vienna, gone himself—as he had promised, and as everyone expected he would—to Spain at the head of his best troops. What would have been the issue of a gigantic duel between these two men—one the personification of the genius of attack, the other of defence? Most Frenchmen are convinced that Napoleon would have carried off the victory; most Englishmen, no doubt, have the opposite conviction—a conviction, it must be owned, which Waterloo seems to justify. They ought, however, to be reminded that the Grand Army had perished in Russia; that in 1815 Napoleon had not the soldiers of Austerlitz under his command; and that the arrival of the Prussians, which gave the Allies such an immense numerical superiority, must count for something in Wellington's victory. The question will remain unsolved to the end of time. Why did Napoleon not solve it in person? Why did he not proceed to Spain when everything seemed to call him thither? Was it care, perhaps even fear, for his own safety that kept him from taking a personal share in a war consisting wholly of skirmishes and ambuscades? Was he absorbed by all the varied anxieties inseparable from the administration of his vast Empire? Did he think that the question could not be immediately solved, and that the war in Spain would cease of itself as soon as he had struck Russia with dismay and forced England by establishing a continental blockade to sign a treaty of peace? M. Lanfrey leaves his readers rather in indecision, and judging by his explanations, is evidently not clear himself on this point. One thing is certain, that Napoleon noised abroad his intended departure for Spain, and yet apparently never had any serious intention of going thither. It is not easy to penetrate his motives or to explain a line of conduct which seems to run so directly counter to the interests of the Emperor.

And is this the only thing difficult to explain with regard to his conduct? Assuredly not. The epoch which forms the subject of the fifth volume of M. Lanfrey's book seems to be the most brilliant of the whole reign. Napoleon has defeated Austria at Wagram. The great English expedition has met with a signal disaster in the fever-breathing marshes of Walcheren. It is true, the war in Spain was being carried on amidst useless successes and painful reverses, but who would have suspected that this obscure struggle going on in one corner of Europe could influence the destinies of the grand empire, the empire which was still continuing, without any apparent difficulties, to extend its

boundaries by the annexation by simple decrees of one vast country after another. In this way, the Papal States, Holland, the Valais, the Hanse towns, a part of Hanover and Oldenburg all lost their last shadow of independence. As though wishing to make his great power felt as much in words as in deeds, the Emperor officially proclaimed the interests of the empire—that is to say, his own private interest, which thus became the official law of public right—to be the object and motive of these unheard-of measures. Europe all the time said nothing. The fact was, Napoleon's power was at that time boundless. Yet it was manifest, even then, that the feet of the colossus were of perishable clay; it is clear to every careful observer that, in spite of its brilliant exterior, the immense erection was fragile and must before long fall to the ground. The conception on which it is based was so insane, and the means employed to carry it out were, if anything, still more so. To dream of a universal monarchy after Charlemagne and Charles V., and to aim at turning Europe into one vast empire by subjecting all the nations to the French régime was surely the most insane and the most guilty of political conceptions. Had Napoleon been successful, had he been able to bring the whole of Europe into lasting submission to the French yoke, he would only have ended in ruining it, if not materially, at all events morally and intellectually. The diversities of genius, temperament and character which distinguish nations from each other are no less necessary to the life and progress of humanity than are diversities of men to the life and progress of nations. To reduce all nationalities to the same level, to convert Rome, Geneva, Amsterdam and Hamburg into so many capitals of French departments, was not merely to trample justice under foot, it was insulting to common sense.

If this fatal system had lasted Europe would have gradually sunk into one dead uniformity, and all intellectual and moral life would have become extinct. It is therefore true (and M. Lanfrey is right in saying so) that England, who at that moment alone withstood Napoleon, became by virtue of the facilities afforded her by her insular position the champion of liberty and civilisation, and deserves the gratitude of the whole world in return. But if the end in view was detestable, the means which the Emperor used to attain that end were no better. Sometimes they seem to have been expressly devised to run counter to the intended results. The moral sense was wanting in the Emperor. He was through life the man who caused the assassination of the Duc d'Enghien and laid a trap for the King of Spain at Bayonne. He not only felt no repugnance for falsehood, cunning, and violence, but had habitual recourse to them in all his governmental acts. And yet, wishing as he did to bring the whole of Europe under his sway, he should have made it his first object to render his authority endurable. He should have done all in his power to lessen the unavoidable humiliation of his rule by the most studied consideration, or at least a just and foreseeing administration. He took no such precautions. We are now and then led to ask whether he did not rely for the establishment

of the Empire on brute force alone because he was aware how monstrous a conception it was, and acknowledged to himself that there was but one way to make it enduring, namely, to crush those over whom that empire was to extend.

The continental blockade was undoubtedly one of the worst inventions of imperial despotism, and one of its gravest errors. Napoleon had flattered himself that he could compel England by that means to lay down her arms, but England suffered far less than his own empire from the blockade, the surest result of which was to ruin the industry of the whole continent. Again, had the whole empire suffered equally from the scourge thus inflicted upon it, the consequences would have been less disastrous; but no sooner had Napoleon recognised the fatal result of the system he had adopted, than for his own benefit and the benefit of the old France, he began to infringe the law he had laid down. It is difficult to conceive anything more iniquitous than the system of licences by which he sold for hard cash permission to French merchants to run the blockade, enforcing it at the same time with the utmost rigour on the rest of his subjects, and whenever he could on his allies as well. Was not this to seek deliberately to exasperate those whose attachment, since he had proclaimed himself their ruler, it should have been his interest to secure? The fact is the faults he committed during those brilliant years are simply innumerable. After the fault of not having put an end to the war in Spain by going thither himself—after the fault of those insane annexations by which he extended his empire from Rome to Hamburg—after the fault of marrying an Austrian princess and quarrelling with Russia, whose powerful sovereign he treated as no well-bred man would treat a private gentleman under similar circumstances, the Emperor committed a fault more serious still when he convoked the Council of 1811.

How was it possible for a man of such exalted genius and so superior a mind, a man trained as he was in the direction of human affairs, to have made a mistake of so grave a nature?

Napoleon believed in force and in force only; he fancied he could command the Church as he commanded an army. This at once renders the annexation of the Papal States and the strict captivity of the Holy Father intelligible; but it is unintelligible that having thus acted he should have deemed it possible to convocate a council. The very thing he ought to have foreseen happened; the men whom he had found tractable and even fearful when they were isolated, acquired a certain self-esteem and *esprit de corps*, which gave them, as soon as they were brought together, a strength and firmness they would never otherwise have possessed.

And to his amazement the Emperor found himself face to face with something that looked like resistance. This had not happened to him for many long years. But he did not thence learn that men were less contemptible than he had believed them to be, he did not give up his project of reorganising Catholicism after his own fashion

and for his own profit, but found himself when the council broke up rather farther from the goal than before.

How many more faults might be enumerated, were we to follow M. Lanfrey step by step through all the chapters of his new volume! And yet the man who committed them was undoubtedly one of the most powerful geniuses the world has ever seen. But no genius has ever yet been able to resist the infatuation of supreme power. The truth is—and this gives the narrative its keen interest, an interest admirably sustained by the author's sober and severe style—that during these three years Napoleon is at war, solely, with himself. Excepting England, whom he cannot touch and who cannot on her side do him any great harm, everything has bent before him and is silent. But he is at strife with his own passions, with that unquenchable thirst for power, that ambition which knows neither curb, measure, nor bounds, which impels him again and again to call everything in question, again and again to stake his crown in order to enrich it with new gems. Russia alone has preserved some degree of independence, and therefore Russia must be conquered. Like the Emperor of Austria and the King of Prussia, Alexander must be reduced to the position of a vassal, so without any reason, without the excuse of having a single grievance to allege, a single motive to put forward, he prepares to invade Russia, denying it all the time in a manner as shameless as it was useless. It is said, and M. Lanfrey just mentions the fact, that several times during those long preparations the ghost of Charles XII. appeared to the Emperor. Unhappily for the hundreds of thousands of men who were to meet their death on the icy fields of Russia, he paid no heed to it. The demon of absolute power had seized on its prey, and was to lead him to his ruin.

ETIENNE COQUEREL.

Our Bishops and Deans. By the Rev. F. Arnold, B.A., late of Christ Church, Oxford. (London: Hurst & Blackett, 1875.)

QUID domini facient, audent cum talia—curates? What is to become of the Bench of Bishops, when the order of "orders" is reversed, and a curate, unbosoming his inner heart to a poet-friend, declares what, in his deliberate opinion, is the lesson taught by the past and present history of our "Bishops and Deans"? It is scarcely probable that a conclave will be urgently summoned to Lambeth with a view to joint-answering Mr. Arnold's challenge, in the 700 pages of which there is little noticeable beyond second-hand ecclesiastical gossip, a heaping-up of bad jokes, and a consistent exhibition of bad taste. If a *bona fide* history of our bishops and deans was needed, it should have drawn a line at the penultimate incumbents of the sees and deaneries, whereas by making his book for the most part a sketch-book of contemporary ecclesiastics, Mr. Arnold panders to the craving for tittle-tattle which is bred by books like Mrs. Stowe's *Sunny Memories*, or Willis's *People I have Met*; and so far from sustaining the already defective rever-

ence of our generation for its ecclesiastical rulers, does his worst by faint praise, covert sneers, half-pronounced insinuations, and the like, to detract from the dignity of an office which he no doubt professes to hold in honour. Purporting to be a sketch of episcopal history since the days of the Reformation, especially during the present reign, where such careers as those of Bishops Philpotts and Wilberforce will strongly mould ecclesiastical history, and advancing thence to a survey of the present aspect of the Church of England, as represented by its bishops and deans, the work before us sadly falls short of its scope by propounding none of those reforms with which, to judge by the preface, it is labouring and travailing; but darkly hinting that our bishops and curates, or rather our deaconate and episcopate, need extensive increase and reform, lays the flattering unction to the majority of its professional readers that "the great body of the priesthood is in an eminently sound state, and efficiently doing its great work." How far Mr. Arnold is a judge in such matters, and what is the mental calibre which he brings to bear upon the contemplation of our spiritual rulers and leaders, a very cursory skimming of the two octavos before us would suffice to show; and, to be frank, an exacter perusal has brought us to the conclusion that, while under the surface of the work there lurks an animus of discontent and cavilling, the author has got up his subject so perfunctorily that he is reduced to generalities and anachronisms, as where he tilts at the "baronial mediæval prelate," as our modern and abnormal exaggeration of "the primitive Catholic idea;" and that whatever crevices there may be in the joints of the episcopal harness, it is not at any rate Mr. Arnold's bow and spear which are likely to penetrate them.

An opening chapter surveys the Victorian era of the Church of England and its three great movements, but it may be inferred with how uncertain a sound Mr. Arnold's trumpet speaks, when we compare his statement that "the influence of such bishops as Blomfield and Philpotts was thin and pale by the side of such a man as Mr. Keble," and that the influence of the latter "was perhaps the most salutary of our age" (p. 10), with the admission "it appears to us that Keble himself stayed in our Church simply because on the balance of probabilities it appeared to him that it might be safest to do so" (p. 11). It seems as if either the author was not fully persuaded in his own mind what judgment he ought to pass upon a party or an individual, or else that he has contracted so inveterate a taste for "hedging," that in result his utterances are singularly Laodicean. When he is contrasting the Evangelical party with the Broad Church and the High, he seems as if divided between blessing and cursing. "As a rule, they scarcely possess the culture, refinement, breadth—of Broad churchmen"—"but in the intellectual gifts of oratory they have probably left Broad Church and High Church equally behind" (p. 19); when his survey of the school of Hare, Coleridge, Arnold brings him to the mention of the influence of Frederick Denison Maurice, and the impression left by his "rich tremulous eloquent

accents," he has no more self-respect than to chronicle the small-beery circumstance that he once counted in the Vere Street Chapel "thirteen people asleep" on a summer morning, when Maurice was preaching. Mr. Arnold might as well have made the fourteenth, as have busy-bodied himself to record the fact; and, if the truth could be reached in the well of his somewhat fathomless mind, we should probably discover that Professor Maurice's impression upon it was simply "nil," for he winds up with an oracular backhander at this admirable preacher and thinker, "We confess that for ourselves obscurity of style generally argues obscurity of thought." Irrespectively of individuals, we have of course no objection to take to this profound canon, but we cannot help thinking that Mr. Arnold's pretensions would suffer speedy collapse if submitted to it. How would he fare, for example, if judged by this sentence, which he has printed touching Bishop Sumner of Winchester—"His great title to distinction," he writes, "is this, that as one of the first five prelates of England he once sat in the high seat once held by Launcelot Andrews." We defy the deffest candidate for a pupil-teacher's certificate to analyse this sentence: and if from style we turn to power and grasp of thought, is there much heed due to one who can call *Ecce Homo* "a book of a class designed to give the *coup de grâce* to Christianity"? A clearer and more candid estimate would be that *Ecce Homo* is incomplete without the obverse presentment of an *Ecce Deus*; but that as the half of a whole it may be read with profit and edification.

It is not very clear why, in the second chapter, Mr. Arnold gives us some rather objectless sketches of Elizabethan and Jacobean bishops, or on what principle they are sketched. As a rule it is the merest gossip about them which is chronicled, and it is surely as needless as it is in bad taste to rip up at this time of day the sad case of the Bishop of Clogher. One might have supposed that these selected sketches were designed to illustrate the *chef d'œuvre* of fine writing which is found in page 50 of the first volume, where it is said of the bishops, "They have been, as it were, the stormy petrels of the political waters; when they appear conspicuously, the vision is ominous of trouble; or, to adopt another ornithological image, we are sometimes reminded of Landseer's picture of the *Swannery attacked by Sea-Eagles*, when we recollect how the lapsed prelates have again and again been attacked by crowds that were not sane, and crowns that were not just;" but it does not seem that Bishops Andrews, Corbet, Bull, Thomas Wilson, and the medley of divines whom he sketches, owe their parading to this prelude of clap-trap imagery and false antithesis. Mr. Arnold gets more amusing, no doubt, when he reviews contemporary divines, and as mere anecdote his sketches would not be amiss. Without pledging our credence, we could afford a grin to the story of the "young Levite" who, at a bishop's breakfast-table, was so 'umble as to decline the replacement of a bad egg by a good one with a "No thank you, my Lord, it's good enough for me;" and as to the story told of

Bishop Vowler Short testing a candidate for holy orders with the first question in the Church Catechism, and making as though he would have plucked him, because he twice answered cumulatively "John Jones." *Credat Judæus*; it would not go down in St. Asaph. But not seldom we detect a sting in these anecdotes. That about Bishop Lonsdale and "that woman's cake" (though it is intended to be collaterally avouched by Mr. Arnold's assurance that "our own legs have reposed under the excellent mahogany" of the lady so slighted), is singularly inconsistent with the kindliness of that genial prelate; but we can understand its finding a place in these voracious chronicles, when the author notes elsewhere that "he had a weakness for men of family and wealth." It is doubtless solicitude for a great divine's appreciation by his quondam diocese, which makes him lament that it should have taken so coolly and indifferently Bishop Thirlwall's retirement to Bath; but is it good or kind taste to tell such tales as that "about one very kindly old bishop who filled his nice house with nice people, and only showed at a late dinner"? Though the name is suppressed, we are meant to identify the bishop in question by his bachelorhood and his *duck-feeding*, and then to laugh at the unwarrantable scurrility about his "being picked up by the housemaid in the morning" (ii. 196). Doubtless the author's acquaintance with Bishop Thirlwall and his late diocese was familiar and of long standing? But some bishops who are not quite Mr. Arnold's ideal are disposed of without an anecdote. Bishop Fraser, for instance, is spoken of as honest, eager, bustling, ubiquitous, and voluble. "Yet somehow he leaves you a little restless and dissatisfied. There is a joint in the harness, a crevice in the armour, and you make up your mind that he is crochety." By the way, has not the Bishop of Manchester stated pretty openly what manner of curates he will promote in his diocese? But of all cool and negatively detractive criticisms the most impertinent is his sketch of Bishop Durnford, "an aged bishop . . . with a cold, clear-cut face, pleasant and garrulous, kindly and refined; a mild, wise, and not inactive ruler," &c. &c. And this is the way an Oxford B.A. writes of two ecclesiastics who, besides having taken in their day the highest honours of their university, are doing good work in their dioceses, and perhaps rather to be congratulated than otherwise in failing to give entire satisfaction to their self-elected critic. It may be a question whether his predilections are to be coveted. They are for the Archbishop of York among archbishops, and the Bishop of Gloucester among bishops. Only it is very odd, he thinks, that the former only took a *third*, and was not considered a clever fellow at Shrewsbury; and as to the latter, you'd hardly dream that "a prelate with so cold, thoughtful, keen, earnest, saintly an expression" could be so "very human," have such a sense of satire and fun, and even get into hot water by a humorous suggestion about not flinging mob agitators into the horse-pond. Is this "dissembling love," or is it not rather "kicking down stairs"? As Mr. Arnold seems to know that the Bishop of Gloucester will probably write

the preface to the New Version, as a former bishop did to the Old, it may, perhaps, be untimely to remark that those prelates strike us as most to be macarized whom Mr. Arnold has least to say about whether for good or evil; but we are free to confess that, taking one sketch with another, we cannot recollect so self-sufficient, slender, and trivial a production as this professed sketch of English episcopal history. Its style is slipshod, though it sets up for criticising episcopal styles, and its inaccuracies are crying; as when in one page we read of the difficulty of "*arranging precedent* between a canon, curate, and his incumbent," and of Dr. Pretymann-Toulman passing away, "gorged with the spoils of Lincoln and Worcester." It may strike casual readers that the book is worth perusal for its longer sketches of Philpotts, Wilberforce, and Blomfield. Perhaps a crucial test would be to empanel a jury of the kinsfolk of either of these great prelates to decide, "yea or nay," whether they would take Mr. Arnold for their biographer. That he will be remembered, even in the dearth of good books on the subject, as the historian of Anglican Episcopacy, not even himself can imagine in his fondest dreams.

JAMES DAVIES.

Fusang, or the Discovery of America by Chinese Buddhist Priests in the Fifth Century. By Charles G. Leland. (London: Trübner & Co., 1875.)

WE should have had much greater pleasure in examining the merits of the problem propounded in this little book were it not for one very serious defect. Whereas the work consists of a narrative from the Chinese Year Books, translated, with comments, by the late learned Sinologist, Dr. Neumann, and edited by Mr. C. G. Leland, the reader is not always quite sure whether he is reading the ancient document or Dr. Neumann's comments, or what Mr. Leland has to say to us on the subject. When we are told of a fifth-century document purporting to recount the discovery of America by the Chinese at that early date, we receive it as a choice dainty which we would fain taste and roll over the palate in its simplicity and entirety, unflavoured by any foreign condiment whatsoever. Illustrative annotations, most thankfully received, can easily be placed near—and the nearer the better—to the annotated text, but should not be so placed as to break the sequence of the language of the important original; and assuredly there ought to be no doubt as to where that original begins and ends, and what portions of the book appertain to it. We commence Chapter I. with the supposition that we are at once launched upon the translation of the ancient text, for the chapter begins with inverted commas, and has the running heading, "The Narrative of Hœi-shin." If the supposition be correct, however, it is soon balked, for a paragraph of thirteen lines brings us to the end of a quotation, and we go on reading without meeting any more inverted commas till we reach pages 15 and 16, where two small paragraphs with inverted commas lead to the idea that the ancient text is resumed;

but, as we go on reading, we come in the course of a few lines to the words "Steller also assures us," when we instinctively say to ourselves, "Surely this was not written by any Chinese in the fifth century." It proves, however, to be only a printer's error in omitting the final commas at the end of the preceding paragraph. Two or three more quotations, with the comments, bring us to the end of the second chapter, but when we reach the second page of the third chapter we are thrown into doubt as to what the preceding extracts have been by encountering the words "We will now give a literal translation of the Chinese report." We console ourselves with the belief that at length we have doubtless before us the true *pièce de résistance*, but, as we read on, we come to the following words, "Many Fusang trees grow there, whose leaves resemble the *Dryanda cordifolia*." Marry come up! we say, this is a fifth-century Chinese document? Where are we? This uncertainty is so irritating that it extorts a complaint which is made very reluctantly, for we would gladly enquire into the subject hand in hand with an editor who freely admits that the problem he has to propound remains a problem still, and at the same time does his best to adduce such facts as may appear confirmatory of his own conclusions. This is not the first time that this interesting subject has been brought under the notice of the English reader. In 1847, the present writer in the introduction to the first edition of his *Select Letters of Christopher Columbus*, printed for the Hakluyt Society, wrote as follows:—

"The first specific statement of a supposed migration from the shores of the old world to those of the new is that which the elder De Guignes presumes to be demonstrable from the relation given by a Chinese historian Li Yen, who lived at the commencement of the seventh century. [The date given by Dr. Neumann is 490.] The said historian speaks of a country named Fou-Sang, more than 40,000 *li* to the East of China. He says that they who went thither started from the province of Leaton, situated to the north of Peking, that after having made 12,000 *li* they came to Japan; that travelling 7,000 *li* northward from that place they arrived at the country of Venchin, and at 5,000 *li* eastward of the latter they found the country of Tahan, whence they journeyed to Fou-Sang, which was 20,000 *li* distant from Tahan. From this account De Guignes endeavours, by a long chain of argument, to prove that the Chinese had pushed their investigations into Jesso, Kamtschatka, and into that part of America which is situated opposite the most eastern coast of Asia. This surmise of De Guignes has been answered by Klaproth in a paper which appeared in the *Nouvelles Annales des Voyages* (tom. 51, 2 série, p. 53). His arguments go to show that the country named Fou Sang is Japan; and that the country of Tahan can only be the island of Saghalien. Humboldt observes upon this subject that the number of horses, the practice of writing, and the manufacture of paper from the Fou-Sang tree, mentioned in the account given by the Chinese historian, ought to have shown De Guignes that the country of which he spoke was not America."

The question then arises whether any fact or argument adduced by Dr. Neumann or Mr. Leland is sufficient to overbalance the arguments of Klaproth, or to contravene this cogent reasoning of the illustrious Humboldt. And first we must look to the

geographical indications of the Chinese text. In the above quotation, from another quarter, we have a series of distances and bearings for arriving at Fusang, which we look for in vain in Dr. Neumann's "literal translation" of the Chinese Report. For two reasons, no reliance whatever can be placed on the distances. The *li* has always been different in different provinces and at different periods, and even had it been a constant, the well-known prodigality of the Chinese in the use of numbers would give it all the worthlessness of inconstancy. But due allowance being made for all this, great importance is to be attached to the bearings, for, obviously, if they fail us, we are but dealing with puerilities. Let us then see whither the above given bearings lead us. The Chinese historian himself brings us to Japan from Leaotung. From Japan we are taken northward (or, as Dr. Neumann says, north-east) to Venchin or the Painted People. The former bearing would lead to Jesso or Saghalien, the latter to Kamtschatka, but Dr. Neumann travels by it far more to the eastward, and thus reaches the Aleutian Islands, whose inhabitants he reconciles with the Venchin by the variety of figures which they used to cut on their bodies before their conversion to Christianity. Thence the original takes us eastward to Tahan, but Dr. Neumann, who wishes to find Alaska in Tahan, can only do so by travelling not eastwards but very strongly in a north-east direction. Let us, however, suppose him arrived in Alaska as Tahan. By his own account Fusang, the object of his final search, lies, according to the Chinese, eastward of Tahan, a bearing which will never bring him to Mexico. He must travel through more than thirty degrees of latitude to the south, unindicated in any way by the text, before he can reach that country. Yet to the country of the Aztecs does he thus arbitrarily lead us, and mainly on the strength of the assumption that the Chinese Fusang-tree, from which the country sought for took its name, "was formerly found in America and afterwards, through neglect, became extinct," or that—

"the traveller described a plant hitherto unknown to him which supplies as many wants in Mexico as the original Fusang is said to do in Eastern Asia—I mean the great American Aloe (*Agave Americana*), called by the Indians 'Maguey,' which is so remarkably abundant in the plains of New Spain."

By such tentative and conjectural processes is an identity aimed at between Mexico and the Fusang of the Chinese narrative, whereas any naturalist will tell us that there is nothing in common between the Chinese "Fusang" and the Mexican "Maguey." Indeed, as far as we can see, the only point in which a plausible analogy between Fusang and Mexico can be traced lies in the sentence that "No iron is found in this land; but copper, gold and silver are not prized, and do not serve as a medium of exchange in the market." Both Dr. Neumann and Mr. Leland realised the fact that the period of Hœi-shin is long anterior to the most remote periods alluded to in the obscure legends of the Aztecs, resting upon uncertain interpretations of hieroglyphics. In this difficulty Mr. Leland cherishes a hope

that "in Old Peru there lurks some slight possibility of elucidating the question of the Chinese in Mexico in the fifth century," and observes that Mexico might have been at one time peopled by a race having Peruvian customs, which in after years were borne by them far to the south. These surmises are made in conjunction with various hypothetical adaptations of Peruvian habits and customs to the Chinese account, not one of which can we realise as sound. We find no fault, but quite the contrary, with all such tentative and suggestive processes. Were the foothold firmer and the foundation stronger, such suggestions might possibly prove of great value; but as the matter stands, it is obvious that they are but the piling up of mere possibilities upon possibilities. Much trouble has been taken to prove the facility with which communication may have taken place between the eastern shores of Asia and the western coast of America. Of this there can be no question. Nor is there much doubt entertained at the present day that the larger portion of the American continent has been peopled in ancient times from Mongolia. But it is to be feared that the final settlement of such a question can never be founded on such "baseless fabrics" as Li Yen's account of Hwei-shin's visit to Fushan. Furthermore, if we consider the remote period of this Buddhist narrative, the unbounded liberality of the Chinese in exaggeration, the circumstance that the period in question is really that of the introduction of Buddhism into Japan; that the Fusang tree answers best to the *Broussonetia papyrifera*, the bark of which is used for paper-making in Japan and elsewhere; it would seem that we have not to look far beyond Japan itself for the limits of this very mythical exploration.

It is with no disrespect to Mr. Leland, or to the much-honoured memory of Dr. Neumann, that we express this want of assent with their conclusions. Nay, further, there is a fact which, for the curiosity's sake, we gladly mention as apparently corroborative of those conclusions. The Chinese narrative closes with a statement that about a thousand Chinese miles eastward of Fusang is an island of women, and if Fusang were Mexico, we might fairly look for this island among the West Indies. Now, it is curious that Columbus in his first letter speaks of the island of Matenino (Martinique) as one in which there were no men, a new version of an old, old story. In sober seriousness, however, we feel unable to insert upon the map among the regions of reality, localities which appear so much more correctly to belong to the dreamland of chimaera.

Since the above was written my friend Professor Douglas has shown me the title of a Japanese book of "Drawings of the various kinds of the Keih Plant (a kind of *Chrysanthemum Indicum*) of Foo-sang," in which the latter name stands for Japan itself.

R. H. MAJOR.

Calendar of the State Papers relating to Ireland, 1608-1610. Edited by the Rev. C. W. Russell, D.D., and J. P. Prendergast, Esq. Rolls Series. (London: Longmans & Co., 1874.)

IRISH history at the beginning of the seventeenth century stands in some respects nearer to our own times than English or French history of the same period. Many years ago when I was attempting to understand the disturbances preceding the colonisation of Ulster, I found the greatest help in a Parliamentary Blue Book relating to certain troubles by which the native population of New Zealand was at that time agitated, while at the present day it is difficult to read about the flight of Tyrone without thinking of that unwieldy name which even South Africans do not always succeed in pronouncing without a slip—Langalibalele.

The work of Dr. Russell and Mr. Prendergast, therefore, ought to be studied by all who wish to know what light history has to throw on the relations between an English government and tribes in a lower stage of civilisation. For those who take a more directly historical interest in its subject, it has a special attraction of a different kind. In his preface to the last volume of the *Calendar of the Carew Papers*, Mr. Brewer said hard things of the Irish chiefs, represented them as thoroughly lawless, and spoke of the colonisation of Ulster as a beneficent measure to the Irish themselves, arguing that their removal from their old homes was a measure of precaution which left them better off than they were before. Such a view, coming from one who writes from the English side of the question, can evidently only be finally accepted after it has been sifted by competent enquirers, and the editors of the present volume may be expected to tell us if they have anything to say against it.

Unluckily calendars, like serial novels, have a habit of breaking off at the most interesting point, and though this volume gives us the preparations for the colonisation we must wait for another before we know whether the editors agree with Mr. Brewer about the improvement in the condition of the natives. In the meanwhile we have only to thank them heartily for what we have got.

With respect to the condition of Ulster in native hands Dr. Russell and Mr. Prendergast are entirely at one with Mr. Brewer. The chiefs had surrendered their lands to Elizabeth, and had received re-grants securing their possession. But the rest of the inhabitants were entirely disregarded.

"The direct result was, that in each country so re-granted but one single freeholder was created, all the rest being 'tenants-at-will, or rather tenants in villenage.' In all the State papers of the period the system is represented as resulting for the tenants in the most painful uncertainty of tenure and great social insecurity and discontent."

Such an unlimited power constituted a strong political danger to the English government, and the desire of ameliorating the lot of the weak and helpless combined with alarm at the consequences of a system which "placed the whole power of the com-

munity unreservedly in their chief's hands for all services whether of war or of peace," to make it desirous to raise the condition of the tribesmen at the expense of that of the chiefs. While such a state of opinion existed at Dublin, it is not necessary to seek far for the cause of the flight of the Earls of Tyrone and Tyrconnel. The Government knew that the rebellion of men whose power it was desirous of weakening was by no means unlikely. The earls knew that it was by no means unlikely that they would be suspected of rebellion whether they rebelled or not. The Langalibaleles of the seventeenth century fled to a foreign land, and the Government, whether legally or not it is difficult to say, obtained a conviction for treason, and declared six counties of Ulster to be forfeited to the Crown.

The sketch given by the editors of the difficulties in the way of a new settlement is alike lucid and impartial. In view of all that has been said since, they have done well to print in full the advice given by Sir Arthur Chichester, one of the ablest of the Viceroy's who have ruled in Ireland:—

"If His Majesty," he wrote, immediately on the flight of the earls, "will assume the countries into his possession, divide the lands among the inhabitants—to every man of note or good desert so much as he can conveniently stock and manure by himself and his tenants and followers, and so much more as by conjecture he shall be able to stock and manure for five years to come—and will bestow the rest upon servitors and men of worth here, and withal bring in colonies of civil people of England and Scotland at His Majesty's pleasure, with condition to build castles and stone houses upon their lands."

If this be done and other measures of defence taken, then

"the country will ever after be happily settled; there will be no need to spend their revenues in the reducing and defence of this realm from time to time, as has been customary for many hundred years heretofore."

This was what Chichester would have preferred. If it was not done, there was nothing for it but to treat the natives as enemies and drive them clean out of the country.

Let us see now what it is that Chichester's plan means. The main difference between the seventeenth and the nineteenth centuries—which, by the way, is a point on which the editors might have touched with advantage—is that the English Government then had no standing army, and had a standing deficit in the Exchequer. To accomplish the work which Chichester contemplated he needed to be strong as well as just. He could not send to the Horse Guards for a regiment or two to be shipped for Dublin. English and Scotch colonists were the only force upon which he could rely.

But if colonists there were to be, were the natives to have the first choice of the soil or not? Chichester, in effect, boldly said "Yes. Treat them as if they were at home. Give them as much as they can really cultivate, and then find room for the colonists." We cannot say whether the plan would have succeeded. But we can safely say that a proposal so generous deserved to succeed.

How far the natives were actually ill-treated in the distribution of land is a point which must be left till the next volume appears to clear up the difficulties of the

MESSRS. ROUTLEDGE are bringing out a new edition of Ormerod's *History of Cheshire*, edited by Mr. Thomas Helsby, of Lincoln's Inn. It will be complete in about fifteen quarterly parts, of which the first has just appeared.

subject. But even this volume brings into light a side of the question which is but too likely to be disregarded by English investigators. When Chichester reached Cavan he published a proclamation commanding the natives to withdraw from the lands allotted to servitors immediately—

"Up rose a lawyer of the Pale, retained by him, and endeavoured to maintain that they had states of inheritance in their possession which were not forfeited by the attainder of their chiefs. He asked two things; first, that they might be permitted to prove this: secondly, that they might have the benefit of the King's proclamation, promising protection for their persons, land, and goods, made about five years before."

The legal point was answered by Sir John Davis, who said that the King was now their chief; "that, as they were mere villains under their lords, they were removable at their wills; that the King, therefore, might dispose of the lands as he had done."

The comment of the editors on this is worthy of attention:—

"The inhabitants," they say, "having no estates, were not admitted to traverse the office. But it is plain from the papers of the period that, if admitted, their plea would have been: first, that whatever might be the powers of their chiefs, no such transplantation had been ever attempted by them; second, that the several families and septa of well-known territories, where the principal men had fixed seats and the poorer families fed their herds in common; third, that often as their chiefs had been attainted before, no such measures had ever been employed," etc.

In short, the English Government, like English governments since, dealt simply with what it could see. Practically the chief was everything and the sept was nothing, just as practically Achilles or Agamemnon was everything and the Myrmidons or Argives who attended the Agora were nothing. But deep in the conscience of the Irish people, it was deep in the conscience of the Greek people, was the belief that the sept was rightly everything and that the chief was merely its executive head. The land was the end of the sept, and in driving Irishmen off the land, on which they had been settled for ages, a feeling of suffering from high-handed justice was created, of which the English Government, looking at outward appearance alone, had no conception.

Whether the grievance was a practical one as well as a sentimental one; whether, short, individual Irishmen were better off or worse off than before the new settlement was effected, is, as I have already said, a question which it would be rash to answer in another volume of the Calendar is in our hands. But it is perhaps allowable so far to anticipate the work which lies before the editors, as to point out that in the subsequent plantations which were effected under Chichester's successor St. John, Chichester's plan was adopted, at least in theory. The natives were to be first provided for. The Londonists had to be satisfied with the land which remained unallotted. Unfortunately, the weak and inefficient Government of England followed too quickly, and everything was again thrown into confusion.

SAMUEL R. GARDINER.

My Private Diary during the Siege of Paris.

By the late Felix M. Whitehurst. (London: Tinsley Brothers, 1875.)

THE late Mr. Felix Whitehurst enjoyed a rather enviable position under the Second Empire. Newspaper correspondents had become a privileged band at the time when he undertook to enlighten the readers of a daily contemporary as to the political aims of Caesar and the theatrical successes of Offenbach; and Mr. Whitehurst was a correspondent of an advanced and popular type. He knew the advantages of his situation, and was not hindered by any natural shyness in using them to the utmost. He was familiar with those "special sources of information" that sound so well in press telegrams; he had "best authorities" at his beck; and there were very few ministerial antechambers or parliamentary lobbies into which he had not penetrated. Where angels and secretaries of embassy feared to tread Mr. Whitehurst was at home, serene and confident. In addition to this Mr. Whitehurst was brilliantly conspicuous in general society, and as he was one of the first to disperse the Olympian cloud that is supposed to envelope the English journalist (some writers are modest enough to say for the benefit of the English press) the result was a public situation that should have commanded a good deal of influence and many exceptional opportunities of getting at the heart of the new Paris and the new Empire. Of such occasions, however, Mr. Whitehurst seems seldom to have availed himself. His writings do not show him to have been troubled with excessive reserve or over-squeamish delicacy; therefore we must suppose that he could not see; that he liked the surface and had no care to go to the core, loved well the myriad uniforms—that were mostly liveries—of the gorgeous era, and never thought about the men. And this was one of the reasons of Mr. Whitehurst's popularity. Other writers preached, moralised, dissected; he chose to be simply the "peintre des fêtes galantes" of the Empire. Others might discuss the attitude of the clergy during the last years of Napoleon's rule; Mr. Whitehurst was content to record that the colour of Mme. de Metternich's dress was *Bismarck en colère*, and that Mme. de Gallifet looked "charming as ever" at the Grand Prix. He possessed an easy, familiar, and rather vulgar style that was just adapted for conveying information of this importance, and that doubtless did much to bring the average English mind to its present peculiar familiarity with the trivialities of Parisian life. It introduced us to the *Femme à Barbe*, and taught us what was *chic* and not *chic*.

That happy colloquial manner, that urbane condescension to slang, that rendered Mr. Whitehurst's correspondence a thing apart, a flower in the desert of dry political discussions and parliamentary reports, is just as visible in the present volumes as in the light articles that charmed us ten years ago. There is still the same profusion of very small jokes with a pseudo Artemus Ward flavour, the same cheap philosophy of a degenerate Epicurean order, the same political silliness, the same personal bravado

—all the old fascinations of our own correspondent. The diarist is as jaunty on September 4 as he used to be on August 15. "Poor Emperor, poor Empress, poor Prince!—poor fickle frivolous French people!"—that is the small sacrifice to sentiment; and then the writer resumes his light-hearted babble of Vachette's *menus* and the *galettes* the sovereign people were shamefully eating at Montmartre. Nothing appears to have seriously affected the diarist's flow of good spirits. He was momentarily dejected at times about a spy whom the crowd was haling to the river (because the spy was so "evidently a gentleman!"); he was occasionally concerned about the fate of notorious racers and the carriage horses of his acquaintances, and consistently refused to eat horse-flesh at the bitterest period of the beleaguement. But as a rule our own correspondent viewed and discussed the woes of his beloved capital with a gay cynicism that must have been hard to keep up on small rations of black bread and mouldy rice. It is this enviable spirit that renders the Diary a not unamusing production. One becomes interested in the cheerful sceptic who knew so many Duchesses de X. and Marquises de M., and possessed such a store of jocular quotations from the Eton Grammar and popular song-books. There is a certain subdued interest in the study of a man who could live out such a period and write such a book about it. The superficial intelligence which, like that of Mr. Whitehurst, would see but the futile incidents and outward features of the siege, is not generally able to record its view in two volumes. And it is fortunate for future historians that this is so.

Mr. Whitehurst appears to have possessed only the most elementary knowledge of the politics and military movements of the siege. We have said that he had exceptional chances of obtaining information. He was constantly asserting himself as the personal friend of the Emperor; he was intimate with many functionaries of the fallen Empire who, it is well known, managed to retain a sort of semi-official position behind the newly-appointed Republican Administration; and yet the Private Diary is scarcely ever accurate except when it gives extracts from public prints, or the tariffs of siege provisions. This is the way in which the diarist describes the last memorable week of August, 1870:—"Monday, August 29: During the past week no great events. French and Prussians seem to be fighting drawn battles, with terrific loss on both sides." And this was the week during which the disastrous march on Montmédy was executed, when it was resolved to succour Bazaine instead of falling back on Paris, when Wimpfen replaced Faily—the week, in fact, that prepared Sedan. After Sedan, on September 2, the Diary simply announces that "accounts are very fishy," and the subsequent story of the pacific revolution is wrong in nearly every particular. Mr. Whitehurst described September 4, like many simple-minded partisans, as a *coup d'état* in the face of the enemy. He could not see that the Empire had collapsed, the Empress-Regent having virtually abdicated by persistently refusing to take any action whatever. He knew nothing of the resolutions arrived at by the

Left and Left Centre, which were to ask the Chamber to appoint a Committee of Defence and to abstain from founding a Republic on the basis of national defeat. Neither does he appear to have heard of the dangers that threatened the Republican party; of the formal proposition to arrest the minority in their houses on December 2; of M. de Casagnac's application for fifty gendarmes, with whom he engaged to "get rid of *ces brailards là*;" and other schemes of a like nature. The majority was too feeble and too terror-stricken to profit by the reluctance of the Left to take office at such a crisis. When M. Jules Favre proposed the deposition of Napoleon III., not a Minister rose to answer or protest. There were veritably "vacances de pouvoir," as M. Thiers said; and when the populace invaded the Chamber, Jules Favre and Gambetta were carried to the Hôtel de Ville by the flood and forced to form a Government. There was nobody to contest their right in that Paris which, says Mr. Whitehurst, with the exception of a small section, had "professed allegiance to the Emperor for eighteen years."

The account of the October insurrection—that first overt symptom of the Commune—is equally inexact. Mr. Whitehurst quarrels with the Trochu administration at every page, but he will not allow the working-classes to manifest discontent on their side. The delegates of the twenty arrondissements demanded that all provisions should be rationed, that sorties should be multiplied, a general requisition, an attack *en masse*, and the installation of the Municipality as supreme power. Nearly all these demands were justifiable, Mr. Whitehurst allows, for his Diary is one long plea against the maladministration of the Trochu Cabinet; but when they are made in the name of a large section of the Paris population, he hints broadly at summary execution. But the politician who announced that he had always been convinced that M. Gambetta was a firm Orleanist should not be restricted in the exercise of his Oriental imagination or required to prove the commonplace virtue of consistency. He is a poet among war-correspondents. For the rest, whoever is interested in the bills of fare of the siege may consult the Private Diary in all confidence. It is a prolix and a willing guide. It is eloquent on the subject of mule cutlets and rats à la mayonnaise. It is full of curious menus, and stories of how the author shared handfuls of eschalots with noble duchesses. It is not very accurate in orthography; but even if you call a *filet Châteaubriand* a *filet château brillant*, it is always a filet. And Mr. Whitehurst was sure to know more of the steak than of the poet.

EVELYN JERROLD.

MESSRS. MACMILLAN and Co. have in the press an "Ecclesiastical History of Ireland," from the earliest date up to the present time, compiled by W.D. Killen, D.D., President of the General Assembly, Theological College, Belfast. The work, which will be exhaustive so far as concerns the chequered history of the Irish Church, will also throw much light on the social features of the various periods treated. It will be in two volumes octavo, and may be expected in the autumn.

NEW NOVELS.

A Wife's Story. By the Author of "Caste." In Three Volumes. (London: Hurst & Blackett, 1875.)

Dulcie. By Lois Ludlow. In Three Volumes. (London: Tinsley Brothers, 1875.)

A Silent Witness. By Edmund Yates. In Three Volumes. (London: Tinsley Brothers, 1875.)

Scarscliff Rocks. By E. S. Maine. In Three Volumes. (London: Smith, Elder & Co., 1875.)

A Losing Hazard. By Courteney Grant. In Two Volumes. (London: Bentley & Son, 1875.)

Miss Angel. By Miss Thackeray. (London: Smith, Elder & Co., 1875.)

ALTHOUGH Charles Dickens bears no likeness to any other English writer of fiction, yet he did succeed in founding a school of novelists, resembling himself only in two particulars, a love for the grotesque side of every-day life, and an imperfect grasp of pure style. The minor stories which appeared in *Household Words* and *All the Year Round* under his management bore the strongest possible similarity to each other, and seemed as though they were turned out with machinery by contract. Many of them have since been collected and reprinted by their several authors, and it may safely be declared that in scarcely one instance, were three or four tales by one writer transferred to the volumes of another, would the acutest reader have been sensible of any change in conception, in treatment, or in language; and it may even reasonably be doubted whether the authors themselves could identify their own property apart from inspection of the manuscripts. There are, however, a few signal exceptions, and one of them is the collection of tales named from its longest piece, "A Wife's Story." These sketches have all, with two exceptions, a considerable individuality and power of the same kind as that which made Mrs. Archer Clive famous for her *Paul Ferroll*, and Mr. Dickens, three of whose letters to the writer are embodied in the preface, was quite justified in recognising something in them far above the usual level of magazine writing, although his usual fault of employing exaggerated language obliges us to discount his strong terms of admiration. The tales are not, with the two exceptions before adverted to, on pleasant themes, and are, in fact, designed as studies of two types of women, the one fierce, undisciplined, and jealous; the other weak and almost crushed to the ground by misfortune, yet endued with some faculty of resistance. Thus, the second tale, "My First and Last Novel" is in truth, if not exactly a watercolour sketch for the oils of the principal story, yet such a related essay as Charlotte Brontë's *Professor* is to her *Villette*; while a parallel connexion may be traced between "Daisy's Trials" and "I do not Love You," the concluding stories of the third volume. "Gurtha" is, on the whole, the best sketch in the collection, as it depends more on skilful delineation of character than on striking incident, but Mr. Dickens's judgment will probably be that of most readers. Within the author's peculiar range, there is only one failure to realise the picture in her mind, that of the

fast young lady in "Daisy's Trials." The mistake here is that Myrrha Brown is made to speak English which is much too good, pure, and cultured to be in keeping with her character. A girl such as she is depicted would not only be less choice in the selection of words, but would largely interlard her prattle with slang, half from defiance and half from bad training. The two exceptions already referred to are mild idyllic stories of the well-known *Household Words* type, and are so far welcome that they give some relief to what is, on the whole, a morbid, though very clever series.

If Myrrha Brown fail from being too refined in diction, no such charge can be brought against the lady who calls herself Lois Ludlow, whose *Dulcie*, in itself a tolerable little story, which might have been judiciously compressed into one volume, is disfigured by attempts at being mannish after the fashion of some of Major Whyte Melville's novels, and by striving to reproduce what the author conjectures to be the usual style of men's talk with one another. It is not, perhaps, being unduly squeamish and fastidious to say that a lady's book is not improved by turns of expression such as "funk like blazes;" and it is certainly within a reviewer's province to point out that the shades of tone and manner in conversations ought to be more artistically marked than by mere stage directions, consisting for the most part of adverbs on the loose without any context. The book is not objectionable nor fast in tone, but it is slangy in diction and crude in idea, without much promise of strength to come.

Mr. Edmund Yates does not aim very high as a novelist. He makes no pretensions to instruct or elevate, and seeks merely to amuse his readers, and that by forcible incident and broad drawing rather than by delicacy of manipulation. And he has his reward, for he is one of the writers whose works are not laid peacefully to rest at the end of the season, but undergo metempsychosis into the ranks of railway literature, with a regularity which shows that he understands his public.

A Silent Witness differs in no essential particular from his other novels, and derives its whole interest from two or three strong situations, somewhat roughly, but not unskilfully, dashed in with a coarse brush. Two murders early in the first volume, one completed and one attempted bigamy in the second, with a fatal accident and a suicide in the third, are, on the whole, a sufficient modicum of stimulant for readers who like a drastic style of fiction, and no doubt Mr. Yates is wise in his generation. But it is a great relief to slower people of a somewhat foggy turn, to take up Jane Austen or George Eliot after an experience of the kind. It is like coming back to a comfortable library after taking the children to a circus or looking at a Hobbema or a Ruydael after a display of cheap fireworks. But that is just because one is a foggy. At any rate Mr. Yates can tell his story, such as it is straight off, without prosing or meandering, and if he could be persuaded not to write "different to" and "frightened of," his English would be very tolerable.

Scarscliff Rocks is a story of considerable

merit, and marks real progress since the author's previous book. There are two localities in which the plot is worked out—a small fishing village on the north-east coast of England and a New Zealand station. The second of these appears to have been drawn from books alone, as it lacks the colour and detail with which the former is painted. The most salient merit of the book is in the carefully studied contrast of the two chief female characters, which are both well conceived and elaborated; but a careful reader will give the preference to another pair, although mere outline sketches in comparison, namely, Mr. Eliot, the rector of the dull village, and his elder daughter, whose grey, patient, and not very useful lives are very subtly treated; and in particular there is much insight in attributing the clergyman's lack of influence and sympathy to the fact of his having, together with a keen sense of the gulf between moral right and wrong, uneasy hidden doubts as to the basis of his creed; whereas his daughter Gertrude, like him in much else, has no such misgivings. If this feature had been brought into greater prominence, instead of being just suggested, and no more, the sketch would have lost much of its delicacy and power, which qualities depend on the very indistinctness purposely given to it. The plot, not quite a new one, has been skilfully handled, and not overwrought, as it might readily have been. As regards some of the details, the dialect and idioms do not ring quite true. They are not Northern English, but Lowland Scotch, between which cognate speeches there are linguistic differences familiar to scholars. And there is a more serious mistake of the kind in the wording of a letter by a Scotch peasant woman, which plays an important part in the story. This letter does not merely contain Scotticisms of expression, but the words are spelt as English persons write the pronunciation of Scotchmen. Now, those who are familiar with the half-educated, know that they have the greatest possible difficulty in reading books phonetically spelt. They know, for instance, that the vocable which they pronounce "thocht" is printed in their spelling-book as "thought." Consequently, when they see "thocht" in print, it is a perfectly strange thing to them, and they attach no idea to it. If some better instructed person explain its meaning, they take offence, regarding the new spelling as intended to ridicule them, and to find fault with their mode of speech, and consequently, a real letter written by a person who speaks a local dialect will be rendered in the ordinary book-language, so far as he knows it, and the spelling, where it differs from the standard of the national school, will be incorrect from ignorance, and not, as in *Scarscliff Rocks*, correct according to the conventional rules for writing dialect. Just test a Dorsetshire national-school child with Mr. Barnes' poems, and see what will come of it.

In *A Losing Hazard* Mr. Courteney Grant has broken new ground, almost un essayed by English novelists, by placing his scene in Holland, around the works of a new dyke and harbour. There is not, however, a great deal of local colour or detail; and as a large part of his company consists of English people

employed on the works, and the remainder of Dutch people connected with them, there is only just enough foreign admixture to impart a little variety to the book. He has improved since his last novel, for this one has a definite plot and some boldness of conception, though scarcely enough ease and finish in execution. Slightly melodramatic in character, and having a buried hoard of jewels as its central point, it is more akin in idea to one of M. Paul Féval's plots than to the ordinary run of English stories. But there is not, as has been implied above, the finish a French artist would have given. One episode leaves a thread hanging, and is not wrought, as it should be, into the web; and the incident of the woman—a well-drawn character—who steals a blue diamond from the works at Amsterdam is out of keeping with her secretive temperament. She is represented, in her passion for jewels, as getting her booty set that very day, and wearing it at a public ball that same evening, where it attracts general attention, followed by immediate detection. The instinct of such a woman, if she were not actually so insane as to ensure her acquittal on that ground, would be to hide her prize till the search had been abandoned, and not to wear it till she was safe out of the country unsuspected. The book, even with these drawbacks and that of a certain jerkiness in style, is a marked advance on *Little Lady Lorraine*, the author's previous novel; and there seems the prospect of capacity for further improvement in a future attempt.

Miss Thackeray has put herself at some disadvantage with her more cultured readers by choosing for her latest book a story so well known to them as that of Angelica Kauffman. However, such readers are in a very small minority, and to the great majority of those who have seen *Miss Angel* in the *Cornhill Magazine*, or in its separate form, the narrative will be as fresh as though the charming heroine were the creation of the author's pen, instead of a drawing from life. The date of the story, a very few years earlier than that of the *Virginians*, necessarily provokes comparison of the daughter's power of delineating a past era with the father's, and allowing for their unlike point of view, there is less interval than might have been looked for. Nevertheless, Miss Thackeray has, in the one particular of conveying to her readers the peculiar aroma of the eighteenth century, been surpassed by another lady, who writes under a pen-name, and some of whose sketches, notably *Squire Bolton's Transgression*, call up the temper of that time more forcibly. But in grace and delicacy of workmanship, and the indication of character by suggestive touches, Miss Thackeray is the superior; and although the conditions of her present story do not enable her to exhibit these qualities so clearly as in the *Village on the Cliff* and *Old Kensington*, nevertheless her readers can never be unconscious of their existence throughout. One caution she does seem to need. Her adapted fairy tales show that she possesses the gift of quiet humour, and that she can be cheerful, and even merry, on occasion. But there is a recurrent plaintiveness of tone, exactly the same in key, though varying in expression,

running throughout all her principal writings, and very noticeable even in the collection of short papers she has lately issued. This is becoming an artistic fault of mannerism. It may, no doubt, represent a particular mood of the author's mind; but that which would be entirely in place were she an essayist, and bent on taking the public into her personal confidence, and thus biographically valuable, detracts from the merit of fiction, because interfering seriously with variety of treatment. Her characters, at best, resign themselves to be contented in a twilight fashion, and invariably find that their dolls are stuffed with sawdust. There are other and healthier views of life and affection of which she is quite able to give sketches to the world, and a little more sunshine would marvellously improve her pictures.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

Bossuet and his Contemporaries. By the Author of "Life of St. Francis of Sales," &c. (Rivingtons.) Within its limits this is a really admirable compilation; it is clear, complete, pleasant, everything but thorough; for that the writer is too conventional and perhaps too respectful. Her view of Gallicism reminds one of the reformers who thought that the Witenagemot constituted an indefeasible prescription in favour of parliamentary government and universal suffrage, and she describes Bossuet's conflict with "probabilism" in a way which shows she has never found out that "probabilism" is simply a hard name for a view that everybody holds now, that a man who thinks he has a right to do a thing which he knows to be questionable, and wants to do it, must be allowed to do it if the thing be only questionable. On the other hand, she is duly severe on Bossuet's persecution of Fénelon, and though she does not dwell on the matter, she shows us candidly in what a horribly business-like way Bossuet presided over the retirement of Louise de la Vallière, and that as a director he had very little idea of doing anything but keeping his penitents quiet and out of mischief. The last point suggests the reflection that the gloomy sublimity of his pulpit eloquence had little religious value: he made people serious and uncomfortable, but as he sent them back to the duties which they recognised before, those of his hearers were most fortunate whom he left in cheerful impenitence like M^{de} de Sévigné.

The Narcissus, its History and Culture. By F. W. Burbidge. (Reeve & Co.) The genus *Narcissus* is one of the most delightful of the old-fashioned kinds of spring flowers now happily again coming into fashion. The handsome volume which Mr. Burbidge has devoted to it deserves no small commendation. His book is a vertebrate book—that is to say, it was undertaken with a distinct purpose and meaning which has been well carried out. Books about plants, especially illustrated books, are too often utterly destitute of any sort of backbone of either utility or interest. They are survivors of a class which fulfilled their destiny as the futile ornaments of the drawing-room table. There is something especially disappointing about productions of such a kind. Illustrated books imply the expenditure of much pains and much money; it is impossible to avoid vexation when both are seen to be wasted. At the hands of Mr. Burbidge neither have been so. In forty-eight plates he has given us portraits of the species of *Narcissus* and of their most notable cultivated forms. If not perhaps as yet in the first rank of contemporary botanical artists, Mr. Burbidge always works with care, and his drawings are free from formality. Then he has had recourse for the more technical part of his book to Mr. Baker, the able assistant keeper of the Kew

Herbarium, who has made an especial study of this genus. The two together have produced a book in every way creditable to themselves and the publisher. All persons who take an intelligent interest in the open air cultivation of herbaceous plants will find it quite indispensable in studying the garden kinds of Narcissus. It is to be hoped that similar volumes may be devoted to Crocus and Iris. These, if treated in an attractive and popular manner, controlled by technical scientific knowledge, will be most useful, although without it they will be worse than useless.

The Golden Guide to London (Sampson Low, Marston, Low & Searle) is just the book to give to one who wishes for a "picture in little" of what Cowper calls "the fairest capital of all the world." It will also please the old Londoner, to whom a feeling of pride in the outward appearance of his home is quite a new sensation. So many improvements have been carried out of late years, that London is fast becoming a handsome city, which it was not in Cowper's day, and this little book does justice to these changes. The engravings, with the exception of a few which formerly appeared in Weale's *Handbook to London*, are fresh, and taken from good points, as the Thames Embankment, and the view of the Foreign Office from St. James's Park; Charing Cross is not so successful as the others. The wants of the visitor seem to be thoroughly understood by the author, and the matter supplied is practically useful, with just such a dash of historical information as "he who runs may read." The *Guide* is not a mere compilation, for the various places have evidently been visited in order that the descriptions may be accurate. The mention of the Regent's Park explosion, and the appearance of the Mirror in the list of theatres, proves that the information is well posted up. It is next to impossible to treat a large subject in a small space without falling into some mistakes: and we have noticed a few, but they are not of much importance. One misprint, however, is amusing. The writer is describing St. Bride's Church, and says that the east window is "a copy by Moss of Mr. Rubens' *Descent from the Cross*." EDITOR.

NOTES AND NEWS.

Jonas Fisher: *A Poem in brown and white*, is the title of a work now in the press, which we are informed on good authority will carry great weight, not only on account of its subject and the treatment thereof, but also on account of the high rank of the author.

SURGEON-MAJOR H. W. BELLEW, of the Bengal Staff Corps, is engaged on a narrative of the Journey of the Embassy to Kashghar in 1873-1874, of which he was a member. The work will appear under the title of *Kashmir and Kashghar*.

PROFESSOR ROBERT K. DOUGLAS is preparing for early publication his two lectures on the Chinese Language and Literature delivered before the Royal Institution.

CHINESE scholars will be glad to be informed that Mr. Edkins is now printing his *Introduction to the Study of the Chinese Characters*. The work will appear in a royal octavo volume of about 200 pages before Mr. Edkins's impending departure to China.

MR. EDWIN ARNOLD, M.A. Oxford, formerly Principal of the Poona College and Fellow of the University of Bombay, is preparing for early publication his translation of the *Gita Govinda* from the Sanskrit of Jayadeva into English verse. We believe that this is the first attempt made to introduce this beautiful pastoral to the English public.

A PENDANT to the itineraries of European travellers to China in the thirteenth century, as Carpini, Marco Polo, &c., by Dr. Bretschneider, of Peking, has just appeared at Shanghai under the title of *Notes on Chinese Mediaeval Travellers to*

the West. Dr. Bretschneider produces reports of four Chinese, who, in the thirteenth century, travelled through Central Asia to Persia, giving an English translation of the original text, with many explanatory notes.

It is well known that one of the oldest and most difficult languages of Persia—the Pehlvi—has now become nearly extinct. Several works on religion and science were written in this language in former times by learned Zoroastrian Dastoor and other literary persons. Lately a desire for the study of this language has been shown by several students in Europe and in India. The great drawbacks for accomplishing this desire were hitherto the want of a dictionary and a grammar. The latter has been supplied by Mr. Dhunjeebhoy Framjee Patel, Dr. Spiegel, and others. No one has yet attempted the preparation of the former. As the Parsee religious works are written in this language, the Dastoor Jamaspjee Minocherjee has considered it one of his duties to undertake this task, and has consequently compiled a Pehlvi, Gujaratee and English Dictionary. It is proposed to issue the work in four volumes, each volume containing about 200 to 250 pages, royal octavo size.

THE REV. K. M. BANERJEA, of Calcutta, is engaged on a tentative edition of a small portion of the *Rig-Veda* (the first thirty-two hymns), with explanatory notes and a grammatical analysis. The work will appear in October next, and will be published by Trübner and Co.

MR. BANERJEA is also engaged on a work which will be entitled *The Aryan Witness*, which will contain the testimony that may be collected from the Vedas and the Zend Avesta in correction of biblical sacred history, and on the fundamental principles of the Christian religion.

At the meeting of the Council of Owens College, held on Friday last, Mr. Alfred Hopkinson, B.A. (Lond. and Oxon.) was elected to the professorship of Jurisprudence and Law, vacant by the resignation of Dr. Bryce. Mr. Hopkinson, who is an associate of Owens College, after a successful career in the College, proceeded to Oxford, where he gained a Second Class in the Classical School in 1872, and a First Class in the Law School in 1873. Mr. Hopkinson was elected Stowell (Law) Fellow of University College in 1873, and Vinerian Scholar in 1875.

DR. PUSER has been ordered absolute rest for a few weeks, and his letter on *The Present Crisis in the Irish Church* is necessarily postponed.

DR. VON SYBEL of Bonn has been appointed Director of the Prussian State Archives at Berlin.

M. PAUL MEYER writes to us that we were in error in announcing that he has been elected to a professorship at the Collège de France, as the election does not take place till December next, and he has "no reason to believe that he has a greater chance of being elected than many other scholars whose merits may be considered, and certainly are, superior to his."

THE ABBÉ MICHAUD's new work, *De l'Etat Présent de l'Eglise Catholique-Romaine en France*, has been interdicted by the French Government.

VICTOR HUGO's new work, *Avant l'Exil*, has just been published. It forms the first volume of a series entitled "Actes et Paroles," and will be succeeded by two other volumes, *Pendant l'Exil* and *Depuis l'Exil*. *Avant l'Exil* contains all M. Hugo's speeches delivered between 1841 and 1851, with indications of his acts in connexion with them. The second volume, *Pendant l'Exil*, is to contain all his speeches from December 2, 1851, which drove him from France, to September 4, 1870, which enabled him to return. *Depuis l'Exil* will give us his speeches from his return to France to the present day; so that the three volumes will furnish a complete summary of the whole of Victor Hugo's public life. The first volume, just

published by Messrs. Michel Lévy Frères, is prefaced by a brief introduction, entitled "Le Droit et la Loi."

MR. HENRY SWEET has printed all the prose texts for his *Anglo-Saxon Reader* for the Clarendon Press Series. The poetical ones will be done in another month.

ALEXANDRA COLLEGE, Dublin, which has done much good in women's education for the last nine years, is trying to raise 10,000*l.* to enlarge its buildings and grounds. Part of the money has already been given, and part raised by debentures, but more donations and more loans are needed to enable the Council to carry out their plans. Mrs. Jellicoe, to whose untiring exertions the success of the College is so largely due, will be glad to answer any applications addressed to her at the College.

WE are glad to hear that Messrs. Chatto and Windus have resolved to publish another play of Mr. Richard Simpson's series, "The School of Shakspeare," which was so warmly commended by Mr. Swinburne in his *Fortnightly* article on the succession of Shakspeare's plays. The same publishers are also reproducing by photo-lithography a very handy-sized copy of the First Folio of Shakspeare's Dramatic Works, 1623, to sell for about 7*s.* 6*d.* If only the acts, scenes, and lines could be marked in the margin, we should have in this reprint a really workable edition of the Folio. Without these helps all copies are troublesome to use.

WE understand that a translation by Mrs. Arthur Arnold of Señor Castelar's *Life of Byron* will appear very shortly. Mrs. Arnold is already known as the successful translator of a work by the same author which was published two years ago by Tinsley under the title of *Old Rome and New Italy*.

MR. ALFRED RIMMER, of Chester, has been preparing, in conjunction with Dean Howson, an interesting work on the Old Streets and Home-steads of England. It will be profusely illustrated by examples collected from all the counties, drawn on wood by Mr. Rimmer, and engraved by Mr. J. D. Cooper, and will be published in the autumn by Messrs. Macmillan and Co.

MR. W. C. HAZLITT's "Shakespeare's Library, a Collection of all the known Plays, Novels, Tales, and other Articles which the great Poet is supposed to have employed in the Composition of his Works," is expected to be out next week. It will be in six volumes foolscap octavo, and will contain revised texts of all the plays in Nichols's old collection, and the novels, tales, and poems in Rodd's, to which Mr. J. P. Collier wrote introductions, besides several later additions, and notes. Among the more important additions are the lives from North's *Plutarch* used in Shakspeare's classical plays, the histories of Lear and Macbeth from Holinshed, Twine's *Patterne of Painfull Adventures* (for *Pericles*), &c. It will be the most nearly complete book of the kind ever published, and a great convenience to Shakspeare students.

AMONG the latest minor acquisitions of the Bodleian Library is a small pamphlet, quite forgotten in our days and mentioned neither in catalogues nor in biographical books, with the title, *Sunday under three Heads:—as it is; as Sabbath Bells would make it; as it might be made*, by Timothy Sparks (London: Chapman & Hall, 186 Strand, 1836). A bibliophile has written in pencil on the title-page "(Chas. Dickens)?" The four illustrations are signed "H. K. B." (Hablot Knight Browne), the illustrator of *Pickwick*. The style has, no doubt, resemblances to that of Dickens. For instance, p. 11:—

"Look at the group of children who surround that working man who has just emerged from the baker's shop at the corner of the street with the reeking dish, in which a diminutive joint of mutton simmers above a vast heap of half-browned potatoes. How the young rogues clap their hands and dance round their father, for very joy at the prospect of the feast ;

and how anxiously the youngest and chubbiest of the lot lingers on tiptoe by his side, trying to get a peep into the interior of the dish. They turn up the street, and the chubby-faced boy trots on as fast as his little legs will carry him, to herald the approach of the dinner to 'mother,' who is standing with a baby in her arms on the door-step, and who seems almost as pleased with the whole scene as the children themselves; whereupon 'baby,' not precisely understanding the importance of the business in hand, but clearly perceiving that it is something unusually lively, kicks and crows most lustily, to the unspeakable delight of all the children and both the parents."

On page 13:—

"You may tell a young woman in the employment of a large dressmaker at any time by a certain neatness of cheap finery and humble following of fashion, which pervade her whole attire; but, unfortunately, there are other tokens not to be misunderstood—the pale face with its hectic bloom, the slight distortion of form which no artifice of dress can wholly conceal, the unhealthy stoop, and the short cough—the effects of hard work and close application to a sedentary employment upon a tender frame."

On page 21:—

"The idea of making a man truly moral through the ministry of constables, and sincerely religious under the influence of penalties, is worthy of the mind which could form such a mass of monstrous absurdity as this bill is composed of."

Finally, on page 39:—

"I was travelling in the West of England a summer or two back, and was induced by the beauty of the scenery," &c.

Dickens was indeed in 1835 in Bristol and Bath (see Forster's *Life of Charles Dickens*, 9th edit., vol. i., p. 8). If those coincidences induced the owner of the book to attribute it to Dickens, could we not oppose the strong evidence of Forster's silence on the subject? Perhaps some of our correspondents may know something about the name of the *nom de plume*, T. Sparks.

In a German work of travels, published in 1753 by Uffenbach, entitled *Merkwürdige Reisen durch Niedersachsen, Holland und Engelland*, it is stated in the account given of the Bremen Library that it contained the entire library of Charles I. Cromwell, so we read, wished to make a present of it to Herr Pauw, the States Ambassador in England; but he, forbidden by his oath to accept of any gift, directly or indirectly, when on a foreign mission, was content to purchase this *Bibliotheca Regia* for the Government of Holland, at a cost of six thousand gulden. Such an expenditure was, however, much grumbled at by Pauw's superiors, though the library was considered to be well worth three times the money even at that period; and brought upon him so many annoyances and vexations that he worried himself to death under the infliction. We give the story as it stands in the pages of this veracious traveller, and confess our inability to furnish any confirmation or refutation of it.

AMONG the many prize essays at Oxford there is one which differs from the rest, in so far as it is meant, not for undergraduates or junior members of the University, but for men who must have completed three years, but not exceeded fifteen years, from their matriculation. It is the "Conington Prize," founded by friends of the late Professor Conington, and intended to be on a level with the prize essays proposed annually by the French Institute or the Berlin Academy. The subjects of these essays are generally connected with questions of the highest importance in different branches of science. They are intended to attract the attention of students to points of real interest which require elucidation, and they frequently lead to the composition of valuable treatises or books marking a solid advance in the history of different sciences. Renan's *Histoire des Langues Sémitiques*, Lenormant's *Essai sur la Propagation de l'Alphabet Phénicien*, Corssen's great work on Latin Pro-

nunciation, are more or less the result of such prizes; and it is to be hoped that the subject proposed for the next Conington Prize may produce a similar result. The subject chosen is "The Greek Dialects," and the essays are to be sent in to the Registrar of the University on or before the first Saturday in Easter Term, 1878.

The dissertation is to embrace a careful collection of the words and grammatical forms peculiar to each dialect, drawn from inscriptions, from the authors of whom writings have been preserved in the different dialects (including fragments and quotations) and from ancient grammarians and lexicographers. The comparative value of these sources is to be estimated, and the best critical editions of the authors to be used. The facts ascertained in the first part of the dissertation are to be applied to determine the question whether the Greek dialects presuppose a fully-developed Hellenic language from which they were derived in course of time, or whether the facts which they present admit of any other interpretation.

The question of dialects is at the present moment the burning question in the Science of Language, and nowhere is there more ample material for treating it than in Greek. The very name of dialect is on its trial, and the solution of the problem whether dialects presuppose a *κοινή*, or whether a *κοινή* is the outcome of original dialects, must determine in a great measure the direction of linguistic studies in the future.

THE *Oxford University Gazette* of the 8th inst. contains the Report of a Committee of Council appointed to consider the requirements of the University as amended and adopted by Council. The document is of too great a length to permit of more than an imperfect summary in these columns, but it suggests several questions of primary importance with reference to academical reorganisation. The "Requirements of the University" are divided into provision for buildings and institutions, and provision for professors and teachers. The former of these two divisions includes an estimate of 50,000*l.* for the building of the proposed new Schools, and a considerable sum for the consequent rearrangement of the structure and fittings of the Bodleian Library—expenses which may be fairly called extraordinary, and for which it is known that a capital sum has already been set apart to accumulate. All the remaining leading institutions of the University also call for considerable expenditure, either for their enlargement and renovation, or for the accommodation of new offices which recent reforms have rendered necessary. It is somewhat startling, however, to learn that the three great scientific departments (Chemistry, Biology, and Physics) make a demand for no less than 30,000*l.* for additional lecture-rooms and laboratories in connexion with the University Museum. Also, the lease of the Botanic Garden has almost expired, and whatever course may be adopted, an outlay of at least 4,000*l.* will immediately be required. It is pleasing to notice that, notwithstanding the mention of these enormous sums, the committee are of opinion that the University Chest can well take upon itself the entire expenditure, and perhaps have something to spare for the foundation of new professorships. With reference to the second head of the division mentioned above, the report of committee is not equally exhaustive or satisfactory. No attempt has been made to frame a comprehensive scheme of the deficiencies of the teaching power of the University according to the subjects to be taught, or the proportionate pressure of their want. A project is indeed brought forward for the establishment of temporary chairs and readerships, which, so far as it goes, is novel and suggestive; and careful regulations are proposed for the nomination and salaries of the holders of such appointments. The occupants of the University Museum have in this matter again obtained at least their due share of prominence. It ought to

be recollected, at least within Oxford, that scientific subjects have during the past twenty years caused a most exhausting drain upon the surplus income of the University, and that while physical science is being abundantly studied elsewhere, there are other subjects of scientific research, such as Philology in its countless branches, and History, which bid fair to be entirely neglected in this country, if not encouraged by the prestige and material support of academical endowment. It is further to be noticed with regret, that no reference is here made to the memorial of the Royal Asiatic Society for the promotion of the study of Oriental languages at Oxford. A suggestion is made in a subordinate paragraph for "the making of occasional grants to individuals for the purpose of carrying on special work in connexion with the studies or institutions of the University;" but beyond this ambiguous and meagre statement there is no recognition throughout this Report of Oxford's great deficiency—which is not want of funds, as the members of the Committee rather seem to imagine, but the absence of the spirit of original work and study, which is beyond the vision alike of the ordinary undergraduate, and of the ordinary tutor.

MR. STOKES's letter in the *Revue Celtique* some time ago, calling attention to the inaccuracies in the facsimiles of the Irish MSS. published by the Royal Irish Academy, has created some commotion in that learned body. It appears that some of the members believe the alleged errors to be no errors, and consequently the matter was referred to the Committee of Polite Literature. This last body came to the conclusion that a number of men should be appointed to collate the facsimile of the *Lebor na Huidre* with the MS., and it now appears that the latter have done their work and reported in favour of the copyists. Who these experts are we have not learnt, but we should be rather surprised to find that Mr. Stokes is so far mistaken as they seem to believe. Besides, on this question of details Mr. Stokes differs from them as to the best method of procuring the facsimiles. The Academy at present, it appears, employs a man who has just enough knowledge of Irish to lead him astray to make the tracing, and another of the same description to revise his work; but Mr. Stokes would rather have a good tracer who is altogether ignorant of Irish, and submit his work to the careful revision of the best Irish scholar to be got. The question is one of immediate importance, as money has lately been voted for this purpose by the Board of Trinity College, Dublin, with a view to defray the expense of publishing a lithographed facsimile of the Book of Leinster. What course the Academy and the Board will ultimately adopt is not yet evident: the angry feelings already aroused do not augur well for the undertaking.

THERE has just appeared at Andernach, in Rhenish Prussia, in the form of a programme of the progymnasium of that town, a most scholarly dissertation on some Gaulish names in -*ācum* in Rhenish Prussia (*Ueber einige gallische Ortsnamen auf -ācum in der Rheinprovinz*, von Dr. Quirin Esser). The detailed commentary which accompanies the names examined shows the author to possess a profound knowledge of Gaulish onomatology. It is well known that the Gaulish suffix -*āco*, corresponding to the Latin suffix -*āno*, denotes property or origin. This suffix has survived the disappearance of the Gaulish language, and is to be met with in a considerable number of names of places in countries originally Gaulish.

THE New Shakspeare Society has just printed Mr. E. H. Pickersgill's paper on "The Quarto and Folio of Shakspeare's *Richard III.*" This paper is an expansion of Mr. Pickersgill's remarks on Mr. Spedding's paper before the Society on the same subject, and has been made at Mr. Aldis Wright's request. Mr. Pickersgill contends that the Folio text is not a corrected copy of the Quarto; but that both

Quarto and Folio were largely altered by different correctors, from Shakspeare's own manuscript, the Quarto being the more cut down for stage purposes, while the Folio underwent the greatest changes in single words and phrases. Thus the long Folio "insertions," as they are generally called, are part of the original text—as their contexts in the Quarto prove—while the many Quarto strong and poetic words, afterwards weakened by the Folio corrector, are Shakspeare's own. Mr. Pickersgill contends that his new view best explains the great and universally acknowledged difficulties of the question.

THE *Allgemeine Zeitung* announces that the sale of the valuable library of the late Dr. Lötich will begin at Marburg on July 19, on the premises of the university booksellers, Messrs. Elvert and Co. The first part of the catalogue has been published, from which it appears that the collection includes numerous Aldines and other rare editions of scarce and valuable works.

We learn through the same journal that Berthold Auerbach has given his admirers a new collection of tales, which for poetic fancy, originality and hearty geniality exceed any of his earlier compositions.

ON June 14, H. L. d'Arrest, Professor of Astronomy at the University of Copenhagen, died in that city in his fifty-third year. He was a German by birth, and studied under the famous Encke. In 1848 he became Observer in the Astronomical Observatory in Leipzig, and was called to Copenhagen to occupy a similar post at Professor Olufsen's death in 1857. He has retained it until now. D'Arrest had a European reputation; he was the discoverer of four comets and of the asteroid Freia, but his great work was the examination of the nebulae by means of spectrum analysis. It is not long since he received the large gold medal of our own Royal Society as a mark of recognition of his scientific services.

NORWAY has lost an eminently useful man in Eilert Lund Sundt, who died at his parsonage in Eidsvold on June 13. His whole life has been occupied in writing and working for the poor, and since 1850 he has been recognised by the government as the official authority on all matters concerning the amelioration of the condition of the working classes. His statistical writings are numerous and important, and he was also the author of a biography of Hans Egede, the missionary bishop of Greenland. Sundt was born at Farsund in 1817.

MR. ELIHU RICH, who died at Margate, June 11, 1875, was born October 8, 1818. The child of Swedenborgian parents, and all his life a disciple of that master, he was engaged in the first half of his literary life on important works for the Swedenborgian Society, of which he was for many years secretary. He compiled for them the *Index Arcanis*, which the late Professor Bush calls a "grand work," "an enduring monument of judgment and diligence, a noble benefaction to the Church." He also wrote for the same society the *Life of Swedenborg*. He was for twenty years the writer of Messrs. Smith and Elder's *Monthly Indian Circular*, a summary of passing events, and review of books and new inventions. He edited for the same firm several books of travels and other works. For Messrs. Griffin he was joint editor of the *Encyclopaedia of Universal Biography*. Mr. Rich translated numerous works, among them Marco's *Travels in South America*, 2 vols., 4to, Blackie and Son. The *Manchester Examiner*, in reviewing it, spoke highly of his faithful work as translator. For Messrs. Sampson Low he did *The Bottom of the Sea*. He for a time edited the *People's Magazine*, S.P.C.K. He edited and wrote a good deal for *Vanity Fair*, during the editor's absence in France in 1870-71. He was joint editor and leader-writer for the *Broad Arrow* from its third number until his last illness. He also wrote a *Popular*

History of the Franco-German War of 1870-71, 2 vols., imperial 8vo., 1,158 pp., James Hagger. He was a contributor to many magazines and newspapers. It is expected that a very interesting paper of his on "Robert Browning's Sordello" may shortly be published. He was a Fellow of the Royal Historical Society and also of the Statistical Society. His knowledge of Indian affairs was great.

MISS ANNA BLACKWELL's translation of the late Allen Kardec's *Le livre des Esprits*, of which the astonishing number of 120,000 copies has been circulated, will, we are informed, appear in a very few days.

NOTES OF TRAVEL.

THOSE readers of the ACADEMY who were interested in the account of the Giants' Cauldrons in the neighbourhood of Christiania may be glad to know that excellent examples of these most extraordinary formations exist in the more accessible locality of Lucerne. In a garden adjoining the "Lion" monument, there are sixteen in all in various stages of development, varying from the small "marmite" $1\frac{1}{2}$ feet in depth, to the largest, which is sixteen feet in depth; the rounded stones, in some instances nearly spherical, the instruments of excavation, lie at the bottom of the cauldron, and consist of erratic blocks from the St. Gothard, and the Axenberg chain, and from other formations more or less distant. The form of excavation is spiral; the rock in which the "Marmites de Géants" are found affords also a good example of the action of a glacier in its polished surfaces and furrows, and its rounded forms or "roches moutonnées." Professor Feierabend, of Lucerne, directed public attention to this discovery in the *Illustrirte Zeitung*, and he has published a brochure on the subject at Lucerne, from which we learn that the spot was laid bare but two years since in digging the foundations for a house.

DR. GEORG SCHWEINFURTH, the eminent African traveller, who has been residing for some time at Riga, his birthplace, has since his return been busily engaged in arranging the extensive collections of plants and insects which he brought back to Europe. Dr. G. Schweinfurth has announced his intention of remaining for some days at Berlin on his way to Paris to attend the Geographical Congress, and sanguine hopes are entertained by many of the leading Prussian savants that he may be induced to accept a chair at the Berlin University, which, it is understood, the Imperial Government desire to offer him. In the meanwhile, the elder Dr. Schweinfurth, who has taken up his residence in Cairo, has been busily engaged in organising the newly-created Geographical Society of Egypt, to the presidency of which he has been nominated by the Khedive, to whose suggestion and support the association owes its existence. The Society was formally opened on June 3, when, in the presence of the chief local notabilities and of a large number of foreign savants and travellers, Dr. Schweinfurth delivered the inaugural address, in the course of which he drew attention to the peculiar local advantages of Cairo for becoming the focus of geographical discovery, from its position at the point of junction between the three old continents. The further meetings of the Society are postponed to October, but in the meantime Dr. Schweinfurth, whose indefatigable ardour, and whose training in the African climate make him disregard the heat, has determined to remain at Cairo through the hot season, in order that he may complete the arrangements necessary for the efficient establishment of the Society, and at the same time superintend the publication of the first number of the *Monthly Proceedings*, which he hopes to have ready by the beginning of November.

A HANDBOOK for travellers, *Palestine and Syria*, is just published by Karl Bäder, of Leipzig.

This volume forms the first part of a travellers' guide to the East, on the same plan as the other well-known works of this publisher. The author is Dr. Albert Socin, who has resided many years in Syria, and whose last journey thither was undertaken with a view to the compilation of this book. The continuation of the work will treat, in two volumes, of Egypt and the Nile up to the second cataract, then of Greece, and finally of Constantinople, the coast of Asia Minor, and the Danube from Pesh to the Black Sea.

ON June 8 Professor Nordenskjöld's Arctic Expedition left Tromsø for Novaya Zemlya. It was conducted by Captain J. N. Isaksen, who has visited Spitzbergen for many successive years, and lately reached Novaya Zemlya itself. The expedition was to proceed straight to the southern coast of Novaya Zemlya, where it was hoped that Samoyeds would be found, and thence in an easterly direction to the mouths of the rivers Obi and Jenisei, where Professor Nordenskjöld would leave the ship and continue his voyage in boats.

AN official account of the Turkish colony of Aradis, or Road Island, recently printed, presents some features of interest. The community resembles rather a small republic than a portion of the Imperial dominions, though nominally governed by an officer of the rank of Mudir with the munificent monthly salary of 6l. 10s. There are 2,000 inhabitants, all of whom, with the exception of three families, are Moslems. They are mostly well to do, and a great air of comfort pervades their houses. Their occupation is derived entirely from the sea, the island itself being a mere rock, void of soil, three-quarters of a mile round, and incapable of production. They still preserve the skill in seafaring pursuits which made them so distinguished in past ages, and are in much request on the Syrian coast as navigators and sailors. Sponge and other fisheries are extensively practised. The comparative wealth among the islanders enables them to lay in large stores of provisions in time of plenty. Food is, therefore, always in abundance at a moderate price, while the presence of many articles of comfort and luxury in the houses shows the intercourse kept up with foreign lands.

NEW GUINEA.

DURING the discussion of Captain Lawson's Paper at the meeting of the Anthropological Institute last Tuesday, Professor Rolleston, after expressing in the strongest terms his conviction of the fictitious nature of Captain Lawson's narrative, read the following letter from a member of the London Missionary Society, at present resident in New Guinea, and at the time of writing the letter entirely ignorant of Captain Lawson's book:—

"Port Moresby, New Guinea: March 18, 1875.

"We arrived here on December 1, and have been living among the people ever since. No other white residents are here, and we seem to be quite isolated from civilisation, for no vessels call or pass within sight of us. It is early yet for me to say much about the place or people, but I have not forgotten my promise to give you information.

"I hope before long to send you a box of such things as are most likely to interest you, but I have not much of a collection yet. In the meantime if you are in London and near our Mission House in Blomfield Street, Finsbury, you could see there a small collection from here, comprising pottery, bows and arrows, drums, hatchets, &c., sent by the Rev. Mr. Murray from Cape York.

"We were somewhat disappointed with both place and people after reading Captain Moresby's glowing description of them.

"The place is barren and unfruitful. Everything seems burnt up by the sun. The fauna, too, seems to be poor. There are no birds of paradise at all in this part of New Guinea. There are but few birds at all. I have skinned a few, which I will send you some day. The only quadrupeds are kangaroos, dogs, and pigs. The kangaroos are the same as Australian. Two kangaroos are unknown here. The dogs are said to be indigenous, and I believe they are. They are domesticated and used by the natives for kangaroo hunting. They do not know how to bark, but they howl in chorus most hideously. Pigs look like some of the English kinds, are wild in the bush, but some are tamed and domesticated. There is also a native rat, the same as the Savage Island rat, smaller than the European.

"There are several varieties of snakes, one (a black) only of which is fatally poisonous; lizards of various kinds, and an iguana.

"I can give you a little authentic information about the people. The inhabitants of this part of New Guinea are of small physique, smaller in every way than the average South Sea Islander. The men are naked, with the exception of a piece of string with which the penis is tied up. The women wear girdles reaching to the knees. Both are tattooed, the women profusely.

"The men and boys all wear a polished stone through the septum of the nose. The women's noses are pierced, but they rarely wear anything through it. The ears of all are pierced in two, and sometimes three places, one at top and another at bottom. The men wear their hair long, the women (when married) short. Neither polygamy nor polyandry is practised, except in a few exceptional cases where a man has two wives. In colour, this people are a shade darker, perhaps, than our South Sea Islanders, but their greater exposure to the sun and no clothes will account, I think, for that. From their countenances and some of their customs I should think they belong to the same race, and that both are of Malayan origin. There are, however, several distinct races inhabiting this part of New Guinea. The race to which the Port Moresbyites belong is called Motu; there is another race, speaking a different language and differing in their customs, called Koitapu. These are a little darker in colour than the Motu, and have been driven out from the coast villages by them, so this people say, and we have other reasons for think-

ing it to be so. Inland, some forty miles at the back of the mountains are a tribe called Koeali, speaking the same language or nearly so as Koitapu. These are probably the indigenes of this part of the land. The Motu make pottery and are great fishermen, Koitapu are hunters but have no canoes and never go to the sea. Both wear nose-stones, Koitapu cook their food, as South Sea Islanders, with hot stones, but Motu boil all their food and never use the hot stones.

"To the west of this about thirty miles is another tribe or race similar in appearance to these, but speaking a different language. These are called Maiva. Beyond this are those called Elema, these are darker in colour and their language is more like Papuan than Malayan. To the east are other races, speaking different languages, but of which I can't speak positively though I have seen them. I hope to know more about the above races by-and-by, but now I must confine myself to the people of this place. Their houses are all built on the beach, below high water mark, on piles nine or twelve feet high. The weapons of war are: bows and arrows (not poisoned); spears, all in one piece and rudely carved; clubs of heavy wood, flat shaped, and also stone clubs—the latter are just like some that I saw in the Museum at Oxford, and said to be hatchets, with a handle about four feet long. They use stones, but not ground or polished ones. Their hatchets are stone like those I gave you from Savage Island, and handled in the same way, only more roughly. The men make good nets, and very large ones both for catching fish and kangaroos. Their canoes are large but very roughly made—no carving at all about them. They do not know the use of fish-hooks at all.

"The women make pottery consisting of large basins, urns and such like. The knowledge of this art seems confined to Motu, the other tribes or races bartering yams, cocoa-nuts, &c., for them. The women are the workers; they carry all the burdens, carry them as the Australian natives at Cape York do, suspended behind by a band across the top of the head. I have seen some of the women's heads quite indented where the band goes. Our knowledge of the language is as yet necessarily imperfect. There are many words in common with the dialects of Eastern Polynesia, but the construction of the language is different. I have no Malayan Dictionary, but in the list given by Mr. Wallace of Malayan words there are but few, very few, of those spoken here.

"The climate is very hot and a good deal of fever and ague is here, but Mrs. Lawes and I have been well hitherto. Mrs. Lawes was the first white lady to land on New Guinea, she and our little boy were great lions for a time. N. G. LAWES."

BOSTON LETTER.

Boston: June 4, 1875.

I have just had the pleasure of looking over an advance copy of the third volume of Mr. Bancroft's *Native Races of the Pacific States*. It treats with great fulness of the mythology and languages of the people described in the previous volumes, whose ways and manners, diverse as they were, read like the record of the most monotonous civilisation, in comparison with the variety of myths set forth by Mr. Bancroft. Almost every tribe has its own way of accounting for the origin of man; many believe that they are descended from animals; the Ahts of Vancouver Island held that men existed at first as birds, animals, or fishes; the Koniags boast of their descent from dogs; the Californians in most cases describe themselves as originating from the coyote. Further south are to be found more coherent myths relating to the creation of the world and of man. The Quiché account is the fullest, as given in the Popol Vuh. Traditions of the destruction of mankind by a flood are very common: they existed among the Mexicans, who have a myth about the building of a tower of Babel; the Nicaraguans, and also among the Thlinkets in British Columbia, who explain the difference between their language and that of the rest of the world by asserting that the large floating vessel which contained the survivors of the flood grounded on a rock, and was broken into two pieces, on one of which were left the ancestors of those who speak the Thlinket language, and on

the other the ancestors of those who speak other tongues.

With regard to physical myths, the worship of the sun, and of the other heavenly bodies to a greater or less extent, was widely spread throughout Mexico. Eclipses consequently caused much excitement, and men with white hair and faces were at once sacrificed to the sun; this was the habit of the Mexicans. The Tlascaltres, on the other hand, sacrificed the ruddiest victims that could be found when the sun was eclipsed, and the whitest only at eclipses of the moon. The usual device of averting evil by noise was also commonly employed, the reason being the belief that the moon was darkened by the dust of battle, and all the noise and shooting arrows up into the sky was for the purpose of distracting her adversary. Comets were considered messengers of evil, as they have been more recently and by more civilised peoples.

As to the gods or spirits worshipped there was great variety. The Tinneh, who inhabit the country north of the fifty-fifth parallel nearly to the Arctic and Pacific Oceans, seem to have no "single expressed idea with regard to a supreme power;" one branch, however, "recognise a certain personage, resident in the moon," to whom they pray for success in hunting. The Mexican religion is a "confused and clashing chaos of fragments." The most important of the Mexican gods Mr. Bancroft considers to have been Tezcatlipoca, and many of the prayers addressed to him are given, with a word of warning, however, as to their absolute authenticity. There is also to be found a full digest of the numerous myths, and their even more numerous explanations about Quetzalcoatl. Huitzilopochtli, more commonly known as Vitzliputzli, the god of war, and the especially national god of the Mexicans, is treated of at length, Mr. Bancroft giving the reader an abridged translation of Professor J. G. Müller's monograph about this god, for the sake, he says, "of the accurate and detailed handling, rehandling, and grouping them, by a master in this department of mythological learning, of almost all the data relating to the matter in hand."

As to the various doctrines about a future state, they are of all kinds. Some races believe in metempsychosis, indeed some go so far as to believe that they return to the primeval condition of animals, plants, and inanimate objects. The Pluto of the Ahts is Chayher, a figure of flesh without bones. In his kingdom there are no salmon, and the blankets are so thin and narrow as to be almost useless for either warmth or decoration. A few of the tribes believed in annihilation; the Nicaraguans held that the wicked alone were annihilated.

The chapters on Language are interesting. Mr. Bancroft mentions different classifications into seven, and into seven hundred families, and regards the dialects as countless. There are four great languages—the Eskimo, which, however, is not properly an American language; the Tinneh family at the northern end of the Rocky Mountain range; the Aztec, and the Maya. Traces of the Aztec appear in Texas, Arizona, Utah, Idaho, Montana, and Oregon, far to the north, as well as in Mexico and Central America. In the author's opinion no Asiatic or European tongue, excepting, of course, the Eskimo, has yet been found in America. All the efforts to detect traces of them he considers idle speculation, and to show how easy it would be to form useless hypotheses, he gives a brief list of words analogous both in meaning and sound, from unrelated languages.

"For the German *ja* we have the Shasta *ya*; for *komm*, the Comanche *kim*; . . . for *weinen*, the Cora *weine*; for *thun*, the Tepehuana *duni*. . . . For the Latin *hic*, *vae*, the Tepehuana *hic*, *vase*; for *lingua*, the Moqui *linga*; . . . for *toga*, *manus*, the Kenai *togaai*, *man*. . . . For the Sanskrit *da*, there is the Cora *ta* (give); for *eké*, the Miztec *ec* (one); for *má*, the Tepehuana *mai* (not) and the Maya *ma* (no); for *masé* (month), the Pima *mahsa* (moon); for *tschandra* (moon), the Kenai *tschane* (moon); for *pada* (foot), the Sekumne *podo* (leg); for *kamé* (love), the

Shoshone *kamakh* (to love); for *pa*, the Kizh *paa* (to drink)."

Every philologist ought to have this list in his mind to warn him from too ready explanation of linguistic problems. Mr. Bancroft has collected what he could about a great number of the dialects—to get even the names of between seven and eight hundred, as he has done, is no light task—with the declension of a noun, the conjugation of a verb, and the translation of the Lord's Prayer, when such could be found. The Mixtec language, one of great antiquity, seems to be one of the most difficult. The following word, meaning to conciliate a person's good graces, must have puzzled backward boys and foreigners, *yokuvuihuwiniyotuwishuatunindisahata*.

I have given a very incomplete account of this volume, which shows all the excellence of its predecessors. It will be found a very complete compendium of all that is known about the subjects treated.

Two volumes of poems have just appeared, one by Miss Phelps, the author of some well-known prose works, and the other, *An Idyl of Work*, by Miss Larcom, some of whose verses have a deserved reputation. In this volume Miss Larcom tries a more ambitious flight, but, it must be confessed, with less success. The story is a rather complicated one of three girls, who worked in mills at Lowell in the old days, before the invasion of the Irish had driven out the intellectual, pallid, New England girls who read metaphysics after work-hours. The poem labours under the disadvantage of being written in blank verse, although occasional rhymed interludes bring a pleasant change to the ear. The main trouble with the book is its super-refined tone of excessive culture, but it shows at times pretty veins of fancy, which seem almost out of place in this rather solemn discussion of serious problems. In her preface the author tells the reader that she herself once worked in the mills, and that in the *Lowell Offering*, and similar magazines, her first writings appeared, so that she has a right to be heard when she chooses this subject; but in the dusty volumes of English poetry of the last century there are to be found many very solemn warnings against religious discussion in blank verse.

Miss Phelps's little volume, which bears the modest title of *Poetic Studies*, deserves attention. The first poem in the volume, "That never was on Sea or Land," is, perhaps, the most striking; it is full of imagination. I would gladly quote a few lines but for the risk of doing the poem injustice. Its merit does not lie in separate phrases which can be safely detached and handed about for admiration, but in the originality and execution of the author's plan.

If any young women read the ACADEMY, and care to know how their cousins in New England disport themselves, let them read a little novel, *One Summer*, which has just been published by Osgood and Co., of this city. They will find it a bright and entertaining little story, which throws more light on the ways of young people over here than do many volumes like *Queechy*, *The Wide World*, *The Lamplighter*, &c. To be sure, one cannot help wishing that some discreet friend had pruned a little here and there.

The centennial celebrations of the beginning of the Revolutionary War are calling forth work from different writers. Mr. Lowell's Ode, read at Concord, April 19, appeared in the June *Atlantic*. Dr. Holmes has written a clever ballad, just published in a little pamphlet, about the battle of Bunker's Hill, of which the hundredth anniversary is celebrated on the 17th of this month. The ballad is very amusing; a grandmother tells to her grandchildren the story of the fight as she saw it from a church-tower in this city.

The Eighth Annual Report of the trustees of the Peabody Museum of American Archaeology and Ethnology contains an interesting account of a collection of earthen dishes and vases, stone and

bone implements, &c., from the state of Missouri, which has recently been added to the Museum. They are relics of the mound-builders. The report contains engravings of some of the jars, pipes, vessels, and instruments.

In vol. xvii. of the *Proceedings of the Boston Society of Natural History* may be found in full Mr. F. W. Putnam's report of his researches in Kentucky and Indiana, of which I made brief mention in a previous letter. Archaeologists should not fail to read it.

THOMAS SERGEANT PERRY.

ARCHAEOLOGICAL NEWS FROM GREECE.

Argos, June 10, 1875.

As this place is not frequently visited by archaeologists or classical scholars from England, a few notes on its objects of interest may be acceptable to you. By a law of recent date passed by the Greek Government, a museum of antiquities is established in each district, and objects of art or inscriptions, when discovered, must be kept there and not sent to any central museum. This is the reason why the museums of Athens strike the traveller as so very poor when he considers the rich country around. But when he takes the trouble to travel through the remotest parts of Greece, he finds in every little town—nay, at times in an isolated country church or in dark stable or shanty—some one or two objects of merit hidden in an almost hopeless obscurity. Where means and ways of travelling are so inadequate, it seems a pity that this policy has been adopted. The new Prime Minister of Greece, upon whom I urged these considerations the other day, argued with a good deal of force that local museums taught the country people the nature and value of antiquities, and would probably ensure the safety of many treasures which would be lost were they to await transportation to Athens. But still I am convinced that for students the present law is injurious, especially as there is no single organ at Athens for noticing each discovery, and for giving some sketch or drawing as a clue to its general value.

Thus at Argos, which is as yet almost virgin soil to the excavator, there are four objects in the museum, but all of interest. There is an inscription which has been published in the Greek *Athenaeum*, I believe. There is an excellent female head, of the best period of Greek art, about half life-size, and strange to say, with one eye a little larger than the other. There is an admirable small female statue, exquisitely draped, of a woman with one foot on a small aquatic bird, which looks like a duck. The head and arms are gone, but the rest is well preserved and valuable. The bird under the foot ought to afford a clue to identify the figure, though I cannot remember any representation like it. The fourth object has been found very lately, and is a relief larger than life size, of the head of Medusa on a large square block of white marble. The face is expressionless and rather archaic in style, though of good and clear workmanship. But the coiffure, which has been finished only at the right side, is very peculiar, and consists of large scales starting from the forehead, and separating into two plaits, which become serpents' bodies, and after sinking as low as the chin, bend upwards and outwards again, till at the height of the forehead they terminate in well-formed serpents' heads. The width between the serpents' heads at the end of the plaits is about double the width of the head. Thus the whole upper outline is something like a large U (W) with rounded angles. The left serpent is carved out perfectly in the relief, but not covered with scales. This type of Medusa is, I think, a very peculiar one, and unlike the specimens found in other museums.

To describe the other curiosities near and about Argos would be to repeat an oft-told tale. Tiryns and Mycenae are quite near, and always full of interest. But I may add that

excellent photographs of these splendid remains may be had from Mr. Constantine, proprietor of the New York Hotel at Athens, who is himself an accomplished photographer. The great theatre of Argos, the largest Greek theatre I have yet seen, was also being photographed (for the first time) while I was there, and will, no doubt, be accessible in the same way. The view from this theatre of the plain of Argos and of the Isonic mountains, would in itself repay a visit. It is the most beautiful prospect among all the varied coast scenery of Eastern Greece. I hope in a few days to send you some additional notes of little-known curiosities in the interior of the country.

J. P. MAHAFFY.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 26, 8 p.m.	Physical: Mr. W. J. Wilson on "The Electrical Conductivity of Liquids;" Dr. W. H. Stone on "Subjective Sensations of Taste."
3.45 p.m.	Royal Botanic.
MONDAY, June 28, 1 p.m.	Sale at Christie's of the Marlborough Gems.
"	Sale at Sotheby's of the Antiquities and Works of Art collected by the late John Williams, Esq., F.S.A.
3.30 p.m.	Musical Association: Soirée (Beethoven Rooms).
TUESDAY, June 29, 3 p.m.	Mozart Concert, Alexandra Palace.
WEDNESDAY, June 30, 4 p.m.	Society of Arts: Anniversary.
FRIDAY, July 2, 4 p.m.	Archaeological Institute.
8 p.m.	Geologists' Association.

SCIENCE.

The Physics and Philosophy of the Senses; or, the Mental and the Physical in their Mutual Relation. By R. S. Wyld, F.R.S.E. (London: Henry S. King & Co., 1875.)

THIS book may be taken as a sign of the growing interest that is felt in England in the question of the relation between the physical, and the more properly mental, elements of our experience. It seems fair to say the growing interest; for the discussion of the problem, what is the external world, and how do we come to perceive it, has received an impulse in late years which does not seem likely to exhaust itself wholly without result; however remote any definite result may as yet appear to be. Nor is it strange that this renewed interest should be felt: for apart from the speculative attractions of the enquiry which come fresh to every mind, and the dearer for prohibition as all prohibited pleasures are, it becomes more and more obvious that there is no question of real importance to human life that can be either pursued to its ultimate issues, or traced to its source, without in some form raising the enquiry, what is the external world; what does our perception of it mean? For this problem involves the meaning of human life; and the meaning of human life involves this problem. They cannot be separated; nor can any worthy or rational thought leave untouched the latter. It did not need the Positivist scheme, based avowedly upon a particular interpretation of our relation to the external world, to give us assurance that the practical issues of life are absolutely bound up with a question.

that might have seemed so remote from them. A consciousness of the connexion is felt by everyone who attempts from any point of view to probe the basis, or test the guides, of his daily life.

Now this more complete inlinking of the theory of our sensuous perception with all the practical questions which most intensely command the soul of man, is a fact of great significance. A guarantee is thus given for the expenditure upon that problem of man's utmost powers. It is placed in the fore-front of his necessities. No more a matter of curiosity, that might be relegated to the special predilections of a few, it stands as a matter of primary importance to every one; and it is certain that no effort man can put forth will be wanting to his final answer.

And it is surely a visibly good thing that this intensity of energy should be thus secured for the investigation of this particular question. For, inviting as it is as a purely intellectual study, one may almost see that its intellectual interest alone could hardly have sufficed for its adequate prosecution. If there is a natural interest in the subject, there is also a natural tendency, immensely strong, to treat it with superficiality; even with levity. Scarcely anywhere does the self-confidence of ignorance so unsuspectingly assume the place of knowledge; and when that spell is happily broken in its first form, and we discover that everything is not settled by knocking on the floor with a stick, where else does the very same feeling so easily and inaudibly re-enter, under an opposite form, the very mind that had expelled it; and the conviction that we knew all about the subject, and there was nothing more to enquire into, resume its sway under the thinly-disguised form that we cannot know anything—and there is nothing more to enquire into? Undermined by this treacherous impulse, on either hand, to treat the question as one settled and fixed—either as known, or as never to be known; but anyhow not to be enquired into—the intellect could never, perhaps, by its own impulses alone, have fairly and thoroughly addressed self to the question: What does our perception of the external world truly mean? At the soul cannot let it go; and thus the intellect cannot quit her task so lightly.

Mr. Wyld's book shows us this, in what we may, without offence, call almost a pathetic form. So glad man's jaded Thought could be to leave this barren and unhelpful round, explored over and over again, until that more is there to say? every conceivable thing that is to be said turning out to be as horridly inconceivable at last. But there she is, clutched once more by her departing vestments, and bidden still to tarry, ere is a solution yet: and we turn to ten; for if useful studies are hindered by delay, still he who bids us has a claim; for there is good scientific work in the drier portions of the volume. And what we find is, that if the world be considered God's power expressed in physical laws, setting our power as expressed in our own mental effort, and matter be no entity but merely the vehicle through which this divine power is transmitted, then we have

a clear, steadfast knowledge of the external fact. But these are the author's words:—

"Had our writers more carefully considered the materials found in Consciousness, and, instead of joining with the unthinking portion of mankind in assuming the existence of an unknown entity called Matter, which is quite inadequate to account for the operations of Nature, and which has for centuries barred all attempts at a rational explanation of natural phenomena—had they, we say, examined a little more carefully, they would have discovered that the physical properties of which we are conscious are but different modifications not of matter, but of force. The apprehension of such a fact as this is most important to philosophy, for when we properly see and believe it, the world at once opens out to us, not as a meaningless mass of matter, but as a magnificent exhibition of power—a system or economy in which the Supreme Being, the source of power and being, by subjecting his absolute power, *qua* the physical world, to fixity and law, fulfils his purposes of sustaining living and conscious beings under the peculiar conditions which we observe in the physical world. . . . By merely assuming those mysterious elements, the chemical atoms, which no man has seen or can see, to be centres of force, and presenting physical substance as an aggregation of such dynamical atoms, the whole theory is complete, without deranging a single fact or principle of science." (p. 541.)

That is, Boscovich's suggestion of the atom as a centre of force alone, without material substance, is the key to open the prison-door of scepticism, and make "the theory of perception at once simple and apparent; for our knowledge of the world is immediately seen to be the result of a connexion between the Supreme Mind and the mind of the creature. . . . He reveals His power by suffering our power to come into direct connexion and counterpoise with His (and also by making us recipients of those arbitrary signs which we call sensations)."

Now it is not because Mr. Wyld's mind is less acute than any other, that he overlooks the obvious reply that the proposal of centres of force as constituting physical things does but shift, and not at all remove, the intellectual difficulty. How force without matter? Does force occupy space, is it impenetrable, and has it weight? If so, it is matter. If not, how do unextended centres of force make up physical extension? Our author, when treating of the ether, p. 205, writes thus:—

"As this subtle, though powerful, medium penetrates all bodies, even the densest, it is thus, as it were, the cushion on which the ultimate atoms of all things rest. It surrounds every atom and keeps each one apart from its fellows, and by its movements, which never cease, it maintains them in constant though invisible vibration," &c.

If there are *only* centres of force, how is ether a medium, how does it keep these centres apart; above all, how keep them in constant vibration? What is a centre of force if it wants keeping in movement? Is it not evident that the ether here serves our author as matter serves other men? That the chemical atoms are conditions—even dynamic conditions—of the ether is a view which has much to commend it (if only the ether itself would but be a thing one could really believe in as existing); but assuredly it does not help us over the difficulty externally of "matter." In short, the external physical world will not be conceived. It insists on landing us in a contradiction; it

compels us to say: whatever exists it is not that; not that which answers either to our sense or to our thought. Mr. Wyld tries to persuade us to accept centres of force as the substance of things, only because so he can directly urge us to recognise "in all the energies of nature an epiphany of God's power;" not because his *thought*, any more than ours, is satisfied.

Does it follow, then, that we do not and cannot know anything about the cause of our perceptions, the real source of our experience? Or is there not a third possibility, namely, that we have yet to recognise the true method of treating the problem? It is remarkable that this view of the case has been so little considered, especially when we recall how full human history is of instances to the point; how full of cases in which persistent failure—leading men to despair—has been simply the precursor to the adoption of a truer method. Science itself is one great example. Men "could not know" the order and connexion of physical events (of phenomena themselves) until, after a long period of vain trying, they adopted a method they had overlooked. Socrates urged the impossibility of knowing the laws of the heavenly bodies in their motions, and quoted the astronomy of his day to prove it.* Failure to accomplish—if we are guided by experience, and that which the history of the past proves to be probable—should lead us to believe that we have yet to recognise the true method for our attempt. And this, we venture to suggest, is the proper inference from the failure man has hitherto encountered in his attempt to discover the true nature of the external world; or, as we should prefer to say, the true cause of his experience. He has not thought him of the true method. This would be the fitting opinion, even if it had to be held in mere vagueness, with no indications as to the direction, even, in which a truer method might be sought. But the case is not so. Quite definite suggestions for a truer method challenge our attention. One, for instance, is to try and gain guidance in the larger problem of perception as a whole, by carefully studying the phenomena of particular perceptions, which are more within our grasp. As, for instance, we find that, in very many perceptions at least, there is given us a knowledge of ourselves or of our relations, as well as of the object; and that we must take account of the former elements as well as of the latter in order to know rightly respecting the thing perceived. So all sight-perceptions, for example, challenge us to recognise our distance; all perceptions of touch, to remember the activity of our own muscles. And in general, in every act of ordinary perception we have to remember two things: one, that modified conditions of our own—as our being moved, our hands having been chilled or heated, &c.—affect the mode of our perceiving; and another, that our impression frequently differs from the truth by involving a non-perception on our part. Even such simple facts as these have not been called on yet to help us in the wider

* Mr. Wyld reminds us in this volume how Newton held chromatic aberration irremediable, though not having recognised the different refractive powers of various kinds of glass.

problem of our perception of the whole. Nor have we duly recalled to mind the fact that we learn to know particular objects by the study of them by more than one means; by uniting two senses, *e.g.*, or sense and thought; and that the imperfect apprehension of the object by one of these means is the very circumstance that renders this union of different means of investigation easy. And we have laid little weight also on a fact to which our author rightly attaches great importance, namely, "our consciousness of possessing mental and animal power," as a source of knowledge. For, simple as this fact may seem, upon the hypothesis that external nature is as it appears to us, or is conceived by us, it assumes a new significance when it is held that the world that exists (if any) is different from that which we can apprehend. For then we come straight upon this fact, that we *feel* things to exist that do not exist; we consciously live our life in a world that is not. Is there no significance, no suggestion as a guide to farther thought, in that?

We may well thank Mr. Wyld for reminding us again that the question of our perception of the external world is not yet closed. And to anyone who is interested in a careful, clear, scientific exposition of the functions of the senses, we can also recommend his volume. In ch. xviii., a suggestion of real value is made as to the method by which single vision is secured, by means of a possible arrangement of the fibres of the optic nerve in the central ganglion.

JAMES HINTON.

SCIENCE NOTES.

PHYSICS.

Phenomena produced in Liquids by Electric Currents of High Tension.—M. G. Planté (*Comptes Rendus*, lxxx., p. 1138) has produced some extraordinary effects with his secondary battery which are very interesting for other reasons and also because they seem to throw light on the origin of fire-balls, of which no rational explanation has hitherto been given. A secondary battery of forty elements, each formed of plates of lead in acidulated water, is charged by two Bunsen's cells. The current from this battery, though only temporary, has sufficient duration to exhibit in all their details the effects produced by the passage of the electricity through imperfect conductors, such as the liquids of voltmeters. Platinum wires connected with the two poles are dipped into acidulated water. In the circuit is introduced also a platinum wire eighty centimètres long and one-tenth of a millimètre in diameter. If the positive terminal be immersed first and then the negative, the latter is surrounded by an envelope of light, but there is no sensible disengagement of gas, nor does the platinum wire become visibly heated. At the end of two or three minutes the luminous envelope disappears, an abundant disengagement of gas takes place at the two electrodes, and the platinum wire at the same time becomes red throughout its whole length.

M. Planté employed also a secondary battery of 200 elements, the discharge current of which was equal to that of 300 Bunsens arranged in series. This battery may be charged in about an hour by two Bunsen's cells. When discharged through a voltmeter containing a saturated solution of common salt, the negative electrode being first immersed, the approach of the positive wire into contact with the liquid determines the formation around it, with a roaring noise, of a small luminous globule of perfect sphericity. On raising

the platinum wire the globule increases in size, attaining a diameter of 10 millimètres; when the wire is depressed the globule assumes a rapid gyratory motion, and having acquired a certain velocity becomes detached, as if attracted by the other electrode, and disappears with an explosion and flame at the negative electrode. This globule is not gaseous, for under these conditions the decomposition of the water takes place with great difficulty; it is a liquid globule in a peculiar spheroidal state, and since it is almost insulated, by reason of its spheroidal state, from the rest of the liquid, must naturally be charged with the same electricity as that of the wire at which it originated, *i.e.*, with positive electricity.

The author observes that cases of globular lightning have generally been observed at the end of a storm, when the electricity of the atmosphere flows freely to the earth through air saturated with aqueous vapour. He regards this portion of the atmosphere as a vast voltmeter, one electrode being formed by a cloud, the other by a point of the earth,—a voltmeter in which the water would be with difficulty decomposed and in which such luminous and calorific phenomena as are described above would play a prominent part. Although fire-balls are certainly not spheres of liquid, they may nevertheless be formed of a ponderable matter charged with electricity, and we may conceive that the high tension of atmospheric electricity may produce with humid air that which dynamical electricity produces with a saline liquid.

Acoustic Reversibility.—Professor Tyndall has shown that when a sensitive flame is placed immediately behind a cardboard screen 18 inches by 12, and a reed-pipe sounded at a distance of 6 feet from the screen, the flame is violently agitated. When the positions of the flame and reed are reversed, the latter being now close behind the screen, and the former at a distance of 6 feet from it, the sonorous vibrations are without sensible action on the flame. This experiment affords an explanation of a difficulty experienced by Arago and others when investigating the velocity of sound between Villejuif and Monthéry in 1822. It was noticed that while every report of the cannon fired at Monthéry was heard with the greatest distinctness at Villejuif, by far the greater number of reports from Villejuif failed to reach Monthéry. Villejuif is close to Paris, and over it (with the observed light wind) was slowly wafted the air from the city. Thousands of chimneys to windward of Villejuif were slowly discharging their heated currents, so that an atmosphere non-homogeneous in a high degree must have surrounded that station. At no great height in the atmosphere equilibrium of temperature would be established. The non-homogeneous air surrounding Villejuif is experimentally typified by the screen with the source of sound close behind it. As the sensitive flame at a distance failed to be affected by the sounding body placed close behind the cardboard screen, so did the observers at Monthéry fail to hear the sound of the Villejuif gun.

Quadrant Electrometer.—In the *Journal de Physique* (May, 1875), appears a short account by M. Terquem of a simple and inexpensive modification of Sir W. Thomson's quadrant electrometer, which has been employed by Dr. Angot and others in experimental researches in statical electricity. This modification, though similar in many respects to that devised by the late Mr. C. Becker, differs from it in one important particular. In Becker's form the aluminium needle is maintained at constant potential by means of a Leyden jar, with the inner coating of which it communicates; of the brass quadrants one pair is connected with the earth, the other with the body whose electrical condition is to be studied. In the form used by Dr. Angot there is no Leyden jar, and the aluminium needle is suspended by a metallic wire. The quadrants are connected in opposite pairs with the two poles of a battery (zinc, water, copper)

of 100 elements, and thus always exhibit a constant difference of potential. The conductor whose electrical capacity or potential is to be investigated is connected with the wire carrying the needle, and the deflections of the needle observed and measured by means of a telescope and scale. The instrument so used gives constant and satisfactory results.

Changes Produced in Iron and Steel by the Action of Hydrogen and Acids.—Mr. W. H. Johnson has communicated the results of his experiments on this subject to the Royal Society (*Proc.* xxiii. No. 158). A piece of iron wire which has been immersed for a few minutes in strong hydrochloric or dilute sulphuric acid becomes more brittle; a piece breaking after being bent once on itself, while before immersion it could be bent backwards and forwards several times without breaking. If the fractured part, while still hot from the effort of breaking, be wetted, it froths, bubbles of gas being given off from the whole surface of the fracture for thirty or forty seconds, making the water on the fractured surface appear to boil violently. It is remarkable that steel when treated in the same manner does not froth, though the action of acids on steel is more rapid and more marked than on iron. The toughness of steel, however, is greatly diminished by a short immersion in hydrochloric or sulphuric acid; so much so that ten minutes' immersion in dilute sulphuric acid will sometimes cause a coil of highly carbonised tempered steel to break of itself into several pieces while in the liquid. The apparent absence of frothing in the case of steel was ascertained by the author to arise from the bubbles of gas being so small as to be invisible to the naked eye. On microscopic examination, numbers of minute bubbles were seen to arise from the moistened fracture. The frothing is not due to oxidation, for the bubbles are still seen if oil be employed instead of water, and no matter how numerous the bubbles, the closest examination fails to show any formation of oxide. That hydrogen is the sole cause of these changes produced in iron, or inseparably connected therewith, is shown by the fact that only those acids which evolve hydrogen by their action on iron produce any change in iron or steel, nitric acid having no effect. Again, if acids be dispensed with altogether, and pieces of iron be subjected to the action of nascent hydrogen (produced by the electrolysis of water or caustic soda), the same results are obtained. A trial was made to ascertain whether similar effects could be obtained in iron by leaving it in an atmosphere of hydrogen gas. The result, however, showed that hydrogen is only occluded by iron when in the nascent state. Experiments were conducted with the view of determining the change produced in the breaking strain and ultimate elongation of iron and steel wires by hydrogen occluded in them after immersion in hydrochloric and sulphuric acids; the experiments show that the tensile strain both of iron and steel is diminished under these circumstances, but that the elasticity of steel wire is increased up to a certain limit. The electrical conductivity of iron wire is slightly diminished when it contains occluded hydrogen, as Graham also found in the case of palladium.

Superposition of Magnetic Layers in Steel.—In a recent number of the *Comptes Rendus* (lxxx., p. 417) is a notice by M. Jamin of experiments on the depth of magnetic layers and their superposition in steel. A steel rod was introduced into a steel tube, and the system magnetised in a helix, in which passed a galvanic current of gradually increasing strength. So long as the current was feeble it acted only on the tube, leaving the core in its natural state. When the current attained a certain strength magnetism began to be imparted to the steel core, and increased in intensity with the current strength, until it finally became what it would have been had the tube been absent.

It thus appears that the magnetism penetrates to a limited depth, which increases with the strength of the magnetising current. In another experiment the steel core was magnetised to saturation before insertion in the tube, and the combination magnetised in the opposite direction by a current of gradually increasing strength. So long as the current was feeble the original magnetism of the core was preserved; after a time, however, it was enfeebled and finally reversed. There is a time during this process when the combination of tube and core does not possess any apparent magnetism; it is not, however, in its natural state, for on separating the two parts of the system they are found to be oppositely magnetised. Neutrality is produced by their superposition. If a steel lamina which has been magnetised be put into dilute sulphuric acid, and withdrawn every half-hour in order to measure its thickness and the magnetism which it has retained, it is found that the latter diminishes, as of course it should, for the acid in dissolving the metal dissolves also the magnetism which it contained. If the lamina were uniformly magnetised throughout its mass, the ratio of the quantity of magnetisation to the thickness would remain constant; but it is not so. It is found that the magnetism diminishes to zero. It follows that the intensity of the magnetic layer on the two faces of the lamina decreases from the surface where it is a maximum, to a certain depth where it is zero. For a given kind of steel the magnetic layer has a maximum thickness, which cannot be exceeded whatever be the strength of the magnetising source.

Position of the Poles of a Magnet.—M. C. G. Müller (*Pogg. Ann. cliv.*, p. 474) investigates the position of the poles of a long steel magnet of small cross-section in the following manner:—The magnet (a magnetised knitting-needle, for example) is attached to two pieces of cork, so as to be perfectly horizontal and place itself in the magnetic meridian when floated in water. A fine-pointed iron wire is then approached vertically from above over one of the ends of the needle, which moves until the resultant of all the acting magnetic forces coincides with the direction of the iron wire. If now the wire be cautiously depressed it will touch the needle at the point of maximum attraction, i.e. at the pole. M. Müller's experiments show that for such magnetic needles, of given length, the poles approach the extremities as the thickness diminishes; that for needles of constant diameter, but varying length, the poles are nearer the extremities as the needle is shorter, but that the ratio of the distance of a pole from the extremity of the length of the needle is not constant.

Polariscope.—In the June number of the *Phil. Mag.* Mr. Spottiswoode describes a new revolving polariscope. The instrument consists of a Nicol's prism, or other ordinary polariser, and a double image prism as analyser. The latter is so cut as to show one image in the centre of the field of view, the other excentric; and the peculiarity of the arrangement consists in giving to the analyser a rapid motion of rotation. If the speed attains eight or ten revolutions per second, the image will remain persistently on the retina during an entire revolution, and all the phenomena which are usually seen in succession will appear displayed simultaneously in a ring by the excentric image. The principle of the revolving analyser is applicable alike to a table polariscope for eye-observations and to one constructed for projection.

Zinc Electrodes.—It was shown by Du Bois-Reymond, in 1859, that amalgamated zinc plates in solutions of zinc salts exhibit no phenomena of polarisation. Patry afterwards showed that the solutions must be neutral. M. A. Overbeck (*Pogg. Ann. cliv.*, p. 445) has made some experiments on the subject, employing currents of gradually increasing strength, the result of which is to show that amalgamated zinc electrodes are not susceptible to polarisation only when the electrolysing

current is weak, but that with a battery of five or six Grove's cells the zinc plates become polarised exactly as if they were platinum. M. Overbeck supposed that when the current is feeble the salt only is decomposed and not the water in which it is dissolved, but that with a more intense current the water itself suffers decomposition.

BOTANY.

Commelynaceae et Cyrtandraceae Bengalenses (paucis aliis ex terris adjacentibus additis).—Mr. O. B. Clarke, M.A., the author of a big folio volume of plates and letterpress, bearing the preceding title, contributed a paper on the Commelynaceae of Bengal to the *Journal of the Linnean Society* (vol. xi. p. 438), in which he did something to clear up the complicated and perplexing synonymy of this group, from the study of living plants. Like most monocotyledonous plants, the Commelynaceae are difficult of discrimination and identification from dried specimens; but Mr. Clarke has drawn his distinctions from the number of cells and manner of dehiscence of the capsules, and from the number, form, and sculpture of the seeds; and if these characters are tolerably constant, the determination of species will be considerably facilitated by their elucidation. In the volume before us, which was published at Calcutta, the author reviews and figures the genera and species of this family found in Bengal. The plates represent ten genera and forty-two species, and were, with the exception of most of the dissections and magnified figures, executed by native artists. As might be expected, they leave much to be desired from an artistic point of view, but they appear to be tolerably faithful outlines, and compare favourably with Wight's *Icones Plantarum*—also by native artists. Their chief value, however, is in the figures of the seeds and capsules of the different species. The attachment of the ovules and their structure is very remarkable; and the position and shape of the embryo and its cap-like covering are characteristic. The surface of the testa of different species presents a great variety of reticulations and markings, and the shape of the seed itself is equally variable. Nothing but the examination of a large number of specimens, both living and dried, can determine the constancy of the characters employed by the writer, but seeds as a rule furnish very trustworthy differences, and garden varieties of many things are readily distinguished by their seeds. Hasskarl's "Genera Commelynacearum" (Regensburg *Flora*, 1866) here rank, that is the new ones proposed by him, mostly as sections. *Pollia Achina* and *Achina indica* were confounded by Mr. Clarke in the paper mentioned above, but he now recognises them as being abundantly distinct. A new monotypic genus, *Amelina Wallichii*, is described and figured. It is founded mainly upon the *capitula regulariter bilocularia, bivalvis, oblonga, apice lata, truncata, fere bicornuta*, and the *semina in quoque loculo unica serie superimposita*. The Cyrtandraceae illustrated number forty-nine species, belonging to twelve genera, one of which *Baeica*, Anders. MSS., is new. It differs from *Baea* in having a four-valved capsule. As a whole, the figures of this family are not so satisfactory as those of the Commelynaceae, but, as the author observes, it rested between such as he is able to give us and none at all, and they will doubtless be of some service in working up the family.

Flore Bryologique de Belgique.—The *Bulletin de la Société Royale de Botanique de Belgique* for May, 1875, contains the first part of a descriptive enumeration of all the mosses hitherto observed growing in Belgium, by M. Gravet. Although that country has not been thoroughly explored, nearly 400 species have already been discovered, and doubtless this number will be considerably increased by future discoveries. In the *Flore Cryptogamique des Flandres* of Kickx, published in 1866, only

164 mosses are described; therefore this contribution to Muscology will be specially welcome to those who interest themselves in the distribution of plants.

Economic Botany.—A new edition of the Official Guide or Handbook to the Museums of Economic Botany of the Royal Gardens, Kew, gives us an opportunity of referring to the rich collection of vegetable substances, both in the raw and manufactured states, to be seen at Kew. The first edition was compiled by Professor D. Oliver, and the additions and corrections to subsequent editions have been done by Mr. J. R. Jackson, the Curator of the Museums; and therefore, although by no means a complete catalogue of the objects exhibited, it is perfectly trustworthy, and contains most of the latest discoveries relating to the sources of valuable drugs, oils, fibres, &c. Thus: *Trachylobium Hornemannianum* is now known to be the tree that produces the copal of East Africa, *Rheum officinale* the source of some of the medicinal rhubarb, *Euryangium Sumbul* of sumbul, *Broussonetia Kaempferi* of the best quality of the paper mulberry fibres employed by the Japanese in an infinite variety of manufactures, and the true Esparto grass is said to be a species of *Macrochloa*, &c. An interesting scrap of information, too, is that canary-seed (*Phalaris canariensis* and other species) is now extensively used for feeding race-horses, as it contains a large percentage of nutritive matter unmixed with less desirable properties. A complete work on applied botany is, however, one of the greatest desiderata in this class of literature.

The Potato Disease.—Mr. Eccles Haigh has published a small pamphlet on the cause and prevention of this dreadful malady, as well as of the now almost extinct "curl." Although this essay appears to be based upon some sound notions respecting the economy of plant-life, yet we regret, for the sake of the community at large, that we cannot join with the author in his sanguine belief that he has discovered the solution of a problem which has baffled all the scientific and practical men of our day. Mr. Haigh lays no claim to practical knowledge, and assuredly his scientific attainments have not stood him in good stead. He has full faith and confidence in a pet theory of the functions of nitrogenous matters in the economy of plant-life, and upon this hinges the utter fallacy, or otherwise, of his presumed cause and prevention. His assumptions and misconceptions fit in together admirably, nevertheless we shall be well pleased if experience show that we have misjudged his essay.

The Alliums.—Dr. Regel, Director of the St. Petersburg Botanic Garden, has recently filled up a very important gap in systematic botany, in a monograph of the large genus *Allium*, which he has just published. A very large number of the 256 species he describes are indigenous in Russian territory, or in countries bordering thereon, which have been very little explored except by Russian travellers. Hence Dr. Regel had far more complete materials at his disposal than could be found in any other establishment, and as compared with some other monographs from the same pen, the present is much more carefully and exhaustively worked out; and it is certainly a most welcome addition to the literature used by those employed in determination of species. But the author betrays some inconsistencies, which those who are acquainted with his previous writings will not be surprised at. His views regarding species and genera seem to undergo a change with each work he publishes, when we consider his monographs of *Vitis*, *Tulipa*, and other genera. *Nothoscordium*, regarded by some as a well-defined genus, he refers to *Allium*, not even according it the status of a section, for he says that although the majority of *Alliums* have only two ovules in each cell, in *A. nigrum* and its allies they are numerous.

ANTHROPOLOGY.

Natives of Western Australia.—Mr. John Forrest, on Tuesday last, brought before the Anthropological Institute an account of the natives of Western Australia, whom he visited. They are divided into two great tribes, called the Jornderuss and the Ballavook, which are again divided into innumerable sub-tribes. These great tribes are exogamous; a Jornderuss may not marry a Jornderuss, but must take a Ballavook. Wife stealing is a constant source of quarrelling among them, and the women are frequently speared or killed. If a husband dies, his wife belongs to the oldest man of his family, who either marries her or gives her to some one else. The children always belong to the mother's tribe. These natives do not wash, but grease themselves with ochre to keep away the flies. Tattooing and marking on the shoulder and breast is almost universal among them, and the rite of circumcision is practised by all the tribes that Mr. Forrest met with, except those of the south-west corner of Australia. It is a religious ceremony, and the men and women part for a fortnight upon the occasion of it.

The natives of the interior are entirely without clothing and suffer much from the cold. They sleep in the open, except in wet weather, when they build small huts. Mr. Forrest believes that they have a sort of belief in a Supreme Being, but can give very little information about him. In the south-west corner of Australia the name for father and mother is the same as for god and sun. They do not believe in natural death, but always assume that some other native has been the cause of it, and frequently kill him for it. Cannibalism is common among the natives of the interior; their weapons are identical with those used in other parts of Australia.

Ethnological Papers for the Arctic Expedition.—Mr. Clements Markham, F.R.S., has contributed to the papers reprinted for the use of the Arctic Expedition, and published by the Geographical Society immediately previous to the departure of the Expedition, several notes on the origin and condition of the Greenland Esquimaux. Although the whole of the Esquimaux race may be regarded as one people, having its origin in Northern Asia, Mr. Markham believes the Greenland Esquimaux to have started from the banks of the Indigirka and Kolyma in Eastern Siberia, at a later period than their brethren who now inhabit the northern coast of America and Labrador. Between the eleventh and fourteenth century there was a great movement among the people of Central Asia. Shaibani Khan, a grandson of Jingiz Khan, led 15,000 families into the northern wilds, and their descendants, the Jakhuts, pressed on until they are now found at the mouth of the rivers falling into the Polar Ocean. But these regions were formerly inhabited by numerous tribes, which were driven away further north over the frozen sea. Mr. Markham gives evidence to show that between Cape Chelagaskoy and Melville Island there is a bridge of islands, the existence of which is proved by the accounts of the natives, by the flight of birds, and by the position of the pack ice in this region. Across this chain of islands the aborigines of northern Siberia fled from their southern invaders, and traces of their subsequent migrations are to be seen in the ruins of Yourts, similar to those still existing in the neighbourhood of Cape Chelagaskoy, on Melville Island, Byam Martin Island, Bathurst Island, Cornwallis Island, on the shores of Wellington Channel, and in North Devon. The whole of this chain of islands having been proved by recent explorers to be unfit for permanent habitation, the fugitives pressed on towards the east and passed over to Greenland by Smith's Sound. Here a portion may have turned northward into the region to be explored by the expedition. Others, known as the Arctic highlanders, are now found on the eastern shore of Smith's Sound, between the Humboldt and Mel-

ville Glaciers, and others pass southward into southern Greenland. This part of Greenland, lying between Cape Farewell and Disko Island on the west coast, was colonised by the Norsemen under Erik the Red in the end of the tenth century. This colony continued to flourish for three centuries and a half, upwards of 300 small farms and villages were built along the sea-shore, and Greenland became the see of a bishop. During the whole of this period no indigenous race was seen in the land, and no one appeared to dispute possession with the Norman colony. But in the middle of the fourteenth century a horde of small men resembling those known to inhabit the coast of Labrador, whom the Normans called Skroellings, appeared on the extreme northern point of the settlement at a place called Kindelfjord, and eighteen Norsemen were killed in an encounter with them. News of the invasion having been sent to the eastern settlement of Norsemen, one Ivar Bardsen came to the rescue in the year 1349, but found that the whole of the western Norsemen had disappeared, and that the Skroellings were in possession. This Mr. Markham believes to be the final achievement of the Greenland Esquimaux in their wanderings from the northern shores of Siberia. The Arctic highlanders who constitute the remaining portion of this horde are found between latitudes 76° and 79°, on the verge of the unknown polar region. They are described as a good-humoured race, of small stature, with scanty beard and coarse black hair. They possess great strength and endurance, and are on the whole intelligent. They have no canoes, nor have they bows and arrows, but their habitations are built of stone, and resemble those found along the belt of islands through which they are supposed to have migrated, and are different from those of the Esquimaux of America, who live in snow huts. A considerable number of words in the language of the Greenland Esquimaux are identical with those of the Siberian tribes near the Gulf of Anadyr, such as the words for sun, earth, water, fire, father, eye, head, and the numerals as far as five. The ethnological portion of the volume concludes by a series of questions drawn up by a committee of the Anthropological Institute for the use of the expedition.

Excavations in Cissbury Camp, near Worthing, Sussex.—During the past week excavations have been carried on in this camp by a committee of the Anthropological Institute, with the view of ascertaining the relative age of the entrenchment, and the pits sunk for the purpose of obtaining flints for implements. These pits occupy the slope of the hill in the interior of the fort on the west side, and also extend in a belt for about 200 yards on the outside. As none of the rings which mark the mouths of these pits cut into the line of the rampart, it was evident that if the pits were in existence before the rampart, all trace of them must have been obliterated by the latter, and it was therefore determined to excavate a portion of the ditch at the point of intersection of the rampart and the belt of pits above mentioned. The result has been the discovery of a pit in the bottom of the ditch, no trace of which was observable on the surface. This pit, or rather shaft, cuts into a portion of the escarp of the ditch in such a manner as to prove that it was constructed previously to the formation of the ditch, and it extends to about 6 feet beneath the latter. At the bottom several galleries were found branching in different directions by means of which the flints had been obtained from the chalk. The result of these excavations, although it has proved satisfactorily that this hill was the site of an extensive flint factory before it was occupied by the ancient Britons for the purposes of defence, has not as yet brought to light any satisfactory evidence of the date of either of these works. The discovery of a large collection of flint flakes about half way down in the silting of the ditch leads to the supposition that the entrenchment, although later than the camp, may still be of the neolithic

age, inasmuch as these flint flakes must have been deposited in their present position after the ditch had been partly filled up by the debris from the rampart. The excavations have been conducted under the superintendence of the president of the Institute, assisted by a committee of members, and will be renewed in July, when it is hoped that further evidence will be forthcoming.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (Monday, June 7).

SIR S. S. SAUNDERS, C.M.G., President, in the Chair. Mr. Briggs exhibited some bred specimens of *Zygæna mehloti*, bearing a strong resemblance to *Z. trifolii*, and mentioned several instances in which the offspring of *Z. mehloti* exhibited a taint of *trifolii* blood; he suggested that *Z. mehloti* might be only a stunted variety. Mr. McLachlan remarked that the insects of the genus hybridised very freely and alluded to their pairing several times. Mr. W. A. Lewis had noticed that *Z. mehloti* was by far the most common insect in the New Forest and as it appeared to have been only discovered of late years, it seemed to support the idea that it was only a stunted variety which had been recently developed there. Mr. Weir said that he had taken the insect twenty years ago in Tilgate Forest.

Mr. McLachlan exhibited a portion of a vine leaf on which were galls of *Phylloxera vastatrix*, the leaf having been recently plucked in a greenhouse near London.

The Rev. A. E. Eaton exhibited the insects which he had recently captured in Kerguelen's Island. There were about a dozen species belonging to the *Coleoptera*, *Lepidoptera* and *Diptera*, beside some specimens of bird-lice and fleas. They were all either apterous or the wings were more or less rudimentary. One of the *Diptera* possessed neither wings nor halteres.

Mr. Briggs exhibited specimens of *Habia prasinana* which, when taken, was heard to squeak several times distinctly, and at the same time, a slender filament, projected from beneath the abdomen, was observed to be in rapid motion, and two small spiracles close to the filament were distinctly dilated.

The President called attention to a larva which he had recently discovered at Reigate in the body of a stylipised female of *Andrena trimmerana*, this larva having a long telescopic process at the anterior extremity, and two reniform processes behind, similar to *Conops*, an insect which had frequently been reared from *Pompilus*, *Sphex* and *Odynerus*, and had also been met with in *Bombus*, although he had never before heard of its being found in *Andrena*.

The Secretary exhibited some specimens of a minute *Podura*, forwarded to him by the Secretary of the Royal Microscopical Society, having been found on the snow of the Sierra Nevada in California.

Mr. F. H. Ward exhibited some microscopic slides showing specimens of a flea attached to the skin of the neck of a fowl.

Professor Westwood communicated a description of a new genus of Clerideous *Coleoptera* from the Malayan Archipelago.

Mr. McLachlan read a paper entitled "A Sketch of our present knowledge of the Neuropterous Fauna of Japan (excluding *Odonata* and *Trichoptera*)."

Part I. of the *Transactions of the Society* for 1875 was on the table.

ZOOLOGICAL SOCIETY OF LONDON (Thursday, June 10).

PROFESSOR MIVART, F.R.S., in the eighth lecture at the Society's Gardens, treated of *Kangaroos*. He drew attention to the minute size and absolute helplessness of the young at the time of birth, and to the manner in which the mother's milk is

forced into its mouth, describing the mechanism by which the windpipe communicates directly with the nostrils, by which all danger of choking is obviated. The family Macropodidae consists of four genera, the species of which are all natives of Australia and the adjacent islands. They all agree in having the hind-limbs longer than the fore, they have no inner metatarsal bone, all the toes of the fore-feet are provided with claws, and they have only two lower incisor teeth. It is now 105 years since kangaroos were discovered by Europeans, they having been first seen by Captain Cook on his return from the Transit of Venus Expedition of 1769. The kangaroos along with six other families constitute the order Marsupialia, the other members being the bandicoots, the phalangers, the wombats, the dasyures, and the opossums. The order is remarkable for the great diversity of structure observed among its members, but is distinguished by several important characteristics, as the inflection of the angle of the lower jaw, the presence of "marsupial bones" and the peculiarities of their reproductive system. In recent times they are confined to the Australian region, excepting some opossums which are found in America; but in the Triassic and Oolitic Ages they ranged over the Northern hemisphere, and one genus fingered in Europe up to the Eocene period.

ROYAL GEOGRAPHICAL SOCIETY (Monday,
June 14).

THE paper read before the Society was the deferred one by Sir Leopold M'Clintock on "Arctic Sledge Travelling." Sir Henry Rawlinson, the president, occupied the Chair, and in the course of his opening remarks announced the intention of the Sultan of Zanzibar to be present at a special meeting of the Society on the 28th instant.

Sir L. M'Clintock commenced by giving a sketch of the rise of sledge travelling in the second and third voyage of Parry and the second of Sir John Ross, between the years 1821 and 1834. The object was then nothing more than how to exist in the Arctic Regions, and all appliances were copied from those of the Esquimaux. It was not till the time of Admiral Sir James Ross that the most important modifications were made, and his designs for sledging are substantially those in use now. Sir Leopold described the nature of the ground to be traversed during the spring months, and then furnished statistics showing the gradual increase of work achieved by a systematic economy and diminution of the weights carried. A rate of twenty miles per diem had thus at last been attained. Dogs were an important auxiliary, as they could drag more than a man, could stand more exposure and only required half as much food. The perfection to which sledge-travelling had been brought would enable a crew to escape from any known position in the Arctic regions. He had the satisfaction of hearing from Lieutenant Payer that the successful retreat of the Austrian Expedition was due greatly to the encouragement derived from this formerly expressed dictum of his. There was so little room for improvement in the equipment of sledging parties, that it would be unfair to expect the results of 1853 and 1854 to be surpassed in 1875. There was only one condition which barred progress, and that was ice too thin to sledge over. It was to be hoped that the expedition would not encounter this obstacle. To sledging they owed the actual survey of many thousand miles of coast line and the discovery of the record of Franklin's expedition, and to it they would also owe the principal share of whatever work might be accomplished by the brave men who had recently left them. The lecturer concluded with a warm expression of confidence in the resolute efforts of the Expedition to attain complete success. A discussion followed in which Admiral Sir R. Collinson, Dr. Rae and Admiral Richards took part.

ZOOLOGICAL SOCIETY OF LONDON (Tuesday,
June 15).

PROFESSOR NEWTON, F.R.S., in the Chair. Among the communications of general interest were two papers by the Rev. S. J. Whitmee, of Samoa, in the first of which he described a remarkable change in the habits of *Didunculus strigirostris*, which has lately become much more arboreal, roosting and breeding in trees instead of on the ground: the probable reason is the introduction of cats and rats into the island. In the second paper a very interesting account was given of *Palola viridis*, a marine worm which appears on the coasts invariably during the last quarter of the moon in the months of October and November, observing lunar time with wonderful regularity. It is also remarkable for its mode of reproduction, both sexes break up simultaneously into sections, and the ova and malt are thus liberated in the water. Professor Owen, F.R.S., described the bones of the huge extinct bird of prey of New Zealand, *Harpagornis moorei*. Sir Victor Brooke, Bart., gave an interesting account of the various races or species of wild sheep which are peculiar to the different mountain ranges of Central Asia, and exhibited several specimens, among them a magnificent skull of the gigantic *Ovis polii*. Other papers were read by Messrs. Sclater, Meyer, Dawson, Rowley, Dobson, Gulliver, and Bowerbank. This was the last scientific meeting of the present session.

METEOROLOGICAL SOCIETY (Wednesday, June 16).

DR. R. J. MANN, President, in the Chair. The following papers were read:—"On a White Rain or Fog Bow," by G. J. Symons, F.M.S.; "On a proposed form of Thermograph," by Wildman Whitehouse, F.R.A.S.; "On the Rainfall at Athens," by Professor W. Raulin (translated by R. Strachan, F.M.S.). These observations were made by M. Julius Schmidt, director of the Greek Observatory, and embrace a period of twelve years and a half, viz., from August 1859 to December 1871. The average yearly fall is 15.83 inches, and the average number of wet days ninety-three. The wettest year was 1864, when 28.30 inches fell, and the driest 1862, with 9.63 inches.

"On the Barometric Fluctuations in Squalls and Thunderstorms," by the Hon. Ralph Abercromby, F.M.S. There are two classes of storms in this country: in one the barometer rises, in the other it falls. The author in the present paper only refers to the former. After mentioning some of the phenomena which accompany storms of this class, he proceeds to give two instances as typical of their general character. In conclusion, he makes the following remarks on their origin: Though in this country squall-storms are almost always associated with primary or secondary cyclones, those in India and Africa are not connected with cyclones, and hence the source of the barometric rise cannot be due to any special phenomenon of cyclone motion. Since the rise is always under the visible storm, it is propagated at the same rate, and in the same manner as thunderstorms. Enough is known of the course of the latter to be certain that they are not propagated like waves or ripples, and hence these small barometric rises are not due to aerial waves, as has sometimes been suggested. Since the general character of the rise is the same whether there is thunder or not, it is evident that electricity, even of that intensity which is discharged disruptively, is not the cause of the rise. If we look at a squall from a distance, we always see above it cumulus, which is harder and more intense in the front than in the rear of the squall. Since cumulus is the condensed summit of an ascensional column of air, it is evident that the barometric rise takes place under an uptake of air. If we consider further that a light ascensional current would give rise simply to an overcast sky, a stronger one to rain, while a still more violent one would project the air suddenly into a region so cold and dry that

the resulting electricity would be discharged disruptively as lightning, the foregoing observations show that the greatest rise is under the greatest uptake. Some meteorologists attribute the low pressure at the equator to the ascending current formed at the junction of the trades, while others attribute the 10 A.M. maximum of the diurnal range of the barometer to the reaction of an ascending column of air due to the increasing heat of the day. The above observations tend to strengthen the view that an ascending column of air gives rise to a reactionary pressure downwards, and more generally to the idea that though the total pressure shown by the barometer is principally statical, or due to the weight of a definite column of air, a small portion is dynamical, or due to the reaction of air motion in that column.

"Notes on Solar Radiation in its relation to Cloud and Vapour," by J. Park Harrison, M.A., F.M.S.

Mr. Scott also exhibited and described Lowe's Graphic Hygrometer.

PHILOLOGICAL SOCIETY (Friday, June 18).

DR. J. A. H. MURRAY in the Chair. Mr. Henry Jenner, of the British Museum, read a paper on the Manx language, in which he gave a short sketch of its grammar, comparing it with the Gaelic of Ireland and Scotland, and an account of the scanty literature of ballads and carols (with a list of all printed Manx books, amounting to about twenty-five), and of the translations of the Bible and Prayer-book. He then traced the gradual decline of the language from the seventeenth century to the present time, chiefly by quotations from Camden, Speed, Challoner, Bishop Wilson, and others, and ended with an account of the present state of the language, including the result of a paper of statistical questions sent by him to the clergy of the Isle of Man last autumn, from which it appeared that the Manx speakers now amount to nearly one-third of the present population, and those who know no English to about 200. Mr. Fennell read a paper on the "Triple Gradation of A in Gothic."

FINE ART.

Memoir of the Life of William Müller. By H. Neal Solly. (London: Chapman & Hall, 1875.)

THE common saying about the unhappiness of the man who has a biographer may be repeated with very special emphasis in the case of the artist. And English artists have, for the most part, fared even worse than their brethren in the matter of biographers. There are, of course, exceptions, but in the main the business of recording an English artist's life and work has fallen either into the hands of a mere book-maker, who has probably failed to be picturesque, and has certainly failed to be critical, or of some gushing friend, who, starting on the assumption that the artist's work was supreme work, has withheld from us no trivial circumstance, and so, instead of presenting us with an ordered essay, in which the man's life and achievement was estimated in relation to his time, has merely emptied into a gaudy volume the ill-digested contents of a memorandum book. These things—and the last especially—are not literature, for literature is not that which is written, but that which is written on high impulse or with a fine carefulness. And who is there that has done for a great English artist what Mr. Brooke has done for a great English preacher?

Mr. Neal Solly is not new to the task of

biography. He gave us David Cox's life, some couple of years ago. He wrote that with the enthusiasm of an ardent admirer, telling in much detail the very simple story of David Cox's career and broadly extolling his work. He tells us William Müller's story, with what seems something less of personal enthusiasm. Nor is this to be wondered at; for though the life-work of Müller and of Cox have certain resemblances in energy, rapidity, decisiveness, that of Cox has an individuality, perhaps in truth greater, certainly more easily noted and loved, and the charm too, of work devoted for the most part (as in a more restricted field the not less noble work of De Wint) to bringing to us vividly the value of everyday scenes and of common hours.

But what was lacking to the memoir of Cox is lacking also to the memoir of Müller. The record is an outward one: telling in full what a biographical dictionary might tell in brief, but giving us not much fresh insight into the work: scarcely much, indeed, into the character. The deficiency is due to no want of pains; but rather to a want of continuity of thought. The book is not fruitful in suggestions. There is some little technical criticism; but of aesthetic criticism, next to none. It is a fairly interesting chronicle of outward life.

Müller—since I am here in the same way to tell his story—was born in Bristol on June 28, 1812, so that there is nothing but the accident of an early death to remove his art from the side of that of men now living; for when he began to paint, in 1830, Constable's work was done, and the greatest of Turner's, Cotman's and De Wint's; and David Cox, who developed slowly, was approaching his later manner. Müller's associates in travel and study were entirely modern men. He went to Germany and Italy with Mr. George Fripp: to Lycia with Mr. Harry Johnson for a pupil. He was the child of a German, settled in Bristol, and of an Englishwoman whom the elder Müller had married, and his first work was done under the eye of J. B. Pyne—then living in Bristol, at St. Michael's Hill. The connexion with Pyne did not, however, last long, though its influence may probably be traced in many of the younger artist's works. It was the earliest of many influences by which Müller was to be in some degree swayed. In 1831 he went visiting in Norfolk, and copied drawings of John Sell Cotman, being "delighted," as Mr. Solly tells us, "with their breadth, simplicity, and sacrifice of details to the general effect." Some few years afterwards Müller met Cotman at dinner in London, and Mr. George Fripp, who was present, remembers his telling the Norfolk painter how much he felt he owed to him. Müller fell next under the influence of Constable, or, rather, of his work; and Constable's influence, tending after all in the same direction as Cotman's, is to be traced more or less to the end of the younger artist's career. First in landscape, and then in interiors with figure subjects, in both oil and water-colour, did Müller display something of that command of *chiaroscuro* which Constable himself, as his often-quoted words declare, reckoned the greatest of his possessions. "Though my pictures should

have nothing else," he said, "they shall have *chiaroscuro*."

Supported, then, and confirmed, rather than started, in methods of treatment congenial to him, Müller at length settled definitely to his work, subject from the first to the usual bad treatment at the hands of the Royal Academy. He had early moved to London, for the sake of the opportunities it offered for his progress, but the landscapes of the Bristol district—many of his favourite village of Whitchurch—were painted for the most part during flying visits made subsequently to his friends in the West. His work, it may be noted here, was always rapid. In three days he could finish an important picture: in an hour he could finish, so far as finish was ever intended, a sketch in water-colour: and, broadly speaking, he may be said to have been almost our last pure sketcher. It is no result of the mere rapidity of his work—for Cox would sometimes work as rapidly, and De Wint was often content with a treatment more simple—that his pictures and drawings speak more to the eye than the mind. That they do so is the consequence of his temperament and character. What he saw in nature we see in his pictures: aspects striking or brilliant, rather than enduringly suggestive.

He had been, in his early manhood, to Switzerland and Italy, and later (charged with a commission from Mr. Graves, the printseller) to the towns and castles which were the cradle of the Renaissance in France: Amboise and Blois, Chambord and Chenonceaux. From this second foreign journey resulted *The Age of Francis the First*: a reproduction of many water-colours made by him at the places named: water-colours now scattered about various private collections. A third foreign journey, undertaken within a year or two of his death, just before middle-age, was fruitful in sketches made in the maturity of his power; and these sketches—the series made when he accompanied the expedition to Lycia—are for the most part in the hands of one collector—Mr. John Henderson, of Montagu Street, Bloomsbury. Had Müller's life been prolonged, many of them would doubtless have served as preparations for pictures of greater individual importance, but executed as they were to his own satisfaction, and at a time when he had the fullest command of his means, they are now of singular value, and will probably always be accepted as more characteristic than those earlier ones produced in the neighbourhood of his birthplace, though these, says his biographer, "have a quiet peaceful charm of their own—silvery, low in tone, and broad—different in truth from any others."

An artist great in sentiment and imagination Müller probably was not, but he was great in virtue of executive power and of unique devotion to his art. His idea of a holiday was a week's absence sketching in North Wales, when that country, the favourite summer-ground of so many painters, was desolate with winter; and there can be little doubt that he shortened his life by his excessive persistence in work. The Lycian journey, with its strange experiences and adventures, fatigued him, and soon after his return he began visibly to fail. The most

interesting chapter in the volume of his memoir is that contributed by Mr. John Harrison, a Bristol surgeon of repute and amateur artist of much enthusiasm; and it is Mr. Harrison's good fortune to be able to relate from personal knowledge much about Müller's method of work and much about his temperament, impulsive, impatient and generous, and, finally, a touching story of his last days. When health had begun to fail him, commissions flowed in. Happily, he did not urgently require the money their execution would have brought: he had always enough for his simple needs as a bachelor. But, nevertheless, if he had not been to the last high-spirited and courageous, he must have felt when success was coming, and health and life going, something of what Constable had bitterly expressed—"Of what use is recognition now? It has come too late. There is no one to share it." Let us hear Mr. Harrison:—

"He continued gradually to fail: two attacks of hæmorrhage induced alarming prostration: still he painted. A few days before he died I was with him. He had received some flowers from a friend that morning—red and white carnations, fuchsias, yellow St. John's wort, and purple and blue flowers made up the bouquet. He separated them with his long thin fingers, and said to me, 'Let us arrange a chord of colour.' He placed them in his sketching water-bottle, and we moved each flower so as to arrange an harmonious whole. 'We must have some carmine,' he exclaimed. It was sent for from a neighbouring shop. All the while, though really tremblingly weak, he was as usual full of spirits. He said, 'when the carmine comes, we will have a stunning effect.' The colour came, and we arranged the little picture exactly as we wished; he made a rapid outline and began to paint, much as he did out of doors, with a common camel-hair pencil, putting in at once each separate leaf and flower, and, when dry enough, sharpening out in the old way. I stayed till it was done: perhaps an hour. It was a lovely thing, and differed from ordinary flower-painting in its subdued colour, thoughtful pictorial effect, and in its power. This small water-colour drawing, about ten inches by seven, was his last. The next day or two he painted in oil on a small millboard the well-known flower picture: still one more day, and an unfinished fruit piece. While his palette was being set for him, he fell back and died."

The circumstance narrated and Mr. Harrison's personal experience give to this passage a kind of interest one could hardly expect in the work of Mr. Solly. But in his work one might reasonably expect something of better arrangement, as well as of higher criticism. The volume, in outward appearance, is sumptuous, not tasteful, and the text is accompanied by illustrations which, like those in the *Life of David Cox*, will not encourage the beholder to know more of the artist. They are undeniably bad.

FREDERICK WEDMORE.

THE BLACK AND WHITE EXHIBITION.

THE third of this series of exhibitions opened at the Dudley Gallery on June 14. It contains a considerable number of very skilful works, sent by artists of repute. In especial, those which have served as illustrations to *The Graphic* have a force and *aplomb* not a little surprising; the artists seem to conceive their subjects, and to set them before their eyes, and then put them into shape executively, with the most entire directness, and unflinching competence. We may cite as ex-

amples the *Ploughing Match* by Mr. Small; and various specimens by Mr. Herkomer—the guillotine-subject from Victor Hugo's *Quatre-vingt Treize*; the *Salt-Mine, Bavaria, Going down*; *A Wirthaus*, &c. The *Stained-Wood Decorations* by the last-named artist, painted in brown on a light-tinted wood, are also talented works. Each of the two panels represents a herdsman, with sentiment that might be appropriate to the parable of the Prodigal Son.

Of severe preparatory study—the sort of material which would in the long run be the most fitting for an exhibition of this sort—there is not much here; and of ideal or exalted subject-matter scarcely anything. *Prometheus bringing Mortals a Light*, by Mr. H. A. Kennedy, seems to promise something in this line; but, when we note that it is “designed to surround a tobacco-jar,” we perceive that the Grecian mythology is less concerned in this invention than the practices and jocosities of smokers. The loftiest subject in the collection is that of Mr. Cave Thomas, *The Fate of Benefactors*—a drawing in red chalk, for the name of “black-and-white” is not absolutely or without exception accurate. This represents allegorically the persecutions, obstructions, and taunts, to which a reformer, or “messenger of truth” is subjected: two of his opponents are laying a cord to trip up his advancing feet; but he steps upon it, and passes on unfalteringly. The reformer is a young man, with a countenance not much unlike Shelley's, but of stronger mould: a star is above his head: he holds a pair of compasses, and a roll of paper. There is much matter in this composition, and many various actions. The most ideal of subjects, however, would be not incompatible with naturalism in feature and action, and of this quality Mr. Thomas has not given us much.

Three of the leading exhibitors are Frenchmen—Lhermitte, Legros, and Bida. Lhermitte is extremely prolific in subjects of peasant-life, old streets, time-scarred buildings, and the like: a tone of sadness or of life-weariness mingles with picturesque perception in his work, which is always on a high level technically. *A Corner of a Market-place, Brittany*; *A Brittany Beggar*; *A Street in Dauphiné*, may be particularly cited. *Un Mendiante de Bruges* is a fine specimen of Legros; the expression of the elderly man in the corner, and the sway in the forms of the two cloaked women kneeling, being given with simple mastery. The etching, *Portrait of Thomas Carlyle*, is a different likeness from the one (wearing a hat) which we noticed lately in the Bond Street Gallery; less striking, but also very good. Bida is a finished and exact executant in chalk, and he gets up his biblical scenes with considerable propriety, but falls a longish way short of inspiration. *Paix à cette Maison*, representing a Christian disciple or missionary entering a house, and saluting its inmates, is of his best quality. Other foreign artists represented on these walls are—Jules Jacquemart, *The Holy Family, after Jordans*, and *Le Liseur, after Meissonier*, etching; Huiber, *Encore sans Lunettes*, and other study-heads of old persons of both sexes, done for the sake of being funny, and with the effect of being ignoble, yet not unsuccessful in their way; Mongin, *La Partie Inégale, after Vibert*, etching; Rajon, *Portrait of the Rev. James Martineau, after Watts*, etching; Emile Lévy, *Venus à la Ceinture*, a pretty enough pencil-drawing; Bauerle, *Dear Baby*, charcoal; Flameng, *La Ronde de Nuit, after Rembrandt*, etching; Wolf, *The Duel*—two male swans combating, as claimants for a female, which appears further off; a fine design full of knowledge, though some of the animal-draughtsmen who have come forward of late years may have gone further in strength of hand, as especially Mr. Heywood Hardy and Mr. Briton Rivière. By the first of these artists is *The Poisoned Arrow*, wherewith a leopard has been struck. The raging beast, his face and limbs contracted with pain, is tugging at the missile with his teeth. *Midnight Assassins*, by Mr. Rivière, has a singularly strange

outlandish aspect. Two lionesses, with a lion close in their wake, are attacking a giraffe—three other giraffes, safe as yet, scud away in the background. Another animal-designer who shows to advantage is Mr. Elwes, author of a pen-and-ink drawing named *Members of a Royal Family, Lion-cubs born in the Zoological Gardens in 1872*. *Nemesis*, by the same artist, represents an ancient lion, at his last gasp, still prowling, and encountering a vulture: he looks at the vulture, and the vulture at him, each with a grim forecast of the immediate future. Mrs. Blackburn portrays *The Raven*: the bird has issued from Noah's ark, and is flying along over the victims of the deluge—a man, a hyaena, a horse hideously swollen.

An exhibition of this kind does not greatly lend itself to detailed criticism: it lacks prime importance in subject-matter, and special novelty or seriousness in artistic form. When we have commended the skill of one exhibitor, or the tact of another, we have said the most of what needs saying. We shall therefore run rapidly through the remaining works.

Brewtnall, *Quavers*, an old man playing the flute. F. G. Walker, *Deuteronomy*, ch. xxiv., v. 19—an old woman and girl gleaning; a somewhat large work, made as forcible as the artist can manage. Mrs. Edward Hopkins, *Après le Dîner*, and other subjects of infants performing the acts of adults; this is at best a cheap sort of humour, but Mrs. Hopkins excels in it, and hits the taste of good-natured papas and mamas in a marked manner. R. W. Macbeth, *Old Friends*, a milkmaid and her cow, good in tone. George McCulloch, *Pencil Sketches of models, draped and undraped*, drawn on a small scale with taste and nicety. James Macbeth, *Leaving the Salon, Paris, 1875*, a true representation of a mob of people hurrying off in a fierce shower of rain; *Arranging the Sculpture-Gallery at the Salon*. Hayllar, *All the Year Round*, and *Once a Week*; these punning titles indicate designs of an elderly mechanic working at his grindstone, and on Sunday dozing in a pew; very clever and well-completed sepia drawings, termed “mezzotint” in the catalogue. F. W. Lawson, *Jane Eyre's Flight*—she is lying exhausted in a swamp. Leslie, *The Ferryman's Daughter*, rather a silly affair, hardly vindicating the initials “A. R. A.” appended to Mr. Leslie's name. W. Britten, *Sketch in the Hayfield*, two women in the costume of the opening years of the present century. Westlake, *Cartoon after a Painting in the Church of St. Francis, Notting Hill*—Christ carrying his cross, and encountering the Maries; a moderately good design in the accepted “religious” style—better, at any rate, than another drawing by the same gentleman of the Assumption of the Virgin. Clausen, *At the Altar of our Lady*. Sandys, *Breydon Water, Norfolk*, one of the really fine things in the gallery; a simple and beautiful drawing of a flat shore and its buildings. Ditchfield, *Study of Rocks*, also a truly able performance. Raven, *The Monk's Walk*, large and striking. Arthur Severn, *Moonlight near Mitcham*. T. R. Macquoid and Percy Macquoid, various studies of trees, leafy and leafless, and other rural material; the one by Mr. Percy Macquoid named *Watching* is more particularly elegant and complete. Colin Hunter, *Shrimping*—a sheeny sea-shore, with the waves advancing and receding; the sound and the hush of them are almost made perceptible to the ear through the eye. Aumonier, *The Thames at Great Marlow, Evening*, large and effective, the white river twisting its way amid the dark stretch of land: this view has been executed in colours. Alfred Parsons, “*Preserved*,” *Longleat Park*, a good pen-and-ink study of tree-trunks. R. Farren, *A Pastoral, Fen Cattle*, a sepia drawing, of orange-brown tinge.

THE INTERNATIONAL EXHIBITION.

A PERSON who has not seen this exhibition in the Royal Albert Hall and adjacent galleries could with difficulty be convinced by words how utterly

worthless it is. Upwards of a thousand works of one class and another are displayed, yet there is next to nothing to look at. Only one picture—and that an uncatalogued one—comes near to being remarkable; the *Margaret in Walpurgis Night* by Gabriel Max. To this work a gold medal was awarded at the Vienna Exhibition of 1873. Max is evidently (as our readers may have gathered when we lately described his *Head of Christ*) one of those painters who work for effect, and who, having determined to do some particular thing, care very little whether the means are “legitimate” or otherwise, but only about making their intention strongly felt. The *Margaret* arrests you at once by its deathly still dreadfulness, and the impression intensifies as long as you remain before it. Besides the wraith of the deserted girl, with the mark of the knife across her throat, the eye has little to rest on, save the dark dim background, three ominous ravens, and the vast shadow of a hand along a hill, presumably the hand of Mephistopheles.

Here we might leave off, for there is really nothing else of a prominent kind. We will however mention as comparatively noticeable—Schaeffels, *Sinking of the Vengeur at the Battle of Aboukir*; Jundt, *Young Mother surprised by a Storm*; Oswald Achenbach, *View between Ceprano and Sara, on the Roman Neapolitan Coast*; O. H. Léon, *The Conversion of St. Hubert*; *The Invasion*, representing cattle and goods driven from a burning village; Oleyhens, *An Inn in the Sixteenth Century*; Junck, *The Travelling Tinman*; Beinke, *Gathering Wild-flowers*; Charles Gussow, *Spectators awaiting the Return of the German Army, 1871*, forcible, real, but low in its realism; Emile Lévy, *L'Amour et la Folie*; W. J. R. Bond, *The Fishing Flat, Schevening*; Weisshaus, *Italian Peasant Women going to Market (water-colour)*; Thomas Pritchard, *Valley of Rocks, Ross-shire (ditto)*; Teyssonnière, *St. Bruno refusing the Presents of Roger*, an able etching; J. de Brackeleer, *A Happy Family*, a pretty terra-cotta group of a mother and two children; E. Trombetta, *The First Steps*, a boy and a chicken, marble statuette. One of the most unsightly of modern sculptures, yet not wanting in a certain sort of cleverness, is a group of two newspaper-boys which stands thus described in the catalogue—apparently with a well-grounded conviction that low art may be made a paying concern: “Focardi, J., Italy. Plaster Group, *I'm first, Sir*. Reproduced in marble, same size, price 2,000*l.*; ditto, half-size, price 1,000*l.*, copyright reserved.”

We quit the International Exhibition with a hearty hope that its managers may be persuaded that by this time they have reached the lowest depth to which even their endeavours can attain; that the art of sinking is therefore exhausted; and that the next thing to be compassed is either a very greatly improved collection, or else (and this would perhaps be now the better alternative) the relinquishment of their project. The “London Annual International Exhibition of Fine Arts” has become an annual exposure of incapacity; and will hereafter, if repeated on the like footing as in the year 1875, be a mere fatuity, a trifling with the public patience.

W. M. ROSSETTI.

ETRUSCAN ANTIQUITIES—TARQUINII AND CAERE.

Rome: May 31.

The Necropolis of Tarquinii (or Tarquinia), near Corneto, and that of Caere (the Pelasgic Agrylla), near Cervetri, may be easily visited from Rome, both being approached by railway. Corneto and Cervetri lie in a region of hills and vales, picturesque though mournful and wild-looking, which bounds the solitary Maremma north-westward from the metropolis. On a recent visit to those sites I ascertained that research and discovery have not ceased; that present authorities, amid the many archaeological claims on their attention, have not forgotten the arts and monuments of Etruscan

antiquity, that much has been accomplished, at Tarquinii more than anywhere else within late years, to excavate and preserve the precious contents of tombs from decay or oblivion. A museum has been formed within the last six months at Corneto, in which all minor objects of value discovered in tombs since then have been placed; and though it is more interesting to see such things *in situ*, it is much easier to study and estimate them in the halls where, as ordered by the Corneto magistracy, they are now well kept and classified. An easy walk from the mediaeval city now decayed and thinly peopled, but itself worthy of a visit, brings us to the regions of unenclosed uplands, divided by a wide, desolate, and uninhabited valley, through which flow two torrents, from the still higher plateaus once occupied by the Etruscan city; and here we may now descend into seventeen subterranean tombs of that vanished race, into all which the custode admits us by the keys of modern doors properly provided for security. All are more or less enriched with artistic adornments—wall-paintings of banquets, funerals, games, the dance, the chariot-race, &c.; and, in a few instances, life-size figures of the dead, reclining on massive sarcophagi as at a feast, with garlands round their necks and tazze for wine in their hands. Of these sepulchral chambers, several celebrated for their wall-paintings have been opened in, or since, the year 1873, and therefore were beyond the range described in the otherwise exhaustive and admirable book by Mr. Dennis. I was sorry to find, however, that not a few of these lately discovered tombs have been again filled with earth in consequence of the want of means or inclination for immediately prosecuting labours on the spot; and it is tantalizing to look down on the freshly turned soil without being able to see what others have so lately inspected. From one of these now closed tombs has been extracted a large sarcophagus, now to be seen at Corneto, with some ornamental reliefs, and an epitaph in the ancient language still so little intelligible even to the most learned enquirers. Only a small portion of the Tarquinian tombs are now to be visited from among the many which have either disappeared or are now closed and filled up because containing no noticeable works of art. Signor Avvalta, a great discoverer, who began his researches about 1823 in the neighbourhood of Corneto, reports of 2,000 tombs, and conjectures that the entire cemetery may have contained in ancient times about two million sepulchres. I need not follow in the steps of the learned author, whose *Cities and Cemeteries of Etruria* may be cited as an authority; but those hypogæa, the ingress to which has been discovered since he wrote, are yet comparatively unknown, save to archaeological circles at Rome, and may therefore be considered as a new subject to most readers. The first discovered among the Tarquinian tombs was that now called "Grotta del Cardinale," penetrated by chance in the year 1699, reopened by our countryman, Mr. Byres, about 1760; again explored and made accessible by a cardinal, Garraupi (hence its popular name) in 1780, and reported of by Micali in 1808. Interesting in the highest degree among those latest reopened is a spacious tomb, one of the largest in the Tarquinian necropolis, called from a conspicuous painting on its rocky walls, Tomba (or Grotta) del Polifemo. On first entering we might fancy ourselves in an immense dark cavern, but the torchlight soon enables us to perceive details like architecture—two massive square pilasters supporting a rock-hewn vault, and numerous paintings, large figures and groups, on the walls; also a few busts and other remnants of sculpture, laid on a ledge, in the dark-hued *venfro* stone. The picture whence this tomb has had the name now arbitrarily given to it, is by no means the finest among the many here before us, and represents Ulysses putting out the eyes of the hideous Polyphemus,

whose distorted face and huge figure are distinctly seen; of the Ulysses little remains except the arms and the long pole which he wields against the disabled Cyclops. More striking and imaginative is another picture of a colossal demon with serpents coiling around his head, the terrific face seen in profile—an example of the ideal of infernal agents in which the ancient Etruscans anticipated the mediaeval Christian notion. As if with intentional contrast to this, the figure of a young woman is painted on the wall, at an angle with the demoniac subject; her face, also shown in profile, is most beautiful, her graceful head adorned with a garland and with long curls flowing down the cheeks—her loveliness such as indeed is rarely seen in the range of Etruscan art; so calm, so pure and placid! Near another angle is a mysterious and also finely-conceived group of a young warrior seated, mournful in mien and attitude, and a terrific demon standing before him, while brandishing against him a huge serpent. Above the former figure, which has a certain heroic nobleness, an expression of stern resignation, is the name in Etruscan form and characters of Theseus—the subject, therefore, may be explained as the punishment of that legendary hero in the lower world for his attempt, with Pirithous, to carry off Persephone. The inscribed name is here easily recognised from its resemblance to the Greek, as in the case of the Polyphemus and Ulysses, both with their Etruscan names above the figures. Not far from this we see a contrasted and pleasing group of two figures: a winged Genius, ferocious in type, conducting, we may suppose, to the Elysian realm a young man who calmly follows, holding a vase in his right hand; this latter is a nude figure with downcast head and graceful pose, resembling the Antinous in the Capitoline Museum, and not only through analogies of form and attitude, but with expression like that marked by pensive sadness in the statue of this Bithynian youth, the favourite of an Emperor. Among the busts found in this tomb are some (in *venfro*) of expressive character, though but rudely executed. The other recently-opened sepulchres in the Tarquinii Necropolis have received names (now popular) from certain subjects occurring among the many paintings on their walls. I may mention them in the order in which they are now shown. The "Tomb of the Dying," in which we see a picture of a woman on her deathbed, attended by mourners, and another more strikingly natural scene of an aged man laid out in death by a youth and a maiden, who are clothing the corpse in a garb like that of a Franciscan friar, with cowl over the head. The "Tomb of the Chase" is so called from a picture with small figures of horsemen, some racing, others chasing wild animals. The "Tomb of the Trigæ" contains, among other pictures, one of a chariot-race in which two chariots, drawn each by three horses, appear, the style and execution somewhat similar to that of the preceding tomb. The "Tomb of the Polcinello" is so called from the figure of a person whose office might have been like that of the Court fools of later ages, in a sort of harlequin costume, with high peaked cap like the mumming figures seen in Italian carnivals, this hero of absurdity having his place among dancers and others engaged in various games—perhaps at a state funeral attended with such gay celebrations.

The "Tomb of the Old Man" (*del Vecchio*) contains a picture of a banquet, at which a loving couple are regaling themselves, reclining at table *vis-à-vis*, the aged husband receiving the caresses of his very young wife, who strokes him under the chin—the accessories and service of the feast indicating luxury. In the "Tomb of the Vases" we find another banquet scene, more spirited and better preserved than the former, in which, also, a married pair are reclining at table, with such display of festal pomp, plate, viands, &c., as indicate affluence and good cheer in high life. On the wall at an angle with that where this group is seen, is

the object from which the tomb is now named; a stand in different compartments on which are placed several vases, the larger painted with red and black figures, such as adorn the terra-cotta vessels of the Etruscans, often with characteristics of superior art—the domestic use of these precious vases being here illustrated. In the museum at Corneto the following objects struck me most, and may be particularised from among others of more or less intrinsic value:—*Bronze*: An embossed shield with an ox-head vigorously wrought in high relief at the centre of the disk, the type of that animal partaking somewhat of the human, but whether this be indicative of any mythological fantasy, or a whim of the artist, I cannot say. *Terra cottas*: A large vase, with figure, red on black ground, of a Genius (or warrior) conducting to Hades (or rescuing from it) perhaps Hercules and Alcestis; a veiled woman who follows has evidently more than human guides. A group of Bacchus and Sylvanus, black on a red ground, adorning a smaller vase. A vase, the largest and finest here (found in June, 1874), is adorned with red figures on a black ground—in the centre of the inner side a single figure of a warrior (the Etruscan Mars?) with a shield, the device on which is a lion; on the outside, a finely conceived and well designed procession of Deities with their respective attributes and the names written above in Etruscan mixed with Greek letters—i.e., Zeus (enthroned, his eagle beside him), Athena, Hermes, Hebe, Dionysos, a Satyr, Thetis, Ares, Aphrodite, Hestia, Ganymede: all these standing, the figure of Zeus alone seated. A certain dignity, at least individuality, distinguishes all in this Olympian group. The Aphrodite is fully draped, as she appears in earlier Greek art before Praxiteles. Near the figure of Hestia is inscribed the name of him who designed, and near to this that of the practitioner who painted from the artist's original, this large and beautiful vase, the gem of the Corneto collection, and unquestionably one of the most precious in the whole countless series of such Etruscan objects. The Greek influence appears most distinctly in this example, and leaves (I think) no doubt as to the source from which this finest Etruscan art received its inspiration. Among mirrors with graffiti in this museum, the two most noticeable are adorned with well-designed groups of the Judgment of Paris, and a youth serving a shepherd, before whom stands a winged Goddess—some version, or episode, probably, of the competition for the prize of beauty. The cabinet of jewels and gold ornaments in this museum contains many small but precious objects; the engraved gems, of minute scale, being indeed treasures of their kind.

In the wildly romantic, rock-bound glen below the little town of Cervetri, a multitude of tombs have their openings, regularly formed doorways with flat lintels, on the rocky surfaces hewn (in many instances) into some architectural form, or at least with the plain ornamentation of cornices and mouldings cut in the native tufa-stone. Here we find ourselves in the Necropolis of Caere, where the first researches, rewarded by valuable treasure-trove, were made in 1829 by the arch-priest of the town (Regolini) and a general named Galassi, and where were opened several important tomb-chambers between 1836 and 1846. I was disappointed at my last visit to this place, in that nothing new to me had been added to the range of accessible antiquities; but was nevertheless glad to learn that research has been pursued, and certain results obtained during late years in this necropolis, as well as at Tarquinii. The Caere tombs are less numerous, so far as hitherto made known; but the ground has been far less worked than that near Corneto. The richest ornamental objects, gold, jewellery, &c., found near the former place, are now in the Vatican Museum. A number of tumuli, almost like natural mounds, grass-grown and shaded by forest trees, add a picturesque feature to the glen below Cervetri.

these yet await the *scavi* that might reveal their funeral recesses, and their perhaps precious contents. The tombs recently opened near Cervetri have been (so far as I could ascertain) again closed, or left neglected, after the removal of their precious contents. At Corneto I secured the services of an intelligent cicerone, acquainted with and able to explain all that is of salient character in the adjacent Necropolis. But in the impoverished town (little more than a village) of Cervetri, I had only the guidance of a peasant, who just knew what doors were to be opened with the keys in his charge, and whose report as to all recently discovered sepulchres on that site was summed up in two words: *aperto, riturato*, "opened, stopped up again." I found one among the most famous and memorable of those Caere sepulchres, the so-called "Tomb of the Bassi Rilievi," which the Marchese Campana discovered in 1850, to such extent inundated that I could only enter it barefooted, and explore it wading almost knee-deep in very cold stagnant water. The sculptured adornments of this spacious tomb consisted of numerous reliefs (all originally coloured) representing weapons, shields, greaves, implements of war and sacrifice, besides things for domestic and culinary use and certain emblems of deities—e.g., the goose of Persephone—also other animals, as the dog, the cat, the lizard, and ox-heads with wreaths between their horns. Over a sepulchral couch for two bodies is a more remarkable subject, representing a seated demon (or Pluto) holding a serpent in one hand, an implement like a steering oar in the other, with the Etruscan Cerberus crouching before him. The other sepulchral recesses are provided each with a double stone cushion for the body, which must have been laid unconfined on the rocky bed. This extraordinary tomb has the architectural forms of a regularly constructed chamber, with two massive pilasters (or piers) supporting a roof divided into compartments and terminating like a Gothic vault. It is reached by a deep-descending staircase between high walls built of tufa blocks, and guarded by couchant lions chiselled in the same volcanic stone, one only of these figures being complete. The picturesque glen, silent and solitary, seems a suitable approach to such dark subterranean resting-places, sanctuaries of the long-forgotten dead—mysterious monuments of a long-vanished nationality, a once opulent civilisation, which has left so little to record its existence except the tomb.

C. I. HEMANS.

ART SALES.

MR. ALBERT WAY'S collection of engravings and etchings was sold by Sotheby, Wilkinson and Hodge, last week. The best of the few engravings by Albert Dürer were bought by Mrs. Noseda. *The Virgin holding a Sceptre, with the Child in her arms, surrounded by a Glory*, sold for 14l. 15s.; the print known as *The Holy Family, with a Butterfly*, for 12l. 5s. There were about a hundred of the etchings of Rembrandt included in the sale, but comparatively few were impressions of a high class. An impression of *The Flight into Egypt, in the style of Elsheimer*, fell to Heuser and Lauser for 8l. 10s.; and to the same buyers *The Great Jewish Bride* fell for 18l. 2s. 6d. For 15l. a good impression of the subject known as *Rembrandt's Mill* passed into the hands of Messrs. Goupil.

On Monday Messrs. Christie, Manson and Woods sold many things in oil and water-colour from different private collections. One of David McKewan's effective interiors, *The Poet's Parlour, Knote*, passed into the hands of Mr. Garrett for 19l. 10s. A water-colour of Mr. Dante Rossetti's was sold for 47l. 5s., the purchaser being Mr. Agnew. A good Copley Fielding, *Ben Lomond*, was bought by the same dealer for 252l. There were two important water-colours of Turner's: one of them a subject engraved in the England and Wales series. This was the *Lyme Regis*, which

fell to Mr. Harrison for 409l. 10s. The second, *Brummen and the Schweitz Mountains; Lake of Lucerne*, a fine example of Turner's later time, fell to Mr. Agnew's bid of 504l.

The oil pictures sold that day included a good example of Israels, *The Lonely Shepherd*; it realised 283l. 10s. *Falstaff's Own*, by Mr. Marks, the Academician, fetched 210l. A picture of Paul Falconer Poole's, *The Conspirators*, realised 241l. 10s. A work by J. Holland, *The Grand Canal, Venice*, was fortunate enough to reach the price of 346l. 10s. And, lastly, a Frederick Goodall, *Gateway at Cairo*, was sold for 174l. 6s.

Of the sale of Mr. Gladstone's collection, which began on Wednesday, and continues till this afternoon (Saturday), we shall give some notice in our next issue.

NOTES AND NEWS.

WE understand that the South Kensington Museum has recently received a valuable collection of Persian porcelain, consisting of water bottles, bowls, vases, &c., from Teheran, and that a still larger collection is now on its way to England.

A LOAN exhibition of works of art is now on view at Southampton. The pictures are principally from the collections of the Earl of Portsmouth and Mr. Cowper Temple, and include examples of Rubens, Rembrandt, Vandyke, Vandervelde, and other Dutch masters.

AN INTERESTING archaeological catalogue has just been published by Mr. John Brent, F.S.A., of the Egyptian, Grecian, and Anglo-Saxon antiquities preserved in the Museum at Canterbury.

HERR KÜSTHARDT, the German sculptor who executed the excellent copy of the Hildesheim Corona for the South Kensington Museum (see ACADEMY, Feb. 27, 1875), has recently published in the Hildesheim *Sonntagsblatt* an interesting account of that remarkable work. The Corona, it appears, was restored in 1818, a time when knowledge and taste in art matters were alike deficient, and many alterations, it is found, were then introduced marring the original effect. After minute examination, however, Herr Küsthardt has succeeded in distinguishing every portion of modern workmanship, and has arrived by this means at the meaning of much that has puzzled antiquarians in its peculiar arrangement of lights. He considers, moreover, that the niches in the open towers that have been supposed to have formerly held silver statues never really did so, for such an arrangement would have destroyed the effect of the perforated *à jour* ornamentation of the towers, though it is difficult to understand why, if the statues were never there, the names of certain characters should have been inscribed beneath the niches. But the great French architect, M. Viollet le Duc, agrees with Herr Küsthardt in thinking that these towers must originally have been intended for lanterns rather than temples, and certainly the effect of light streaming through their open spaces into the dim cathedral would have been far more beautiful than any other mode of lighting. The seventy-two sockets for candles, barbarously fastened with wooden screws right into the beautiful ornaments of the "battlements of the heavenly Jerusalem," supposed to be symbolised by these pinnacles, evidently never formed part of the intention of the original artist.

THE Bavarian Assembly in a recent sitting was occupied with several questions relating to art education, and in particular with the desirability of placing the art treasures in the national collections more within the reach of students by means of models, copies, and photographs. The Minister of the Interior has accordingly decreed—(1) that the casts and other reproductions taken from the statues and pictures in the Bavarian Museum, and educational establishments, shall be offered at a much lower price than formerly; and (2) that a comprehensive descriptive catalogue

shall be prepared as soon as possible of all the art objects in the Museum. Both chambers of the Assembly also made it their request that glass painting should be included among the other subjects of education in the programme of the Academy of Fine Arts.

WE have received a catalogue of "Works by George Cruikshank, produced from 1799 to 1875, consisting of upwards of eleven hundred examples, including oil paintings, water-colour drawings, and proof etchings." This is printed by "The Executive Committee for securing the Collection to the Nation," and is preceded by list of said committee, and a circular issued by them. We quote from this circular:—

"With a view to do honour to Mr. Cruikshank two committees were lately formed. By one it was proposed to offer him a testimonial in recognition of his services as an artist, and as a social reformer; while the other contemplated the purchase of his works for the country. To secure combined action, the promoters of the two movements met and coalesced; and on conferring with Mr. Cruikshank, found that the only form in which he would accept a testimonial was in the purchase of his collection for the nation. It was accordingly resolved to adopt measures for purchasing the collection, and for that purpose the executive committee was formed.

"The committee find that the collection, which embraces upwards of eleven hundred specimens, may be procured for 3,000l. To raise this amount, and so to preserve the more esteemed productions of Mr. Cruikshank's genius, the committee invite the co-operation of all lovers of art, and the public generally. The collection has been produced during the long period of seventy-six years—obtaining for the artist a celebrity almost unrivalled. Mr. Cruikshank has refined his art. By his satirical sketches he has exposed pretext, and swept from society and the statute-book many revolting abuses. While promoting humour he has strongly rebuked vice. His pencil has been the handmaid of morality, and his most playful designs have imparted wisdom. His illustrated publications have cheered the old and amused the young; while his cartoons have found admission where less attractive monitors had been repelled. His *One Pound Bank-Note*, his *Bottle*, and his *Worship of Bacchus*, stamp him as the most philanthropic artist of his age."

Admitting the full force of this praise of the veteran's labours in the cause of temperance, and agreeing quite as fully with the justice of rewarding the artist after a long and unrequited career by purchasing his collection for the nation, we will abstain from criticising the remaining portion of the circular, which speaks of Cruikshank being only second as an artist to Rembrandt! The interest of his works is the interest of contemporary delineation of manners, costumes, and passing events, these latter not always carefully depicted in his case, we fear—and the power of Cruikshank we acknowledge is the power of an acute observer and of an able satirist and humorist. The moral aspect of London life for fifty years is indelibly stamped on the woodcuts and etchings of Cruikshank. All honour to George Cruikshank!

Contributions to the Art Collection Fund should be made payable to the treasurer, George William Reid, Esq., of the British Museum, at the London and County Bank, Oxford Street, and addressed to him or to the Acting Secretary, Mr. W. E. Poole, at the Committee Rooms, 11 Chandos Street, Cavendish Square, W.

With regard to the works to be purchased, they include a number, especially at the early period of the life of the artist, of sketches and other original works; but the selection of mature etchings and woodcuts is not of course complete at all, even in respect to his best things. The illustrations to *Jack Shepherd* (Sheppard?) we have always thought, on the whole, the best series of works of that kind done by Cruikshank, and these we do not find among the proofs. Ordinary impressions of these may be easily added, however, and also all those for Ilone's works on the Prince Regent and George IV. and the later *Omnibus* and other comic publications.

THE Prix de Salon seems again to have produced great dissatisfaction. French artists are almost unanimously of opinion that it was due to M. Georges Becker for his remarkable work representing Rizpah driving the birds of prey from the dead bodies of her sons (described in *ACADEMY*, June 5), but the jury have not so awarded it. In a letter addressed to M. Becker in *L'Art* of last week, M. Paul Leroi, however, congratulates that young artist on not having attained the Prix and been sent to Rome. "Que seriez-vous allé y faire? Vous y cristalliser dans vos défauts et n'acquérir rien de ce qui vous manque pour compléter vos remarquables qualités appuyées sur le savoir le plus sérieux." On the other hand the proprietors of *L'Art* have had the "happy thought" of placing every year at the disposal of any artist, who, like M. Becker, shall distinguish himself by exceptional artistic talents at the Salon, a sum of 1,000 fr. to assist him in foreign travel and study in Italy, or any other country that he may desire. This sum *L'Art* now offers to M. Becker.

THE Künstlerhaus at Vienna has awarded its gold medal, as expected, to Hans Makart, not for his great subject of Anthony and Cleopatra on the Nile, but for a smaller work, *A Siesta in the Court of the Medici*. The other medals have been awarded to Victor Tilgner for his bust of Mdle. Wolter, and to Franz Lenbach for a portrait of the Baron Lephart.

A FINE picture by Domenichino, representing David with the head of Goliath, was stolen in March, 1871, from the little town of Fano, near Pesaro, on the Adriatic, of which it had been for more than two centuries the chief ornament. The Syndic of Fano, after an indefatigable search, has at last succeeded in recovering this treasure for his town, in a lamentable state it is true, but still not so far damaged as to be beyond hope of restoration. Several persons supposed to have been implicated in the theft have been examined, but have been acquitted. It will, no doubt, be extremely difficult to lay hands on the real originators of the robbery.

ON June 7 the Exhibition of industrial art products at Dresden was opened in the Curland-Palace with great éclat. The variety and excellence of the collection generally has apparently exceeded the expectations of the people of Dresden, who have shown a great interest in the preparation for and inauguration of the exhibition. The most celebrated schools of art from the ninth century downwards, and nearly all the best-known names in the domain of creative plastic and textile art are represented in the collection, which bids fair to prove one of the most interesting features of attraction at Dresden during the present year.

THE managing committee of the Chilean International Exhibition of 1875 has announced that among many other proposed prizes, a first-class medal and a sum of 250 pesos will be awarded for the best oil-painting exhibited by a foreigner, and a similar medal and 500 pesos for the best piece of statuary by a foreigner. In addition to these official awards the Intendente of Santiago, el Señor Vicuña Markaña, offers various prizes at his own expense for the best models, plans, and descriptions of foundling, orphan, and other public asylums.

THE results of the excavations made at Pompeii on June 14 in the presence of the Dowager Queen of Sweden were unusually brilliant. In the first chamber that was opened, a number of women's ornaments were found, including a gold bracelet, a pair of silver earrings, besides a few coins and various objects which had probably belonged to the toilette, as small glass, alabaster, and other vases. Near them lay the bronze lock, hasps and setting of a casket, in which they had probably been deposited. In another chamber, apparently adapted for a triclinium, a bedstead was found similar to the one now in the National Museum at

Naples which excited so much attention at the time of its discovery; and in the same apartment two bronze vases were recovered in a very perfect condition.

THE French papers announce the discovery of a quarry of excellent lithographic stones in the forest of Montréal, near Nantua, which bid fair to rival those of Munich.

A MONUMENT to Théophile Gautier was inaugurated in the Montmartre cemetery on Thursday last. It is by M. Godebski, of the Academy of St. Petersburg, who gave his services gratuitously, and consists of a base of free-stone supporting a sarcophagus in Carrara marble, on which is seated a Muse of the purest Renaissance character, resting her arm on a medallion of the poet, which is said to be a striking likeness.

THE King of Bavaria has granted a sum of 56,400 florins for the purchase of works of art, to be divided as follows:—10,000 florins for an historical painting representing a deed of arms of a Bavarian regiment in the war against France, painted by Frank Adam; 10,000 florins for a war monument, executed by the sculptor Zambusch, to be set up in Augusta, to which sum the town of Augusta will add 30,000 florins; 24,000 florins for the completion of the paintings in the Catholic Church at Ohiemair; 6,000 florins for a monument recording the union of Lutherans and Reformers, to be placed in the Protestant Church of Kaiserslautern; 6,000 florins for the restoration of the old paintings in the Catholic Church of Kerrieden; 4,000 florins for those in the Protestant Church at Nordlingen; and 18,000 florins for a monumental fountain to be erected in the Maximilian-Platz at Bamberg.

A VERY important collection of works of art and art-industry belonging to the Freiherr von Minutoli, is to be sold at the end of this month in Germany. The collection formerly formed the chief part of the Museum at Liegnitz, but owing to various difficulties in its management that institution has been broken up, and Herr Minutoli now offers its contents to the public. A large number of interesting glass paintings, specimens of German and Venetian goldsmith's work, plastic works in marble, terra cotta, and bronze, antique glass, specimens of old pottery, in particular the celebrated Erfurt jug, and Oriental and other porcelain, besides many valuable paintings, are included in this sale.

THE Salon closed on Sunday last. During the forty-eight days it was open 139,070 persons were admitted by payment, and 371,361 gratuitously. The receipts showed a considerable falling off from last year.

THE STAGE.

The Ticket of Leave Man re-appeared on the Olympic stage, last Monday, after several years' absence, and it will probably be found that the piece retains a share of its old popularity. It is brought forward at the right time when London society, which delights in the class of entertainment given at the Court and the Prince of Wales's, is inclined to desist from playgoing, or at all events when the country visitors and others may be reckoned upon to support a drama which London society can hardly be expected to find amusing. The popularity of *The Ticket of Leave Man* is due to a wholesome moral and abundant surprises. It is, therefore, especially adapted to country tastes. There is little to say that has not been said before about the play itself. The cast has always been a strong one, and is strong now as on the first production of the piece. Mr. Henry Neville, as everybody knows, was the original hero; Mr. Horace Wigan, the original detective; and Miss Kate Saville—a niece of Miss Faucit's, then prominently before the public—was the original heroine. She gave place pretty quickly to Miss Lydia Foote, who came from the East or

from over the water, and made a reputation at once by her performance of her part, which she played, if our memory serves us, for a couple of hundred nights. That was about eleven years ago. Miss Foote is elsewhere; Mr. Wigan still, and permanently, a detective, but also in another place; and Mr. Neville alone is true to the Olympic and his part of Bob Brierly. All this, most people know, but few know that within a few months of the production of *The Ticket of Leave Man* in London it was produced at a provincial theatre—the Bristol Theatre—with a cast perhaps even stronger as a whole than the London cast, and, as was more the custom in those days, entirely different. Mr. William Rignold, whose rendering of the ruffianly brother in the *Two Orphans* only a little while since, at the Olympic, will not be forgotten, was Bob Brierly; he gave it an uncouthness that fitted the part though it was less pleasant than the hearty manliness of Mr. Neville. Mr. George Rignold—now, in his own line, a celebrity—played the detective. Miss Henrietta Hodson, whom since then London playgoers have seen much, was the Bristol Sam Willoughby—played then as now, in London, by Miss Farren; Mr. Coghlan was Green Jones, played in town by Mr. Soutar; and the Bristol May Edwards, the heroine of the piece, was Miss Kate Terry. Not a bad cast—that—it will be admitted, for any theatre in town or country. It is true that the actors were not just then as famous as they were clever. But they managed, sooner or later, to become so.

THE benefit of Miss Guillon le Thière, who lent excellent service in the *New Magdalen* and other pieces, was to take place on Thursday at the Gaiety, when the *New Magdalen* was to be acted, and, after it, *Awaking* (from the French of *Marcel*), with Mr. Clayton in the part played at the Royalty by Mr. Lin Rayne, and Miss Roselle in that played at the Royalty by Miss Hollingshead.

A STRONG programme, thoroughly in accordance with Adelphi tastes, has been prepared for Monday at that theatre, when Mr. J. Clarke will take his benefit.

SIGNOR SALVINI's last nights are announced at Drury Lane. It is possible that he may appear at the Gaiety next season, along with Signor Rossi and Mdme. Ristori.

MDLLE. DELAPORTE will, we hear, give her *comédies de salon* at Marlborough House this evening.

MISS LYDIA THOMPSON will play both in comedy and burlesque on Friday next, on the occasion of her benefit, at the Globe.

THE first morning performance at the Prince of Wales's Theatre was highly successful. *Sweethearts* was played, of course, by Mr. Coghlan and Mrs. Bancroft. It was followed by *A Happy Pair*—a light piece, which Miss Ellen Terry filled with pathetic expression. The performance, though in some sense an experiment and a *tour de force*, tended to confirm the reputation which Miss Ellen Terry has recently been at pains to preserve.

Round the World in Eighty Days will this evening close its career at the Princess's.

Le Procès de Voradieu, by M. Hennequin, has been given successfully at the Paris Vaudeville. It is played by a stronger group of actors than the Vaudeville has often been able to muster, and is said to be bright and witty.

MDLLE. BLANCHE BARETTA's *début* at the Français gave old playgoers nothing new to criticise. She appeared as Henriette in *Les Femmes Savantes*, a part in which she had previously been seen at the Odéon. Her performance at the Français was perhaps hardly as good as those she had given on the other side of the river. She will shortly appear in pieces which will be new to her, and it is then only that her qualifications for the Français can be properly judged, though the surroundings of a beginner at the Théâtre Fran-

çais are such that they sometimes have much such an effect on the aspect of his performance as that of the assembled pictures in the Academy upon a work previously glorious in the safe solitude of the studio.

Les Cinq Francs d'un Bourgeois de Paris is the name of the last light thing at the Théâtre des Folies Dramatiques.

M. CHARLES MONSELET is something of a scholar, more of a wit, most of a *bon vivant*; and we see him, to some extent, as all three in his new little piece *L'Ilote*, at the Théâtre Français. There is some good fooling in it. The scene is in Sparta, where one Ohremès, a good follower of Lycurgus, is anxious for the fate of his young nephew, who has already perceived the excellence of a woman, and may at any moment discover the excellence of wine.

... "Fait grave et capital!
Chez Léandre a parlé la voix de la nature,
Hélas! Et je vais voir, pour peu que ceci dure,
En lui l'austérité fléchir sensiblement.
De plus, il me paraît incliner par moment
Vers l'attrait des festins. O Lycurgue! ô Lycurgue!
L'intéressant neveu que jour et nuit j'objurgue
Tourne à l'ivrognerie. A son dernier repas
Il but trois verres d'eau, c'est là le premier pas.
D'abord l'eau pure, et puis le vin pur. Il s'expose
A de réels dangers. ...
Pour en faire un sujet exemplaire, il faudrait
Le tableau d'un ilota abruti par l'orgie.
Mais, oui! c'est bien cela. ... Face immonde et
rougie.

Un ilota complet, bien à point, odieux,
D'une horreur salubre éclairerait ses yeux.
Il le faudrait aussi montrer à Fleur-de-Sauge."

Fleur-de-Sauge is the young woman of whose excellence Léandre has become aware. "Il le faudrait," donc, "aussi montrer à Fleur-de-Sauge,"—

"Afin qu'à cet aspect la petite restât
Dans la timidité conforme à son état.
C'est justement le jour qu'à Sparte nos éphores
Ont en grande appareil débouché les amphores
Et fait griser, ainsi que l'ordonnent nos lois,
Abominablement vingt ilotes de choix.
Vingt ivrognes gonflés des vins des côtes grecques,
Trébuchans et roulans, ronds comme des pastèques."

The *Ilote* arrives, or rather he is a false one, who does as well for M. Monselet. He is from Athens, and by no means of opinion that wine is only good to excess now and then as a warning to the prudent. Léandre is given something to drink; so is Fleur-de-Sauge; after which that young woman dances a dance with Gnathon; and what use, then, is the following lesson which *L'Ilote* had conveyed?

... "Il faut hâir encore
Tout ce qui charme Athènes et ce que Sparte ignore;
Tout ce qu'un peuple ardent, né sous les oliviers,
Voit naître et glorifie, et partout enviés,
Les arts triomphateurs, les beaux vers, les statues,
L'immortelle Vénus, les grâces peu vêtues,
La danse ionienne et les douces chansons."

The fooling is good, as far as it is M. Monselet's; and so is the acting, as far as it is Got's and Mdle. Reichemberg's.

MUSIC.

AUBER'S "HAYDÉE."

Of some forty operas which Auber composed, it would be remarkable that so very few are known in this country were it not for the well-known fact that the patrons of our opera houses care much less what than whom they hear, and it consequently answers the purpose of managers better to produce such threadbare works as *Norma*, *Son-nambula*, *Lucrezia Borgia*, *Lucia di Lammermoor* or *La Traviata*, than to go in search of novelties. By confining their repertoire chiefly to works in which opportunities are given for display to the popular soprano or tenor, and which at the same time every member of the orchestra knows nearly

by heart, both expense and trouble are saved in rehearsal; and, however much we may regret it, it would be unreasonable to expect that Mr. Gye or Mr. Mapleson would for the sake of art be at the trouble and expense of bringing out works which, however interesting to the musician, would fail in all probability to attract their fashionable supporters, and would most likely result in a loss. Of all Auber's works there are only four or five which are ever to be heard at our opera houses, and even these—with the exception of *Masaniello*, which is what the French call a "grand opera"—that is to say, sung throughout—are spoiled by the substitution of recitative for the spoken dialogue of the original, to say nothing of the inevitable damage to the works by the translation of the original French text into Italian. The best thanks of all who really love music for its own sake are therefore due to the managers of the Gaiety Theatre for the opportunities at present being afforded of hearing some of these charming and sparkling works not only in their original form, but, as has been previously said in these columns, presented with a completeness and perfection of *ensemble* that leave absolutely nothing to desire. No apology is necessary to our readers for recurring to this subject week after week, because each week presents some fresh novelty, and there is certainly no entertainment at present in London which has such claims upon the attention of musicians as these truly admirable performances.

Two of Auber's most charming comic operas—*Les Diamans de la Couronne* and *Le Domino Noir*—had been previously produced at the Gaiety, and, beside the *Haydée* which was brought out last Saturday, *Fra Diavolo*, *Sirène*, and *La Part du Diable* are announced as in preparation. Such an opportunity will therefore be afforded of making acquaintance with the genius of one of the greatest French composers as has seldom before offered itself in this country.

Haydée is Auber's thirty-first opera. It was first performed at the Opéra Comique, Paris, on December 21, 1847, having been preceded by *La Barcarolle* and followed by *L'Enfant Prodigue*. The libretto, as with many of its composer's works, is from the pen of M. Scribe, and though perhaps on the whole hardly one of his best, contains good situations, and is by no means devoid of interest. Lorédan, the Venetian admiral, had in early life by cheating at dice ruined a companion of his, Andrea Donato, who in consequence committed suicide. Remorse preys upon Lorédan, who, as a partial reparation for the wrong he has done, has adopted Rafaela, the niece of Donato, and intends to marry her, and to leave her half his property, and the other half to the son of Donato if he can be found. Rafaela herself, however, loves a young man, Andrea, who, to be near her, enlists in Lorédan's ship, and when asked his other name, simply replies that he is going to make one. Lorédan himself is beloved by Haydée, a Greek slave whom he has bought to ensure her safety. One of his officers, Malipieri, who is jealous of him, finds him in a state of somnambulism, to which he is subject, and from his disjointed words, and from a written confession intended for young Donato, which, while still asleep he gives to Malipieri, the latter obtains possession of his secret. The young Andrea greatly distinguishes himself in a naval engagement, and being appointed by Lorédan as commander of a ship, confesses his second name to be Donato; and Lorédan discovers in him the youth whom he was seeking. Being made aware of his passion for Rafaela, he consents to their union the more readily as his intention of marrying Rafaela himself was not the result of affection, but simply of a desire to make reparation for the wrong he had done. On their arrival at Venice, Malipieri demands the hand of Rafaela for himself, and on Lorédan's refusal threatens him with exposure and shows him his own confession. Lorédan is still firm, and defies him to do his

worst. Haydée has overheard their conversation, and, confessing her love to her master, undertakes to save him. Meanwhile news has come that the supposed slave is a princess of Cyprus, and as Cyprus is now a part of the Venetian Republic, she is consequently a Venetian and free. She, however, refuses to leave him, and meeting Malipieri she tells him she knows his secret, and asks him to name the price of it. He offers to give her the paper if she will be his wife, and to save Lorédan. She consents. Having obtained the paper, she gives it to Lorédan, who has meanwhile been chosen as Doge; and Andrea meeting Malipieri kills him in a duel, thus releasing Haydée, to whom Lorédan (as may be anticipated) offers his hand.

The music of this work, though containing some charming numbers, is not as a whole in Auber's best vein. The opera can hardly be called "comic," except in the French sense of "opéra comique," that is, an opera with spoken dialogue. There is only one humorous part in *Haydée*—that of Domenico, the old servant of Lorédan; on the other hand, the whole part of Malipieri, and such portions as the sleep-walking scene in the first act, are serious rather than comic in their tone. Auber's unflinching stream of melody and piquancy of rhythm do not forsake him; but the sparkling vivacity of the *Diamans* or the *Domino Noir* is seldom to be found here. The opera nevertheless contains a few musical gems of the first water. Foremost among these is Haydée's song with chorus, in the second act "C'est la corvette," in which the effect of the *bouche fermée* for the chorus, so often abused in modern French music, is admirably employed. Very beautiful, too, are Andrea's song "Glisse, glisse, ô ma gondole," the duet for Haydée and Lorédan in the third act "Je t'aime, ô mon maître, je t'aime," and some other numbers which might be named; but on the whole the charm of the performance at the Gaiety arises from the excellence of the acting rather than of the music.

To speak first of the new tenor, M. Tournié, whose first appearance (as Zampa) was briefly recorded last week. This gentleman possesses a very good and powerful tenor voice, and though, like most of his countrymen, somewhat addicted to the *tremolo*, he sings like an artist. His great success, however, is as an actor. The finale of the first act, in which Lorédan in a state of somnambulism goes through the whole of the gambling scene in which he had ruined Donato, makes great demands upon the performer. It is not too much to say that M. Tournié was fully equal to the requirements of the part. Throughout the whole opera, however, his acting was so uniformly good that it is difficult to select any portion for special notice. No less excellent was M. Dauphin, as Malipieri, the villain of the piece. His singing of the song "A toi seul la puissance," in which he expresses his jealousy and hatred to Lorédan, was given with much power, and with an intense malignity of expression which showed M. Dauphin as an actor of great ability. M. Barbet was thoroughly satisfactory as Andrea, and M. Sujol has hardly been better suited with any part (unless perhaps that of Hortensius in the *Fille du Régiment*) than with that of Domenico, in which he was at times exceedingly droll. Mdme. Naddi as Haydée was most charming. Like nearly all the company, she unfortunately indulges too much in the *vibrato*, but with this qualification, she can be unreservedly praised. She was irresistibly encoored in the song "C'est la corvette," already referred to: but perhaps her greatest effect was made in the duet with Lorédan. She sang with great brilliancy her air in the third act "Pour punir pareille offense;" but this movement is musically by no means one of the best pieces in the work. The part of Rafaela was sustained by Mdle. Mary Albert, a young lady pleasing though not remarkable as a singer, but a most excellent and versatile actress. The finished *ensemble* of the whole performance was

quite as noticeable as on previous occasions; and the orchestra, under the able and careful direction of M. Hasselmans, has much improved in finish and refinement since the commencement of the season. EBENEZER PROUT.

A GRAND concert was given last Saturday at the Crystal Palace, in honour of the visit of the Sultan of Zanzibar. Handel's *Acis and Galatea* and a miscellaneous selection of music were performed on the large orchestra by the Handel Festival choir. Concerts given on special occasions such as this present few features of artistic interest, and call for no detailed comment. It will suffice to say that the solo parts in Handel's work were sustained by Miss Edith Wynne, Mr. Edward Lloyd, Mr. Montem Smith, and Signor Foli.

THE seventh Philharmonic Concert, on Monday evening, brought forward Mendelssohn's "Italian" symphony, a selection from Sullivan's "Tempest" music—one of his best, if not his best work—the overture to *Die Braut von Messina* (Schumann), and *Tannhäuser*, and Beethoven's concerto in G, in which Signor Lodovico Breitner confirmed the favourable impression he had produced in his first appearance at a previous concert of the season. The vocalist was Mdlle. Varese.

At last Saturday's New Philharmonic Concert the specialty was Brahms's very interesting Piano-forte Concerto, brilliantly played by Herr Alfred Jaell. The orchestral pieces given were Mendelssohn's "Reformation" symphony, the overtures to the *Freischütz* and *Guillaume Tell*, and Gounod's *Entr'acte* from *La Colombe* and "Funeral March of a Marionnette." Mr. Santley was the vocalist.

THE fourth and last of the excellent chamber concerts given by Messrs. Ludwig and Daubert took place at the Langham Hall on Wednesday evening. The most important feature was Beethoven's great quartett in C sharp minor, Op. 131, played by Messrs. Ludwig, Jung, Zerbini, and Daubert. The programme also included Mendelssohn's sonata in B flat for piano and violoncello, performed by Messrs. Franklin Taylor and Daubert, two movements from Bach's sixth sonata for violin solo (Herr Ludwig), and Beethoven's piano sonata in E minor, Op. 90 (Mr. Franklin Taylor).

LAST Tuesday afternoon the pupils of Mdme. Sainton-Dolby's Vocal Academy gave their first concert at Willis's Rooms. The programme was an excellent one, and the pupils who performed (Misses Wigan, Vernon, Courtney, Cunningham, Wallace and Meenan) were assisted by Miss Eva Leslie, a former pupil of the Academy, Mr. V. Fabrini and Signor Federici in the vocal, and by Mr. Beesley and M. Sainton in the instrumental department. Mdme. Sainton-Dolby is so well known as a successful teacher that it is almost needless to add that the performance of her pupils did great credit to her instructions.

THE National Academy for the Higher Development of Pianoforte Playing also gave an Invitation Concert of its students at the Beethoven Rooms, Harley Street, last Saturday. Without entering into detailed criticism (for, of course, students should not be judged from the same standpoint as professional musicians), it may be said that all the pupils acquitted themselves creditably, while some showed really remarkable talent, and that on the whole "higher development" came off with flying colours.

THE first concert for the present season of the Musical Artists' Society was announced for last evening. This society, which we have before had occasion to mention with praise in these columns, is founded with the laudable object of giving English composers the opportunity of producing new works. How well it carries out its purpose may be judged from last evening's programme, which consisted almost exclusively of compositions by its members, and included a piano

trio by Mr. J. F. Barnett, sonatas for piano and violin by Messrs. E. H. Thorne and J. Lea Summers, a piano duet by Mr. C. E. Stephens, piano solos by Messrs. H. C. Banister and Eaton Fanning, and vocal music by Mdme. R. O'Leary Fanning, Miss Oliveria Prescott, and Messrs. A. Gilbert, C. Gardner, Louis N. Parker, H. Baumer, and Arthur O'Leary.

A GRAND concert is announced for next Tuesday at the Alexandra Palace, in aid of the funds of the International Mozart Institution at Salzburg. The programme is to include the "Jupiter" symphony; the pianoforte concerto in D, to be played by Mr. Charles Hallé; the double concerto for violin and viola, by Mdme. Norman-Néruda and Herr Straus. The vocalists are to be Mdlles. Singelli and Pernini, Mdme. Déméric-Lablache, Miss Rose Hersee, Mdlle. Georgina Schubert, Mr. Edward Lloyd, and Mr. Santley. The conductors will be Sir Julius Benedict, Mr. Dannreuther, and Mr. Weist Hill. The concert, we are informed, has been arranged by Mr. Sigmund Menkes, the agent of the Mozart Institution in London.

THE first session of the Musical Association will terminate on Monday evening with a *conversazione* to be held in the Beethoven Rooms, Harley Street.

HERR SUCHER, the conductor of the Comic Opera at Vienna, has been invited to succeed Hans Richter in a similar capacity at the National Theatre in Pesth.

VERDI is the hero of the day in Vienna, and the local press supplies the public with all the information possible regarding his history. The most curious of the particulars related of him is certainly the fact that he was dismissed from the Conservatorio at Milan on account of—a total want of musical talent. Verdi had been sent to this establishment by a lawyer in his native village, who took an interest in him when he was a lad working in his father's mill, and picking up some notion of the science of music from the organist of the place. The same generous patron came to his assistance six years later at the turning-point of his career. The Scala at Milan then required a new opera; the libretto by Solera was ready, the subject was *Nabucco*, and two or three composers had in vain attempted to draw inspiration from this text. Verdi's kind friend now bent all his energies towards obtaining the task for his *protégé*; but though the latter willingly undertook the composition, the *improvisario* was not so easily induced to risk the production on the great Milanese stage of a work by a composer dismissed from the Conservatorio for lack of talent. His patron had, therefore, to spend large sums in caution-money under various forms; but at length the decisive moment came. Verdi's *Nabucco* was produced, and was triumphantly successful. It was regarded as nothing less than a musical revelation. The composer was called upon the stage some thirty times, and stood there in a threadbare coat and questionable boots gazing at one particular box in which sat a happy old miller from the country. To revert to the present, the great success of the *Requiem* has induced Verdi to promise to visit Vienna during the next winter-season in order to direct the performance of his *Don Carlos*, which has been accepted at the Court Opera House.

THE list of prizes and certificates in music granted by Mr. John Hullah at the Society of Arts Examinations has just been published. The first prize is taken by Mr. D. McGhie, and the second by Mr. W. Millar, both of Glasgow. The ladies' prize is awarded to Miss Louisa Dickes, of London. The total number of certificates granted is 131, as against 102 last year. The two prizemen are both Tonic Sol-fa-ists, as are also 75 out of the 131 who receive certificates. During the past nine years Tonic Sol-fa-ists have taken eight first prizes at these examinations. The total number of certificates granted during that period is 707, and 438 of these have been taken by Tonic

Sol-fa-ists. The examination is, of course, conducted strictly in the old nomenclature and notation. A large proportion of the Tonic Sol-fa students who have obtained certificates have been trained at Anderson's University, Glasgow.

A CORRESPONDENT at Milan of the *New Free Presse* denies the correctness of the *Figaro's* information regarding the condition of the work of Donizetti lately found at Bergamo, and supplies the following particulars regarding this composition. The first act of the opera in four acts *Le Duc d'Alba*, is indeed quite finished: it certainly forms, however, only a prologue to the following acts, and hence its brevity presented an opportunity to the composer of producing a conspicuous piece of music. A few numbers of the second act are finished; but not a single piece of music in the larger half of this act, in the whole of the third and fourth acts, is complete. The vocal music is jotted down without accompaniment in the most cursory manner, only indicated, and only some notes here and there permits the intended harmonisation and instrumentation to be at the same time divined. It was intended at Bergamo to produce the first act of *Le Duc d'Alba*, and the fragments of the second, at the great memorial festival to be held there next September in honour of Donizetti, but the *maestri* entrusted with the arrangement of these works, Bertuletti and Zanetti, gave their opinion strongly against this, and the proposed performance was given up. The correspondent who evidently cannot forgive the *Figaro* for having announced the work found at Bergamo as a great artistic novelty, which interested France next to Italy, observes that the veneration for Donizetti suddenly developed by this journal seems very absurd when it is remembered that the Grand Opera in Paris possesses, but has never produced, one of the finest works of the composer *Don Sebastian*, written expressly for that stage.
